KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā as in ale, fate.
ȧ " " senate, chaotic.
â " " glare, care, and as *e* in there.
ă " " am, at.
ä " " arm, father.
á " " ant, and final *a* in America, armada, etc.
a " " final, regal, pleasant.
a̱ " " all, fall.
ē " " eve.
ė̄ " " elate, evade.
ĕ " " end, pet.
ē " " fern, her, and as *i* in sir, etc.
e " " agency, judgment.
ī " " ice, quiet.
i̇̄ " " quiescent.
ĭ " " ill, fit.
ō " " old, sober.
ȱ " " obey, sobriety.
ô " " orb, nor.
ŏ " " odd, forest, not.
o " " atom, carol.
oi " " oil, boil.
o͞o " " food, fool, and as *u* in rude, rule.
ou " " house, mouse.
ū " " use, mule.
u̇̄ " " unite.
ŭ " " cut, but.
u " " full, put, or as *oo* in foot, book.
û " " urn, burn.
y " " yet, yield.
B " " Spanish Habana, Córdoba, where it is like English *v* but made with the lips alone.

ch as in chair, cheese.
D " " Spanish Almodovar, pulgada, where it is nearly like *th* in English then.
g " " go, get.
G " " German Landtag = *ch* in Ger. ach, etc.
H " *j* in Spanish Jijona, *g* in Spanish gila; like English *h* in hue, but stronger.
hw " *wh* in which.
K " *ch* in German ich, Albrecht = *g* in German Arensberg, Mecklenburg, etc.
n̲ " in sinker, longer.
ng " " sing, long.
N " " French bon, Bourbon, and *m* in the French Étampes; here it indicates nasalizing of the preceding vowel.
sh " " shine, shut.
th " " thrust, thin.
TH " " then, this.
zh " *z* in azure, and *s* in pleasure.

An apostrophe ['] is sometimes used as in tā'b'l (table), kăz''m (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as G, H, K, N, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME XXIII

VALUE.
Professor Alvin Saunders Johnson.

VAN DYCK.
Dr. George Kriehn.

VARIATION.
Mr. C. William Beebe; Mr. George W. Hunter; Professor Alpheus Spring Packard.

VASE.
Professor Charles Knapp; Professor James Morton Paton; Dr. George Kriehn.

VEDA.
Professor John Lawrence Gerig; Professor Maurice Bloomfield.

VEDANTA.
Professor John Lawrence Gerig.

VEGA CARPIO.
Professor John Driscoll Fitz-Gerald.

VEGETABLES.
Dr. Edwin West Allen.

VENEZUELA.
Professor Roscoe R. Hill; Mr. Oscar Phelps Austin; Mr. George Parker Winship.

VENICE.
Mr. Edward L. Engle; Professor A. D. F. Hamlin; Professor Dana Carleton Munro.

VERGIL.
Professor Charles Knapp; Professor John Carew Rolfe.

VERMONT.
Hon. G. H. Parker; Mr. Allen Leon Churchill; Professor F. H. Hankins; Mr. Charles Vernon Katz; Mr. F. W. Jones.

VERSAILLES.
Mr. Edward L. Engle; Professor J. Salwyn Schapiro; Professor A. D. F. Hamlin; Mr. Irwin Scofield Guernsey.

VERSIFICATION.
Professor Arthur A. Livingston; Professor Charles Knapp; Professor George Philip Krapp; Professor Clifford Herschel Moore; Mr. Arthur F. Whittem.

VERTEBRATA.
Mr. C. William Beebe; Mr. George W. Hunter; Dr. William Diller Matthew.

VETERINARY MEDICINE.
Dr. Edwin West Allen; Dr. Alfred Charles True.

VICTORIA (STATE OF AUSTRALIA).
Professor Robert M. Brown; Mr. John W. Russell; Professor J. Salwyn Schapiro; Mr. Irwin Scofield Guernsey.

VIENNA.
Dr. F. T. Haneman; Professor J. Salwyn Schapiro; Professor Dana Carleton Munro.

VIENNA, CONGRESS OF.
Professor Nelson P. Mead.

VINCI, L.
Dr. George Kriehn.

VIOLIN.
Professor Alfred Remy.

VIRGINIA.
Mr. Thomas L. Watson; Mr. Allen Leon Churchill; Professor F. H. Hankins; Mr. Charles Vernon Katz; Mr. F. W. Jones.

VISION.
Professor Edward Bradford Titchener.

VISION IN ANIMALS.
Professor Edward Bradford Titchener.

VISUAL SENSATION.
Professor Edward Bradford Titchener.

VITAL STATISTICS.
Professor F. H. Hankins; Professor Walter Francis Willcox.

VOLCANO.
Mr. David Hale Newland; Professor Angelo Heilprin.

VOLTAIC CELL OR BATTERY.
Mr. Henry S. Carhart.

VOLTAIRE.
Professor E. J. Fortier; Professor Adolphe Cohn.

VOLUNTEER.
Major LeRoy S. Lyon, U.S.A.

WAGES.
Professor F. H. Hankins; Professor Alvin Saunders Johnson; Dr. Roland P. Falkner.

WAGNER.
Professor Alfred Remy.

WALES.
Professor Robert M. Brown; Mr. M. A. Raynes; Dr. Clark Wissler; Professor Charles Knapp; Professor Dana Carleton Munro.

WALLENSTEIN.
Miss Juliet Stuart Poyntz; Professor J. Salwyn Schapiro.

WALLOONS.
Professor A. Carnoy.

WALL PAPER.
Mr. George Leland Hunter.

WAR.
Professor F. H. Hankins; Professor Henry F. Munro; Professor James B. Scott.

WARBLER.
Mr. C. William Beebe; Mr. George W. Hunter.

WAR IN EUROPE.
Colonel Cornélis De Witt Willcox, U.S.A.; Professor F. H. Hankins; Professor Nelson P. Mead; Captain Lewis Sayre Van Duzer, U.S.N.; Mr. Herbert T. Wade; Mr. Irwin Scofield Guernsey.

WASHINGTON (STATE).
Mr. H. Landes; Mr. Allen Leon Churchill; Professor F. H. Hankins; Miss Josephine Preston; Mr. Charles Vernon Katz; Mr. F. W. Jones.

WASHINGTON, D. C.
Mr. Henry B. F. Macfarland; Professor A. D. F. Hamlin.

WASHINGTON, GEORGE.
Dr. Newton D. Mereness; Professor William Peterfield Trent.

WATCH.
Mr. Herbert T. Wade.

WATER.
Professor Martin A. Rosanoff; Dr. Marcus Benjamin.

WATERLOO.
Colonel Cornélis De Witt Willcox, U.S.A.; Professor Edwin A. Start.

WATER METER.
Mr. Harry Barker.
WATER POWER.
Mr. Harry Barker.
WATER PURIFICATION.
Mr. Moses Nelson Baker.
WATER SUPPLY.
Mr. Moses Nelson Baker.
WATER WHEEL AND TURBINE.
Mr. Harry Barker.
WATER WORKS.
Mr. Moses Nelson Baker.
WAVES.
Professor Joseph Sweetman Ames.
WAXES.
Professor Herman T. Vulte.
WEATHER BUREAU.
Professor Charles F. Marvin; Professor Cleveland Abbe.
WEAVING.
Mr. George Leland Hunter; Mr. Louis Wells Clarke.
WEIGHTS AND MEASURES.
Professor David Eugene Smith; Mr. Samuel Wesley Stratton.
WELL SINKING.
Mr. Harry Barker.
WELSH LANGUAGE AND LITERATURE.
Professor John Lawrence Gerig.
WESTERN AUSTRALIA.
Professor Robert M. Brown; Mr. John W. Russell; Professor J. Salwyn Schapiro; Mr. Irwin Scofield Guernsey.
WEST VIRGINIA.
Hon. I. C. White; Hon. H. S. Green; Hon. M. P. Shawkey; Mr. Allen Leon Churchill; Professor F. H. Hankins; Mr. F. W. Jones; Mr. Charles Vernon Katz.
WHEAT.
Dr. Edwin West Allen; Dr. Alfred Charles True.
WHISKY.
Dr. Edwin West Allen; Mr. Charles Albert Crampton.
WHITMAN, W.
Professor William Peterfield Trent; Dr. Horatio Sheafe Krans.
WICLIF, J.
Professor Irving F. Wood.
WILDERNESS, BATTLE OF THE.
Colonel Cornélis De Witt Willcox, U.S.A.
WILL (in law).
Mr. Harold R. Medina; Dr. Harlan F. Stone.
WILLIAM II.
Professor Nelson P. Mead.
WILSON, (T.) WOODROW.
Mr. W. W. Pierson; Dr. Talcott Williams.
WINDMILL.
Professor Frederick Remsen Hutton.
WINDOW.
Professor A. D. F. Hamlin.
WINE.
Dr. Edwin West Allen; Dr. W. D. Bigelow.
WIRELESS TELEGRAPHY AND TELEPHONY.
Mr. Frederick A. Kolster.
WISCONSIN.
Mr. Lawrence Martin; Mr. Allen Leon Churchill; Hon. T. B. Nagler; Hon. C. P. Carey; Mr. Charles Vernon Katz; Mr. F. W. Jones.
WITCHCRAFT.
Dr. Robert H. Lowie.
WOMAN SUFFRAGE.
Dr. George Elliot Howard.
WOMAN'S WORK.
Dr. George Elliot Howard.
WOMEN IN INDUSTRY.
Professor F. H. Hankins.
WOMEN'S CLUBS.
Professor F. H. Hankins; Mrs. Phillip North Moore.
WOOL.
Dr. Edwin West Allen; Dr. Alfred Charles True.
WOOL AND WORSTED MANUFACTURES.
Mrs. E. B. McGowan.
WORDSWORTH, W.
Professor Wilbur Lucius Cross; Dr. Horatio Sheafe Krans.
WÜRTTEMBERG.
Professor Robert M. Brown; Mr. M. A. Raynes; Professor J. Salwyn Schapiro; Mr. Irwin Scofield Guernsey.
WYOMING.
Mr. L. W. Trumbull; Mr. Allen Leon Churchill; Professor F. H. Hankins; Mr. Charles Vernon Katz; Mr. F. W. Jones.
X RAYS.
Professor Joseph Sweetman Ames; Dr. Albert Warren Ferris.
YACHT AND YACHTING.
Mr. Herbert L. Stone.
YALE UNIVERSITY.
Mr. Edwin Rogers Embree; Mr. Allen Leon Churchill.
YELLOW FEVER.
Dr. David Gilbert Yates; Dr. F. T. Haneman.
YELLOWSTONE NATIONAL PARK.
Mr. L. F. Schmeckebier.
YIDDISH.
Mr. Felix Vexler; Rev. Julius N. Greenstone.
YOGA.
Professor John Lawrence Gerig; Professor A. V. W. Jackson.
YOUNG MEN'S CHRISTIAN ASSOCIATION.
Professor F. H. Hankins; Mr. Erskine Uhl.
YOUNG WOMEN'S CHRISTIAN ASSOCIATION.
Professor F. H. Hankins; Miss Elizabeth Wilson.
YUAN SHIH-KAI.
Dr. Paul H. Clements.
ZADOKITES.
Professor Nathaniel Schmidt.
ZECHARIAH.
Professor Nathaniel Schmidt.
ZINC.
Dr. C. H. Mathewson; Dr. David Gilbert Yates.
ZIONIST MOVEMENT.
Professor F. H. Hankins; Mr. Isidore Delson.
ZOÖLOGY.
Mr. C. William Beebe; Mr. George W. Hunter.
ZOROASTRIANISM.
Professor John Lawrence Gerig; Mr. Felix Vexler; Professor A. V. W. Jackson.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

VALJEAN, vål'zhäN', JEAN. The hero of Hugo's romance *Les misérables,* an ex-convict, converted through the kindness of an ecclesiastic. On regaining his liberty he devotes his life to rearing Cosette, the child of Fantine, whom he has saved from cruelty and sorrow. See COSETTE.

VALK, välk. A town of Livonia, Russia, 102 miles northeast of Riga. Pop., 1910, 20,500.

VALKY'RIE. An English cutter, 126 feet in length, with which Lord Dunraven competed for the *America's* cup in the races in 1893, when she was defeated by the *Vigilant.* She was sunk in a collision in the Firth of Clyde in the following year. See YACHTING.

VALKYRIES, vål-kĭr'ēz (Icel. *valkyrja,* chooser of the slain). In Scandinavian mythology, the maidens, usually nine in number, who attend on Odin (q.v.). Adorned with golden ornaments, they ride through the air in brilliant armor, order battles, and distribute the death lots according to Odin's commands. Fertilizing dew drops on the ground from the manes of their horses, light streams from the points of their lances, and a flickering brightness announces their arrival in the battle. They conduct the souls of the heroes who fall in battle to Valhalla (q.v.), where they act as his cup bearers. Two valkyries, Hrist and Mist, are cup bearers to Odin himself.

The valkyries are of diverse origin. Some of them spring from elves and other superhuman beings, and some are the daughters of princes, who in their lifetime are numbered among the valkyries, showing all their qualities, and becoming valkyries when they die. They ride generally in companies of three, or of three times three or four times three. The valkyries represent the clouds, especially those of the storm. As the white clouds, however, they are regarded as swan maidens, one of the most widespread beliefs in folklore. Whosoever gains possession of their feathered robes has them in his power. Their evolution into the maidens of Odin seems to be of later origin. Still later, in the Icelandic versions of the Nibelung Saga, Brunhilda (q.v.), the daughter of Odin, is represented as a valkyrie. The myth of the valkyries has been treated in *Die Walküre,* the second of the four divisions of Wagner's music drama, *Der Ring des Nibelungen.*

VALLA, vål'lä, LORENZO or LAURENTIUS (c.1407–57). An Italian humanist of the early Renaissance. He taught at Pavia, Milan, and Naples, and wrote theological and critical works whose departure from established points of view stirred up heated polemics with Filelfo and Poggio. About 1448 he was saved from the Inquisition only by his patron, King Alfonso V, who assisted him to flee to Rome. There he was befriended by Popes Nicholas V and Calixtus VI. In 1450 he was appointed to a professorship of rhetoric in the University of Rome. Of especial importance is his *De Elegantia Latinæ Linguæ* (6 books, 1471), which went through 59 editions in less than a century and is still consulted. He was a pioneer in the higher criticism by writing his comparison of the Vulgate New Testament with the Greek originals. He made Latin translations of Homer, Herodotus, and Thucydides, and a careful edition of Quintilian. His collected *Opera* were published in Basel, 1543. For his biography consult: Vahlen (Berlin, 1870); Mancini (Florence, 1892); Wolf (Leipzig, 1893); Schwan (Berlin, 1896); Barozzi (Florence, 1891); consult also J. E. Sandys, *A History of Classical Scholarship,* vol. ii (Cambridge, 1908).

VALLADOLID, väl'yà-ᴅô-lēᴅ'. The capital of the Province of Valladolid, Spain, 102 miles northwest of Madrid, on the left bank of the Pisuerga River (Map: Spain, C 2). The plain bordering this river is well irrigated and very fertile. The climate is genial, because of the moderate elevation, pure air, and generally cloudless sky. The city was long the capital of Castile and León, and later of all Spain, and contains many marks of its former greatness. The Campo Grande is larger than the Plaza Mayor at Madrid. Upon the Plaza del Campanillo, now a modern market, fronts the house once occupied by Cervantes (q.v.). Near the church of the Magdalen, on a street named after the great discoverer, stands the house in which Columbus died. From the side of the Plaza de Portugalete rises the cathedral, a Renaissance structure begun by Juan de Herrera, during the reign of Philip II, and yet incomplete. Santa María la Antigua, the most interesting church of the city, a Gothic creation of the twelfth century, enlarged in the fourteenth, contains a retable, which is the masterpiece of Juan de Juni. The thirteenth-century church of San Pablo, remodeled by Cardinal Torquemada in the fifteenth century and mod-

ernized by the Duke of Lerma 200 years later, was often the meeting place of the ancient Cortes. This and the Colegio de San Gregorio, now occupied by municipal offices, are two of the finest examples of Gothic architecture in the world. The Colegio de Santa Cruz now contains the provincial library and museum, which preserves some fine paintings. The university (see VALLADOLID, UNIVERSITY OF) has an elaborately sculptured façade. The ancient royal palace now serves the sessions of the provincial audiencia. The city has manufactures of chocolate, flour, woolen and silk goods, iron and metal ware, gloves, and pottery. Pop., 1910, 67,742. The Roman origin of the city is in dispute. Two important church councils were held here during the twelfth century (1124 and 1137), and another in 1322. In 1808 it took a prominent part in the uprising against the French, and, as a result, suffered severely at the hands of the invaders.

VALLADOLID. The capital of Michoacán, Mexico. See MORELIA.

VALLADOLID. A town of Yucatan, Mexico, situated 100 miles southeast of Mérida (Map: Mexico, P 7). The town is well laid out, and possesses a Jesuit college and the remains of a fine Franciscan convent. It manufactures cotton goods. Pop., about 5000, mostly Indians and mestizos. Valladolid was founded in 1544.

VALLADOLID. A town of Negros, Philippines, in the Province of Negros Occidental, situated on the coast, 16 miles southwest from Bacólod. It is an important military post. Pop., 1903, 10,550.

VALLADOLID, UNIVERSITY OF. A Spanish university, one of the oldest foundations in Europe, in existence at least since 1260, and raised to the rank of university in 1346. With many gifts and privileges from kings and popes alike, it flourished greatly until the eighteenth century. It has faculties of law, medicine, natural science, and philosophy and letters. There are about 4600 students.

VALLANDIGHAM, văl-lăn'dĭ-gam, CLEMENT LAIRD (1820–71). An American politician, born at New Lisbon, Ohio. After a year in Jefferson College, Pennsylvania, in 1837–38, he taught for two years in Maryland; was admitted to the Ohio bar in 1842; was elected to the Ohio Legislature in 1845; edited the Dayton *Western Empire* in 1847–49; and from 1857 until 1863 was a member of the National House of Representatives. In politics he was an extreme States-rights Democrat. He violently attacked the Lincoln administration both in and out of Congress, and his conduct led to a resolution for an inquiry into his loyalty, while numerous petitions for his expulsion were presented. After his term in Congress expired he continued to make incendiary speeches against the government. As a result he was arrested in May, 1863, by order of Gen. Ambrose E. Burnside (q.v.); was tried by court-martial; and was sentenced to be imprisoned in Fort Warren. President Lincoln, however, changed the sentence to deportation into the Confederate lines. Thence Vallandigham made his way to the Bermudas, and thence to Canada. In the same year he was nominated by his party for the governorship of Ohio, but was defeated by the overwhelming majority of 100,000 votes. He was allowed to return in the following June; became supreme commander of the Sons of Liberty (see KNIGHTS OF THE GOLDEN CIRCLE); and took an active part in the Democratic convention of 1864. In June, 1871, while acting as counsel in a murder trial, he attempted to illustrate his theory of how the shooting had been done, and was killed by the accidental discharge of the pistol. Consult J. L. Vallandigham, *Life of Clement L. Vallandigham* (Baltimore, 1872), and J. F. Rhodes, *History of the United States from the Compromise of 1805* (New York, 1907).

VALLE, văl'lā, PIETRO DELLA (1586–1652). An Italian traveler, born in Rome. He was educated in the arts and sciences and became a member of the Roman Academy of the Umoristi. In 1611 he took service against the Moors of Barbary. He traveled extensively in the Orient during the years 1614–26, going to Turkey, Egypt, Palestine, Persia, and India, studying the languages and the customs of these countries. In 1621 he visited the ruins of Persepolis, and copied several of the characters of the cuneiform inscriptions there. While in India in 1623 he first drew attention to the existence of the ancient Sanskrit language. Of his works, which are all marked by careful observation, but also betray a weakness for the miraculous, the most famous is the *Viaggi in Turchia, Persia ed India descritti in 54 lettere famigliari* (2 vols., 1650–58; 2d ed., 1662–63), translated into French (4 vols., 1661–63), German (1674), and English (1664), while a new translation in the latter language was made by Grey, *Travels of Pietro della Valle in India* (2 vols., 1892).

VALLE CAMONICA. See CAMONICA.

VALLE DEL CAUCA, väl'yā dĕl kou'kā. A western department of the Republic of Colombia. It borders the Pacific Ocean and extends across the western Cordillera and the valley of the Cauca River in its upper course. Its area is variously estimated from 4179 to 10,808 square miles. The climate varies from frigid to tropical in different parts of the department, with an average temperature of 77° F. The chief products are cacao, coffee, tobacco, corn, rice, bananas, sugar cane, and potatoes. Stock raising is carried on extensively. The mineral wealth consists of gold, silver, and platinum. There are also factories of cigars, matches, chocolate, pottery, and straw hats. Pop., 1912, 217,159. The capital is Cali, which was founded in 1536 and had a population of 27,747 in 1912.

VALLE DE SANTIAGO, väl'yā dā sän'tē-ä'gō. A town in the State of Guanajuato, Mexico, situated in a fertile valley, 45 miles south of the city of Guanajuato (Map: Mexico, H 7). It has a celebrated parish church, built during the early years of the eighteenth century. Municipal population, 1910, 12,737.

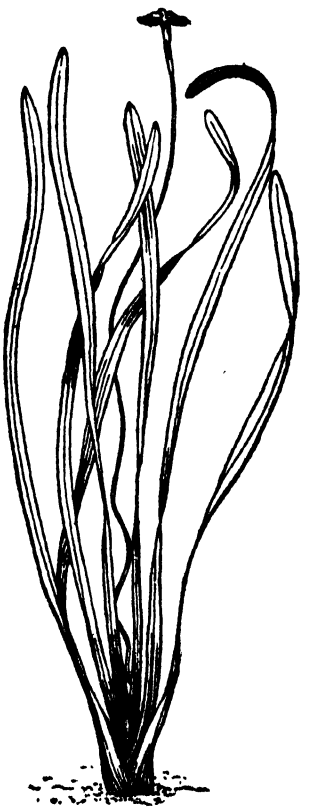
VALLEJO, văl-yā'hō. A city in Solano Co., Cal., 30 miles north by east of San Francisco; on San Pablo Bay, and on the Southern Pacific, and the San Francisco, Napa, and Calistoga railroads (Map: California, C 4). It has public and convent schools and a Carnegie library. Other features include the city hall, the buildings of the various fraternal organizations, the Home for Orphans, and the Sailors' Club House. Vallejo is surrounded by a rich farming section and is of considerable industrial importance. The leading establishment is the Mare Island Navy Yard, which gives employment to nearly 2500 men. There are also a cement plant, a fish cannery, flour and planing mills, and a tannery. A quicksilver mine is operated near the city. Vallejo was founded in 1851 to be the capital of the State, and the Legislature met here in 1851, in 1852, and for a time in 1853.

Pop., 1900, 7965; 1910, 11,340; 1915 (U. S. est.), 13,119.

VAL'LENTINE, BENJAMIN BENNATON (1843–). An American journalist and author, born in London and educated at King Edward VI's school at Birmingham. He went to the United States and wrote for various New York papers, becoming dramatic critic for the New York *Herald*. He was one of the founders of *Puck* in 1877, and was its editor down to 1884. To this periodical he contributed a series of humorous observations on current events under the titles "Fitznoodle in New York," "Fitznoodle in America," and "Fitznoodle at Home" (1877–84). He wrote the plays *Fitznoodle; A Southern Romance; In Paradise* (1899); *Fritz in New York;* and *Madame Saccard* (adapted from Zola's drama *Renée*).

VALLEY. A depression in the land surface usually occupied by a river. The chief agency in the formation of a valley is erosion carried on by the running streams and assisted by the natural decay or weathering of the rocks in which the channels lie. The relative rapidity with which the two agencies of erosion and weathering perform their work determines to some extent the form of the valley. In dry regions where erosion along the river bed proceeds at a rapid rate compared to the weathering of the rocks on the sides the valley may be narrow and bordered by steep walls. With the lapse of time, however, erosion alone will widen the valley as the stream tends more and more to cut away the walls in proportion as the channel is lowered to base level, and when this stage is reached the course of the stream wanders from one side to the other, forming a flood plain by deposition of the silt that has been brought down from above. See RIVER.

VALLEY CITY. A city and the county seat of Barnes Co., N. Dak., 58 miles west of Fargo, on the Northern Pacific and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: North Dakota, F 4). A large flour mill is situated here, and there are important agricultural and nursery interests. The institutions include a State normal school and a Carnegie library. There is also a fine natural park. The place was settled in 1875–76 and incorporated in 1887. Pop., 1900, 2446; 1910, 4606.



VAL'LEYFIELD. The capital and a port of entry of Beauharnois County, Quebec, Canada; on the St. Lawrence River and Lake St. Francis, and on the Grand Trunk and the St. Lawrence and Adirondack railways, about 40 miles southwest (direct) of Montreal (Map: Quebec, F 6). It is the western terminus of the Beauharnois Canal. It has a Roman Catholic cathedral, a college convent, and a hospital; and there are various manufactures. The city owns its water works and electric-lighting plant. Pop., 1901, 11,055; 1911, 9449.

VALLEY FORGE. A small village on the Schuylkill River, in Chester Co., Pa.; on the Philadelphia and Reading Railroad, 24 miles west-northwest of Philadelphia. Here on Dec. 17, 1777, after the battles of Brandywine and Germantown and the occupation of Philadelphia by the British, the American army, of about 11,000, encamped for the winter. Washington chose this place partly for its defensibility and partly to protect Congress, then in session at York, Pa., from a sudden British attack. Owing largely to the incapacity of the quartermaster-general and of the Commissary Department the men were left without adequate shelter, food, or clothing, and in consequence suffered terrible hardships, many dying of starvation and cold. At no time were more than half of their number fit for active service. It was here, however, that Baron Steuben (q.v.) trained, disciplined, and reorganized the army, and thus enabled it to fight with greater efficiency in subsequent campaigns, and it was here (May 1, 1778) that news reached Washington and his troops of the consummation of the French alliance. On June 18, 1778, Washington abandoned his camp and reoccupied Philadelphia preparatory to pursuing the British across New Jersey. A State commission, appointed in 1893, has purchased about 475 acres of the original camp ground and converted it into Valley Forge Park, containing Washington's headquarters and other historic landmarks that have been preserved or restored. Maine (1907) and Massachusetts (1910) have erected memorials to their soldiers who were encamped there.

VALLEY JUNCTION. A city in Polk Co., Iowa, 5 miles west of Des Moines, on the Chicago, Rock Island, and Pacific and the Minneapolis and St. Louis railroads (Map: Iowa, D 3). There are large railroad repair shops, several coal mines, Portland cement works, and extensive stockyards. Pop., 1900, 1700; 1910, 2573; 1915 (State census), 3026.

VALLEY QUAIL. See PARTRIDGE.

VALLGREN, vål'grĕn, VILLÉ (1855–). A Finnish artificer and sculptor. He was born in Borgå, and resided long in Paris, whither he went in 1878, after studying architecture in the Helsingfors Polytechnic. He entered the Ecole des Beaux-Arts, and studied under Cavalier. His small bronzes, urns, candelabra, etc., which are distinguished by elegance, truthfulness, and intense artistic feeling, rank him as one of the foremost of modern decorative artists. His subjects are sometimes idealistic and symbolical, sometimes sternly realistic, and their effect is heightened by a patina of varied tints. Of his statues and portraits, several are in New York in the Vanderbilt collection, and he is well represented in the Imperial Castle and National Museum at Helsingfors, in the Museum of Arras, and in the Berlin National Gallery.

EEL GRASS (*Vallisneria spiralis*).

VAL'LISNE'RIA (Neo-Lat., named in honor of Antonio Vallisneri, an Italian botanist of the eighteenth century). A genus of small, stemless, aquatic plants, with grasslike leaves, belonging to the family Hydrocharitaceæ, and

found in the warm parts of both hemispheres. They generally grow in running waters. *Vallisneria spiralis* is particularly celebrated on account of its peculiar process of fecundation. The flowers of the female plants rise to the surface of the water by uncoiling their long spirally twisted stalks; the flowers of the male plants become detached, having previously grown on short spikes at the bottom of the water, and expand, floating about upon the surface. After fecundation, the female flowers return under the water by the recoiling of their stalks and the fruit is ripened under water. The plant is found in ditches and bogs in Italy, southern France, and the United States, where it is called wild celery, and is famous as the food of the canvasback duck.

VALLOMBROSA, väl'ôm-brō'zà, CONGREGATION OF. A branch of the Benedictine Order, founded in the eleventh century and taking its name from its mother house, a celebrated abbey of Tuscany, situated among the Apennines in a valley surrounded with forests, whence the name. Its founder was St. John Gaulbert, born at Florence either in 985 or 995. The congregation was a contemplative one and observed strict silence. It spread into France and through Italy, but never had more than 60 houses. Its decline was hastened by the vicissitudes of the mother house, which was pillaged in 1527 by the troops of Charles V. It was plundered in 1808 by the French troops. In 1866 it was appropriated by the Italian government, and since 1870 has been used as a school for the Royal Academy of Forestry. A few monks still remain, partly occupied in the duties of the meteorological station founded in 1654. Vallombrosa was visited by Dante, celebrated by Ariosto in the *Orlando Furioso*, and mentioned by Milton in a famous passage of *Paradise Lost*.

VALLS. A town in the Province of Tarragona, Spain, 50 miles west of Barcelona, on the left bank of the Francolí (Map: Spain, F 2). It has textile factories, potteries, flour mills, and distilleries. Its ancient walls give it a picturesque aspect. Pop., 1910, 11,911.

VALMORE, väl'môr', MARCELINE DESBORDES. A French poet. See DESBORDES-VALMORE.

VALMY, väl'mē'. A village of France, in the Department of Marne, 36 miles southeast of Rheims (Map: France, N., K 3). It is noted as the scene of a battle (Sept. 20, 1792) in which the French under Kellermann (q.v.) and Dumouriez repulsed the Prussians under the Duke of Brunswick, after displaying fine bravery under a furious cannonade from the enemy. The battle or skirmish, frequently spoken of as the cannonade of Valmy, did not cost either army more than 800 men, but, though from a military point of view an insignificant affair, it produced moral effects of the greatest importance. It was the first triumph of the Republican arms, and freed the French nation from the temporary panic inspired by the foreign invasion. Napoleon made Kellermann Duke of Valmy in 1809.

VALMY, DUKES OF. See KELLERMANN, F. C. and F. E.

VALOIS, FELIX OF. See FELIX OF VALOIS.

VALOIS, va'lwä', HENRI DE. See VALESIUS, HENRICUS.

VALOIS, HOUSE OF. A branch of the Capetian dynasty (q.v.) which occupied the throne of France from 1328 to 1589. It originated in the person of Charles, second son of King Philip III, who obtained in 1285 the County of Valois as an appanage from his father. Philip IV, the elder brother of Charles, left three sons, who reigned one after the other and died without male issue, and the succession fell, by the Salic law, to the eldest son of Charles, who accordingly ascended the throne as Philip VI (q.v.). The elevation of the house of Valois to the throne of France gave rise to long and bloody wars with Edward III of England, who claimed the crown through his mother, Isabella, the daughter of Philip IV. (See HUNDRED YEARS' WAR.) The French crown fell by regular succession of son to father to John the Good (1350–64), Charles V (1364–80), Charles VI (1380–1422), Charles VII (1422–61), Louis XI (1461–83), and Charles VIII (1483–98). Charles VIII having died without male issue, the crown fell to the representative of the nearest collateral male line, Louis, son of Charles, Duke of Orléans and grandson of Louis, Duke of Orléans, the younger brother of Charles VI, who ascended the throne as Louis XII (1498–1515), the first of the Valois-Orléans house; but, he also dying without male issue, the succession devolved upon the descendants of his uncle, Count Jean d'Angoulême, whose grandson, Francis I (1515–47), succeeded. Francis I was followed by his son Henry II (1547–59). Henry's three sons, Francis II (1559–60), Charles IX (1560–74), and Henry III (1574–89), occupied the throne in succession, but, none of them leaving male heirs, the crown devolved upon Henry IV of Navarre of the house of Bourbon (q.v.), which was descended from Robert, a younger brother of Philip III.

VALONA, vä-lō'nä, or **AVLONA**, äv-lō'nä (the ancient Greek *Aὐλών, Aulōn*). A seaport in Albania, on the Gulf of Avlona (Map: Turkey in Europe, B 4). It has a safe and spacious harbor and considerable trade in the products of the surrounding region, especially oil, wool, grain, cattle, and hides. The inhabitants manufacture arms and engage in fishing. It was held by the Turks from 1464 until the Balkan War of 1912–13 (q.v.), being incorporated in the Vilayet of Janina. In 1913 it became the seat of government of the newly erected Principality of Albania. It was occupied by the Austrians in the great war which began in 1914. (See WAR IN EUROPE.) Pop., about 6500.

VALO'NIA (It. *vallonia*, from Gk. *βάλανος, balanos*, acorn; connected with Lat. *glans*, Lith. *gile*, OChurch Slav. *zlendi*, acorn). The acorn cup of *Quercus ægilops*, a species of oak indigenous to Asiatic Turkey. It is rich in tannic acid, in consequence of which it is extensively used by tanners. The tree is cultivated along the Mediterranean shores. The exportation of the acorn cups or valonia is quite an important industry of Smyrna. They contain as much as 32 per cent tannin and are in especial demand for the production of high-grade leathers of light color and firm texture. In Algeria the tree is used for reforesting the mountains, as it grows rapidly and seems well adapted to its surroundings. See LEATHER, *Manufacturing Processes*.

VALORIZATION, or VALORISATION. A term applied to the equalization of the market prices of commodities by regulating their available supply. It is especially applied to such a plan when carried out by government aid. It is, however, best known in connection with the Brazilian Coffee Valorization Plan. For several years preceding 1905 Brazilian coffee growers

had suffered from very low prices due to large crops and unregulated methods of marketing. The result was that the prosperity and even to a large extent the existence of the industry were threatened. Under an act of 1905 passed by the State of São Paulo the government was authorized to purchase coffee and dispose of it in the markets of the world. The plan was backed by the Brazilian government. The entire record crop of 1906–07 was bought up and withheld from the market. Loans to the amount of $75,000,000 issued by the State of São Paulo and guaranteed by the Brazilian government were negotiated through London and New York bankers to finance the scheme. In 1909 an international syndicate or committee was created to regulate the disposal of the coffee and secure the retirement of bonds based thereon. The coffee held in this manner increased to over 7,000,000 bags at one time. Portions of the holdings were sold semiannually at auction in New York, London, Havre, Rotterdam, and elsewhere. The effect of the scheme was shown in an increase in the wholesale price from an average of about seven cents during several years preceding the plan to 14 to 16 cents in 1912–13. The world's available supply of coffee was in this manner equalized and the price regulated. The prosperity of the industry in Brazil was restored; violent fluctuations in price from years of good to those of poor crops were avoided; and the losses previously experienced from occasional overproduction and unremunerative prices were obviated.

In May, 1912, the United States Department of Justice began suit against Henry Sielcken and other agents of the scheme in that country, on the ground that 931,000 bags of valorization coffee stored in Brooklyn constituted a violation of the Sherman Antitrust Law. This case was protested by the Brazilian Ambassador on the ground that the United States could not interfere with the property of another nation. Negotiations between the governments followed with the result that the United States agreed to withdraw the suit if Brazil would secure the disposal of the coffee by April, 1913. In January, 1913, the International Valorization Committee meeting in London stated that all syndicate coffee held in the United States had been sold to 80 buyers in 20 different States. Thereafter the government suit was withdrawn. About the same time 300,000 bags were sold in Europe and it was announced that no more would be disposed of by the syndicate during 1913, though it held at that time more than 3,000,000 bags in storage in various European centres. Moreover there was nothing to prevent the syndicate from controlling the United States market by operating from some convenient Canadian centre.

VALPARAISO, văl'pȧ-rī'sō. A province of west Chile, bounded by Santiago on the south and east, Aconcagua on the north and east, and the Pacific Ocean on the west (Map: Chile, E 4). The small islands of Juan Fernández are included in the province. Area, 1953 square miles. The surface is largely mountainous and sterile in the southern part, but fertile in the north. The chief occupation, outside the capital, is agriculture. Pop., 1907, 281,872; 1912, 311,809. Capital, Valparaiso (q.v.).

VALPARAISO. The capital of the Province of Valparaiso, Chile, and the chief seaport of the Republic, situated on a bay of the Pacific, 68 miles (116 miles by rail) west-northwest of Santiago (Map: Chile, E 4). The older and business portion of the city extends along the shore of the bay, while on the slope of the surrounding hills are the finer residence suburbs. Viña del Mar, a few miles to the east, is a noted suburb and seaside resort. Valparaiso enjoys a mild and equable climate, the average temperature being 58° F., the average for January 63° F., and for July 53° F. The average annual rainfall is about 13.5 inches. The town has some well-constructed streets and a square with many monuments. The more important monuments include statues of Columbus, William Wheelwright, who built the first railway in South America, Thomas Cochrane (tenth Earl of Dundonald), who organized the Chilean navy, and a fine monument to the navy, surmounted by a statue of Admiral Prat. The port is strongly fortified and the government maintains here a large naval arsenal. The chief manufactures are cotton goods, machinery, and ironwork; other interests are the manufacture of tobacco, the bottling of mineral water, sugar refining, brewing, and distilling. The harbor is accessible and has a complete system of docks, warehouses, and shipyards. Valparaiso is the most important commercial city of Chile and is making rapid progress. It exports grain, wool, leather, guano, saltpetre, and copper. Its chief imports are textiles, other manufactures, and mineral products. In 1912 nearly one-half the imports of Chile passed through Valparaiso; the same year the port ranked seventh in exports. It is the seat of a United States consul. Pop., 1903, 143,769; 1912, 179,794. The city was founded by Juan de Saavedra in 1536. It was visited by a terrible earthquake in 1855. During the civil war of 1891 it was taken and partly sacked by the congressional troops. On Aug. 16, 1906, a tremendous earthquake caused the greater part of the city to crumble in ruins. The worst shock lasted five minutes.

VALPARAISO, văl'pȧ-rā'zō. A city and the county seat of Porter Co., Ind., 44 miles southeast of Chicago, Ill., on the Pittsburgh, Fort Wayne, and Chicago, the Grand Trunk, and the New York, Chicago, and St. Louis railroads (Map: Indiana, C 2). It is chiefly a residential city, and has the Valparaiso University, St. Paul's Academy, a Carnegie library, Christian Hospital, and a fine courthouse. The city is in a rich farming district, and manufactures mica products, paint, electrical specialties, cut glass, steel products, and educational specialties. Valparaiso was settled in 1836 and incorporated in 1856. Pop., 1900, 6280; 1910, 6987.

VAL'PY, Abraham John (1787–1854). An English printer and editor, second son of Richard Valpy, the head master of Reading School. From his father's instruction he passed to Pembroke College, Oxford, graduating in 1809. While a schoolboy at Reading he published a selection from Cicero's *Letters*, which went through several editions. With the intention of rivaling the great classical printers, he began business in London, first in Chancery Lane and subsequently (1822) in Red Lion Court, Fleet Street. Among the classics published by him are Brotier's *Tacitus* (5 vols., 1812); a reissue of Stephens's *Thesaurus Græcæ Linguæ* (12 vols., 1816–28); the *Delphin Classics*, with George Dyer as editor (141 vols., 1819–30); and *The Family Classical Library*, translations into English (52 vols., 1830–34). He also founded the *Classical Journal* (1810) and a periodical called

the *Museum* (1822) and brought out an illustrated edition of Shakespeare (15 vols., 1832–34). In or about 1837 he sold his business and became interested in an insurance company and other financial undertakings.

VALTELLINA, väl'tĕl-lē'nȧ. The upper valley of the Adda River, in the Province of Sondrio, Italy, extending from the Stilfser Joch (Stelvio Pass) to Lake Como. More particularly, however, it designates only the lower portion (some 55 miles long). This is a luxuriant, charming little district, opening towards the west between the Bergamese and the Bernina Alps. The valley is famed for its wines. Grain and fruit are also produced. Sondrio and Tirano are in this valley. In mediæval times the Valtellina was a part of Lombardy. It was wrested from the Duke of Milan by the people of Grisons in 1512. In 1620 the Roman Catholics sought through the murder of the adherents of the Reformed faith to free the district from the rule of the Swiss Confederation. The Confederates, however, were able ultimately to maintain possession of the valley with the help of Spain and Austria. In 1797 Napoleon united it to the Cisalpine Republic. In 1814 it passed to Austria and in 1859 to Italy.

VALUE (OF. *value*, value, fem. sing. of p.p. of *valoir*, from Lat. *valere*, to be strong, able). In political economy, a word that is most commonly used to designate the power of a commodity to command other commodities in exchange. The term is applied, however, to several other conceptions. The potential capacity of an object to meet human needs is sometimes called value—value in use, in the terminology of the classical economists. In modern scientific economics, the term "utility" has for the most part supplanted this use of the word "value." Another meaning which the term "value" conveys is the significance of an object to an individual as the indispensable condition of a certain satisfaction. Value in this sense of the term is frequently called subjective value, to distinguish it from objective or exchange value (the first conception noted above). Subjective value is of two kinds, subjective use value, where the importance of an object is gauged by the direct satisfaction to be obtained through its consumption, and subjective exchange value, where the importance of an object is gauged by the satisfaction it will yield indirectly, through exchange.

A distinction is usually made between market value and normal or natural value. Market value is the purchasing power of a commodity in the open market on a given day; normal or natural value is the value which would prevail if competitive forces worked without friction. Market values fluctuate widely from day to day; normal values change, if at all, only with changes in the fundamental conditions of production and consumption.

The word "price" is often used as synonymous with "exchange value." Economists define price as the power of a commodity to command money in exchange; value (exchange or objective) is the power of a commodity to command in exchange commodities in general.

In order to have value, an object must satisfy some human want, and it must exist in a quantity which is insufficient wholly to satisfy all desire for it. It must possess utility and scarcity. In the case of most commodities, limitation in supply is due to the necessity for effort or sacrifice in winning such commodities from nature. In explaining value, economists have been inclined to emphasize one or the other of these two essential conditions. On the one hand, we have the cost theories of value; on the other, the utility theories. As representative of the cost theories we may take that known as the classical theory, derived from Adam Smith, logically developed by Ricardo, and substantially completed by Senior, Carey, John Stuart Mill, and Cairnes. According to this theory, market value is determined by demand and supply, being fixed at the point where the former just equals the latter. Value increases directly with increase in demand, inversely with increase in supply (other conditions remaining the same). In the case of commodities that may be freely reproduced without increase in cost, cost of production determines normal value. If market value is not high enough to cover cost of production some producers will turn to other industries, with the result that value will rise through decrease in supply. If, on the other hand, market value exceeds cost of production, producers will secure a profit which will lure other producers into the field, whose competition will reduce prices to the cost level. In the case of commodities produced at varying costs (e.g., the products of agriculture) values will tend to equal cost to the producer in the least favorable situation whose product is nevertheless necessary to meet the demand. The classical economists recognized a third class of commodities, consisting of those which could not be reproduced (e.g., paintings by the old masters), and of those whose production is controlled by a monopoly. The value of such commodities, in their theory, is derived from their utility and scarcity. Such commodities were regarded as relatively unimportant; accordingly, the law that value is controlled in the long run by cost of production was held to be nearly universal.

During the second and third quarters of the nineteenth century the classical theory of value was almost universally held by economists; it serves as the basis of much of the economic thought of the present day.

A second theory of much historical importance is the labor theory of value. Adam Smith argues that in a primitive society the respective amounts of labor spent on commodities must have served as a basis for their exchange value; Ricardo in many passages speaks as though he regarded labor as the basis of exchange value, although a general examination of his work leaves no doubt that he admits the determining influence of other elements in value besides labor. The theory was adopted by Karl Marx and his followers as a theoretical basis for socialism. Whatever part of the value of a commodity falls to the landlord or the capitalist Karl Marx regarded as a deduction from the fruits of labor, since labor alone created value. The difficulty in accounting for the value of goods produced at a varying expense in labor, of goods which are not reproducible, and of those which are freely given by nature, but in quantities not adequate to the demand, deprives this theory of scientific value.

Utility theories of value were unsuccessful in explaining the facts of value, until the second half of the nineteenth century, when the concept marginal utility was discovered. By a well-known psychological principle, the pleasure de-

rived from the satisfaction of any given want declines with each successive unit of satisfaction experienced. If an individual possesses a stock of goods for consumption, some units of this stock may be so used as to yield a high degree of satisfaction; other units will yield less, and the final or marginal unit may yield but little satisfaction, however great the satisfaction from the first unit may have been. The absolute importance to the individual of any unit in his possession will be measured by the utility of the marginal unit, since the loss of any other unit would at once be made good by the substitution of the marginal unit. In his private economy, an individual values his goods according to their marginal utilities. In exchange, both buyer and seller compare the marginal utility of the commodity to be bought and sold with the marginal utility of money. If the seller finds that the marginal utility of the money offered him exceeds the marginal utility of the commodity for sale, he is naturally willing to sell; if the buyer finds that the marginal utility of the commodity exceeds that of the money demanded, he purchases. Naturally, many sellers would be willing to take a price less than that which they are offered; many buyers would pay more than they do rather than go without the commodity they desire. A certain number of buyers, however, possess limited means, and would not purchase if the price rose above a certain figure. A number of sellers would hold their property rather than take a lower price. It is these buyers who are least eager to buy and sellers least eager to sell who hold the power of determining ratios of exchange, all other purchases and sales, in an open market, conforming to the values set by these.

The marginal-utility theory does not deny that in the long run the values of commodities tend to correspond with their respective costs of production; but it gives a new interpretation to the fact. Costs consist themselves in values —value of labor, capital, use of land, etc., used up in the manufacture of a commodity. These things are not valued for their own sake, but for the sake of the products for final consumption into which they enter. Naturally, these commodities are valued marginally. If pig iron in one use creates a value equal to 40, in another use a value represented by 10, the latter use will determine the value of pig iron. But under free competition there would be a tendency to increase the production of commodities in which pig iron created a value of 40, withdrawing iron, if necessary, from the less productive use. The result would be that the value of iron in the more profitable use would decline, and with it the value of the commodity into which it entered. In this way it appears as if value were determined by costs. On the other hand, the increase in value of iron in the least profitable use, resulting from the withdrawal of iron from that use, shows quite clearly that in a broad view it is the commodity for final consumption that determines the value of the elements in cost, not cost that determines values.

This theory was originated by Gossen in the fifties, but gained no attention at the time. Two decades later it was rediscovered by Jevons, Menger, Walras, and J. B. Clark, working independently. Through the consistency with which it explains the diverse phenomena of value, it has received wide acceptance, although it has been unable to displace the classical theory completely. Marshall has endeavored to reconcile the two theories, holding that cost of production and marginal utility, taken together, explain value, but that neither theory alone explains it satisfactorily. In this view he is followed by probably the majority of American and English economists. See POLITICAL ECONOMY.

Bibliography. All standard works on economics present a general theory of value. For the classical theory, the best expositions are J. S. Mill, *Principles of Political Economy* (ed. by W. J. Ashley, New York, 1909), and J. E. Cairnes, *Character and Logical Method of Political Economy* (ib., 1874). For the labor theory, see Karl Marx, *Capital: A Critique of Political Economy* (3 vols., Chicago, 1906–09). For the marginal-utility theory consult: Gossen, *Gesetze des menschlichen Verkehrs* (Brunswick, 1854); C. W. Macfarlane, *Value and Distribution* (Philadelphia, 1899); A. C. Whitaker, *History and Criticism of the Labor Theory of Value in English Political Economy* (New York, 1905); H. J. Davenport, *Value and Distribution* (Chicago, 1908); William Smart, *Introduction to the Theory of Value* (2d ed., New York, 1911).

VALUE, STANDARD OF. See MONEY.

VALUES (Fr. *valeurs*). The relation of the different parts of a painting to each other, with reference to the light and shade they reflect. Value does not consider color as such, but its relative appearance in light and shade. Consult the works referred to under COLOR.

VALVA'TA. A small pulmonate mollusk of American fresh waters, remarkable for the squareness of its whorls. See Colored Plate of SNAILS.

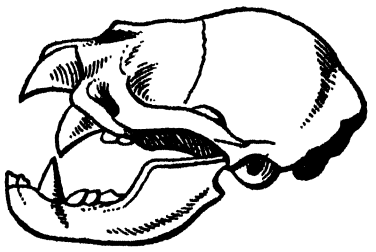
VALVE. A device or appliance for controlling the flow of liquids, gas, or loose material through a pipe, chute, or other form of passageway. With the general use of steam, water, gas, and other fluids, a great variety of valves have been invented and are in daily use. These valves bear various trade names based on their purpose, the shape or motion of the valve, and the method of operation. Thus we have safety valves, globe valves, slide valves, screw valves, reducing valves, regulating valves, etc. Valves generally, whatever their specific names may be, can be included in a general classification with reference to the manner in which their motion is obtained, or in a general classification with regard to the motion relative to the valve seat. In the first classification are: (1) valves opened and closed by hand; (2) valves operated by independent mechanism; (3) valves operated by mechanism connected with the machine whose operation they control; and (4) valves opened and closed by the motion of the fluid whose flow they control. Classified with regard to their motion relative to the valve seat there are: (1) valves which rotate in the opening, (2) valves which rise and fall from and to their seats, and (3) valves which open and close by sliding on and parallel to their seats. It is obvious that the characteristics of the first and second classifications may be combined in one valve; thus a slide valve may be operated by hand like the ordinary hand-screw gate valve, by separate mechanism, like the hydraulic gate valves for water works, or by mechanism connected with the medium operated, like the slide valve of a locomotive. A flap valve con-

sists of a disk hinged at one side. One form of butterfly valve consists of a disk hinged at diametrically opposite edges and slit through the centre parallel to the hinges. In another the hinges are placed on the diametrical slit. A disk valve consists of a circular disk seated on a grid and free to slide up and down for a limited distance on a rod or bolt passing through a hole in its centre. Lift or poppet valves consist of a disk with a flat or beveled edge seated on a circular disk; they operate by their own weight, like a disk valve, or by means of springs or rods. Slide valves are of various forms. The gate valve used on water mains consists of a metal disk sliding between two seats inclined towards each other so as to form a wedge-shaped slot. This disk is also wedge-shaped to correspond with the slot, and is raised and lowered by a stem attached to its upper edge and screwed up and down by a hand wheel. Cocks consist of a conical plug seated in a conical casing; both plug and casing have a hole through them in the line of the pipe, and by turning the plug so that the holes coincide the valve is opened. Valves are usually made of metal; but may be combined with rubber or leather, to secure tightness. Consult Dalby, *Valves and Valve Gear Mechanism* (London, 1906). See AIR COMPRESSOR; GAS; LOCOMOTIVE; PUMPS AND PUMPING MACHINERY; SAFETY VALVE; STEAM ENGINE; WATER WORKS.

Valves in Musical Instruments. These are mechanical devices, in brass instruments, for lengthening or shortening the column of air. By means of this mechanism the older natural horns and trumpets, which had only a diatonic scale, were changed to chromatic instruments capable of producing every chromatic interval within their range. The number of valves is generally three, though some instruments have four. Two systems of valves are now in general use—piston valves and rotary valves. The latter afford the player a lighter manipulation of his instrument, but are more likely to get out of order. For valves in the organ, see ORGAN.

VALVERDE, văl-vâr'dâ. An old settlement on the east bank of the Rio Grande, Socorro Co., N. M. A sharp engagement took place here Feb. 21, 1862. General Canby, stationed at Fort Craig with 3800 men, disputed the advance up the river of a force of about 3000 Confederates under General Sibley, but was compelled to withdraw within his works.

VÁMBÉRY, väm'bār-y', ARMINIUS (1832–1913). An Hungarian traveler and Orientalist, born at Szerdahely, near Pressburg. He was largely self-educated. In 1854 he went to Constantinople as a private tutor, where he later became private secretary to Fuad Pasha. With the assistance of the Hungarian Academy he traveled through Armenia and Persia from 1861 till 1864. He became professor of Oriental languages at the University of Budapest in 1865, retiring from active life in 1905. The literary activity of Vámbéry was confined, in the main, to the Ural-Altaic linguistic stocks, especially the Turkish. The most important of his works are: *Reise in Mittelasien* (1865; 2d ed., 1873); *Meine Wanderungen und Erlebnisse in Persien* (1867); *Etymologisches Wörterbuch der turko-tatarischen Sprachen* (1878); *Altosmanische Sprachstudien* (1901); editions of the *Kudatku-Bilik* (1870) and the *Schibaniade* (1885); *Geschichte Bocharas oder Transoxaniens* (2 vols., 1872); *Primitive Kultur des turko-tatarischen Volkes* (1879); *Das Türkenvolk* (1885); *The coming Struggle for India* (1885); *Hungary* (1887); *Travels and Adventures of the Turkish Admiral Sidi Ali Reis* (1899); *Western Culture in Eastern Lands* (1906). Consult his *Arminius Vámbéry: His Life and Adventures* (7th ed., London, 1889), and *The Story of My Struggles* (2 vols., New York, 1904).



VAM'PIRE (Serv., Bulg. *vampir*, Russ. *vampirŭ*, Little Russ. *vampyr*, *uper*, White Russ. *upir*, vampire, probably from North Turk. *uber*, witch). In Slavic folklore, a corpse that rises at night from his grave, and drinks the blood of the living, which he obtains by sucking, without arousing the sleeper. He may not only appear in human form, but can assume the shape of a dog, cat, toad, or any blood-sucking animal. The victim loses appetite, wastes away, and after a few days expires without any visible disease. The corpse of the destroyer, being thus supplied, remains pliable and lifelike. The veins are full, the cheeks ruddy and plump, and the mouth is gory—properties which enable an inquirer to ascertain the vampire quality. The most effective remedies against the vampire are cremation of the corpse, or nailing it by a thorn or aspen stake driven at one blow through the breast to the bottom of the grave to prevent the body from wandering. Yet another mode of destroying the vampire is to chop off the head of the corpse with a grave-digger's shovel.

Communities as well as individuals may be attacked by the vampire. In general, children are first destroyed. The demon may, however, be traced by sprinkling salt on the floor of the house which it haunts. Vampirism is seldom a matter of choice, but a necessity depending on criminal character, or some other reason which is likely to render a spirit uneasy in the grave. Thus witches, wizards, suicides, children of the devil, or illegitimate offspring of parents themselves illegitimate, are vampires, while the leap of a cat or the flight of a bird across a corpse may force even the innocent dead to become a vampire. Vampirism is, moreover, regarded as infectious, since, it is believed, a man who has been the object of attack may be turned into a vampire. The practice of burying murderers and other criminals with a stake through the body was evidently brought about by dread of their turning into vampires; as regards suicides, this custom was only abolished in England by a statute of George IV. A survival of the superstition has been cited in New England as late as the first half of the nineteenth century, while in 1870–71 there were several trials for vampirism in West Prussia, Pomerania, and Mecklenburg.

The belief in vampires is part of the widespread fear of malignant ghosts (see GHOSTS), especially the Lamiæ (q.v.), fostered by the mediæval belief of the Greek Catholic church that all who died under ecclesiastical ban were kept alive by the devil for the ruin of their surviving friends. The belief is an ancient one, treated by Philostratus and Phlegon of Tralles, by Goethe in his *Braut von Korinth*, and in operas by Palma (1812), Hart (1820), Marschner (1828), and Von Lindpainter (1828). Consult: Augustin Calmet, *Dissertations upon the Apparitions of Angels, Demons, and Ghosts and concerning . . . Vampires* (Eng. trans., London, 1759); Wilhelm Hertz, *Der Werwolf* (Stuttgart, 1862); W. R. S. Ralston, *Russian Folk-*

tales (London, 1873). Bram Stoker has embodied in his novel *Dracula* (New York, 1899) a mass of the vampire belief of eastern Europe.

VAMPIRE. A Neotropical blood-sucking bat of the section Desmodontes of the family Phyllostomidæ, and especially of the genera *Desmodus* and *Diphylla;* specifically, *Desmodus rufus.*

SKULL OF A TRUE VAMPIRE.

Showing extraordinary form of piercing incisors in the upper jaw of *Desmodus rufus.*

These bats are of small size, are tailless, and have nose leafs, an organization modified in accordance with their habits of subsisting by sucking blood from the bodies of the larger mammals, including man, usually while the victim is asleep. The single pair of upper incisors are prolonged and sharpened into caniniform teeth, which will pierce the skin like lancets and are rooted in bones of unusual size and solidity. The canines are large, the premolars small, and the molars absent. The gullet is so small that nothing but liquid food can pass, and the stomach is intestiform, while the intestinal canal is modified to suit a diet of blood. The blood of the victim is likely to continue to flow after the vampire departs. Repeated visits of the vampire may so weaken a horse, a cow, or a human being, that death may follow. In some places and times it becomes dangerous to sleep exposed to the bat's attack, but the total of injury done is far less than is popularly believed. *Desmodus* inhabits forested regions from Central America to Chile. Another still smaller bloodsucker is the closely related Brazilian *Diphylla ecaudata,* whose habit is to pare away the skin until the blood oozes through the shaved space.

The family (Phyllostomidæ) is very large, and distinguished from other bats by the presence of three bony joints in the middle finger of the hand (wing). They are greatly diverse in habits and fare. Some are exclusively insectivorous; the majority feed mainly or entirely on fruits; two species are exclusively blood drinkers; and one section, the javelin bats (Phyllostoma), while probably subsisting mainly on fruit, sometimes also attack animals and men. In the uncertainty of information as to this group, the word "vampire" has been widely and often mistakenly applied. It is commonly given, e.g., to the great South American false vampire (*Vampyrus spectrum*), which feeds wholly on fruit, and is quite harmless. It measures 28 inches across the expanded wings, and is common about villages. For illustrations and bibliography, see BAT.

VAN, vän. The capital of the Vilayet of Van, in Turkish Armenia (Map: Turkey in Asia, E 2). The town, surrounded by double walls and a moat, is poorly built, with narrow streets and flat-roofed mud houses. An interesting feature is the ancient castle, standing on a rock about 300 feet high. There are fragments of cuneiform inscriptions on the walls and a trilingual inscription of Xerxes on the south side of the castle rock. A number of Christian schools in the town are maintained by the American Mission. The population is estimated at 30,000.

Armenian historians give to Van the name of Shemiramagerd, or the City of Semiramis. The city is believed to have been the capital of the ancient Kingdom of Urartu. The region had a language of its own which is known as Vannic. In the middle of the fourth century A.D. Sapor II captured Van. At the beginning of the tenth century it became the capital of the Armenian Province of Vasburagan. It was captured at the end of the fourteenth century by Timur, after whose death it passed to Persia, and in the sixteenth century to the Osmanlis. The Russians occupied Van in 1915 with the help of Armenian regiments. See WAR IN EUROPE.

VAN, LAKE. The largest lake in Asiatic Turkey. It lies near the Persian and Russian boundaries, between Armenia and Kurdistan, and between the sources of the Euphrates and Tigris, at an altitude of over 5000 feet (Map: Turkey in Asia, E 2). It is about 80 miles long and 10 to 50 miles wide, with an area of 1400 square miles. Its shores are very irregular, and the lake is surrounded by densely wooded mountains. It receives a few short streams, but has no outlet, its water being very salt. Near its east shore lies the town of Van.

VANAD'INITE. A vanadinate of lead with lead chloride crystallized in the hexagonal system. It has a resinous lustre, and is yellow, red, or brown. It usually occurs as prismatic crystals with smooth faces and sharp edges, also sometimes in rounded forms and globular incrustations, and is found in the Urals, Sweden, Argentina, South Africa, and Mexico, and in the United States with wulfenite and pyromorphite at localities in New York, Arizona, and New Mexico. This mineral is a source of vanadium salts, which are used as a pigment for porcelain, and in ink manufacture.

VANA'DIUM (Neo-Lat., from *Vanadis,* a Scandinavian goddess). A metallic element discovered by Del Rio in 1801, and later investigated by Sefström in 1830 and by Wöhler and Berzelius in 1831. It is never found native, but occurs in combination as vanadic acid in a number of minerals, including descoloizite, endlichite, motthamite, psittacinite, roscoelite, and vanadinite. The last-named mineral, from Spain, Chile, and Argentina, constitutes the principal commercial source of vanadium at the present time. In Colorado, vanadium and uranium are together extracted from the mineral carnotite with a hot solution of sodium carbonate; from this the uranium is next removed by means of caustic soda, and then the vanadium is precipitated in the form of calcium vanadate. Vanadium has also been found in the lava at Vesuvius and spectroscopically in the sun. It is a difficult metal to obtain pure, but was isolated by Roscoe by heating the anhydrous dichloride in pure dry hydrogen.

Vanadium (symbol, V; atomic weight, 51.0) is a white metal having a specific gravity of 6.03 and melting between 1700° and 1800° C. (3092° and 3240° F.). The metal combines with platinum to form an alloy, and with oxygen forms a suboxide, a monoxide, a dioxide, a trioxide, and a pentoxide, of which the last two act as acid-forming oxides, forming hypovanadic

and vanadic compounds. Of the various vanadium salts, ammonium metavanadate, formed by dissolving the pentoxide in ammonium hydrate, is used as a black pigment, frequently with aniline as a dye, and also as the basis of a permanent black ink. But the most important use is found by metallic vanadium itself (prepared in the electric furnace), whose addition, in quantities of only one or two tenths per cent, to chromium steel and other steels imparts to them an extraordinary degree of elasticity and tensile strength, which are particularly valuable in automobile construction.

VAN AMRINGE, ăm'rĭnj, JOHN HOWARD (1835–1915). An American mathematician and educator, born in Philadelphia. In 1860 he graduated from Columbia, where thereafter he taught mathematics, holding a professorship from 1865 to 1910 when he retired. From 1894 to 1896 he was also dean of the School of Arts and thereafter dean of Columbia College. He was without a rival in popularity among Columbia men during his long service and afterward till his death. Besides making many addresses on subjects relating to the university, Van Amringe wrote much in the same field. He was the first president of the American Mathematical Society.

VAN BEMMEL, vän bĕm'ĕl, EUGÈNE, BARON (1824–80). A Belgian author and educator, born at Ghent. He studied law, but turned to literature, and in 1846 attracted considerable attention by his *De la langue et de la poésie provençales*. In 1849 he was called to the chair of French literature at the University of Brussels, where he lectured on modern political history, archæology, and comparative literature. He was secretary of the Society of Belgian Authors and first director of the *Revue Trimestrielle*, which he founded in 1854 and which in 1864 became the *Revue de Belgique*. In 1871 he was made rector of the university. Besides many contributions to periodicals, Van Bemmel published: *Voyage à travers champs: la province de Luxembourg* (1849); *L'harmonie des passions humaines* (1854); *La Belgique illustrée* (1855); *Etude sur les monuments druidiques* (1857); *Histoire de Saint Josse-ten-Noode* (1869); *L'Ourthe et l'Amblève pittoresques* (1873); *Patria Belgica* (1871–75); *Don Placide: mémoires du dernier moine de l'Abbaye de Villers* (1876), a novel; *Histoire de Belgique empruntée textuellement aux récits des écrivains contemporains* (1880). He died in Brussels.

VAN BENEDEN, PIERRE JOSEPH. See BENEDEN.

VANBRUGH, vän-brōō', IRENE (?–). An English actress. The daughter of a clergyman named Barnes, she was born at Heavitree, Exeter, was educated in London and Paris, and in 1901 was married to Dion Boucicault, an actor, son of Dion Boucicault (q.v.). She acted with Miss Sarah Thorne at Margate, and in 1889 joined J. L. Toole, touring with him in Australia and New Zealand. In 1892 she became a member of Beerbohm Tree's company, and in 1895 of Arthur Bourchier's company, with which she appeared in America in 1896. She had important rôles in the following plays: *The Chili Widow; The Admirable Crichton; Letty; His House in Order; The Great Conspiracy; Mid Channel; Grace; Passers By; Rosalind; Open Windows; The Land of Promise; Der Tag; The School for Scandal.*

Her sister, Violet Vanbrugh, also a well-known actress, became the wife of Arthur Bourchier (q.v.).

VANBRUGH, vän-brōō', SIR JOHN (1664–1726). An eminent English architect and dramatist. He was born in London, the grandson of a Protestant refugee from Flanders. John Vanbrugh at about 19 went to France, presumably to study architecture, but returned to England two years later and got a commission in the army, becoming a captain. In 1690 he was again in France, and was arrested as a spy, being made a prisoner in the Bastille. He was released late in 1692 and returned to England. His first play was *The Relapse, or Virtue in Danger*, a sequel to Colley Cibber's *Love's Last Shift*, from which Sir Novelty Fashion reappears in Vanbrugh's piece as the inimitable Lord Foppington. It was produced at Drury Lane late in 1690, and established its author as one of the leading wits and dramatists of the day. In the following spring his comedy of *The Provok'd Wife*, brought out at Lincoln's Inn Fields Theatre, met with an even better reception. The year 1698 is notable in dramatic history for the publication of Jeremy Collier's famous *Short View of the Immorality and Profaneness of the English Stage*. Vanbrugh was among those attacked, and he published in the same year a pamphlet in reply, *A Short Vindication of The Relapse and The Provok'd Wife from Immorality and Profaneness*. Of his other works, several of them free adaptations from the French, the best is *The Confederacy*, a brilliant comedy, produced in 1705 at the new theatre that he built in the Haymarket for himself and Congreve.

Meanwhile, he had been making his way as an architect. In 1701 he began erecting for the Earl of Carlisle the palace of Castle Howard in Yorkshire. In 1702 he was appointed Comptroller of the Board of Works. In 1705 he was engaged to erect Blenheim Palace, which Parliament had voted to the Duke of Marlborough; but the Duchess, after her husband's death, refused to pay Vanbrugh and dismissed him. After much trouble he managed to get nearly all the money due. He was knighted in 1714, and died at Whitehall.

His comedies have not maintained their popularity, their licentious tone preventing their being read to the extent to which the keenness of their satire and the genuine character of their humor would otherwise entitle them.

At his death Vanbrugh left an unfinished comedy called *The Journey to London*, which Cibber completed and produced at Drury Lane in 1728 as *The Provok'd Husband*. Consult: W. C. Ward, in Introduction to his edition of the *Dramatic Works* (London, 1898); Max Dametz, *John Vanbrughs Leben und Werke* (Vienna, 1898); Leigh Hunt, *The Dramatic Works of Wycherley, Congreve, Vanbrugh, and Farquhar, with Biographical and Critical Notes* (new ed., London, 1855); William Hazlitt, *Lectures on the English Comic Writers*, ed. by W. C. Hazlitt (ib., 1903).

VAN BRUNT, HENRY (1832–1903). An American architect, born in Boston, Mass. He graduated at Harvard in 1854. Among the more important buildings of which he was the architect are Memorial Hall at Harvard, the library building of the University of Michigan, the First Church in Boston, and the Electricity Building at the World's Columbian Exposition. Among his writings are *Greek Lines and Other*

Architectural Essays (1893), and a translation of Viollet-le-Duc's *Discourses on Architecture.*

VAN BU'REN. A city and the county seat of Crawford Co., Ark., 5 miles northeast of Fort Smith, on the Arkansas River and on the St. Louis, Iron Mountain, and Southern, and the St. Louis and San Francisco railroads (Map: Arkansas, A 2). It ships large quantities of fruit; and has an extensive mining-car factory, cotton gins and compress, railroad repair shops, a zinc smelter, and foundries and machine shops. Pop., 1900, 2573; 1910, 3878.

VAN BUREN. A town in Aroostook Co., Me., 242 miles by rail north of Bangor, on the Bangor and Aroostook Railroad (Map: Maine, E 1). It is the seat of St. Mary's College, and contains the Convent of the Good Shepherd. Van Buren has extensive lumber interests. Pop., 1900, 1878; 1910, 3065.

VAN BU'REN, MARTIN (1782–1862). Eighth President of the United States. He was born at Kinderhook, N. Y., Dec. 5, 1782, studied law with William P. Van Ness in New York City, and was admitted to the bar in 1803. He early developed a fondness for politics and held successively the offices of Surrogate of Columbia County (1808–13) and State Senator (1812–20), in the latter capacity being recognized as the leader of the Tompkins faction of the Republican party. In 1815 he became Attorney-General of the State, a position from which he was removed in 1819 on account of his rupture with the administration of Gov. De Witt Clinton. In February, 1821, he was elected to the United States Senate, and in the same year served as a delegate in the State Constitutional Convention. In the Senate, to which he was reëlected in 1827, he served for a number of years as chairman of the Judiciary Committee, supported the tariff bills of 1824 and 1828, opposed internal improvements by the Federal government, and became a strong advocate of States' rights (q.v.). He resigned from the Senate to accept the office of Governor of New York, to which he was elected in 1828. Van Buren was an enthusiastic supporter of General Jackson for the Presidency in 1828, and became Jackson's Secretary of State the following year, but resigned in 1831 to accept the post of Minister to England. The refusal of the Senate, from motives arising from pique, to confirm his nomination after he had sailed only brought increased popularity to Van Buren, and with the support of Jackson easily secured his nomination and election to the vice presidency in 1832. During all the vicissitudes of Jackson's administration Van Buren succeeded in retaining his confidence unimpaired, winning especial favor from the President because of his attitude in the Peggy O'Neill episode (see EATON, MARGARET O'NEILL), and soon came to be regarded as his logical successor. In 1835 he was nominated by the Democratic party, and in the following year was elected President, receiving 170 electoral votes, as against 73 given to his principal opponent, the Whig candidate, Gen. W. H. Harrison. Van Buren's term was made notable by a widespread financial panic resulting partly from certain measures of President Jackson's Administration, and partly from the spirit of reckless speculation which prevailed at the time. The chief measure of his administration was the establishment of the independent treasury system for the safekeeping and disbursement of the public moneys. This system, after a short interruption during the Whig supremacy, became a part of the permanent policy of the country. President Van Buren was renominated in 1840 for the presidency, but, chiefly on account of the financial distress of the time, for which he was to a considerable extent held responsible in the popular mind, he was overwhelmingly defeated by the Whig candidate, General Harrison. In 1844 he was again a candidate for the Democratic nomination, but on account of his opposition to the annexation of Texas he was opposed by the southern Democrats, and was defeated. In 1848 he was nominated for the presidency by the newly formed Free-Soil party (q.v.). His ticket diverted sufficient votes in New York from General Cass, the Democratic candidate for President, to insure the latter's defeat and the triumph of the Whigs. He supported Pierce in 1852 and Buchanan in 1856, and remained to the day of his death a Democrat except on the question of slavery extension.

Van Buren attained eminence at the bar, but never practiced after his election to the United States Senate in 1821. As a politician he was surpassed by few, if any, men of the time, and for many years was the controlling spirit of the Albany Regency (q.v.). He wrote a fragmentary work entitled *An Inquiry into the Origin and Cause of Political Parties in the United States,* published in 1867. The most valuable of his numerous biographies is that by E. M. Shepard in the "American Statesmen Series" (Boston, 1899). Consult D. S. Alexander, *Political History of the State of New York* (New York, 1906); William MacDonald, *Jacksonian Democracy* (ib., 1906); J. G. Wilson, ed., *The Presidents of the United States,* vol. ii (ib., 1914). (See UNITED STATES.) One of his sons, John (1810–66), popularly known as Prince John, graduated at Yale in 1828, became an able and prominent lawyer, and was Attorney-General of New York in 1845–46.

VAN BUREN, WILLIAM HOLME (1819–83). An American surgeon, born in Philadelphia. He graduated from the medical department of the University of Pennsylvania in 1840; entered the army and served in Florida and on the Canadian frontier; was on the staff of Bellevue Hospital from 1849 till 1852; was professor of anatomy in the medical college of New York University from 1852 till 1866; and from 1866 till shortly before his death occupied the chair of surgery in Bellevue Hospital Medical College. He translated Bernard and Huette's *Operative Surgery and Medical Anatomy* (1855), and Morel's *Compendium of Human Histology* (1861). He also published: *Contributions to Practical Surgery* (1865); *Lectures on Diseases of the Rectum* (1874); and, with Dr. E. L. Keyes (q.v.), *A Practical Treatise on Surgical Diseases of the Genito-Urinary Organs* (1874).

VANCE, LOUIS JOSEPH (1879–). An American novelist. He was born in Washington, D. C., and was educated in the preparatory department of the Brooklyn Polytechnic Institute. Besides contributing short stories and verse to magazines after 1901, he wrote many popular novels, among them: *The Brass Bowl* (1907); *The Black Bag* (1908); *The Bronze Bell* (1909); *The Fortune Hunter* (1910); *The Bandbox* (1912); *Joan Thursday* (1913); *The Lone Wolf* (1914); *Sheep's Clothing* (1915).

VANCE, ZEBULON BAIRD (1830–94). An American soldier and politician, born in Bun-

combe Co., N. C. He attended Washington College, Tenn., and in 1851–52 studied law at the University of North Carolina. In 1852 he was admitted to the bar. He was a member of the State Legislature in 1854, and in 1858 was elected to Congress as a Whig to fill the unexpired term of Thomas L. Clingman (q.v.). He opposed secession as long as possible but raised a company which became a part of the Fourteenth North Carolina Regiment. Later he was elected colonel of the subsequently famous Twenty-sixth North Carolina Regiment, and served in eastern North Carolina and in the Seven Days' battles. In 1862, while in the field, he was elected Governor, and at once bent all his energies to the successful prosecution of the war. Upon the collapse of the Confederacy, he was imprisoned in Washington from May 20 to July 5, 1865, but was then released on parole. In 1870 he was elected to the United States Senate, but, as his disabilities had not been removed, was refused admission. He resigned in 1872, and resumed the practice of law in Charlotte. In 1876, after an exciting campaign, he was for the third time elected Governor. He was again elected to the United States Senate in 1879, and was reëlected in 1885 and 1891. Consult Dowd, *Life of Zebulon B. Vance* (Charlotte, N. C., 1897).

VAN CEULEN, CORNELIUS JANSSEN. See JANSSEN, CORNELIUS.

VAN COR'LEAR, or **VAN CURLER,** ARENDT (c.1600–67). A Dutch colonist in America, born in Holland. Emigrating to New Amsterdam (New York) in 1630, he made an expedition to the Iroquois country in the winter of 1634–35, of which he kept a journal. In 1642 he became superintendent of Rensselaerswyck, and as such was called upon to conduct frequent negotiations with the Indians, whom he treated with uniform consideration and justice and over whom, in consequence, he exercised a powerful influence, by which he preserved peace for many years between them and the whites. Throughout the Mohawk country, and to a certain extent among the eastern Indians generally, the name Corlear soon came into use to designate the English governors (especially of New York), and was so used for more than a century. In 1661 he bought the Great Flat of the Mohawk River from the Indians, and in 1662 founded Schenectady, the first agricultural settlement in the province in which farmers could hold land in fee simple, free from feudal annoyances. In 1667, while on his way to Quebec to visit the French governor, he was drowned off Split Rock, in Lake Champlain.

VAN CORT'LANDT, JACOBUS (1658–1739). An American merchant, brother of Stephanus Van Cortlandt (q.v.). Born in New York City, he became the founder of the Yonkers branch of the family, and his estate was finally purchased by New York City and made into Van Cortlandt Park. The manor house in the park has been restored and is now used as a historical museum. Van Cortlandt was one of the most notable men of the colony, and served as mayor of New York City in 1719.

VAN CORTLANDT, PHILIP (1749–1831). An American soldier and legislator, born in Westchester Co., N. Y. He became a land surveyor at 19, and in June, 1775, after the outbreak of the Revolutionary War, entered the Continental army as lieutenant colonel, serving in the campaign against Burgoyne (1777), in Sullivan's expedition against the Iroquois Indians (1779), and in the Virginia campaign, which closed with the capture of Yorktown (1781). He became a colonel in November, 1776, and a brevet brigadier general in September, 1783. Subsequently he was a member of the State Convention which ratified the Federal Constitution (1788), of the New York Assembly (1789–90), of the New York Senate (1791–94), and of Congress (1793–1809).

VAN CORTLANDT, STEPHANUS (1643–1700). An American Colonial administrator, born in New Amsterdam (New York City). He was a member of the Court of Assizes, a legislative-judicial body, under the first English Governor, Nicolls. He had various ranks from captain to colonel in the regiment of Colonial militia; and from 1677 almost continuously until his death was mayor of New York City, being the first native American to hold that position. Other positions under the British colonial government were those of Governor's Councilor, Judge of the Common Pleas, Justice and Chief Justice of the Provincial Supreme Court, Commissioner of Revenue, Deputy Auditor General, and Deputy Secretary of the Province. In 1697 William III, by patent, erected Van Cortlandt's large estates into the lordship and manor of Cortlandt. The manor house, built on the north shore of Croton Bay, was still standing in 1916. In it were entertained many of the noted men of the revolutionary period. See also VAN CORTLANDT, JACOBUS.

VANCOUVER, văn-kōō'vēr. The metropolis of western Canada and the fourth largest city in the Dominion, situated on a peninsula in Burrard Inlet (q.v.), an arm of the Strait of Georgia (Map: British Columbia, D 5). It has steamship connections with Japan, China, India, New Zealand, Sandwich Islands, Alaska, Seattle, Victoria (B. C.), and points along the American coast, and is the terminus of the Canadian Northern, the Canadian Pacific, and the Great Northern railways. Vancouver is the seat of the University of British Columbia opened in 1915 and among its noteworthy features are beautiful parks, particularly Stanley Park with its preserve of virgin forest, and numerous modern office buildings and institutions the most important of which are the Canadian Bank of Commerce, Bank of Montreal, Merchants Bank, Customs House, Hotel Vancouver, Vancouver General Hospital, public library, Orphanage, and the court house and provincial administrative offices. The city is an important centre of the timber industry, the value of its lumber exports in 1914 being $12,755,834. The salmon canning and fishing industries are also centred here and its many large industries include shipbuilding, sugar refining, fish packing, and the manufacture of jute, furniture, and machinery. The fine harbor allows for a large foreign trade and in 1915 the exports were valued at $15,172,233 and the imports at $25,705,360. The registered tonnage of 18,478 seagoing and coasting vessels entered and cleared was 10,347,563 for the year ending March 31, 1915. The bank clearings for the same period amounted to $369,995,095. The city, named for Capt. George Vancouver, R. N., who explored and named Burrard Inlet in 1792, has had a remarkable growth. Pop. (city proper), 1886, 600; 1891, 13,709; 1901, 27,010; 1911, 100,401.

VANCOUVER. A city and the county seat of Clarke Co., Wash., 3 miles north of Portland,

Oreg., on the Columbia River, the Great Northern, the Spokane, Portland, and Seattle, the Northern Pacific, and the Union Pacific railroads, and on several steamship lines (Map: Washington, C 4). It has St. James College (Roman Catholic), opened in 1856, the State School for the Blind, and the State School for the Deaf and Dumb Defective Youths. The headquarters of the military department of the Columbia are there, the Vancouver barracks (q.v.). Other features include the House of Providence, St. Joseph's Hospital, the Carnegie Library, courthouse, high-school and post-office buildings, and a United States Land Office. There is also a picturesque park, in the heart of the city. The industrial establishments include brick and tile works, bottling works, a box factory, creameries, flour and lumber mills. Vancouver was founded by the Hudson's Bay Company in 1828, and was first incorporated in 1858. Pop., 1900, 3126; 1910, 9300; 1915 (U. S. est.), 12,555.

VANCOUVER, GEORGE (1758–98). An English naval officer and explorer, who served with Cook in his second and third voyages. In 1791 he was sent to Nootka Sound (q.v.) to receive the transfer of the disputed territory from the Spaniards. He went by way of the Cape of Good Hope, touched at Australia and New Zealand, where he surveyed and mapped a portion of the coast hitherto unknown, and then proceeded by way of Tahiti to Nootka. In the following year he passed through the Strait of San Juan de Fuca, discovered the Gulf of Georgia and circumnavigated Vancouver Island. He then carefully examined for the first time the coast north of San Francisco, and returned to England in October, 1795. His account of his expedition was published in 1798, in London, under the title, *A Voyage of Discovery to the North Pacific Ocean and Round the World in the years 1790–95.* Consult C. F. Newcombe, *The First Circumnavigation of Vancouver Island* (Victoria, 1914).

VANCOUVER BARRACKS. A United States military post in the State of Washington, established in 1848. The reservation, which embraces 640 acres, is on the right bank of Columbia River, 120 miles from its mouth, and 8 miles from Portland, Oreg. The railway station, telegraph station, and post office are Vancouver, Wash. There are quarters for a regiment of infantry, which with a company of engineers formed the garrison in 1916.

VANCOUVER ISLAND. An island on the Pacific coast of North America, politically a part of British Columbia (Map: British Columbia, D 5). Area, nearly 20,000 square miles. The island is mountainous, belonging to the adjacent chain on the continent. Victoria Peak is the highest point, reaching an elevation of 7484 feet. The coast presents a fiordlike aspect, being roughly irregular. Nootka Sound is on the west. Lakes and rivers abound, but none of the streams are navigable. The climate is moist and mild. There are forests of coniferous and deciduous trees. There is plenty of big game, and the fisheries are rich in salmon, herring, and sturgeon. Gold is found in the rivers; iron and copper ores are abundant; and particularly noteworthy are the coal mines, which supply the whole Pacific coast. The island has railway communication extending from Victoria northwesterly to Alberni. Victoria, the capital of British Columbia, is situated at the southeastern end of the island. Pop., 1911, 31,660.

Vancouver was discovered in 1774, and in 1792 was circumnavigated by George Vancouver. The United States laid claim to it, but relinquished it under the Oregon Boundary Treaty in 1846. At the instance of Great Britain the Hudson's Bay Company agreed to vacate the island for 10 years, in order that settlers might enter. As a result it was made a colony at the end of that time, and in 1866 it was united with British Columbia.

VAN CURLER. See VAN CORLEAR.

VAN'DA (Neo-Lat., from Skt. *vandana*, parasitic plant). An Indo-Malaysian genus of plants of the family Orchidaceæ. The species, of which there are about 20, are generally epiphytic, are well supplied with foliage, and grow vigorously. *Vanda suavis*, one of the most remarkable species, has large fragrant white or yellow flowers with a violet lip. *Vanda cærulea* is highly prized for its panicles of azure flowers.

VANDAL, vän'dål', ALBERT (1853–1910). A French historian, born in Paris. His work shows much scholarly research and sober judgment. He was elected to the French Academy in 1897. He wrote: *En karriole à travers la suède et la Norvège* (1876); *Louis XV et Elizabeth de Russie* (1882); *Ambassade française en Orient sous Louis XV* (1887); *Napoléon et Alexandre Ier* (3 vols., 1894–97), awarded the Vaubert prize; *Les voyages du Marquis de Noutel* (1901); *L'avènement de Bonaparte* (1902). He succeeded Albert Sorel (q.v.) at the school of political science and wrote little during the latter part of his life.

VANDA'LIA. A city and the county seat of Fayette Co., Ill., 69 miles northeast of St. Louis, Mo., on the Kaskaskia River, and at the junction of the Vandalia and the Illinois Central railroads (Map: Illinois, F 8). The old State House is the most prominent feature of the city. Vandalia has a foundry, machine shops, a tarring plant, a paper mill, stave and wagon factories, a saw mill, and a brickyard. Pop., 1900, 2665; 1910, 2974.

VAN'DALS (Lat. *Vandali, Vinduli, Vindili*). An ancient Germanic or Teutonic people. Procopius (q.v.) states that they originally occupied the country about the Palus Mæotis (Sea of Azov). If this is so, they migrated later to the northwest, and settled south of the Baltic, between the rivers Vistula and Viadua (Oder). When they appear in history in the second century A.D. they inhabited the region to the northeast of the Riesengebirge, and figure as the associates of the Marcomanni and the Quadi (qq.v.) in the plundering expeditions into Pannonia and the wars with Marcus Aurelius (q.v.). In the latter half of the third century they are found in the Roman province of Dacia (q.v.), along with Goths (q.v.) and Gepidæ. According to Jordanes (q.v.) the Gothic King Geberic annihilated a large part of the nation on the banks of the Maros. The remainder were transplanted by Constantine to Pannonia (about 334 A.D.), where they lived in peace for 60 years. But at the beginning of the fifth century, urged, it is said, by Stilicho (q.v.), they abandoned their new homes, and in company with the Suevi, Alani, and Burgundians, led by their King, Godegisil, burst into Gaul, which they wasted for the space of three years. Thence they swept through the passes

of the Pyrenees into Spain, which experienced a similar fate; and finally, after much quarreling and fighting with their German associates, they settled in a part of Bætica, which received from them the name of Vandalitia (modern Andalusia, q.v.). In 489, at the call of Bonifacius (q.v.), Roman Governor of Africa, they crossed the Strait of Gibraltar, under their leader, Genseric (q.v.), in one resistless horde (numbering 50,000 to 80,000 in all), carrying devastation and ruin from the shores of the Atlantic to the frontiers of Cyrene (q.v.). They were joined by the Donatists (q.v.), a sect of African heretics, and, being themselves Arians, inflicted great cruelties upon the orthodox Christians. Meantime Bonifacius endeavored to undo his treachery. He marched against the Vandals, but was defeated with considerable loss, and driven into Hippo (now Bona), which he defended for more than 14 months. Reenforced by a Byzantine army under Aspar, he sallied out against the Vandals, but was again defeated. This decided the fate of Africa. In 439 Genseric broke the peace which he had concluded with Valentinian III in 435, and conquered Carthage (q.v.). A new peace was established which recognized the authority of the Vandals over north Africa from the Atlantic to Cyrene, over the Balearic Isles, Sardinia, Corsica, and part of Sicily. In 455 the Vandals invaded Italy and plundered Rome for 14 days. After the death of Genseric (477), his son, Hunneric, cruelly persecuted the Catholics. He warred against the Moorish races in north Africa, who were trying to recover their independence, and by his piracies kept the Mediterranean in a state of alarm. His successors, Guntamund (484–496) and Thrasamund (496–523), were comparatively mild and tolerant rulers. But the warm climate and the love of luxurious pleasure now began to enervate the spirit of the Vandals. Thrasamund was compelled to solicit aid from his brother-in-law, Theodoric (q.v.), who sent a Gothic contingent to him to help him against the Moors of Tripoli. After his death, Hilderic (523–530), a son of Hunneric, became ruler, but his subjects grew discontented, and he was overthrown by his uncle, Gelimer, in 530. This led the Greek Emperor Justinian (q.v.) to send an expedition, under Belisarius (q.v.), against Gelimer. When the latter heard of the arrival of the Byzantine general he caused Hilderic and his sons to be put to death, but was himself soon after forced to seek refuge in Numidia. In 534, after two defeats by Belisarius, he surrendered, was carried to Constantinople in triumph, and died in Asia Minor. Most of the Vandals were drafted into the Imperial army, and were lost in the Persian wars. The few who remained in Africa rapidly disappeared among the natives. Consult: Procopius, *De Bello Vandalico;* Wrede, *Die Sprache der Vandalen* (Strassburg, 1866); L. Schmidt, *Geschichte der Wandalen* (Leipzig, 1901); Pasquale Villari, *The Barbarian Invasions of Italy*, English translation by Linda Villari (New York, 1903); *Cambridge Medieval History*, vol. i (ib., 1911); E. Gibbon, *Decline and Fall of the Roman Empire*, chapters xxxiii and xli, ed. by J. B. Bury (London, 1912); and the article "Vandalen" in Fr. Lübker, *Realexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

VANDAMME, vän'dàm', Dominique René (1771–1830). A French general, born at Cassel (Nord). He enlisted at Martinique in 1788, and, returning to France at the beginning of the Revolution, gained distinction as the commander of a free corps which he organized in 1792, and became at the age of 22 a brigadier general in the army of the North. He fought in Belgium under Jourdan and on the Rhine, became general of division in 1799, and distinguished himself at Austerlitz (1805). In the following year he was placed in command of the Württemberg troops, and in this capacity occupied Silesia in 1806–07, and took part in the Austrian campaign of 1809. In 1812 he commanded the forces in Westphalia, but, owing to dissensions with King Jerome, was removed. After the battle of Dresden (1813) he was intrusted by Napoleon with the pursuit of the allies, but at Kulm (August 29–30) was surrounded and compelled to capitulate with 10,000 men. During the Hundred Days he was created a peer by Napoleon (he had been made Count in 1808), and fought at Ligny and Wavre. He was banished after the second restoration and lived for some time in America.

VAN DEN BOSCH, vän dĕn bŏs, Jan (1780–1844). A Dutch general, born at Herwynen. In 1797 he went to Java as a lieutenant and rapidly rose to be a colonel. In 1815 he became chief of the general staff and later major general. In 1830 he was appointed Governor-General of Batavia and was the founder of the Dutch system of civilizing the natives. In 1833 he became Minister of State for the Colonies and was raised to the nobility in 1839.

VAN'DERBILT, Cornelius (1794–1877). An American capitalist and financier, born near Stapleton, Staten Island, N. Y. He had practically no schooling. At the age of 16 he established a ferry between Staten Island and New York for passengers and farm products. At 18 he owned or controlled three boats, and from that time on his interests in shipping rapidly increased. He rapidly acquired a considerable fleet of river and harbor boats, and in 1817 built and became captain of the first steamboat running between New York and New Brunswick, N. J. A company was organized of which he obtained in 1824 a controlling interest. In 1827 he leased the New York and Elizabeth Ferry and made it a paying investment. In 1829 he began the construction of a fleet of steamboats to compete with the existing Hudson River and Long Island Sound lines. Gradually he obtained control of the important competing lines, established new lines out of New York to Boston and other coast points, and started a new line on the Delaware River. Subsequently his fleet became the largest of the sort in the world, and led to their owner being popularly known as the Commodore. In 1851 he established a steamship and transfer line to California by way of Lake Nicaragua, which successfully competed with the existing Panama route. During the Crimean War he established a transatlantic line between New York and Havre. About the time of the outbreak of the Civil War, having accumulated a fortune of upward of $10,000,000 in the steamboat business, he gradually began to withdraw from that and transfer his capital to railroads, the great possibilities of whose development appealed to him. He had become president of the New York and Harlem Railroad as early as 1857, and in 1864 he obtained control also of the Hudson River Railroad, the stock of which had fallen

to a low figure, worked it in conjunction with the Harlem line, and soon placed it on a paying basis. In 1867 he obtained control of the New York Central Railroad, was elected its president, and in 1869 consolidated with it the Hudson River road. Eventually he completed his plan of a through trunk line from New York to Chicago by securing the Lake Shore, Canada Southern, and Michigan Central roads. At his death his fortune, estimated at about $100,000,000, was left largely to his son, William H. Vanderbilt. A bequest of $1,000,000 was made for founding Vanderbilt University at Nashville, Tenn.

VANDERBILT, CORNELIUS (1843–99). An American financier and capitalist, son of William H. Vanderbilt and grandson of "Commodore" Cornelius Vanderbilt. He was born at New Dorp, Staten Island, and was privately educated. After serving as a banking clerk in New York he entered the brokerage house of Kissam Brothers. In 1865 he entered the service of the New York and Harlem Railroad, of which he was treasurer from 1867 to 1877. In the latter year, upon his father succeeding "Commodore" Vanderbilt as president of the New York Central Railroad he became its first vice president, in which position he had almost complete control of the finances of the road. In 1878 he became treasurer of the Michigan Central Railroad and vice president and treasurer of the Canadian Southern. Subsequently he was for several years president of both of the last mentioned roads, besides being president of the New York and Harlem, and after 1886 chairman of the board of directors of the New York Central Railroad. At the same time he was director in more than 34 different railway corporations. He gave largely to educational and religious institutions, among which were Vanderbilt University, Yale University, and the Cathedral of St. John the Divine in New York City. To the Metropolitan Museum, New York, he presented Rose Bonheur's "Horse Fair."

Of his sons, Cornelius, the eldest, devoted his attention primarily to his numerous financial interests. Alfred Gwynne and Reginald Claypoole Vanderbilt became especially known for their interest in show horses, the former, who was lost when the *Lusitania* was sunk in 1915, having been president of the National Horse Show Association of America. Their sister Gladys, who married Count Laszlo Széchényi, was a nurse in Austrian hospitals during the European War and received from Emperor Francis Joseph the Order of the Red Cross. For another sister, see WHITNEY, GERTRUDE VANDERBILT.

VANDERBILT, GEORGE WASHINGTON (1862–1914). An American capitalist, son of William Henry Vanderbilt (q.v.). He was born at New Dorp, Staten Island, N. Y., and was educated partly abroad, where he did much traveling. He did much for the New York Free Circulating Library, gave to Teachers College its site on Morningside Heights, and to the American Fine Arts Society (New York) presented the exhibition room known as the Vanderbilt Gallery. He is known especially for his estate, Biltmore, near Asheville, N. C., consisting of 100,000 acres which he laid out as a great park. Here, in 1892, Gifford Pinchot (q.v.) began the first systematic forestry work in the United States, and here also notable experiments in agriculture were carried on. On the great estate at Biltmore Vanderbilt erected one of the finest of American country houses.

VANDERBILT, WILLIAM HENRY (1821–85). An American capitalist and financier, the son of "Commodore" Cornelius Vanderbilt (q.v.), born in New Brunswick, N. J. He was educated at the Columbia College Grammar School, and at the age of 18 became a banking clerk in New York City. A few years later failing health compelled him to retire to a farm on Staten Island. He was appointed receiver of the Staten Island Railroad, which had fallen into difficulties, and in two years cleared it from debt, connected it with New York by a new ferry line, and as a result was chosen its president. Thenceforth his father made him a partner in all his large railroad and financial transactions, and manager of the various railroad interests he acquired. The son became vice president of the New York and Harlem Railroad in 1864, and in the next year vice president of the New York Central and Hudson River lines. At his father's death in 1877 he succeeded him as president of the latter road, and under his able and skillful management the control was completed of the Michigan Central, Lake Shore and Michigan Southern, Canada Southern, and Chicago and Northwestern systems. Subsequently the Nickel Plate and West Shore roads were acquired. He gave largely during his lifetime to Vanderbilt University, the College of Physicians and Surgeons (Columbia University), and other educational and philanthropic institutions.

His sons, William Kissam, Frederick William, and George Washington Vanderbilt (q.v.), succeeded to their father's large railroad and other financial interests. The brothers built the Vanderbilt Clinic in New York. William K. Vanderbilt was a founder and president of the New Theatre. His first wife after her divorce married O. H. P. Belmont and gained prominence as a leader in woman suffrage, and his second wife became known for her many charities and her personal interest in social-welfare movements. In 1915 she was awarded the French Foreign Office gold medal for work on behalf of the American Ambulance Corps in the European War.

VANDERBILT UNIVERSITY. A coeducational institution for higher learning at Nashville, Tennessee. It was founded in 1875 through donations received from Cornelius Vanderbilt (1794–1877) (q.v.) amounting to $1,000,000, and other members of the Vanderbilt family also gave largely to it later. The organization includes a College of Arts and Sciences, schools of law, religion, medicine, dentistry, pharmacy, and engineering. The annual enrollment is about 1000 students. In 1913 Andrew Carnegie gave to the School of Medicine $1,000,000 for endowment and equipment. The total resources in 1916 amounted to more than $4,000,000. The annual income is about $200,000. The governing board of the university is a self-perpetuating board of trustees composed of 33 members with an active executive committee of seven members. The library contains about 60,000 volumes. The faculty in 1916 numbered 169, headed by president J. H. Kirkland, LL.D., D.C.L.

VAN'DERGRIFT. A borough in Westmoreland Co., Pa., 40 miles by rail east of Pittsburgh, on the Pennsylvania Railroad. It has the largest sheet steel plant in the world. In July, 1915, the borough of Vandergrift Heights, whose population in 1910 was 3438, was consolidated with Vandergrift. Pop., 1900, 2076; 1910, 3876.

VANDERGRIFT, MARGARET. Pen name of Margaret Thomson Janvier. See JANVIER, THOMAS ALLIBONE.

VAN'DERKEMP, FRANCIS ADRIAN (1752–1829). An American scholar and writer, born at Kempen, Holland, and educated in the University of Groningen. In 1777 he became a minister in Leyden where he remained for several years. In politics and in religion he was a liberal, and incurred the displeasure of the Dutch government. He joined the armed forces of the Patriot party, which sought political reform in opposition to the Orange party, and was taken prisoner. He was released in December, 1787, and came to New York the following year with letters of introduction from John Adams and Lafayette. For six years his home was Esopus on the Hudson, after which he removed to the neighborhood of Lake Oneida, where he was engaged in agriculture during the remainder of his life. He was chosen a member of learned societies and admitted to the honorary degree of LL.D. by Harvard College (1820). In addition to many printed papers he left an autobiography, which has furnished the material for a memoir written in 1903 by Mrs. Helen Lincklaen Fairchild. Many of his manuscripts are preserved by the Pennsylvania and Buffalo Historical Societies and by Columbia University.

VAN'DERLIP, FRANK ARTHUR (1864–). An American financier and writer, born in Kane Co., Ill. After a boyhood spent on a farm and a country school education, he was apprentice in a machine shop at Aurora, Ill., and studied stenography at night by writing with chalk on his lathes. Then he was employed on a local newspaper, and next became a student at the University of Illinois and at Chicago University. He studied finance under Joseph French Johnson (q.v.). From 1890 to 1894 he was financial editor of the Chicago *Tribune*, in 1894–97 associate editor of the Chicago *Economist*. Appointed by President McKinley Assistant Secretary of the Treasury in 1897, he resigned in 1901 and became vice president of the National City Bank of New York, of which, from 1909, he was president. In 1915 he became chairman of the great new American International Corporation, formed to promote American commercial and industrial interests in foreign countries. Vanderlip studied financial and industrial conditions abroad in 1901, conferring with Ministers of Finance in all the European countries. After his return he published (1902) *The American Commercial Invasion of Europe* and took an active part in formulating important financial legislation. Besides the book named and many addresses on financial subjects, he published: *Business and Education* (1907); *Modern Banking* (1911); *A Plea for Intellectual Freedom in Currency Legislation* (1913); *Business and Politics* (1915).

VAN'DERLYN, JOHN (1776–1852). An American portrait and historical painter, born near Kingston, N. Y. He was a protégé of Aaron Burr, who supported him as a pupil of Gilbert Stuart, in Philadelphia, and sent him to Paris, where he studied for five years. On his return to America in 1801 he lived in the house of Aaron Burr, then Vice President, where he painted the well-known profile likenesses of Burr and his daughter. In 1803 he returned to Paris, also visiting England in 1805, and then went to Rome, where he remained three years. Here he painted his "Marius Among the Ruins of Carthage" (1807), which received a gold medal at Paris in 1808. In 1812 he finished his second chief work, "Ariadne of Naxos" (Pennsylvania Academy of Fine Arts, Philadelphia). He painted a number of portraits of public men in Paris, and in America after he settled in New York in 1815. For 12 years his panoramas of Paris, Athens, Mexico, and Versailles and other paintings were exhibited in the New York Rotunda, a building erected for that purpose in City Hall Park. The financial returns were small and he was more or less in need of money during the remainder of his life. He died in destitution at Kingston. In 1842 he received the commission for his "Landing of Columbus," one of the large panels in the rotunda of the capitol in Washington, well known from its use upon the United States five-dollar note. Only the design, however, is by Vanderlyn, the execution having been intrusted by him to a French painter.

Vanderlyn's paintings show superior draftsmanship and skill in composition, and his portraits are carefully modeled and good in characterization. The best known are those of Washington in the capitol at Washington; President Taylor (Corcoran Gallery, ib.); Aaron Burr and R. R. Livingston (New York Historical Society). In the Metropolitan Art Museum are portraits of John A. Sidell, Frank Waddell, and the artist.

VAN DER STAPPEN, CHARLES. See STAPPEN, C. P. VAN DER.

VAN DER STUCKEN, stu'ken, FRANK (1858–). An American composer and musical conductor, born in Fredericksburg, Tex. When but six years old he was taken by his parents to Antwerp, and was thus enabled to study with Benoit. In 1876 he went to Leipzig, where he spent two years in study with Reinecke, Grieg, and Langer, after which he traveled through Europe for two years. In 1881 and 1882 he served at the Breslau City Theatre as kapellmeister. He succeeded Leopold Damrosch in 1884 as director of the Arion Club of New York, was conductor of the Symphony Concerts at Cincinnati, Ohio, in 1895–1907, dean of the College of Music there in 1897–1901 and honorary dean thereafter. From 1906 to 1912 he was conductor of the biennial May Festival at Cincinnati. He composed the opera *Vlasda* (1883); the symphonic prologues *William Ratcliff* and *Pax triumphans; Festival March* for orchestra; *Festival Hymn; Inauguration March;* incidental music to Shakespeare's *The Tempest;* an orchestral episode, *Pagina d'amore;* mixed and male choruses *a capella;* numerous songs.

VANDER VEER, ALBERT (1841–). An American surgeon, born at Root, N. Y. He studied medicine at Albany and Washington, D. C., graduating from the National Medical College in 1862. He took part in the Civil War as surgeon of the Sixty-sixth New York Volunteer Regiment. In 1865 he settled in Albany and in 1869 became a professor in the Albany Medical College, of which he was also dean from 1896 to 1905, and where he held the chair of surgery after 1902. He served as president of the American Surgical Association in 1905 and of other important societies. His writings treat especially of uterine surgery and surgery of the abdomen.

VANDERVELDE, vän'dĕr-vĕl'de, EMILE (1866–). A Belgian statesman, born at Ixelles. He studied law at the University of

Brussels, and became doctor of laws in 1885 and doctor of social science in 1888. In the latter year he organized the Circle of Student Socialists at Brussels, and in 1898 founded the Socialist Antialcoholic League. Eventually he became a member of the International Socialist Bureau. Elected a deputy for Charleroi in 1894, he quickly distinguished himself in the Chamber by his eloquence. Reëlected for Brussels in 1900, he became chief of the parliamentary Socialist group, being again successful at the polls in 1906. When the European War broke out in 1914, he became premier of the Belgian War Ministry, and he was a member of the Belgian Commission that protested to President Wilson against German treatment. His wife visited the United States, where she raised $300,000 for Belgian relief. Vandervelde's writings include: *Les associations professionelles d'artisans et d'ouvriers en Belgique* (1892); *L'Evolution industrielle et le collectivisme* (1896; Eng. trans., *Collectivism and Industrial Evolution*, 1901); *La question agraire en Belgique* (1897); *Le Socialisme en Belgique* (1898), with Destrée; *L'Alcoolisme et les conditions du travail en Belgique* (1899); *La propriété foncière en Belgique* (1900); *L'Exode rural et le retour aux champs* (1903); *Le Socialisme et l'agriculture* (1906); *La Belgique et le Congo* (1911).

VAN DER VLUGT, WILLEM. See VLUGT.

VAN DER WAALS, JOHANNES DIDERIK. See WAALS.

VAN DER WEYDEN. See WEYDEN, VAN DER.

VAN DEVAN'TER, WILLIS (1859–). An American jurist, born at Marion, Ind. He graduated from Asbury College (later De Pauw University) in 1878 and from the Cincinnati Law School in 1881. After practicing at Marion, in 1884, he settled at Cheyenne, Wyo. In 1886 he was commissioned to revise the territorial statutes. While city attorney of Cheyenne, member of the territorial legislature (1887–88), and Chief Justice of the Wyoming Supreme Court (1889–90), he came to be recognized as a leader in the Republican party. From 1897 to 1903 he was Assistant Attorney-General of the United States, assigned to the Department of the Interior. During the same period he was professor of law at George Washington (then Columbian) University. In 1903 he was appointed a justice of the Federal Circuit Court and in 1910 President Taft appointed him an associate justice of the United States Supreme Court. He delivered numerous opinions on complicated corporation and railroad cases. In United States *v.* Patten (226 U. S., 525), he declared that a conspiracy to corner a staple commodity in order to enhance its price came under the provisions of the Sherman antitrust law. See PATTEN, JAMES A.

VAN DE VELDE, vän dâ vĕl'de. A family of Dutch artists. See VELDE, VAN DE.

VAN DIE'MEN'S LAND. See TASMANIA.

VAN DORN, EARL (1820–63). An American soldier, born near Port Gibson, Miss. He graduated at West Point in 1842. He took part in the military occupation of Texas and in the Mexican War, and was brevetted major. After the war he was engaged in suppressing the outbreak of the Seminole Indians in 1849–50, and later in the operations against the Comanches in the Indian Territory. After the secession of his native State he became a Confederate soldier, was appointed brigadier general, later succeeded Jefferson Davis as major general of the Mississippi forces, and in March, 1861, received an appointment as colonel in the Confederate army. He was promoted brigadier general in 1861, major general in September of that year, and in January, 1862, became commander in chief of the Trans-Mississippi Department. He was defeated at Pea Ridge in March, 1862, and was superseded by General Holmes and given command of a division in the army of the Mississippi. Again promoted, he commanded his own and Sterling Price's troops in the unsuccessful attack on Rosecrans at Corinth, Oct. 3 and 4, 1862. After his defeat at this point charges were brought against him for neglect of duty, but he was completely exonerated by a court of inquiry. Superseded by Pemberton, he commanded a division under the latter, and while in command of the Confederate cavalry during the first advance movements of the Federals on Vicksburg, won an engagement at Holly Springs, Miss., and conducted other operations with great success and brilliancy. He continued in the field until May, 1863, when he was shot and killed as a result of a private quarrel.

VANDU'ARA. The Roman name of a town in Scotland, now called Paisley (q.v.).

VAN DU'ZER, LEWIS SAYRE (1861–). An American naval officer, born at Elmira, N. Y. Graduating from the United States Naval Academy in 1880, he was promoted through the various ranks of the service to captain in 1911. During the Spanish-American War he participated as an officer of the U.S.S. *Iowa* in the battle of Santiago and the destruction of Cervera's fleet (1898) and also in the attack on San Juan, P. R. During the Philippine Insurrection he served on the *Charleston* and *Petrel* (1898–1900), and at the outbreak of the Boxer Rebellion in 1900 he went to China. In 1900–02 he was an instructor in ordnance at the United States Naval Academy, and in 1908–09 commanded the *Cleveland*. After serving as commandant of the Navy Yard at Olongapo, P. I. (1909–10), and as captain of the yard at the Brooklyn Navy Yard (1910–13), he was in command of the U.S.S. *Utah*, until 1914, when he retired. He received several medals. Besides editing the *Army and Navy Year Book* in 1895 and 1896, and contributing to technical journals and various reference works, he served as nautical and naval editor of the NEW INTERNATIONAL ENCYCLOPÆDIA.

VAN DYCK, dīk, ANTHONIS, called in England SIR ANTHONY VANDYKE (1599–1641). The most important portrait painter, next to Rubens, of the Flemish school; also a figure painter and an etcher. He was born at Antwerp, March 22, 1599, the son of Frans van Dyck, a wealthy silk mercer, and his second wife Maria Cuypers, who was known for her skill in embroidery. He was placed, at 10, with the painter Hendrik van Balen; in 1615 he was independently established at Antwerp with Jan Brueghel the younger. His heads of Christ and of the Twelve Apostles attracted the attention of Rubens, who made the young artist his assistant and friend. He lived in the great master's house, and fell completely under his influence, often painting the same subjects in a manner which makes it extremely difficult to distinguish them, as, e.g., in several works at Berlin and a "St. Jerome" at Dresden. In 1618 he was admitted to the Painters' Guild. In November, 1620, on invitation of the Earl of Arundel, he went to

England, and was granted a pension by James I. By this time he had formed a more independent style, still based upon Rubens's but less robust in character and bright in color, and more refined. In February he was granted eight months' leave and presumably traveled in Italy. In 1622 he was again in Antwerp to attend his father's deathbed, and shortly afterward we find him in Venice.

He next went to Genoa, where he was warmly welcomed by the resident Flemish painters, like the brothers De Wael, whom he commemorated in the portrait of the Capitoline Museum (Rome) and in that of Jacobus de Wael and his wife at Munich. He was much influenced by the great Venetian masters and gradually changed his style and method of painting. His Italian sketchbook, now in possession of the Duke of Devonshire, gives interesting record of his studies, many of which are after Titian. Some of his finest productions belong to this period. Wonderfully characteristic is the series of portraits of the Genoese nobility, in their rich, costly robes and glittering jewels, which are still to be seen in local palaces. One of these, "Portrait of a Lady and Child," is now in the Morgan collection, Metropolitan Museum, New York. At Rome (1623) he portrayed Cardinal Bentivoglio (Pitti Palace), and in 1624, while on a visit to Palermo, he painted Philip of Savoy (Viceroy of Sicily) (Turin), besides painting the celebrated Madonna del Rosario (see MADONNA). Afterward he painted portraits of other members of the house of Savoy at Turin, now in the Pinacoteca. He probably returned to Antwerp about 1627 and the following five years contain his best work. In friendly rivalry with Rubens, he established an influential school. Sometimes he painted after Rubens's sketches, achieving works difficult to distinguish from his master's, as in "St. Martin Dividing His Cloak" (National Gallery, London, and Saventhem, Belgium), and the "Raising of the Brazen Serpent" (Madrid and Richmond). This is the period of his chief religious works. At his father's dying wish he presented to the Dominican Sisters at Antwerp a picture of "Christ on the Cross" (1629, Antwerp Museum). This was a favorite subject; others were the "Pietà" and "Bewailing Christ," of which there are splendid examples at Antwerp, Vienna, and Munich. Of his Madonnas well-known examples are at Munich, Paris, Berlin, and Palermo. His mythological subjects are less frequent; among the best known are "Danaë" (Munich) and "Diana and Endymion" (Prado).

His many portraits of this period, including the nobility and his fellow artists, show increased dignity and nobility of character, but are less brilliant and of a softer, more golden color scheme than his Italian portraits. His celebrity is attested by the appointment as court painter to the Spanish regents of the Netherlands, Albert and Isabella; his portrait of the latter is in Madrid. Other sitters were Maria de' Medici, the exiled Queen mother of France, her son Gaston, Duke of Orléans (Earl of Radnor), and the Marquis Spinola. Most of Van Dyck's best portraits in European galleries belong to this period; among them are those of Frans Snyders and his wife (St. Petersburg and Cassel), the Count Palatine of Neuburg, the full length Duke and Duchess of Croy, the so-called Burgomaster of Antwerp and wife, and the Organist Liberti—all at Munich; the beautiful Princess Luisa de Tassis (Liechtenstein collection, Vienna); Anna Wake (The Hague); President Ricardo and his son (Louvre); and Cornelis van der Geest (National Gallery, London), besides many others in English private collections.

Van Dyck also designed for the school of engravers which Rubens had founded, his plates being executed by Paulus Pontius, Lucas Vorster, and others. He himself etched about 22 plates with fine technique; but he generally preferred to etch only the heads, leaving the detail to engravers. During his stay in Italy he began to collect materials for an iconographic work portraying the chief celebrities of the day. The studies in *grisaille* are dispersed over Europe, but the complete work was published at Antwerp in 1641. It is usually known as Van Dyck's *Centum Icones* or *Iconographiæ*.

For some time Van Dyck had been receiving overtures from the English King, instigated by the Earl of Arundel and his friend Kenelm Digby. He had been persuaded in 1631, but, differences arising, he went instead to Holland. There he portrayed Prince Henry of Orange and his wife and the Princes Charles Louis and Rupert, sons of the exiled King of Bohemia (Vienna Gallery). At this time, probably, occurred his visit to Frans Hals at Haarlem, which romancers have elaborated upon. Upon his arrival in England (1632) the King assigned him a house in Blackfriars (London) and apartments in the royal palace of Eltham for the summer; he was knighted and named painter in ordinary to their Majesties, and the year following was granted a yearly pension of £200. The many portraits of the royal family which he now began are perhaps his best known works. Among these are Charles I, the Queen, and their children, and Charles I on horseback, at Windsor; an equestrian portrait of the King in the National Gallery; the portraits of the King and Queen at St. Petersburg, and at Dresden, and "Charles I Hunting," in the Louvre. From 1634 to 1636 Van Dyck was again in Antwerp, where he portrayed the new Regent, Don Ferdinand of Austria (Madrid), and the family of Count John of Nassau (Panshanger), and many others, besides painting his remarkable portrait group of the "Magistracy of Brussels in Session" (destroyed by fire, 1695). From 1636 to 1640 he resided in England, and painted the host of ancestral portraits scattered throughout the seats of the English nobility. Only the sketch and the finishing touches of most of these paintings are by the master himself, the rest being left to assistants. Among the most charming are the two celebrated groups of the King's children, the three with the spaniel (1635, Dresden), and five with the great Dane (1637, Windsor). Van Dyck is well represented in the public collections of the United States, particularly in works of the Genoese period. The Metropolitan Museum, New York, contains nine examples, including the Marchese Durazzo and "Lucas van Uden" in his Genoese manner, and the Earl of Warwick and James, Duke of Lennox (a marvelous example), of the English period. He is represented in the Boston Museum, the Art Institute, Chicago, in the Gardner collection, Boston, and by four examples each in the Frick collection, New York, and the Widener collection, Philadelphia.

On the death of Rubens in 1640 Van Dyck was

SIR ANTHONY VAN DYCK

"QUEEN HENRIETTA" OF ENGLAND, FROM THE PAINTING IN THE DRESDEN GALLERY

invited to Antwerp to complete his pictures for the King of Spain, but declined. In the same year he went to Paris, but was disappointed in his hopes of a commission to decorate the Louvre. In failing health he returned to London, where he died Dec. 9, 1641. He was a man of refined character and aristocratic bearing, remaining all his life the *pittore cavalleresco* of his colleagues in Italy. These traits are very perceptible in the many portraits of himself which he painted, in the beautiful youthful example of Munich as in the maturer work in the Uffizi. From his youth he was a favorite of the fair sex, and many were his adventures; but in 1640, at the King's wish, he married Mary Ruthven, a court lady of noble descent.

Van Dyck's character made him par excellence the portraitist of the aristocracy; his portraits are aristocratic and refined, usually with a touch of melancholy, sometimes, indeed, being almost posed and sentimental. Much modern sympathy for the cause of the roistering Cavaliers of England is based upon his noble portraits of Charles I and his followers. In him Flemish realism was tempered by the refining influence of Italy, manifesting itself in more subdued coloring and increased nobility of form. What Rubens sought to express by dramatic action he showed by intensity of expression. Van Dyck trained many assistants, but did not form a school. He exercised a great influence upon the later English portraitists.

Bibliography. The principal monographs on Van Dyck are by Max Rooses (Eng. trans., London, 1900), the chief authority; Lionel Cust (ib., 1911); and Fierens-Gevaert (Paris, 1912); also *Masters in Art*, vol. i (Boston, 1900), containing a bibliography. Among other biographies are those of A. Michiels (Paris, 1881), J. Guiffrey (ib., 1882), E. Knackfuss (Bielefeld, 1902), and Stokes (New York, 1905). For illustrations of all his paintings see Emil Schaeffer (Stuttgart, 1909); for his etchings, F. Newbolt (New York, 1906), and A. M. Hind (Boston, 1915); for engravings, W. Heinemann (London, 1911).

VAN DYCK, Cornelius Van Allen (1818–95). An American missionary. He was born at Kinderhook, N. Y., and graduated M.D. at Jefferson Medical College, Philadelphia, 1839. The next year he went as medical missionary to Syria. He was stationed at Beirut, Abeih, and Mount Tabor; was principal in a seminary (1848–52); in the Sidon field (1852–57), and later at Beirut. In 1846 he was ordained to the ministry. He made himself master of the spoken and written Arabic, and undertook the work left unfinished by the death of Eli Smith of translating the Bible into Arabic. Ultimately he entirely rewrote the translation in the style of the Koran. He was the manager of the Mission Press at Beirut from 1857 to 1880; physician to St. John's Hospital and professor of pathology in the Syrian Protestant College there from 1857 to 1882, when he became physician at St. George's Hospital. He superintended the printing of his Bible translation by the American Bible Society, and taught Hebrew in Union Theological Seminary in New York (1866–67). Van Dyck made many translations of religious, scientific, and medical works into Arabic.

VAN DYCK, Ernest (1861–). A Dutch tenor singer, born at Antwerp. He studied in Paris under Saint-Yves. In 1886 he was engaged to sing the rôle of Parsifal, in which his success was instantaneous, and through which he obtained a world-wide reputation. He made his début as Lohengrin in 1887. In 1888 he was engaged for the Vienna court opera, and subsequently made many tours of Europe and America, appearing at the Metropolitan Opera House in the season of 1898–99. He was prominently identified with the first productions of Wagner's music dramas at the Grand Opéra of Paris.

VAN DYKE, Henry (1852–). An American Presbyterian clergyman, author and scholar, born in Germantown, Pa. He graduated at the College of New Jersey (Princeton) in 1873 and at Princeton Theological Seminary (1877), and studied for two years at Berlin University. From 1879 to 1882 he was pastor of the United Congregational Church of Newport, R. I., and then of the Brick Presbyterian Church, New York City, till 1900, when he became professor of English literature at Princeton. In 1902–03 he served as moderator of the General Assembly of his denomination. In 1908–09 Dr. Van Dyke was American lecturer at the University of Paris. He was elected to the American Academy of Arts and Letters and received numerous other honors. By appointment of President Wilson he became Minister to the Netherlands and Luxemburg in 1913. His writings, of which those devoted to nature became especially popular, include: *The Reality of Religion* (1884); *The Poetry of Tennyson* (1889, 1895); *The Christ-Child in Art* (1894); *The Other Wise Man* (1896); *The Builders, and Other Poems* (1897); *The Gospel for a World of Sin* (1899); *The Toiling of Felix, and Other Poems* (1900); *The Ruling Passion* (1901); *The Blue Flower* (1902); *Essays in Application* (1905); *Days Off* (1907); *Out-of-doors in the Holy Land* (1908); *Le Génie de l'Amérique* (1909; in Eng., *The Spirit of America*, 1910); *Collected Poems* (1911); *The Unknown Quantity* (1912); *Grand Canyon and Other Poems* (1914).

VAN DYKE, John Charles (1856–). An American art historian and critic. He was born at New Brunswick, N. J., and studied at Columbia University, and for many years in Europe. He was admitted to the New York bar in 1877 but never practiced law. In 1878 he was appointed librarian of Sage Library, New Brunswick, and in 1899 professor of art history in Rutgers College. He was elected to the National Institute of Arts and Letters. His many publications on art subjects include: *How to Judge a Picture* (1888); *Art for Art's Sake* (1893); *A History of Painting* (1894; new ed., 1915); *Nature for its Own Sake* (1898; 4th ed., 1906); *Opal Sea: Continued Studies in Impressions and Appearances* (1906); *Studies in Pictures* (1907); *The Desert* (1906); *The Mountain* (1916); *New Guides to Old Masters*, a series of critical guide books. He also edited *Modern French Masters* (1896); *Old Dutch and Flemish Masters* (1901); *Old English Masters* (1902); and a series of histories covering the history of art in America. His work is distinguished by lucid style and sound criticism, particularly from a technical viewpoint.

VAN DYKE, Paul (1859–) An American historian, brother of Henry Van Dyke (q.v.). Born in Brooklyn, N. Y., he graduated from Princeton in 1881 and from Princeton Theological Seminary in 1884, and studied at Berlin in 1884–85. He was a Presbyterian minister at Geneva, N. Y., in 1887–89, taught

church history at Princeton Seminary in 1889–92, and was pastor of the Edwards Congregational Church at Northampton, Mass., in 1892–98. Thereafter he held the chair of modern European history at Princeton University. His writings include *The Age of the Renascence* (1897) and *Renascence Portraits* (1905).

VANE, CHARLES WILLIAM STEWART. See LONDONDERRY, third MARQUIS OF.

VANE, SIR HENRY (HARRY) (1613–62). An English statesman. He was the son of Sir Henry Vane, a statesman of the reign of Charles I. He studied at Magdalen Hall, Oxford, but never matriculated, because he refused to take the oath of allegiance and supremacy. At an early age he became a Puritan, and embraced independent principles in religion and republican principles in politics. In 1635 he sailed for New England. He was soon after elected Governor of Massachusetts, but, having quarreled with the leaders of the Colony, returned to England in 1637. Through his father's interest he was appointed joint treasurer of the navy, and entered Parliament in 1640. He immediately joined Pym and the other Parliamentary leaders in their opposition to Charles I, and was one of the originators of the Root and Branch Bill for the total abolition of Episcopacy. After the death of Pym in 1643 Vane became the leader of the House of Commons, which power he retained until 1646. He was a member of the Westminster Assembly; was the chief instrument in carrying the Self-Denying Ordinance (1644); carried to the House of Lords the articles of impeachment against Archbishop Laud; and was one of the commissioners at the treaties of Uxbridge (1644–45) and the Isle of Wight (1648). But he was too strict a parliamentarian to view with satisfaction the increasing power of Cromwell and the army. He labored for an accommodation with the King, and after Pride's Purge refused to sit in Parliament, taking no part in the execution of the King. On the establishment of a Commonwealth, however, in February, 1649, he was appointed one of the Council of State and was one of its most active and efficient members. After the expulsion of the Rump in 1653 he broke definitely with Cromwell and withdrew from public affairs. Vane wrote *The Retired Man's Meditations; or, The Mysterie and Power of Godliness* (1655) and *A Healing Question Propounded and Resolved* (1656). The latter was so hostile to Cromwell's Protectorate that the author was imprisoned in Carisbrooke Castle, Isle of Wight. He was released after a detention of four months, and attempts were made by Cromwell to win him over, but Vane was inflexible, and during the rule of the great Protector and his son Richard he maintained an attitude of sullen discontent. When the Restoration took place, Vane was one of the 20 persons excluded from the general pardon; and in July, 1660, he was committed to the Tower. On June 2, 1662, he was arraigned and indicted for high treason before the Middlesex grand jury, found guilty, and on the 14th was beheaded on Tower Hill. There are *Lives* of Vane by J. K. Hosmer (Boston, 1888) and by John Willcock (London, 1913).

VÄNER, or **VENER,** vā'nēr, LAKE. The largest lake in the Scandinavian Peninsula, and the third largest in Europe (Map: Sweden, E 7). It is of oval shape, but contracted near the middle by two outjutting peninsulas, and most of the islands of the lake lie between these points, tending to divide the body. Its greatest length from northeast to southwest is 90 miles, its greatest breadth 45 miles, and its area 2309 square miles. Its greatest depth is 295 feet. The coasts are irregular, in the north high, steep, and rocky, or forest-covered. Lake Vänner is fed by several streams of considerable size, the largest being the Klar Elf. Its outlet to the southwest is the lower Göta Elf (q.v.), discharging into the Cattegat. The lake is an important avenue of commerce. It is connected by the Göta Canal with Lake Vetter, and thence with the Baltic Sea on the east, while access through the Göta Elf is afforded by a canal around the Trollhätta Rapids. Another canal connects the lake with Frederikshald in Norway.

VAN ESS, KARL and JOHANN. See ESS.

VANES'SA. See MOURNING CLOAK.

VANESSA. The disguised name given by Swift to Esther Vanhomrigh, formed from the first syllables of her whole name. See SWIFT, JONATHAN.

VANE-TEMPEST-STEWART, CHARLES STEWART. See LONDONDERRY, sixth MARQUIS OF.

VAN EYCK, īk. The name of two celebrated Flemish painters. See EYCK, VAN.

VAN GEHUCHTEN, vän ge-hŭk'ten, ARTHUR (1861–1914). A Belgian anatomist, born at Antwerp. For many years he was professor in the faculty of medicine at the University of Louvain. In 1914, after the partial destruction of the university by the Germans, Van Gehuchten went to Cambridge, England, where he taught biology at the university till his death. The results of his remarkable researches in anatomical science were set forth in his *L'Anatomie du système nerveux de l'homme* (1893; 4th ed., 1906). Van Gehuchten is especially known for his contributions to the theory of neurons. (See NERVOUS SYSTEM AND BRAIN.) Besides the work mentioned and many monographs and contributions to reviews, he published: *Cours d'anatomie humaine systématique* (3 vols., 1906–09); *Les centres nerveux cérébro-spinaux* (1908); *La radicotomie postérieure dans les affections nerveuses spasmodiques* (1911).

VAN GOGH, VINCENT. See GOGH.

VAN HASSELT, ANDRÉ. See HASSELT.

VAN HISE, vän hīs', CHARLES RICHARD (1857–). An American geologist and educator, born at Fulton, Wis. He graduated in 1879 at the University of Wisconsin, where he afterward taught, holding successively chairs of metallurgy, mineralogy, and geology. In 1903 he was elected president of the university. Associated with the United States Geological Survey from 1883, in 1900 he was appointed geologist in charge of the division of Pre-Cambrian and metamorphic geology. From 1897 to 1903 he was consulting geologist for the Wisconsin Geological and Natural History Survey, and in the latter year became president of the board of commissioners of the same. Van Hise became a member of the National Academy of Sciences and in 1907 served as president of the Geological Society of America. In 1892, upon the foundation of the *Journal of Geology*, he was made one of its editors. An authority on American Pre-Cambrian geology, and particularly on the iron-bearing series of the Lake Superior region, on the deposition of ores, and on the principles of structural and dynamic geology as applied to crystalline rocks, he pub-

lished: *Correlation Papers . . . Archæan and Algonkian* (1892); *Principles of North American Pre-Cambrian Geology* (1896); *Some Principles Controlling the Deposition of Ores* (1901); *The Iron Ores of the Lake Superior Region* (1901); *An Attempt to Reduce the Phenomena of Rock Alterations to Order under the Laws of Energy* (1903); *The Conservation of Natural Resources in the United States* (1910); *Concentration and Control* (1912; new ed., 1915).

VAN HORNE, SIR WILLIAM CORNELIUS (1843–1915). A Canadian railway president. He was born near Joliet, Ill., and was educated at the local schools. Beginning railway service as a telegraph operator in 1857 he rapidly advanced through various positions to the presidency of the Southern Minnesota Railway (1877–79) and in 1880–82 was general superintendent of the Chicago, Milwaukee, and St. Paul. As general manager of the Canadian Pacific (1882–84) he had a prominent part in the measures which successfully completed that railway in 1885, and he was afterward successively vice president (1884–88), president (1888–99), and chairman of the board of directors (1899–1910). He was also president of or director in a large number of financial and industrial corporations. Van Horne strongly opposed the Taft-Fielding reciprocity agreement in 1911. In 1894 he was knighted (K.C.M.G.).

VANIL'LA (Neo-Lat., from Sp. *vainilla, vaynilla,* vanilla, vanilla bean, little pod, dim. of *vaina,* pod, from Lat. *vagina,* sheath). A genus of epiphytic orchids, natives of tropical America and of Asia. The seedlings germinate in the ground, and climb with twining stems to a height of 20 to 30 feet on trees, upon

VANILLA PLANIFOLIA.

which they live, clinging by fibrous roots produced from the nodes. The stem is four-cornered and juicy; the leaves long and fleshy; the very large fleshy, generally fragrant, flowers in spikes; the fruit, a podlike fleshy capsule, opening along the side. The vanilla of commerce is chiefly the fruit of *Vanilla planifolia,* a species indigenous from Mexico to Peru, and cultivated in the West Indies, Mauritius, and Ceylon and elsewhere. The plant is propagated by cuttings and is allowed to climb trees that will afford it a partial shade. It furnishes a crop in three years and lives for 30 or 40 years. Since it is not self-fertile, artificial fertilization of the flowers is resorted to in successful plantations. The fruit is cylindrical, 7 to 8 inches long, and less than ½ inch thick. It is gathered before fully ripe, dried in the shade, and sweated, to develop and fix the aroma. This manipulation, which is a kind of fermentation, requires great care, and upon it the value of the product depends. The fruit contains within its tough pericarp a soft black pulp, in which many minute black seeds are embedded. It has a peculiar, agreeable odor, and a sweetish taste, most pronounced in the interior pulp. It is much used by perfumers and also for flavoring chocolate, sweetmeats, ices, etc. The aromatic principle of vanilla is vanillin ($C_8H_8O_3$), produced artificially by several methods. Owing to the high price of the best vanilla beans, sometimes amounting to $10 to $15 per pound, the artificial product is used to a great extent, especially in adulterating cheaper grades. It has not the delicate odor of the natural product and has a tendency to break up, forming undesirable compounds. The extract of Tonka bean (q.v.) has also been used as a cheap substitute for vanilla.

VANILLA GRASS. See HOLY GRASS.

VAN ING'EN, WILLIAM BRANTLEY (1858–). An American mural painter. He was born in Philadelphia, studied there at the Pennsylvania Academy of Fine Arts under Schuessele and Eakins, with John La Farge in New York, and in Paris under Bonnat. At first an assistant of La Farge, he afterward executed independently many mural decorations in public and private buildings, including six panels in the Congressional Library, Washington, eight in the United States Court House, Chicago, 14 in the Pennsylvania State Capitol at Harrisburg, 16 in the United States Mint Building, Philadelphia, and five in the Administration Building, Panama Canal (1914–15). His work displays careful draftsmanship and skillful use of warm, glowing color.

VANINI, vä-nē'nē, LUCILIO (1585–1619). An Italian freethinker, born at Taurisano. He taught successively at Geneva, Paris, and Lyons, at the last of which cities he published in 1615 the *Amphitheatrum Æternæ Providentiæ.* On account of his pantheistic teachings he was forced to flee to England. When his dialogues *De Admirandis Naturæ Reginæ Deæque Mortalium Arcanis* came out in Paris the following year they were burned by the Sorbonne. Vanini then went to Toulouse, where he began to teach. Here he was again accused of atheism and witchcraft, and was burned at the stake on the day of his condemnation. His dramatic death gave him a reputation not justified by the achievements of his life.

VANITY FAIR. In Bunyan's *Pilgrim's Progress,* a fair held in the town of Vanity, at which all comers are supposed to give themselves up to thoughtless frivolity—synonymous with the world of gay pleasure.

VANITY FAIR. A celebrated novel by Thackeray, published in monthly parts (January, 1847–July, 1848) and in book form with illustrations by the author, in 1848. The name

was derived from *Pilgrim's Progress*. Becky Sharp (q.v.) is a character.

VAN LAER, vän lär′, ALEXANDER THEOBALD (1857–). An American landscape painter. He was born at Auburn, N. Y., studied at the National Academy of Design and at the Art Students' League, New York, and in Holland under George Poggenbeek. Good examples of his landscapes, which are nearly always taken from the neighborhood of his home in Litchfield, Conn., and are charming, intimate interpretations of nature in her gentler moods, include: "February Snow" (Brooklyn Museum), "Connecticut Hillside" (National Gallery, Washington), and "On the Brandywine" (Herron Art Institute, Indianapolis). Van Laer was elected a member of the National Academy in 1909, and became well known as a lecturer on art subjects.

VAN LEN'NEP, HENRY JOHN (1815–89). An American Congregational missionary and scholar. He was born in Smyrna, Asia Minor, and was sent to the United States for education at the age of 15. He graduated at Amherst College (1837), studied theology at Andover, and sailed as a missionary of the American Board to Turkey (1849). He was stationed in Smyrna, Constantinople, and Tokat in connection with educational institutions, and traveled in Greece, Palestine, and Egypt. He was a notable linguist and teacher. He returned to the United States, because of failure of health, in 1869, and became professor in Ingham University, Le Roy, N. Y. (1876), and principal of Sedgwick Institute, Great Barrington, Mass. (1879). He was author of *Travels in Asia Minor* (1870), *Ten Days Among the Greek Brigands* (1874), and *Bible Lands* (1879).

VAN LENNEP, vän lĕn'nĕp, JACOB. See LENNEP, JACOB VAN.

VANLOO, vän'lō′. A family of French painters. The eldest, JACQUES (1614–70), and his son ABRAHAM LOUIS (1641–1713), were born in Holland, but settled in Paris under Louis XIV. Of the latter's two celebrated sons, the elder, JEAN BAPTISTE VANLOO (1684–1745), was born at Aix (Provence), and studied with his father and with Benedetto Luti at Rome. In 1720 he restored the frescoes of Il Rosso and Primaticcio at Fontainebleau, and in 1731 became a member of the Academy. From 1736 to 1742 he was in England under the patronage of Robert Walpole and the Prince and Princess of Wales. His forceful and striking portraits were in great demand, but enfeebled health caused his retirement to his native town, where he died. His historical paintings, which show sound technique, include "Diana and Endymion" (1731) and "Institution of the Order of the Holy Ghost in 1578," both in the Louvre.

His brother, CHARLES ANDRÉ (1705–65), a genre, historical, and portrait painter and a sculptor, usually called Carle Vanloo, was born at Nice, studied with Jean Baptiste, and under Benedetto Luti and the sculptor LeGros at Rome, where on a subsequent visit he was employed by the Pope and the King of Sardinia. He became a member of the Academy in 1735, was made professor in 1737, and director in 1763. His large decorative, mythological, and religious paintings, such as the "Marriage of the Virgin" in the Louvre, are inferior to those of contemporary masters; but his minutely executed, charmingly colored genre scenes, of which the best are "A Rest during the Hunt" (Louvre), "Spanish Conversation," and "The Concert" (Wallace collection), show accurate and keen observation of contemporary life. The three sons of Jean Baptiste were also painters of some reputation.

VAN MARCKE, märk, EMILE (1827–90). A French cattle painter. He was born at Sèvres and studied under Troyon at Barbizon. His work is less bright in color and more heavily realistic than his master's, unlike whom he usually represents animals in a state of repose. He received the cross of the Legion of Honor in 1872 and a gold medal at the Paris exhibition. He is represented in the Louvre and the provincial museums of France, and in the Metropolitan Museum, New York, and other public and private collections in the United States, where his works are very popular.

VANNER. See ORE DRESSING.

VANNES, vän. The capital of the Department of Morbihan, France, at the mouth of the Vannes, 84 miles northwest of Nantes (Map: France, N., C 5). It is a quaint, decadent town, and contains the venerable cathedral of St. Pierre, the eighteenth-century church of St. Paterne, a Hôtel de Ville (1884), St. Simon College (1886), with its seventeenth-century chapel, a museum of natural history and one of Celtic and Gallo-Roman antiquities. Part of the old walls remain, notably the Tour du Connétable. Vannes has linen and cotton mills, tanneries, breweries, and ironworks. Shipbuilding is extensively carried on. Vannes was the capital of the Veneti. It became the Roman Dariorigum Venetorum. Pop., 1901, 23,375; (town) 1911, 17,842.

VANNUCCI, vän-nōōt'chē, PIETRO. See PERUGINO, PIETRO.

VANNUTELLI, vän'nōō-tĕl'lē, SERAFINO, CARDINAL (1834–1915). An Italian Roman Catholic churchman. He was born at Genazzano, studied there, and graduated in philosophy and theology in the Capranica College, Rome. After teaching theology in the Pontifical Seminary, he was secretary to the Papal Nuncio in Bavaria, auditor to the court of Maximilian in Mexico, and apostolic delegate to Ecuador, Peru, Colombia, and Central America. He was made Papal Nuncio to Brussels in 1875, and to Vienna in 1880. In 1887 he was created Cardinal, and later became Vice-Chancellor of the church. It was understood in 1903, when Cardinal Sarto became Pope as Pius X, that Vannutelli was the candidate of the Triple Alliance. In that year he was made dean of the Sacred College. His brother, VINCENZO VANNUTELLI, was made Cardinal in 1889.

VAN NUYSSEN, ABRAHAM JANSSENS. See JANSSENS, ABRAHAM.

VAN RENSSELAER, vän rĕn'se-lär, KILLIAN (1595–1644). A Dutch merchant, active in the founding of the Dutch colony of New Netherland. He came of a wealthy family of Amsterdam, where he received a good education and became a leading diamond and pearl merchant. He was one of the promoters and organizers of the Dutch West India Company, to which he advanced large sums of money, and loaned several vessels. After the successful settlement of the New Amsterdam colony he purchased, through an agent, a large tract of land on the Hudson, south of Albany, where he established a settlement of mechanics and farmers, called Rensselaerswick. The estate covered almost all of three counties—Albany, Rensselaer, and Colum-

bia—and was the first and the largest of the patroonships in New York. (See PATROON.) Van Rensselaer himself did not come to America, but managed his estate through an agent.

VAN RENSSELAER, văn rĕn'se-lĕr, MARIANA GRISWOLD (1851–1914), usually known as MRS. SCHUYLER VAN RENSSELAER. An American author. She was born in New York City, and was married in 1873, her husband being a well-known journalist. She was at one time president of the Public Education Association of New York. Mrs. Van Rensselaer was elected an honorary member of the American Institute of Architects and in 1910 received the degree of Litt.D. from Columbia University, a signal honor. Her writings include: *Henry Hobson Richardson and his Works* (1888); *English Cathedrals* (1892; 4th ed., 1902); *Art out of Doors* (1893); *Should We Ask for the Suffrage?* (1894); *One Man Who was Content* (1896); *Niagara, a Description* (1901); *History of the City of New York in the Seventeenth Century* (1909); *Poems* (1910).

VAN RENSSELAER, STEPHEN (1764–1839). An American political leader known as the Patroon. He graduated at Harvard in 1782. Engaging early in politics, he was elected to the Assembly in 1789; was a member of the State Senate from 1790 to 1795; was Lieutenant-Governor of New York from 1795 to 1801; presided over the State Constitutional Convention of 1801; and was again in the Assembly in 1808–10. He took a great interest in military affairs, becoming major general of the State militia, and in 1812 directed the unsuccessful assault upon Queenstown. He took an active interest in the construction of the Erie Canal and was one of its strongest promoters. In 1810–11 he was one of a commission appointed to explore the proposed route, and from 1816 until his death was a member of the Canal Commission, being its president from 1824 to 1839. In 1819 he became a regent of the University of the State of New York, and was subsequently its chancellor. In 1824 he established at Troy a scientific school which, two years later, was incorporated as the Rensselaer Polytechnic Institute. From 1823 to 1829 he was a member of Congress. He published *A Geological and Agricultural Survey of the District Adjoining the Erie Canal* (1824). Consult Barnard, *A Discourse on the Life, Services, and Character of Stephen Van Rensselaer* (1839).

VAN REY'PEN, WILLIAM KNICKERBOCKER (1840–). An American surgeon. He was born in Bergen, N. J.; was educated in the University of New York (M.D., 1862); entered the naval service of the United States as assistant surgeon, in December, 1861, and during the Civil War was stationed for a time at the Naval Hospital in New York City, and then served on the *Saint Lawrence* in the East Gulf Blockading Squadron. He was promoted to be a surgeon in 1868, a medical inspector in 1887, and a medical director in 1895. During the Spanish-American War he supervised the fitting out of the hospital ship *Solace*—the first practical hospital ship ever used in any navy. From 1897 to 1902 he was surgeon-general and medical director of the United States Navy, retiring with the rank of senior rear admiral. In 1905 President Roosevelt appointed him chairman of the central committee of the American National Red Cross Association.

VAN ROOY, văn rō'ê, ANTON (1870–). A Dutch dramatic bass singer, born in Rotterdam. Most of his vocal training was received under Stockhausen of Frankfort. For a time he devoted himself entirely to the concert platform, and won fame as a lieder singer and in oratorio. The strong dramatic quality of his voice led Frau Wagner to offer him the rôle of Wotan at Bayreuth (1897), after which he was engaged in similar parts in England and America. He first appeared in London in 1898, and he went to New York in 1899, becoming a favorite in German opera in both cities.

VANS. A people who, according to their inscriptions, occupied what is now Armenia before the Armenians. Their language, preserved on old Vannic monuments, is considered non-Aryan, with possibly Caucasic affinities. See VAN.

VAN SANT'VOORD, GEORGE (1819–63). An American lawyer and author. He was born at Belleville, N. J., graduated at Union College in 1841, was admitted to the bar in 1844, practiced at Kinderhook, N. Y., in 1846–51, and then removed to Troy. He was a member of the State Assembly in 1852 and 1856, and district attorney for Rensselaer County in 1860–63. His publications include: *Principles of Pleading in Civil Actions Under the New York Code of Procedure* (1852); *A Treatise on Practice in the Supreme Court of the State of New York in Equity Actions* (1860); *Life of Algernon Sydney* (2d ed., 1853); and *Lives of the Chief Justices of the Supreme Court of the United States.*

VAN SCHAACK, shăk, PETER (1747–1832). An American lawyer and author. He was born at Kinderhook, N. Y., and graduated at Columbia College in 1768. In 1773 he was appointed to revise the Colonial statutes, in 1777 was summoned before the committee on conspiracies for opposing the Revolution, and, refusing to swear allegiance to the State of New York, was sent to Boston, where he remained until the following year. He was then banished and went to England, returning to New York in 1785 after a statute had been passed restoring his rights as a citizen. He was readmitted to the bar and gained a wide reputation as a practitioner and instructor. In later life he became blind. He published *Laws of the Colony of New York* (1773) and *Conductor Generalis, or the Duty and Authority of Justices, Sheriffs, Coroners, etc.* (1788). Consult H. C. Van Schaack (ed.), *Life, Journal, Diary, and Letters of Peter Van Schaack* (New York, 1842).

VAN s'GRAVESANDE. See GRAVESANDE.

VAN SWIETEN, GERARD. See SWIETEN.

VAN 'T HOFF, vänt hŏf', JACOBUS HENRIK (1852–1908). A Dutch chemist. He was born in Rotterdam, and was educated at the Polytechnic School in Delft, and in the University of Leyden, also studying chemistry under Kekule in Bonn and Wurtz in Paris. In 1874 he published a full though brief account of the stereochemical theory (see STEREOCHEMISTRY), with which his name as its founder will always be associated. In 1878 he became professor of chemistry, mineralogy, and geology in the University of Amsterdam. He declined a call to the University of Leipzig in 1887, but in 1896 he was made honorary professor in the University of Berlin, while the Berlin Academy of Sciences enabled him to establish a research laboratory, where he applied successfully physicochemical theories to the study of geological phenomena, and especially the study of the conditions of formation of the Stassfurt salt deposits. Van 't Hoff's views on stereochemistry as presented in his first paper

(translated into French, German, and English, *Chemistry in Space*, 1891), although opposed by many chemists at first, soon received universal acceptance, and have formed the starting point for a whole series of brilliant investigations which have thrown much light on molecular structure. In the second branch of his work Van 't Hoff applied mathematical and thermodynamical principles to chemical reactions and equilibria (see THERMOCHEMISTRY), summing up a part of his work in his *Etudes de dynamique chimique* (1884). He was also the first to point out clearly the analogy between the gaseous state and that of dilute solutions, and developed the laws governing the relations of the latter, laying the basis for the great development which physical chemistry has had in recent years. Becoming interested in heterogeneous equilibria he turned his attention to double salts, and especially to minerals, such as those of the Stassfurt deposits. For 10 years he and his students carried out these studies, contributing 51 papers to the proceedings of the Academy of Sciences of Berlin, and, as a result, the problem as to the origin of these salts, at least from the chemical point of view, is to be regarded as having been completely solved. In 1901 his achievements led to his being made the recipient of the first Nobel prize in chemistry. Many other honors came to him, including honorary memberships in various foreign societies.

VAN TIEGEHEM, vän tē'gĕm', PHILIPPE EDOUARD LÉON (1839–1914). A French botanist, born at Bailleul (Nord), and educated at the Ecole Normale Supérieure, where he became maître de conférences in 1864. He was elected to the Academy of Sciences in 1877, and in 1879 became professor of botany in the Museum of Natural History. He held also a like position in the Institut National Agronomique after 1898. In 1908 he was elected life secretary of the Académie des Sciences. He translated Sachs's great manual under the title *Traité de botanique* (2 vols., 1873–74), and wrote *Recherches sur la structure du pistil et sur l'anatomie comparée de la fleur* (1871); *Traité de botanique* (1884; 2d ed., 1890); *Eléments de botanique* (2 vols., 1885–88; 3d ed., 1898); *Recherches sur les phanérogames sans graines* (1897). His most important contribution to botany was the stelar theory, which had an important influence upon the subsequent development of vascular anatomy.

VAN TWILLER, WOUTER or WALTER (c.1580–c.1650). A governor of New Netherland, born at Nieukirk, Holland. Until his appointment as Governor, which he owed to the influence of his wife's uncle, Killian van Rensselaer (q.v.), he was a clerk for the Dutch West India Company at Amsterdam. He arrived at New Amsterdam, as Governor, in 1633. Owing to inexperience he was soon involved in troubles, not only with the neighboring English and Indians, but with his own people. In spite of his protests and a military demonstration, colonists from New England took possession of the Connecticut valley, but he was more fortunate on the Delaware, where his soldiers captured a shipload of intending settlers from Virginia. Though his management of affairs showed little ability, his shrewdness and the growing prosperity of the Colony enabled him to accumulate a private fortune. He returned to Holland in 1637.

VAN TYNE, CLAUDE HALSTEAD (1869–). An American historian, born at Tecumseh, Mich. He graduated from the University of Michigan in 1896, studied at Heidelberg, Leipzig, and Paris in 1897–98, and took his Ph.D. at the University of Pennsylvania in 1900. In 1903 he returned to the University of Michigan as a teacher, becoming professor of American history in 1906 and head of the department of history in 1911. In 1913–14 he lectured in the French provincial universities on the Harvard Foundation. Besides editing various works, he contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA, and wrote: *The Loyalists in the American Revolution* (1902); *The American Revolution* (1905); *History of the United States for Schools* (1915), with A. C. McLaughlin.

VANUX'EM, LARDNER (1792–1848). An American geologist, born in Philadelphia, Pa. He graduated in 1819 at the Ecole des Mines, Paris, and was professor of chemistry and mineralogy at South Carolina College in 1819–26. In 1827–28 he studied the geology of Ohio, New York, Tennessee, Kentucky, and Virginia, for the State of New York, to whose Legislature he submitted a report. He was a geologist of the New York Geological Survey in 1836–42. The Association of American Geologists was formed in 1840 through his suggestion, and he was also one of the founders of the American Association for the Advancement of Science. He assisted in arranging the New York State geological collection, the basis of the subsequent State museum. He published numerous papers.

VANVES, vänv. A town of the Department of Seine, France, one mile southwest of the fortifications of Paris (Map: Paris and vicinity). Pop., 1911, 15,545.

VANVITELLI, vän'vē-tĕl'lē, LUIGI (1700–73). An Italian architect of Dutch parentage (Van Witel), born in Rome. At the age of twenty-six he became supervising architect of St. Peter's. He designed a palace and two churches (San Francesco and San Domenico) at Urbino, and remodeled Michelangelo's church of S.M. degli Angeli at Rome. His masterpiece was the vast palace erected at Caserta in 1752 for Charles III of Naples, with its remarkable garden and cascades. The palace, nearly 800 by 600 feet, is distinguished by many impressive features, especially its stairs, halls, and vistas, chapel and theatre, and is one of the finest works of late Italian architecture.

VAN VLECK, EDWARD BURR (1863–). An American mathematician, born at Middletown, Conn. He graduated from Wesleyan University, Conn., in 1884, attended Johns Hopkins in 1885–87, and studied at Göttingen (Ph.D., 1893). He was assistant professor and professor (1895–1906) at Wesleyan, and professor after 1906 at the University of Wisconsin. In 1913 he became president of the American Mathematical Society, of whose *Transactions* he was associate editor (1902–05) and editor (1905–10). Besides monographs in mathematical journals he published *Theory of Divergent Series and Algebraic Continued Functions* (1903).

VAN WERT. A city and the county seat of Van Wert Co., Ohio, 78 miles southwest of Toledo, on the Pennsylvania, the Ohio Electric, and the Cincinnati Northern railroads (Map: Ohio, A 4). It has the Brumback Library, the county hospital, a Y. M. C. A., a Y. W. C. A., and several fine public parks. Among its industrial establishments are railway machine shops, a tobacco stemmery, a canning factory, and manufactories of novelties, lumber products, etc. Pop., 1900, 6422; 1910, 7157; 1916 (est.), 8000.

VAPEREAU, vàp'rō', LOUIS GUSTAVE (1819–1906). A French encyclopædist, born in Orléans, and educated at the Ecole Normale in Paris. He taught philosophy in Tours (1843–1852) and, returning to Paris, studied law and was admitted to the bar in 1854, but forthwith gave himself entirely to literary pursuits. In 1858 he published the first edition of his *Dictionnaire des contemporains*, a standard work of reference in constant process of revision (6th ed., 1891–93). Vapereau edited also a *Dictionnaire universel des littératures* (1876); *L'Année littéraire et dramatique* (1859–69), and other similar works. He was from 1877 to 1888 Inspector General of Primary Schools. During the Prussian invasion (1870–71) he was prefect of Cantal, and later of Tarn-et-Garonne.

VAPOR. A term employed to designate the gaseous state of substances that are ordinarily liquid or solid, such as water, benzene, iodine, etc. It has been proposed that the term "vapor" be applied to gaseous substances below their critical points (see CRITICAL POINT), i.e., at all temperatures at which they may be liquefied by sufficient pressure, while the term "gas" should be restricted to the state of substances above their critical points, i.e., when their existence in the liquid or solid state is impossible. Such a usage of the terms might, however, be somewhat misleading, as it might convey the idea of a difference in the general behavior of gaseous substances below and above their critical points. No such difference is really known to exist, the laws of the gaseous state being equally well obeyed below and above the critical point. The most important property of vapors is their density, which leads immediately to a knowledge of the relative weights of molecules. The density of a vapor is usually expressed in terms of that or hydrogen taken as unit, and then the molecular weight of the given substance is twice its vapor density. The best methods of determining the vapor density of substances together with the apparatus used are described under MOLECULES—MOLECULAR WEIGHTS (q.v.). The vapors given off by mixtures are themselves mixed; e.g., a mixture of water and alcohol emits a mixture of water vapor and alcohol vapor. At any given temperature the vapor given off by a solid or a liquid, whether single or mixed, exerts a certain definite pressure which is generally referred to as the vapor pressure (or vapor tension) of the liquid. The vapor pressure of a mixture is the sum of the partial pressures of its components—quantities of the greatest importance in the theory of mixtures and solutions as well as in the theory of distillation (q.v.). See also EVAPORATION; GASES, GENERAL PROPERTIES OF; CRITICAL POINT; BOILING POINT.

VAPOR BATH. See BATH.

VAPORIZATION. See EVAPORATION.

VAR, vär. A department of southeast France, situated in the former Province of Provence (Map: France, S., L 5). Area 2333 square miles. The department is covered by the lower spurs and foothills of the Maritime Alps. The chief river is the Argens. Viticulture is the principal industry, producing nearly 30,000,000 gallons of wine annually. Silk culture is also carried on to some extent, and there are manufactures of pottery, paper, silk, and soap. Pop., 1901, 326,384; 1911, 330,755. The capital of the department is Draguignan, and the largest city is Toulon.

VARĀHAMIHIRA, vä-rä'hä-mĭ'hĭ-rä (?–587 A.D.). A celebrated Hindu astronomer who was born near Ujjain and began his calculations about 505 A.D. Tradition makes him one of the Nine Gems at the court of King Vikrama (q.v.). He was the author of four astronomical works, including the *Pañcasiddhāntikā*, edited by Thibaut and Dvivedi (Benares, 1889); the *Bṛhatsaṁhitā*, an encyclopædic treatise in one hundred and six chapters (ed. by Dvivedi, ib., 1895–97); the *Bṛihaj-jātaka* or *Horā-çāstra* (translated by C. Jyer, Madras, 1885); and the *Laghu-jātaka* (partly translated by Jacobi, 1872). Consult Thibaut, "Astronomie, Astrologie und Mathematik," in Bühler and Kielhorn, *Grundriss der indo-arischen Philologie* (Strassburg, 1899).

VARAN'GIANS. The name by which the Old Norse invaders of Russia (q.v.) were known to the Slavs. The word signifies in the Old Norse men who have pledged themselves to a leader. The celebrated Varangian Guard of the Byzantine emperors, which existed from the tenth century, was composed mainly of Northmen and Goths from Sweden and Norway, though later other Teutonic warriors, notably English, were among their numbers. See NORMANS.

VARAN'IDÆ (Neo-Lat. nom. pl., from *Varanus*, from Ar. *waran*, *warsal*, lizard). A family of aquatic lizards, called warans, varans, safeguards, etc. See MONITOR.

VAR'DAMAN, JAMES KIMBLE (1861–). An American lawyer, journalist, and legislator, born in Jackson Co., Texas. His family moving to Mississippi, he read law in an office at Carrollton and was admitted to the bar in 1881. He edited successively the Winona *Advance*, the Greenwood *Enterprise* and *Commonwealth*, and from 1908 the weekly *Issue*, published at Jackson. At the same time he was prominent in Democratic politics. From 1890 to 1896 he was a member of the State House of Representatives, of which he was Speaker in 1894. He saw service in Cuba during the Spanish-American War and rose to be major. Defeated for Governor in 1895 and 1899, he was elected to that office in 1903. Though strongly opposed to participation of the negro in politics or even in the suffrage, he denounced lynching, and in 1904 called out the militia to protect a negro until he had had a trial by law. Although defeated by John Sharp Williams for the United States Senate in 1907 and in 1910 by LeRoy Percy, in 1911 he was selected in a primary election of unusual bitterness by an overwhelming majority.

VARDÖ, värd'ē. A town on the northeast coast of Norway. It is the most eastern town of Norway, and mentioned in 1307. The old Fort Vardöhus, dating from before 1307, is the northernmost fort in the world. Fishing, fish-oil refineries, shipping, and commerce are the principal industries. In 1910, 8177 people, with 1747 boats, took part in the cod fisheries at Vardö. In the same year were produced 26,219,230 kgs. codfish and 5089 hls. cod-liver oil. Pop., 1910, 3111.

VAR'DON, HARRY (1871–). A British golf champion. In 1914, for the sixth time, he won the English open championship. In 1913 he played in the United States and was defeated for the American open championship at Brookline, Mass., by Francis Ouimet, an American amateur, whose success made a sensation be-

cause of his youth. Edward Ray (q.v.) was third in this match, which had been featured by a triple tie in the final round the preceding day (September 19). For many years Vardon and Ray were leading figures in British golf. Vardon published *The Complete Golfer* (1907) and *How to Play Golf* (1912).

VAR'EC (Fr., from Icel. *vāgrek*, wave wrack, stuff thrown ashore by the waves). A crude sodium carbonate obtained in Brittany and Normandy, France.

VARESE, vä-rā'zā. A town in the province of Como, Italy, 37 miles northwest of Milan and 4 miles east of Lago Maggiore (Map: Italy, B 2). The picturesque scenery gives the town considerable prominence as a place of resort. The most interesting edifice is the church of San Vittore, dating from the sixteenth century. Varese has a museum with a valuable collection of historic relics. There are manufactures of wine, silk goods, paper, furniture, organs, carriages, etc. Pop. (commune), 1901, 17,715; 1911, 21,605 (town, 7721).

VARGAS, vär'gäs, José María (1786–1854). A Venezuelan politician and surgeon, born in La Guayra. He studied medicine at Caracas and Edinburgh, and became professor in the University of Caracas. He took part in the revolutionary movements, was a member of the constituent congress of 1830, and in 1834 was named vice president. The following year he was elected to the presidency, but resigned in 1836 on account of the difficulties of his administration. He was Senator (1838–46) and Councilor of State (1847–49). In 1853 he went to New York City, where he died.

VARGAS, Luís de (1502–68). A Spanish religious painter, born at Seville. He is reputed to have been a pupil of Perino del Vaga at Rome, where he spent 28 years. He was influenced by Sebastiano del Piombo and the Flemish painter Kempeneer, and is more robust and personal than his Castilian contemporaries. Though inferior as a colorist, he was an excellent draftsman, and particularly excelled in portraiture. Of his frescoes, which were considered his best works, none survive. His principal oil paintings are in the cathedral of Seville: a "Nativity" (c.1541), and his masterpiece, the "Temporal Generation of Christ" (1561), popularly known as the "Gamba."

VARIABLE STARS. In the majority of instances the stars show no appreciable fluctuations of brightness. There are, however, about 5000, known as variable stars, which exhibit very distinct changes of luminosity, changes which in some cases are irregular, in others periodic. The first periodic variable discovered was Mira in the constellation Cetus (q.v.), but, although it was first observed by Fabricius in 1596, it was not until 1667 that its period was definitely established by Boulliaud. Another famous variable star is Algol (q.v.). The application of photography to the study of the heavens has resulted in a rapid increase in the number of stars recognized as variable. See Star.

VARIANCE (from Lat. *variantia*, difference, diversity, from *variare*, to change, vary, from *varius*, different, various). In the law of pleading, an inconsistency or difference between the original process by which an action is begun and the pleadings; or a difference between the facts alleged in the pleadings and those proved by the evidence introduced at the trial. A variance between the process and pleadings must be objected to before a trial is had on the merits, as it is generally held to be cured by verdict. The practice under modern codes is characterized by considerable liberality with the end of meting out substantial justice as between the parties, and hence in case of a slight variance between the pleadings and the proof it is customary to permit an amendment at the trial to conform with the proof. Where the variance is substantial, however, and is concerning matter which the other party is not prepared to meet, no proof of facts not alleged in the pleadings will be permitted. Moreover, in case the proof adduced shows an entirely different cause of action from that set forth in the pleadings, the variance is fatal. Consult the works of Stephen and Chitty on *Pleading*.

VARIATION (Lat. *variatio*, from *variare*, to change, vary). Structural or functional deviations from the parent form or type. Naturalists are working towards the discovery and classification of facts, and of causes producing variation. Species are unequally variable; there are plastic as well as rigid ones. Nature prevents overvariation by competition; otherwise crowding of species would result. The greatest range of variation occurs in cultivated plants and domestic animals; yet the turkey does not vary whether living in America or Europe, nor does the guinea fowl in America depart from the African type; and the cat varies much less than the dog. Wide-ranging, much diffused, and common species vary most, and those of large genera more frequently vary than those of genera containing but one or only a few species. Persistent or ancient and cosmopolitan forms have not varied through long periods of their history. See Heredity; Lamarckism.

It was claimed by Darwin that variation is by chance, though he adds that this is "a wholly incorrect expression," for in nature there is no such thing as chance, the expression serving "to acknowledge plainly our ignorance of the cause of each particular variation"; and he states that "the direct action of changed conditions leads to definite or indefinite results." But it is more probable that, though variations may in some cases seem to be fortuitous, in general throughout geological time variation has been regulated by changes in physical and biological conditions of environment along certain determinate lines, the variations becoming permanent when they prove useful. That the direction of variation is dependent on the surroundings is shown by the gradual atrophy of eyes in animals living in darkness. The reduction in the number of limbs and toes is conditioned by the mode of life. The variation in the colors of animals is in direct relation with the varying amount of light and shade to which they are exposed. See Protective Coloration and Resemblance.

Primarily variation is due to the changes of the environment, i.e., to the differences in atmospheric pressure, electricity, gravity, light, to changes of temperature (heat and cold), and of the mechanical and chemical state of the water or air, as well as the kind and amount of food. The causes are mainly external, but some are apparently internal, such as reproduction. These physical agents have been called the primary factors of organic evolution (q.v.) operating on the most primitive and plastic one-celled forms of life, which in the beginning led to the origin of the different types of life or lines of development.

Nomenclature. A variant is one of the dissimilar conditions of form in which an organ appears; thus the variants of the number of rays of a scallop shell are 13, 14, 15, etc. A variant must be sharply distinguished from a variety, which is a group term for individuals that breed true to one another, and resemble one another in color, size, and other characteristics less broad and general than specific ones. A variate is one of the varying units of study; each scallop shell is, in respect to the number of its rays, a variate, and in 1000 scallops there may be, e.g., 200 variates (ray numbers) falling in the variant class of 16 rays. Each different variant thus usually includes a number of variates. Variates are of two sorts: counted and measured (integral and graduated). For example, the number of rays on a scallop shell (15, 16, 17, etc.) is an integral variate; the diameter of the shell is a graduated variate. The data of variation may be classified in various ways, but two main types are (1) slight variations and (2) sport variations. Slight variations are such trivial differences as distinguish one adult male of a homogeneous community from another male of this community, the number of grains on one head of rice from the number on a second head of rice. It is the noticed and yet unnoted form of variation. Sport variations are the relatively rare occurrence of great differences cropping out in a community. These are sometimes incompatible with life, and are then known as monsters; but when sports persist, and are bred from, they may impress themselves with peculiar strength; e.g., Ancon sheep, and the downless peaches called nectarines. Variable characters may also be classified as integral and graduated. They play a nearly equal part in evolution, for some species have differentiated chiefly along the line of multiplication or reduction of the number of parts, while other species have varied in size, color, and other qualities of parts. Again, variates may be either individual or organal. Individual variates belong to different individual animals or plants, whereas organal variates are found in the multiple organs of one and the same individual, e.g., the length of a fish is an individual variate: the diameter of one of its scales as compared with that of the others is an organal variate. According to Huxley's definition, a race is a propagated variety. These terms—variant, variety, race, species—are by no means fixed, since in many instances gradations may be found which more or less completely link them.

Variation with age is a matter of daily observation. First of all, the absolute size of the body and its organs tends to increase with age up to a limit. Secondly, the proportions change. Some organs are developed precociously, i.e., the child's head; others are retarded, e.g., the length of the child's legs. Careful measurements of the shell of a crab have shown that the shell grows larger in proportion to its breadth as it grows older. Especially at the time of sexual maturity in most animals special features develop greatly that are earlier latent. Not only the size, but also the variability of organs, changes with age. Thus the standard deviation of the stature of the five-year-old child is 3 inches; of the seven-year-old child, 2.85 inches. Variation with sex is likewise a widespread phenomenon. Not all organs vary in the two sexes, however, but only the so-called secondary sexual ones, such as the mane of mammals; the comb, wattles, and tail feathers of fowl; the plumage of most birds; and the antennæ of moths. The old idea that the male was uniformly more variable is not markedly true. In the wings of some insects the female is the more variable.

The fact of selection is best measured by variability, any species after selection being presumably less variable than before; the mean also may be changed by selection if this acts especially on the large or on the small. By selection we may, moreover, divide a binomial species into two pure groups, each centring about one of the modes. Darwin and others have thought that by selection of minute variations a species might be changed to any extent, but this view is combated by some, especially De Vries, who maintains that selection of slight variations can improve qualities already present, but cannot originate new ones, for which we must wait upon haphazard appearances (sports).

Correlated variation is the term applied to the common case of two organs so interdependent that when the one varies the other varies likewise. Multiple parts, such as the segments of an earthworm, vary just as different individuals do and follow the same laws, and where one of these repeated parts varies, they all vary in the same direction. Thus, if a peculiar spot appears in one segment of a leech, it is apt to appear in the whole series of segments; also, a variety of a species characterized by one peculiarity is apt to be characterized by a series of peculiarities. The variability of the various elements of a series or multiple repeated organ differs in the different cases. For example, the spots on the thoracic shield of a potato beetle are sometimes constant in size and occurrence; in others, the reverse. In the case of linear series, like the series of teeth on the jaw, it is often true that the terminal members of the series are the most variable. In general, the rule holds that specific characters are more variable than generic ones. But the relation between species and varying characters is even closer, as examination of extreme types will show. There is thus such a relation between the species of a genus that each, while maintaining its peculiar modes, varies especially in the direction of the others. A species remains constant only in a constant environment. This is illustrated in every estuary, where mollusks found near the fresher water are smaller than those in the open sea. Insects are darker along the seacoast. A passage from one part of the country to another shows that animals gradually become dissimilar, and even the individuals of the same species undergo a change which may be apparently quite independent of environment. This is shown in the Galapagos Islands, whose climatic conditions are practically the same, yet on each island the lizards are peculiar, and only one kind of lizard occurs on an island. See EVOLUTION; HYBRIDITY.

port, *Statistical Methods, with Special Reference to Biological Variation* (3d ed., New York, 1913).

VARIATION. In music, a transformation of a melody by melodic, harmonic, contrapuntal, and rhythmic changes. The subject chosen is called the theme; it is first simply harmonized with or without an introduction, and then repeated in a variety of forms. The oldest variations are the doubles, in which the fundamental theme was not altered. But since the time of Haydn and Mozart the form of the variation has become more artistic. The theme appears with new harmonies, the mode is changed from major to minor or vice versa; there is variety of key and rhythm, and the melodic intervals themselves are often altered. Frequently a new melody is added as a counter subject to the original theme. The only principle to be observed is that the original theme shall always be recognizable by some feature.

VARIATION OF LATITUDE. See LATITUDE, VARIATION OF.

VARIATION OF MAGNETIC ELEMENTS. See COMPASS; TERRESTRIAL MAGNETISM.

VAR'ICEL'LA (Lat., dim. of *variola*, from *varius*, spotted). The medical term for chickenpox (q.v.).

VAR'ICOCELE (from Lat. *varix*, dilated vein, from *varus*, bent, stretched, knock-kneed, awry + Gk. *κήλη*, *kēlē*, tumor). In surgery, a varicose state of the veins of the spermatic cord. It is caused by the same conditions which give rise to varicose veins (q.v.) elsewhere. There exists under these conditions a sense of fullness, or even heavy, dragging pain in the scrotum, in which the varicocele can be felt as a soft knotted, irregular mass. The treatment consists of wearing a proper support, bathing with cold water, exercise, and care of the bowels. In some instances ligation of the veins is called for.

VAR'ICOSE VEIN (Lat. *varicosus*, full of dilated veins, from *varix*, dilated vein), or VARIX. A dilated and tortuous vein. Varices are of common occurrence in the submucous veins of the rectum (constituting hemorrhoids or piles), in the spermatic veins, giving rise to varicocele (q.v.), and in the veins of the lower extremities. They are very rarely found in other veins, such as those of the scalp, neck, and groin. Cooks, washerwomen, soldiers, and others whose occupation involves much standing, are specially prone to varicose veins. Varices may occur at almost any period of life, but are chiefly developed during middle age. Their formation is aided by any condition of the system which impedes the circulation, as certain diseases of the heart, lungs, and liver, and by continued overeating and the use of alcoholic stimulants, which are liable to induce hemorrhoids. Senile degeneration, gout, pregnancy, and the excessive exercise of the athlete may act as causes in certain cases. In varicose veins the coats of the dilated vessels may become thickened or may become thin; they may be lengthened so that the veins become tortuous; the dilation may be unequal, giving rise to the formation of pouches; and, in consequence of the enlarged calibre of the vessels, the veins act imperfectly, and their walls gradually undergo degeneration. Varices occurring in the leg commonly give rise to deeply seated aching pain in the limb, with a sense of weight, fullness, and numbness, before there is any external appearance of the affection. In a more advanced stage the ankles swell in the evening and the feet are cold. After a time a small tumor of a bluish tint appears, which disappears on pressure, but returns on the removal of the pressure, and is caused by a dilated vein. This dilation extends and forms knotty, irregular tumors, soft to touch, diminishing on pressure or on the patient assuming a horizontal posture. These tumors commonly occur in the middle of the leg, along the track of the saphenous veins, but they often extend along the whole of the leg and thigh. The deep as well as the superficial veins may be involved and the varices may be as large in diameter as a lead pencil.

The treatment of varicose veins is palliative or radical. All obstructions to the return circulation should be removed, and the wearing of garters absolutely forbidden. The use of an elastic bandage or elastic stocking upon the limb, the evenly distributed pressure of which supports the veins, is palliative. Such treatment, combined with proper dietetic and hygienic measures, is usually sufficient to meet the requirements of ordinary cases. It is not, however, curative. The radical or curative method of treatment consists in ligation or thorough excision of the sections of the enlarged veins at intervals of about 2 inches.

VARIED THRUSH. A thrush commonly known as the OREGON ROBIN (q.v.).

VARIETY (in biology). See VARIATION.

VARIETY (theatre). See VAUDEVILLE.

VARI'NUS. See GUARINO DA VERONA.

VARI'OLA. See SMALLPOX; VACCINATION.

VA'RIOLITE. See ORTHOCLASE.

VA'RIX. See VARICOSE VEIN.

VAR'LEY, JOHN (1778–1842). An English water-color painter. He was born at Hackney, London, and worked at first with a silversmith, afterward becoming assistant and pupil to Joseph Charles Barrow. His first exhibited picture, "View of Peterborough Cathedral," appeared at the Royal Academy in 1798. Some of his paintings, which are notable for broad, free treatment and fresh, pure color, are: "Beddgelert Bridge" (1800); "River Scene" (1840); "Bolton Abbey" (1842); and "Burial of Saul" (all in South Kensington Museum). He wrote several treatises on landscape painting, was one of the original members of the Society of Water Color Painters (1804), and numbered among his pupils David Cox, John Linnell, Mulready, and William Hunt.

VARLEY, JOHN PHILIP. See MITCHELL, L. E.

VARNA, vär'nȧ. The chief seaport of Bulgaria and the principal port of the Black Sea between Kustendje and the Bosporus, situated on the Bay of Varna, 325 miles by rail east-northeast of Sofia (Map: Balkan Peninsula, G 3). It is an old, irregularly built town with an unprotected harbor. The industrial establishments include tanneries and an extensive cotton spinnery. Varna carries on an extensive trade in animals, dairy products, grain, skins, and cloth. In the vicinity of Varna is the summer residence of the King. Pop., 1900, 33,443; 1910, 41,317—chiefly Bulgarians, Greeks, and Turks. Varna is identified with the ancient Milesian colony of Odessus. It is memorable as the scene of the defeat of the Hungarians under King Ladislas and John Hunyady by the Turks under Amurath II in 1444. It withstood an attack by the Russians in 1773, but was taken by them in 1828. In 1854, in the Crimean War, it was used as a base of operations by the allies. It was

bombarded by the Russian fleet in 1915. See WAR IN EUROPE.

VARNHAGEN, vär'nä-zhĕn', FRANCISCO ADOLFO DE (1816–78). A Brazilian diplomat and scholar, born in São João do Ypanema. He studied in Portugal, devoting himself especially to the history of Brazil. In 1859 he returned to South America, was appointed Minister to Paraguay, but soon resigned because of his disapproval of López's government. In 1865 he became Minister to Chile and Peru, whence, in 1868, he was transferred to Vienna, where he died. He wrote: *Florilegio de poesia brasileira* (1850–53); *Trovas e Cantares* (1853); *Examen de quelques points de l'histoire géographique du Brésil* (1858); *Amerigo Vespucci* (1865); *Nouvelles recherches sur les derniers voyages du navigateur florentin* (1869); *Ainda A. Vespucci* (1874); and the *Historia do Brasil* (1854–57).

VARNHAGEN VON ENSE, färn'hä-gen fŏn ĕn'zĕ, KARL AUGUST (1785–1858). A German author, born in Düsseldorf. After studying medicine at Berlin and philosophy at Halle, Berlin, and Tübingen, and helping (1803) to edit Chamisso's *Musenalmanach*, he entered the Austrian army (1809), and was wounded at Wagram. He joined the Russian army in 1813, entered the Prussian diplomatic service (1814), accompanied Chancellor Hardenberg to the Congress of Vienna, and (1815) became Minister at Karlsruhe. Having lost his official position in 1819, Varnhagen devoted himself chiefly to literature, although he continued to take a keen interest in political affairs, and was from time to time active in diplomatic matters. His first work was an account of experiences in the war of 1813, *Geschichte der Hamburger Ereignisse*, followed by the *Geschichte der Kriegszüge Tettenborns* (1814). In the same year he married Rahel Levin (see VARNHAGEN VON ENSE, RAHEL), a Jewess of great intellect, who exercised a remarkable influence upon his subsequent career. At Berlin the Varnhagens became a rallying point for men distinguished in science, art, and letters, and theirs was the most important German salon. Varnhagen wrote stories (1815), poems (1816), a remarkable character sketch of Goethe (*Goethe in den Zeugnissen der Mitlebenden*, 1824), and, between 1824 and 1830, five volumes of similar *Biographische Denkmale*. In 1833 Rahel died, and in 1834 Varnhagen published a memorial of her in three volumes, followed (1836) by two volumes of a *Galerie von Bildnissen aus Rahels Umgang* and (1843–46) by seven volumes of *Denkwürdigkeiten*. Varnhagen's style, modeled on that of Goethe, is remarkable for elegance and precision. His reminiscences are of permanent historical value. He died in Berlin Oct. 10, 1858, and left 14 volumes of Tagebücher (1861–70), two volumes of *Denkwürdigkeiten* (1859), a volume of studies in Prussian history, *Blätter aus der preussischen Geschichte* (1868), and a volume of *Biographische Porträte* (1871). *Letters* to him from A. von Humboldt were published (Leipzig, 1860). There is an edition of selected *Works* (19 vols., Leipzig, 1871–77). Consult article by R. Haym in *Preussische Jahrbücher* (Berlin, 1863).

VARNHAGEN VON ENSE, RAHEL, *née* LEVIN (1771–1833). A German literary woman, born in Berlin. She became a familiar figure in literary and artistic circles at Hamburg, Paris, Prague, and Frankfort-on-Main, and in 1814 was married to Karl August Varnhagen von Ense (q.v.), over whose career she exercised a remarkable influence. Her husband published a memorial of her, *Rahel, ein Buch des Andenkens für ihre Freunde* (3 vols., 1834; new ed., 1903), and also *Galerie von Bildnissen aus Rahels Umgang* (2 vols., 1836). After her husband's death were published *Briefwechsel zwischen Rahel und David Veit* (2 parts, 1861) and *Briefwechsel zwischen Varnhagen von Ense und Rahel* (6 vols., 1874–75). Consult Ludmilla Assing, *Aus Rahels Herzensleben* (Leipzig, 1877); Emma Graf, *Rahel Varnhagen und die Romantik* (Berlin, 1903); Ellen Key, *Rahel, eine biographische Skizze* (ib., 1907).

VARNISH (OF., Fr. *vernis*, varnish, p.p. of OF. *vernir*, to varnish, probably from ML. *vitrinus*, glassy, from Lat. *vitrum*, glass). Varnishes are solutions of resins or drying oils which form transparent liquids capable of hardening on exposure to air, either by evaporation of the solvent or oxidation or both.

There are three classes, as follows: *Spirit*, where the solvent consists of some volatile liquid, such as alcohol, acetone, etc. A familiar example of this type is shellac varnish. *Turpentine*, or solutions of resins in oil of turpentine. *Oil*, drying oils, such as linseed, poppyseed, and Chinese wood oils, either alone or mixed with resins and thinned with turpentine. This last type has superior lasting quality, but is very expensive and difficult to prepare.

Turpentine and oil varnishes may also contain rosin, which is usually considered as an adulterant, and seriously detracts from the resisting quality to moisture and sunlight. The resins commonly used are shellac, mastic, sandarac, and dammar for spirit varnishes; and amber, copal, anime, kauri, and dammar for other types.

In the manufacture of spirit varnishes the resin is dissolved in the warmed solvent, cooled, and clarified. When necessary, alcohol soluble coloring matter, such as dragon's blood, cochineal, etc., may be added. For oil varnishes it is necessary to heat the resin for some time above its boiling point in order to drive off volatile oils and render the residuum soluble in hot boiled oil, which is now added. After thorough incorporation by means of stirring and heating the mass is cooled to 130°–140° C. (266°–284° F.) and thinned with turpentine. Several months of storage are necessary for clarification. In order to overcome the large losses sustained in heating the gums, they may be dissolved in naphthalene under pressure at 250°–290° C. (450°–522° F.), the resulting solution mixed with the drying oil, and the naphthalene distilled off. Lacquers or natural varnishes (see GUMS) are milky juices of certain trees found in the East. On heating, the sap loses water and furnishes a brown oily liquid which may be colored or mixed with pigment and thinner and acts as a varnish. Japans are dark-colored boiled oils sometimes mixed with asphaltum. They are largely used in coating sheet metal and are usually baked on. Consult: W. T. Brannt, *Varnishes, Lacquers, Printing Inks, and Sealing Waxes* (Philadelphia, 1893); A. H. Sabin, *The Industrial and Artistic Technology of Paint and Varnish* (New York, 1904); M. Bottler, *German Varnish Making* (ib., 1912); C. D. Holley, *Analysis of Paint and Varnish Products* (ib., 1912); G. H. Hurst, *Painters' Colors, Oils, and Varnishes* (5th ed., Philadelphia, 1913); Sir T. E. Thorpe, *Dictionary of Applied Chemistry* (New York, 1913); F. H. Thorp, *Outlines of Industrial Chemistry* (rev. and enl. ed., ib., 1914).

VARNISH TREE. A name given to several trees of the family Anacardiaceæ because the resinous juice is used for varnishing or for lacquering. The black varnish tree (*Melanorrhœa usitata*) is described in the article on MELANORRHŒA, and the Japan varnish tree (*Rhus vernicifera*) in the article on SUMACH. Other trees valuable for the varnish they yield are *Gluta benghas* and *Melanorrhœa wallichii*, natives of Java, Sumatra, Borneo, Celebes, and other East India islands. The juice is extremely acrid, and soon hardens into a black resin. To obtain it pieces of bamboo are inserted into the bark and allowed to remain all night, as the juice flows more freely by night than by day. It is prepared for use by boiling with equal parts of oil obtained from the fruit of *Mimusops elengi*.

VAR'NUM, JAMES MITCHELL (1748–89). An American soldier, born at Dracut, Mass. He graduated at Brown (then Rhode Island) University in 1769, was admitted to the bar in 1771, and practiced at East Greenwich, R. I. In 1774 he became commander of the celebrated Kentish Guards, and in May, 1775, was made colonel in the First Rhode Island Infantry. For efficient services at the siege of Boston, at Harlem Heights, and at White Plains he was appointed brigadier general of Rhode Island troops in December, 1776, soon afterward, in February, 1777, taking the same rank in the Continental army. After participating in the battle of Monmouth and in Sullivan's Rhode Island campaign, he resigned on March 5, 1779, and resumed the practice of law. He was major general of the State militia from 1779 to 1788, was a member of the Continental Congress in 1780–82 and again in 1786–87, and in 1787 was appointed one of the Supreme Court judges of the Northwest Territory, removing to Marietta, Ohio, in June, 1788.

VAROLIO, vä-rō'lyō, COSTANZO (c.1543–75). An Italian surgeon and anatomist, born at Bologna. He was a student and professor at the University of Bologna, and afterward went to Rome as physician to Pope Gregory XIII. His studies of the human brain are still remembered by the anatomical designation of *Pons Varolii*. He is the author of *De Nervis Opticis* (1573).

VAROTARI, vä'rō-tä'rē, ALESSANDRO (1590–1650). A Venetian painter, born at Padua, and usually called Il Padovanino. He imitated the style of Veronese and Titian, whose works he studied in Venice. The frescoes in the church of St. Andrea at Bergamo are known to be his work, and there are two of his pictures in the National Gallery, London. His best works are "The Marriage at Cana" (1622), in the Academy at Venice, and "St. Liberatus," in the Carmine, Venice. He passed the greater part of his life in Venice and Padua, and his paintings are preserved chiefly in those cities. Consult Ridolfi, *Le Maraviglie dell' Arte* (Venice, 1648).

VAR'RO, MARCUS TERENTIUS (116–27 B.C.). A Latin author, known as the most learned of the Romans. He was born at Reate, in the Sabine territory. He studied first under L. Ælius Stilo Præconinus and then under Antiochus, a philosopher of the Academy. Varro served with distinction in the wars against the Cilician pirates and Mithridates; afterward, as legatus of Pompey in Spain, he was compelled to surrender his forces to Cæsar. He shared the fortunes of the Pompeian party till its defeat at Pharsalus, after which he obtained his pardon from Cæsar, by whom he was employed to collect and arrange the great library designed for the public. For a time he lived in retirement, chiefly at his villas near Cumæ and Tusculum, busily writing. When the second triumvirate was formed his name was on the list of the proscribed; but he escaped, and, after some time spent in concealment, he was received under the protection of Octavianus. The rest of his life was spent in his studies. Varro was the most learned and the most prolific of Roman authors. He declared that he had composed 490 books (book here, it should be noted, includes subdivision of works). Only two of his works have survived, and one of these is in a fragmentary state. The most considerable of his writings, whether lost or extant, are as follows: (1) *De Re Rustica Libri III*, still extant, the most important treatise on ancient agriculture known. (2) *De Lingua Latina* (grammatical), which originally extended to 25 books, only six of which, however, have come down to us, and even these are in an imperfect form. (3) *Antiquitatum Libri*, comprising two sections, the *Antiquitates Rerum Humanarum*, in 25 books, and the *Antiquitates Rerum Divinarum*, in 16 books. This, his greatest work, the one on which his reputation for learning was mainly founded, has unfortunately perished, except a few fragments. (4) *Saturæ*, composed in various metres, and occasionally also in prose. These pieces, copied to some extent from the productions of Menippus the Gadarene, were apparently a series of comments on a variety of subjects, generally in the form of dialogue, and aiming at the enforcement of moral lessons or serious truths in a familiar style. Of these we have only fragments. The best edition of the *De Re Rustica* is that of Keil (Leipzig, 1884); of the *De Lingua Latina*, that of Spengel (Berlin, 1885), and that of G. Goetz and F. Schoell (Leipzig, 1910). The *Saturæ Menippeæ* are published in Bücheler's edition of Petronius (5th ed., Berlin, 1912). Consult: Gaston Boissier, *Etudes sur Varron* (Paris, 1861); Martin Schanz, *Geschichte der römischen Litteratur*, vol. i, part ii (3d ed., Munich, 1909); J. W. Duff, *A Literary History of Rome* (London, 1909); the article "Terentius, 21," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914); M. S. Dimsdale, *A History of Latin Literature* (New York, 1915).

VARSOVIENNE, vär'sō'vyĕn' (Fr., Warsaw dance). A modern dance in three-quarter time and moderate tempo, beginning on the up beat and having a strong accent on the first beat of the even measures. It originated in France about 1850, and is a modification of the Polish mazurka or redowa (qq.v.).

VAR'TABED. See ARMENIAN CHURCH.

VARUNA, vä'rōō-nä (from Skt. *var*, surround, encompass, probably connected with Gk. *οὐρανός, ouranos*, heaven). In Vedic mythology, the representative of the all-encompassing heaven. Only a dozen hymns in the Rig Veda are addressed exclusively to his praise, but they show him to be the noblest of the Vedic divinities. He is generally invoked in company with Mitra (q.v.). The sun is their common eye; the heaven is their golden abode. As creator and regent of the world, Varuna rules the universe with unswerving laws. A thousand spies, the stars or rays of light, seek out offenders against his rule; there is no escape from his omniscience, even by flight unto the farthest heaven; his bonds and fetters are ever ready for the guilty;

and inevitable punishment awaits those who have aroused his wrath. At the same time it is his all-wise providence that protects the good. In his divine keeping are a thousand remedies that relieve the miseries incurred by sin and hold death afar. The reward of immortality is Varuna's abode hereafter. As sovereign of the vaulted sky Varuna is the lord of the waters. The sea is his domain, the rivers flow at his bidding, and the rains descend in accordance with his ordinances. Through his sovereignty over the waters he inflicts dropsy upon those who sin against his law. As an Aditya he is sometimes coupled with other gods than Mitra, while his great rival for supremacy in the hearts of the people is Indra (q.v.).

In post-Vedic mythology Varuna sank into insignificance beside Prajapati (q.v.) as a supreme being, and in the later Indian religion his dominion is confined simply to the sea and to the supremacy over the West. Consult: Karl Bohnenberger, *Der altindische Gott Varuna* (Tübingen, 1893); W. J. Wilkins, *Hindu Mythology* (2d ed., London, 1900); Alfred Hillebrandt, *Vedische Mythologie*, vol. iii (Breslau, 1902); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); L. D. Barnett, *Antiquities of India* (London, 1913).

VA'RUS, PUBLIUS QUINTILIUS. A Roman general. He belonged to a noble family. He was consul in 13 B.C. About 20 years later he was appointed Governor of Syria, and on his return was sent by Augustus to command the armies of Germany. The Germans, under the leadership of a chief of the Cherusci, named Arminius (q.v.), attacked Varus, who, with three legions, the usual number of auxiliaries, and a strong body of cavalry, had proceeded as far as the Weser. By false intelligence the proconsul was induced to quit his intrenched camp and to leave the highway for a shorter route. The Romans marched in a long straggling line, encumbered with baggage, with their wives and children. Suddenly they were assailed by the Germans in the depths of the Teutoberg Forest, and it was with difficulty they forced their way to a clear space to encamp for the night. For the next two days the Romans struggled on, marching and fighting with decreasing forces and exhausted strength, intending to reach, if possible, the fortress of Aliso on the Lippe. Finally they were met by the main force of the Germans and completely broken. Varus killed himself in despair. This victory of the Germans, gained 9 A.D., rolled back the tide of Roman conquest. The Rhine, instead of the Weser, again became the boundary of the Empire.

VASA, vä'sä. A government of western Finland, Russia, extending along the Gulf of Bothnia, and covering an area of 16,105 square miles (Map: Russia, B 2). The coastland is low and indented, but the surface rises in the interior into a rocky plateau interspersed with lakes and marshes. The climate is severe and only the coast region and the river valleys are suitable for agriculture. Rye, oats, barley, and potatoes are the principal farm products. The manufactures are of considerable extent and variety, including lumber, paper, metal wares, rubber goods, articles of apparel, food products, etc. There is a lively commerce with the Baltic ports. Pop., 1897, 446,772; 1912, 515,500, about one-third Swedes and the rest Finns.

VASA, or **NIKOLAISTAD,** nē'kō-lī-städ'. The capital of the Government of Vasa, Finland, a short distance from the Gulf of Bothnia (Map: Russia, B 2). The town is the seat of the Governor of the län. Commercially it is the chief town of Osterbotten (in East Bothnia). Its industrial establishments include shipyards, woolen mills, and sawmills. Sawn timber is its chief article of export. Pop., 1897, 13,493; 1912, 22,000. The town was named Nikolaistad in honor of Nicholas I of Russia, when rebuilt after the fire of 1852.

VASA, HOUSE OF. A Swedish royal family, which mounted the throne in the person of Gustavus I in 1523 and ruled till 1654. The most distinguished member of the house was Gustavus II Adolphus (1611–32). His daughter Christina, who was unmarried, resigned the throne in 1654 in favor of her cousin Charles X Gustavus, Count Palatine of Zweibrücken, who inaugurated a collateral female branch. Christina died in 1689. The house of Vasa furnished three kings to Poland, from 1587 to 1668. This branch of the family became extinct with John Casimir, who abdicated in 1668 and died in 1672.

VASA ORDER. A Swedish order of merit, founded in 1772 by Gustavus III. The decoration is a white enameled cross with eight points, surmounted by a crown and worn on a green ribbon.

VÁSÁRHELY, vä'shär-hĕl-y'. The name of two towns in Hungary. See HÓDMEZÖ-VÁSÁRHELY and MAROS-VÁSÁRHELY.

VASARI, vä-zä'rē, GIORGIO (1511–74). An Italian painter and architect, chiefly known as a biographer of artists. He was born at Arezzo, and on the advice of his kinsman, Luca Signorelli, he first studied painting under Guglielmo di Marsiglia. Pollastra, the poet, taught him Latin, and the lad's ability to recite whole books of the *Æneid* won for him the patronage of the Cardinal of Cortona, who, in 1523, took him to Florence. There he was a pupil of Michelangelo and Andrea del Sarto and studied the humanities with the two Medicean princes, whose guardian the Cardinal was. During the exile of the Medici Vasari's fortunes suffered, but he went in the train of Cardinal Ippolito to Rome, and studied for many months with such assiduity that he was brought back to Arezzo on a litter. Upon his recovery Duke Alessandro de' Medici of Florence made him his court painter. In this capacity Vasari painted family portraits, frescoed the Medici Palace, and designed the decorations of Florence upon the visit of Charles V. After Alessandro's assassination he spent three years painting for the monks of Camaldoli, visited northern Italy and Venice, and resided at Rome (1529), and in other parts of Italy. In 1555 he was summoned to Florence by Duke Cosimo, in whose service he remained until his death. From the duke Vasari received a large pension and many gifts and honors, including the appointment to the office of gonfaloniere (chief magistrate) of Arezzo for life. He transformed the interior of the grand Palazzo Vecchio into apartments suitable for a duke's residence, and frescoed the Great Hall which the Republic had intended for Michelangelo and Leonardo. He also designed a number of buildings for the duke, including the Uffizi in Florence. Later he served alternately Pope Julius III and the duke. In 1573 he finished the decorations of the Sala Regia in the Vatican, but his intended masterpiece, the frescoes of the cupola of Florence, was unfinished at his death, June 27, 1574. He possessed a lovable and upright character, and was diligent, but he lacked genius.

Vasari was one of the most versatile artists of the later Renaissance. Modern criticism finds his painting mannered and without originality, but judges more favorably of his architecture. His masterpiece, the Uffizi, is a fine, harmonious building, admirably adapted for its various purposes. Other chief works are the Vigna di Papa Giulio near Rome, the church of the Badia, and his own house (now Casa Montauti at Arezzo), the cupola of Madonna dell' Umiltà at Pistoja, and the new sacristy of San Lorenzo, Florence.

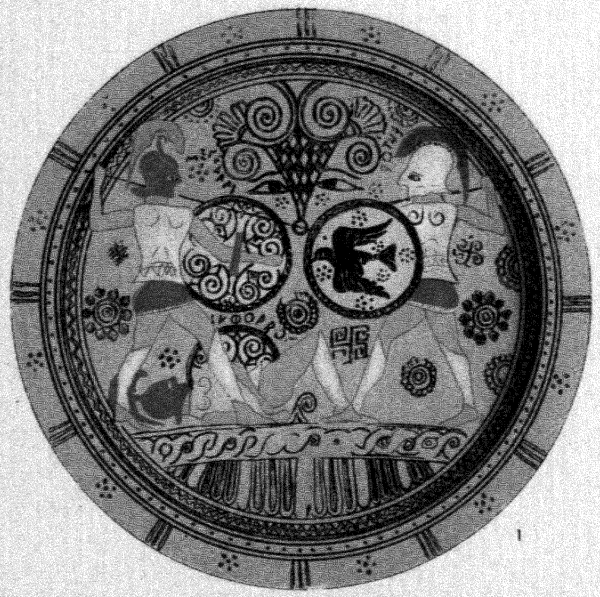
But Vasari's greatest service by far to art is his world-renowned *Lives*, to which we owe our chief knowledge of the artists of the Italian Renaissance. This monumental work was undertaken at the suggestion of Cardinal Farnese (afterward Pope Julius III) in 1542; the first edition appeared under the title *Vite de' più eccellenti, pittori, scultori, ed architetti*. A second edition, enlarged and improved, appeared in 1568. The work is excellent in style, full of local color, and really remarkable in the acuteness and catholicity of its appreciation. He was, however, far too dependent on hearsay and gossip, inexact in facts and dates, and even guilty of wholesale plagiarism without acknowledgment. Nevertheless, his work remains, for its day, a monument of erudition and criticism, and not without justice has he been termed the father of modern art history and criticism. Monumental modern editions of the *Vite*, with complete notes, and biographies of the author, are those of Le Monnier (15 vols., Florence, 1846); Milanesi (9 vols., ib., 1878–85); Karl Frey (Munich, 1911); English translations are by Mrs. Foster (London, 1850), and by Gaston C. de Vere (10 vols., New York, 1912–16), the most accurate. Editions of selected biographies with admirable notes are by Blashfield and Hopkins (4 vols., New York, 1896), and, less scholarly, by E. L. Seeley (ib., 1906).

VASCO DA GAMA, väs'kô dâ gä'mâ. See GAMA, VASCO DA.

VASCONCELLOS, väs'kŏn-sĕl'lŏs, JOAQUIM ANTONIO DA FONSECA E (1849–). A Portuguese critic, born at Oporto, and educated in Hamburg and Coimbra. He became professor of German at Oporto in 1883, and in 1889 was put in charge of the local Museum of Trade and Industry. His publications in the periodical *A Actualidade*, conducted by himself, and in separate volumes, concern the fine arts in general and music and German literature in particular. They include: *O Faust de Goethe e a tradução de Castilho* (1872); *Luiza Todi* (1873); *Reforma do ensino de bellas artes* (3 vols., 1877–79); *Albrecht Dürer e a sua influencia na peninsula* (1879); *O consummado germanista* (1879); *Goësiana* (4 vols., 1879–81).

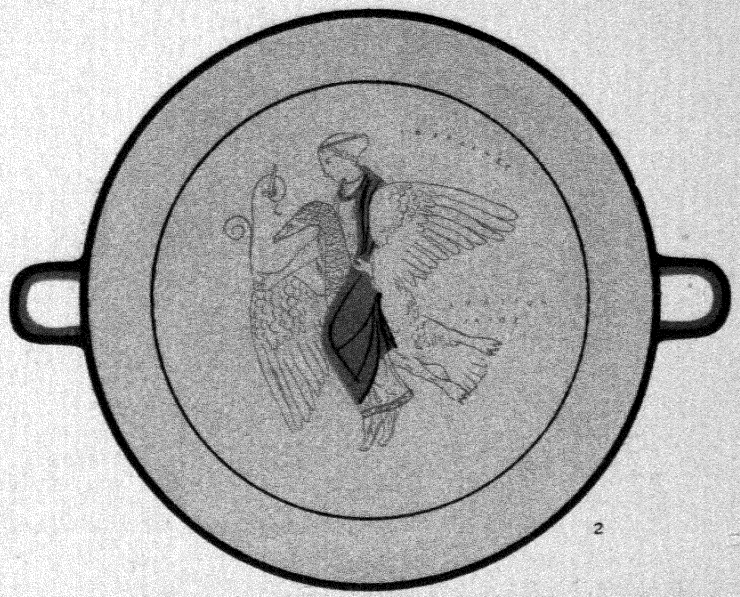
VASCONCELLOS, KAROLINE MICHAËLIS (1851–). A Spanish philologist, born in Berlin. In 1876 she was married to Joaquim Vasconcellos (q.v.). Early devoting herself to the languages of the Spanish peninsula, she published: *Erläuterungen zu Herders Cid* (1868); *Romancero del Cid* (1870); *Studien zur romanischen Wortschöpfung* (1876); *Poesias de Francisco de Sâ de Miranda* (1885); *Studien zur hispanischen Wortdeutung* (1886); "Geschichte der portugiesischen Litteratur," in Gröber's *Grundriss der romanischen Sprachen* (1894); and *Randglossen zum altportugiesischen Liederbuch* (1896–1902); *O Cancionero da Ajuda* (2 vols., 1904); *Estudos sobre o romanceiro peninsular: romances velhos em Portugal* (1907–09).

VASCO'NIA. See GASCONY.



VAS'CULAR TISSUE (from Lat. *vasculum*, little vessel, diminutive of *vas*, vase, vessel). A tissue characteristic of the higher plants, comprising two regions that differ in the character and function of the vessels. The vessels of the xylem are tracheæ or tracheids, whose function is water conduction; those of the phloem are sieve vessels, whose function is associated with the transfer of food. Vascular tissue is also the chief tissue for mechanical support. See HISTOLOGY; MORPHOLOGY.

VASE. A vessel, more or less circular in form, used for practical or ornamental purposes. The material is generally pottery, though stone, glass, metal, etc., are frequently used, especially for ornament. The use of vases is common to all peoples, both ancient and modern; but it was in Hellenic lands that vase making attained highest perfection, alike in form and in artistic decoration; to the Greek vase, therefore, this article is mainly devoted.



Earthenware vessels were in almost universal use among primitive peoples, and in their clay forms and decorations furnish valuable information to the anthropologist, the archæologist (See ARCHÆOLOGY; ARCHÆOLOGY, AMERICAN; POTTERY), the student of the life of a given people (see end of this article), and, through the inscriptions on them, to the student of language. It is not, however, till a more advanced state of artistic development has been reached that the vases attract attention for their intrinsic merit. If, moreover, the rich prefer vessels of stone or metal, and the use of clay is confined to the poor, the potter is apt to produce cheap, rude, or carelessly made wares, even when the other crafts show the possession of high artistic skill. Thus, in Egypt, though good clay abounds, the vases are in general of little interest. The material for the study of early Oriental ceramics is neither so plentiful nor so minutely classified as is that from other lands. Moreover, the conservatism of the East is displayed in the persistence of a limited number of forms and old linear decorations, in marked contrast to the variety of the Greek types.

The Greek lands and Italy have yielded a vast mass of material, falling into well-defined groups, whose general succession is clear, and whose chronology is in most cases well established. Very early forms are those found in the lower strata at Troy, the island graves, and some of the pottery of Cyprus (q.v., at end). The clay is coarse and the vases are shaped without the aid of the potter's wheel. The decoration, when present, consists of incised lines in geometrical patterns. The color is black or red, according to the firing, and an apparent glaze is due to the polishing of the surface, as no coloring matter seems to have been employed. Towards the end of this period appear vases with decoration in colors, wheel-made, and showing much taste and skill. In addition to geometric designs there now appear plants and animals. Special classes of these vases are those from Thera and the Kamares ware of Crete (q.v.), whose relation to the Mycenæan pottery is still a subject of discussion. The earlier group of Mycenæan vases is decorated in dull colors on a highly polished clay. Later a more lustrous paint is used and the clay is very fine. A favorite form is the false-necked jar or amphora. (See Fig. 4 on Colored Plate.) Favorite subjects are representations of sea plants, the cuttlefish,

nautilus, and murex, all of which are rendered very successfully, though with a tendency to become conventional. For the Minoan-Mycenæan pottery found in Crete, see ARCHÆOLOGY, II, *Minoan or Ægean Period*, towards the end.

With the fall of the Mycenæan civilization near the end of the second millennium, B.C., there is a return to a prevailingly geometric style, in which the straight line replaces curves and spirals. The vases, of pale clay, are covered with mæanders, zigzags, concentric circles, and triangles, to which are later added rows of water birds, and, occasionally, animals. Some show scenes from human life. As the first great discovery of these vases was made outside the Dipylon Gate (q.v.) at Athens, they are sometimes called Dipylon vases, though this name should not be given to Bœotian, Argive, or other non-Attic varieties. During the eighth and seventh centuries the increased intercourse with the East is reflected in the vases. On the islands and among the Ionians of Asia Minor was developed a great variety of local schools, all showing great fondness for elaborate decorations covering the entire surface of the vase. Rows of animals often surround the body of the vase, while the field is filled with rosettes, stars, crosses, and similar ornaments. An interesting example is a plate from Rhodes (Colored Plate, Fig. 1), representing the conflict of Hector and Menelaus over the body of Euphorbus; it is the earliest example of an Homeric scene in art. While it is certain that Ionian influence was prominent in this development, it is not yet possible to determine the exact history of the local schools. On the Greek mainland the Oriental influence may be seen in the delicate little vases commonly called Proto-Corinthian (probably of

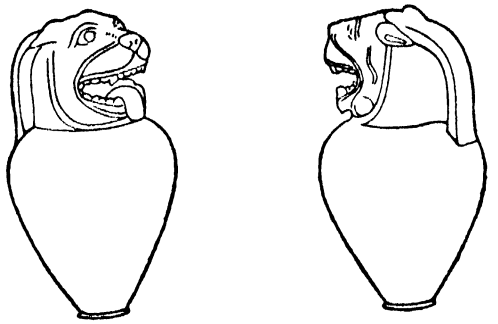

FIG. 1. PROTO-CORINTHIAN LECYTHUS.
From the *Journal of Hellenic Studies*.

Argive manufacture), and especially in the earlier Corinthian ware. Owing to the commercial importance of Corinth, her vases are found in Sicily and Italy and their manufacture seems to have continued even after the established supremacy of the Attic ware. They are of light clay, rather heavy in form and decorated with figures in black glaze with some use of red and violet. A white slip is also employed to indicate the flesh of women. At Naucratis and Cyrene the body of the vase was covered with this slip, on which were painted decorations in dark color.

Early in the sixth century the Athenian potters began to enter the field; they soon won complete mastery. They heightened the red of the clay by artificial means, and invented a black glaze of exceeding brilliancy. The earlier series is the black figured, in which the design is in black on the natural color of the clay. The details are indicated by incised lines, and a somewhat scanty use of red and white, though this last is always employed for the flesh of women. Near the end of the sixth century this technique was largely supplanted by the red figured, in which the body of the vase is covered with black glaze, while the figures appear in the natural color of the clay. The details are indicated by fine lines of black. While the earlier vases in this technique show the characteristics of archaic art, soon after the Persian wars there is greater correctness of drawing and more restraint and dignity of treatment. (See Colored Plate, Figs. 5 and 8.) Later there appears a tendency to substitute prettiness and delicacy for dignity, and, while there is astonishing fineness of line, there is a distinct loss of power. In the fourth century the use of gilding and bright colors marks the decline. At this time also the practice, known in the early fifth century, of combining a vase and a figurine (Colored Plate, Fig. 7) grew more common. Here we may perhaps trace the influence of works in metal, and it is certain that this was a large factor in the disappearance of wheel-made pottery and the substitution of vases formed in a mold and decorated with figures in relief, the so-called Megarian ware. Another series of Attic vases is distinguished by decorations in various colors on a white slip (Colored Plate, Fig. 2). The chief examples are seen in the *lecythus*, or jar used to contain oil and perfumes in the service of the dead. These vases are among the most beautiful products of Greek ceramic art; they were not made for export and are rarely found outside of Attica and Eretria. See Colored Plate, Fig. 3.

In Lower Italy the Greek colonies seem to have developed local styles as early as the fourth century. All show a departure from the purer Attic taste in a love of florid and excessive ornamentation and the use of bright colors. This leads to scenes introducing many figures, often arranged in rows, with ornamental borders of flowers and tendrils. Some of the vases of the earlier period are, however, fine examples of the potter's art. Colored Plate, Fig. 6.

In northern and central Italy the history of ceramics is chiefly concerned with the earlier and ruder types, valuable for ethnology, but with little artistic interest. The cemeteries on the Alban Mount, the Esquiline, and elsewhere yield rude vases of coarse clay, usually of a sooty black or dull gray. In Etruria there developed a distinct type, the bucchero nero of Italian writers. These vases are of coarse black clay. They are not painted, but polished and decorated with reliefs impressed in the soft clay by a stamp. The forms and reliefs show plainly the influence of metal vases, as well as of the Oriental and Greek importations. Though this ware seems to have been manufactured as late as the fourth century, the Etruscans were also great admirers of the Greek painted vases, which they imported in large numbers, and imitated, though with but small success.

About the end of the first century B.C. there appears in Italy, and later in Gaul, Germany, and Britain, the Arretine ware, of red clay, highly glazed, and decorated in relief. It commonly bears a potter's stamp, and is hence often called terra sigillata ware. The term Samian is almost certainly a misnomer. The best vases are of fine light clay with decorations evidently derived from the rich gold and silver plate in use among the wealthy. The Loeb collection of

Arretine pottery, now in the Fogg Museum in Harvard University, has been catalogued by G. H. Chase (New York, 1908). Another important collection of this ware is in the Boston Museum of Fine Arts.

In the preparation of the clay and the vase on the wheel Greek processes do not differ essentially from those described under POTTERY. Essential in the spirit of Greek ceramics is the absence of the merely mechanical and the presence of the free personality of the potter. Bands around the vase were drawn by the aid of the wheel, but all the other decoration was free-hand. In the black-figured ware the figures were first drawn in outline and then filled with solid color. After firing the details were engraved and the other colors added. A final firing made the vase ready for the market. In the red-figured ware the potter first drew his design on the soft clay with a dry point, thus allowing ample opportunity for alteration in details. The outlines were then marked by a border of lustrous black, and the body of the vase was covered with the same color. The details were then added under conditions that made correction impossible, while the full effect could not be seen till the firing brought the color to the surface. That the potter was proud of his art is shown by the frequency of signed vases during the sixth and earlier fifth centuries. Common also during this period was the practice of placing on the vase the name of some youth noted for his beauty or popularity, accompanied by the word καλός, *kalos*, beautiful. Consult the three monographs of Klein, named below in the bibliography.

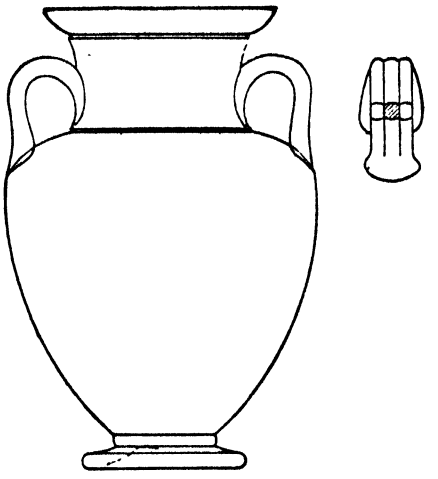

FIG. 4.

GREEK AMPHORÆ

2, early type showing imitation of metal forms; 3, early type; 4, later type.

The forms of the Greek vases are manifold, and a comparison of any collection with the tables given in catalogues will show the wonderful subtlety of the Greek artist in devising variations on well-established types.

Of the most important varieties, the *pithos* (Latin *dolium*) was a large jar of coarse clay used for storing grain or liquids, much as a modern hogshead is used. The *amphora* was a smaller vessel, primarily for storing oil or wine, but later a decorative vase. The body was somewhat large, the neck and mouth narrow. The Roman amphora was longer and narrower; the bottom was often pointed, for convenience in setting the amphora in the ground. Among the Romans the amphora was so often used for transporting liquids and solids, both by land and by sea, that the carrying capacity of vessels was reckoned by amphoræ. The *hydria*, or water pitcher, is in form much like the amphora, but distinguished by three handles, two on the shoulders for lifting, and one at the neck for use in pouring. An important vessel was the *crater*, or mixing bowl, in which wine and water were mixed and from which guests were served. In early times this is a round-bottomed bowl (*deinos*) on a stand, but later it was provided with a low foot, and developed into a number of graceful shapes. (See Colored Plate, Fig. 5.) For oil and perfumes the *lecythus* was used, a tall, slender vase, with small neck and bell-shaped mouth. Gradual changes fashioned this into the graceful white funeral lecythus, already described. The *aryballus* was a small, round jug with very small neck and broad, flat lip—a favorite form with the Corinthian potters. Prominent among the cups are the *cantharos*, a large cup on a foot with high handles rising above the rim, and the *scyphos*, whose form is well shown in Colored Plate, Fig. 8. The favorite of the Attic potters was the *cylix*, a rather shallow saucer-like vase mounted on a foot. The decoration was applied on the outside, where two fields were

marked by the handles, and also in a small circular field in the centre of the inside. Consult Hartwig's *Griechische Meisterschalen der Blütezeit* (Berlin, 1893). Other common vases are the *rhyton*, or drinking horn, the *œinochoë*, or small pitcher, and the *pyxis*, or ladies' toilet box, commonly decorated with scenes from the life of women.

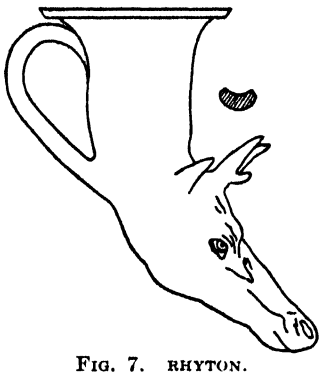

FIG. 7. RHYTON.

There are few fields of Greek study which are not illumined by the light shed by these earthen vessels. For the history of the language and of the alphabet, the inscriptions on the vases are of the utmost value. Consult P. Kretschmer, *Die griechischen Vaseninschriften ihrer Sprache nach untersucht* (Gütersloh, 1894). In the personal life of the Greeks the importance of the vases becomes manifest. The scenes represented cover the entire range of life: children at play, young men at their gymnastic sports, the soldiers arriving for battle, and the girls and women within the house, spinning, weaving, etc. The marriage procession, the sacrifice, and the various ceremonies connected with the burial of the dead are all vividly shown on the vases. The artists drew a large part of their inspiration from mythological literature, and freely reproduced the versions then most popular. Hence these works are often valuable authorities.

Bibliography. See the "Bibliography by Authors," in Salomon Reinach, *Répertoire des vases peints grecs et étrusques*, vol. ii (Paris, 1900), and the "Bibliography by Subjects," in J. H. Huddilston, *Lessons from Greek Pottery* (New York, 1902). The history of Greek vases is not treated fully from the most modern standpoint in any single work. Still valuable are: Rayet and Collignon, *Histoire de la céramique grecque* (Paris, 1888); Dumont and Chaplain, *Les céramiques de la Grèce propre* (ib., 1881–90); Von Rohden, "Vasenkunde," in Baumeister, *Denkmäler des klassischen Altertums* (Munich, 1885–88); the article "Vas," in William Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891); E. Robinson, *Catalogue of Greek, Etruscan, and Roman Vases in the Boston Museum of Fine Arts* (Boston, 1893); Edmond Pottier, *Catalogue des vases antiques de terrecuite du Louvre* (Paris, 1896, 1899, 2 vols. of photographic plates with a text), of great value for the general characteristics of Greek vase painting, a history of the study, and the early styles. Excellent works are: W. Klein, *Euphronios: eine Studie zur Geschichte der griechischen Malerei* (2d ed., Vienna, 1886); id., *Die griechischen Vasen mit Meistersignaturen* (2d ed., ib., 1887); id., *Die griechischen Vasen mit Lieblingsinschriften* (ib., 2d ed., 1898); F. W. E. Gerhard, *Auserlesene griechische Vasenbilder* (Berlin, 1840–58); Lenormant and De Witte, *Elite des monuments céramographiques* (Paris, 1844–61); Otto Benndorf, *Griechische und sicilische Vasenbilder* (Berlin, 1869–83); G. T. Lau and others, *Die griechischen Vasen: ihr Formen und Decorationsystem* (Leipzig, 1877); Furtwängler and Löschke, *Mykenische Thongefässe* (Berlin, 1879); Genick and Furtwängler, *Griechische Keramik* (ib., 1883); Furtwängler and Löschke, *Mykenische Vasen* (ib., 1886); Harrison and McColl, *Greek Vase Paintings* (London, 1894); Hermann Thiersch, *Tyrrhenische Amphoren* (Leipzig, 1899); Furtwängler and Reichhold, *Die griechische Vasenmalerei, auswahl hervorragender Vasenbilder* (Munich, 1900 et seq.), still unfinished, but probably the most accurate publication of Greek vases yet attempted; H. B. Walters, *History of Ancient Pottery* (2 vols., London, 1905); Edmond Pottier, *Douris and the Painters of Greek Vases*, English translation (London, 1909); Arthur Fairbanks, *White Lekythoi with Outline Drawing in Glaze Varnish* (New York, 1907); J. R. Wheeler, "Vases," in H. N. Fowler and others, *Handbook of Greek Archæology* (ib., 1909); W. Riezler, *Weissgrundige Attische Lekythen* (Munich, 1914); Arthur Fairbanks, *Athenian Lekythoi with Outline Drawing in Matt Color on a White Ground* (New York, 1914); "Vasen," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914). The vases scattered in expensive publications and periodicals are collected in small outline drawings in Reinach's *Répertoire*, cited above. Important also are the catalogues of the collections at Athens by Couve and Collignon (Paris, 1902); Berlin, by Furtwängler (2 vols., Berlin, 1885); the British Museum, by Smith and Walters, vols. ii–iv (London, 1893–96); of the Louvre, by Edmond Pottier (3 vols., 1896–1906); of the vases in the Bibliothèque Nationale, by A. de Ridder (1901–02); of Vienna, by Masner (Vienna, 1892); of the Ashmolean Museum of Oxford, by P. Gardner (1893); and of Munich, by Jahn (Munich, 1855), with an introduction which laid the foundation for the scientific study of Greek vases.

VASELINE. A trade name for a variety of petrolatum (q.v.).

VA'SEY, GEORGE (1822–93). An American botanist, born near Scarborough, Yorkshire, England, and educated at the Berkshire Medical College, Pittsfield, Mass., where he graduated in 1848. He practiced medicine for 20 years in Illinois and in 1872 became botanist of the Agricultural Department at Washington. His works, which were published by the government, are: *A Descriptive Catalogue of the Native Forest Trees of the United States* (1876); *The Agricultural Grasses of the United States* (1884); *A Descriptive Catalogue of the Grasses of the United States* (1885); and *Grasses of the South* (1887).

VASILI, vȧ'zē'lē', COMTE PAUL. The nom de plume of Juliette Adam (q.v.).

VASILKOV, vȧ-sēl-y'-kôf'. A district town in the Government of Kiev, South Russia, 25 miles southwest of Kiev (Map: Russia, D 4). It manufactures small articles of gold and silver, leather, brick, soap, and candles. Pop., 1910, 16,816.

VASISHTHA, vȧ-sĭsh'tȧ. One of the most celebrated Vedic Rishis, the spiritual adviser of King Sudas in ancient northern India, and the traditional author of several hymns of the Rig-Veda, particularly in the seventh book. To him is also attributed a law book known as the *Vasiṣṭha Dharma Śāstra* (ed. by Stenzler, London, 1876, and by Führer, Bombay, 1883), another proof of the priestly tradition in the family of the Vasishthas. For legends concerning Vasishtha, see Muir, *Original Sanskrit Texts*, vol. i (2d ed., London, 1872); and consult:

Kaegi-Arrowsmith, *The Rigveda* (Boston, 1886); Dowson, *Hindu Mythology* (London, 1879); Wilkins, *Hindu Mythology* (2d ed., London, 1900). See VIŚVĀMITRA.

VÁSQUEZ DE CORONADO, väs'kâth dĀ kō'rō-nä'dō, FRANCISCO. See CORONADO, FRANCISCO VÁSQUEZ.

VASSAL. Under the feudal system, one who was invested with a fief and who was bound to render feudal services and homage to a superior lord. The great lords of the realm who held directly of the King were known as crown vassals, but the term "vassal" was also applied to their feudal retainers. The services to be performed by a vassal depended upon his rank and station; if he was a great lord his chief duties were to serve the King in time of war and also furnish men and arms for military purposes; if he was only an insignificant tenant of a noble, his chief obligation might be to assist personally in the cultivation of his superior's lands. See FEUDALISM and authorities there referred to; also FEUDAL TENURE.

VAS'SAR, JOHN ELLISON (1813–78). An American lay preacher and missionary, a cousin of Matthew Vassar, founder of Vassar College, born at Poughkeepsie, N. Y. He worked in the Vassar brewery at Poughkeepsie, but from religious convictions withdrew from the company and devoted his time and money to missionary work. In 1850 he became an agent and colporteur of the American Tract Society, and traveled as its representative throughout the West. During the Civil War he was at the front with the Union armies, and after its close devoted himself to religious work in the South. He was popularly known as Uncle John Vassar. Consult T. E. Vassar, *Uncle John Vassar* (New York, 1879).

VASSAR, MATTHEW (1792–1868). An American philanthropist, founder of Vassar College. He was born at East Dereham, Tuddenham Parish, England, and in 1796 was brought to the United States by his father, James Vassar, a wool grower, who in 1797 settled on a farm near Poughkeepsie, N. Y., and four years later established himself as a brewer there. In 1806 Matthew left home, and for four years worked in a country store near Newburgh, N. Y. Returning to Poughkeepsie, he entered his father's business as a bookkeeper. In 1811 the brewery was destroyed by fire, and the family reduced to comparative poverty. Matthew then began business as a brewer on his own account, and accumulated a large fortune. He contributed liberally to numerous charities, but is chiefly remembered as the founder of Vassar College (q.v.). He died suddenly on June 24, 1868, while reading his annual report to the board of trustees of the college. Consult B. J. Lossing, *Vassar College and its Founder* (New York, 1867), and E. H. Haight, ed., *The Autobiography and Letters of Matthew Vassar* (ib., 1916).

VASSAR, MATTHEW, JR. (1809–81). An American philanthropist, nephew of Matthew Vassar, the founder of Vassar College. He was born in Poughkeepsie, N. Y., and at an early age entered the brewery established by his uncle and father, and of which he later became the successful manager, accumulating a considerable fortune. He strongly favored his uncle's project for establishing Vassar College, and was named by him a member of its first board of trustees, which position he held, together with that of college treasurer, until his death. He gave the college $100,000 to endow professorships, $50,000 for other purposes, and with his brother constructed the Vassar Brothers Laboratory. He gave also to public institutions in the city of Poughkeepsie, his gifts in all amounting to about $500,000. His brother, JOHN GUY VASSAR (1811–88), began business as a member of the brewery firm, but was compelled by ill health to travel. He journeyed for 30 years and published some of his experiences under the title of *Twenty Years around the World* (1861). He was one of the original trustees of Vassar College, and gave jointly with his brother a considerable amount of money to the institution.

VASSAR COLLEGE. An undenominational institution for the higher education of women, incorporated in 1861 as Vassar Female College. It was established through the gifts of Matthew Vassar, who gave 200 acres of land, and $788,000 for that purpose. The college is situated near Poughkeepsie, N. Y., on a level plateau, 3 miles east of the Hudson River. The present corporate name was adopted in 1867. The original endowment given by Matthew Vassar has been increased by other members of the Vassar family, and by gifts of friends of the college in various parts of the United States. The total endowment on Jan. 1, 1916, including fellowships and scholarships, amounted to $1,775,365, and the acreage in campus and farms amounted to 800. The student enrollment in the college is limited by a resolution of the board of trustees to 1000, but the pressure for admission and the difficulty of gauging withdrawals make it impossible to maintain this limit to exactness. The enrollment for 1915–16 was 1125. Students are admitted on passing the examinations set by the college entrance examination board, or by an examination covering three years of preparation in four selected subjects. The course of study, which is partly elective, covers four years, and leads to the baccalaureate degree. The degree of master of arts is also conferred in course. The physical equipment of the college includes 25 buildings, seven of which are dormitories and resident halls; a farm of 675 acres, maintaining a model dairy, operated for the benefit of the college dining rooms, an open-air theatre, athletic grounds, flower gardens and conservatories, lakes and woodlands. The library contains about 86,000 books and pamphlets. The faculty in 1916 numbered 138, headed by President Henry Noble MacCracken, L.H.D. Consult Taylor and Haight, *Vassar* (New York, 1915), and M. H. Norris, *The Golden Age of Vassar* (Poughkeepsie, 1915).

VASSILENKO, vàs'sĕ-lôŋ'kō, SERGEI NIKIFOROVITCH (1872–). A Russian composer, born at Moscow. In 1895 he entered the Moscow Conservatory. Profiting by such masters of composition as Taneiev and Ippolitov-Ivanov (qq.v.), he composed, in 1901, as his graduation exercise, the prize-winning cantata, *The Legend of the City of Kietzh*, an original and effective work, which in 1893 was produced as an opera. Vassilenko's later works are neither so original nor so interesting as his earlier ones, the composer having come under the influence of French impressionism and other ultramodern musical tendencies. From 1907 he was director of the Moscow historical symphony concerts. Besides the cantata mentioned, his compositions include a symphony in G minor; the vocal works with orchestra *The Widow* and *The Whirlpool;* an

Epic Poem for orchestra; a symphonic poem, *The Garden of Death.*

VASTO, väs'tō. A town in the Province of Chieti, Italy, situated on rising ground, 1½ miles from the Adriatic, and 70 miles northwest of Foggia (Map: Italy, E 3). It has a Gothic cathedral, a town hall with a museum, and interesting remains of the period of Roman occupation. The industries are olive culture, fishing, stock raising, and the manufacture of wine, wax candles, and brick. Vasto, the ancient *Histonium*, was an important town under the Romans. Pop. (commune), 1901, 15,538; 1911, 14,827 (town, 10,090).

VĀTA. See VĀYU.

VATATZES, JOHN III. See JOHN III VATATZES.

VATHEK, vȧ'tĕk'. An Oriental romance, written by William Beckford in 1782, originally in French. It has been considered the best Oriental story ever written by an Englishman, and presents a remarkable alliance of the sublime and the fantastic. Consult Garnett, *Essays of an Ex-Librarian* (London, 1901).

VATICAN, COUNCIL OF THE. A council held in Rome in 1869–70 and considered by Roman Catholics as the Twentieth Ecumenical Council. (See COUNCIL.) In 1867, 300 years after the Council of Trent, Pope Pius IX announced his purpose of holding another council. The period between this announcement and the publication of the Pope's encyclical (June 29, 1868), definitely summoning the council, was replete with controversy regarding it. Many of the prelates and of the general body of the clergy, especially of France, Belgium, Germany, and Holland, as well as many Catholic statesmen, considered it inexpedient, largely for political reasons. Austria united in discountenancing the projected meeting, and, although Napoleon III was not indisposed to it within certain limits, his ministry generally regarded it with distrust. The government of Italy opposed it openly. On the festival of the Immaculate Conception (Dec. 8, 1869) the council held its first session in the basilica of the Vatican. There were present 719 prelates, 49 of whom were cardinals, 9 patriarchs, 4 primates, 121 archbishops, 479 bishops, and 57 abbots and generals of monastic orders. This number gradually rose to 764. Although the doctrine of infallibility had not been formally announced as a portion of the programme of the council till its actual convention, yet it may be said that the council had but two real objects: the solemn ratification of this dogma, and the utterance of a protest against infidelity in all its aspects, whether of rationalism, pantheism, materialism, or atheism. Although the decrees setting forth the doctrines of the Church regarding God, the creation, the relation of faith to reason, etc., were unanimously adopted in the third public session (April 24, 1870), the decision in regard to infallibility was not arrived at so harmoniously, and not till a much later period.

It had been arranged that the committee on faith should consider all other matters lying within its sphere, relating to the Church, before treating of its head and his prerogatives, but, on April 22, 1870, those prelates in favor of it addressed a collective note to the council urging that all questions should give way to that of papal infallibility. The Pope approved of this change, and ordered an inversion of the order of business accordingly. The first vote was not arrived at till July 13, when, out of 601 members, 88 voted *non placet*, or adversely. These, however, were by no means necessarily to be taken as not believing in the doctrine. In most cases they were simply opposed to its definition, at this time, as an article of faith. On the final vote on the question, July 18, 1870, only two prelates recorded their votes against the definition; and even these, with all the rest of their recusant brethren, ultimately acquiesced in the decrees of the council. For the significance of the definition, see INFALLIBILITY. The council was adjourned and indefinitely postponed, Oct. 20, 1870, in consequence of the outbreak of the Franco-Prussian War.

Vacant, *Etudes théologiques sur les constitutions du concile du Vatican* (2 vols., Paris, 1895); William Arthur, *The Pope, the Kings, and the People . . .* (London, 1903), containing a bibliography. The documents are in *Acta et Decreta Concilii Vaticani* (Freiburg, 1892).

VATICAN, PALACE OF THE. The residence of the Pope in Rome, and the seat of the great library, museums, and collections of art which constitute one of the chief attractions of the city for visitors. Pope Symmachus (498–514) was the first to build a residence on the site, which was formerly occupied by the gardens of Nero. For a long time, however, the popes resided mainly at the Lateran. Nicholas V (1447–55) began a systematic policy of improving the Vatican. The buildings around the three small courts nearest St. Peter's date from his time; they include the Cappella Paolina, the Borgia apartments and the Sala Reggia. The Sistine Chapel (q.v.) was built by Pope Sixtus IV (1471–84). The same policy was pursued by Alexander VI and Julius II, who summoned Bramante (q.v.) to Rome in 1503 to connect by parallel galleries 400 yards long the two groups of buildings at the north and south ends of the present palace. Under Paul III and especially Leo X the work was continued, after Bramante's death in 1514, from his plans. He created the octagonal court of the Belvedere and the hemicycle or Nicchione at the north end, and the court of San Damaso at the south end, with the arcades later decorated by Raphael and known as his Loggia. The present papal residence overlooking the colonnade of St. Peter's was the work of D. Fontana (q.v.) under Sixtus V. Clement VIII, and Paul V. He also built the magnificent library (1586–90), dividing the great court in two. The Braccio Nuovo was built by Raphael Stern under Pius VII about 1810. In recent years Pius IX carried out many important works of completion or restoration. The palace covers about 13½ acres, and is said to contain over 1100 rooms. With its chapels, decorated chambers, and museums the Vatican forms one of the greatest treasure houses of art in the world. The decorations of the world-famous Sistine Chapel (q.v.) are treated under a separate heading and under MICHELANGELO, the Stanze and Loggia of Raphael and his tapestries under that artist's biography, the frescoes of the chapel of Nicholas V under FRA ANGEL-

ico, and the gorgeous decorations of the Appartamento Borgio under Pinturicchio. The collection of antiquities begun by Pope Julius II and increased by the Medicean popes in the early sixteenth century received most of its treasures under Clement XIV and Pius VI in the late eighteenth century. The museum of ancient sculpture, its most important part, ranks with that of Naples as the first in the world. Among its best-known statues and groups are the Apollo Belvedere, the Laocoön group, the Zeus Otricoli, the Belvidere "Hercules" torso, the best copy of the Apoxyomenos of Lysippus, of the Cnidian Aphrodite of Praxiteles, and many others. The Vatican also contains valuable Egyptian, Etruscan, and Christian museums; and a picture gallery, relatively small in size, contains several paintings of the first rank, such as the "Madonna di Foligno" and the "Transfiguration" by Raphael.

The library of the Vatican was first made a public library by Nicholas V. It contains over 34,000 manuscripts, including those of the Greek New Testament, of Vergil, Terence, and one of Dante with miniatures by Giulio Clovio.

Bibliography. By far the best description of the Vatican and its contents was written by various scholars connected with the Vatican and edited by Ernesto Begni and others, *The Vatican—its History—its Treasures* (New York, 1914). Briefer and more popular accounts are M. K. Potter, *The Art of the Vatican* (new ed., Boston, 1903), and D. B. W. Sladen, *How to See the Vatican* (New York, 1914). A magnificent series of plates (without text) of the architecture is contained in P. M. Letarouilly, *Le Vatican et la basilique de St. Pierre de Rome* (3 vols., Paris, 1882). For the Borgia apartments consult Ehrle and Stevenson, *Les fresques du Pinturricchio dans les Salles Borgia du Vatican* (Rome, 1898); for the museum, Venturi, *The Vatican Gallery*, English translation by L. C. Piovanelli (Rome, 1890).

VATICAN FRAGMENTS. See Fragmenta Vaticana.

VATTEL, vȧ'tĕl', Emmeric de (1714–67). A Swiss jurist and publicist, born at Couvet, near Neuchâtel. He studied at Basel and Geneva. In 1741 he published a defense of the philosophical system of Leibnitz. In 1744 he received an office in Dresden and from 1746 to 1758 he was the representative of Augustus of Saxony and Poland at Bern. From there he returned to Dresden, where he became a privy councilor. He wrote: *Loisirs philosophiques* (1747); *Mélanges de littérature, de morale et de politique* (1757); but his great work on international law, for which he is famous, is *Droit des gens, ou Principes de la loi naturelle, etc.* (1758). This has been translated into numerous foreign languages (into English in 1760, and with notes by Chitty in 1838), and has still great value.

VÄT'TER, or VET'TER, Lake. A lake in Sweden, second in size to Väner (q.v.). It lies about 25 miles southeast of the latter (Map: Sweden, E 7). It is of elongated shape, with a length of 82 miles and a maximum breadth of about 14 miles, and has an area of 738 square miles. It occupies a deep inclosed valley whose bottom is below sea level, the altitude of the lake surface being 289 feet and the depth of the water 390 feet. The shores are high, steep, and picturesque, and the water is remarkably clear. The lake receives a few small streams from the plateau of southern Sweden; but peculiar disturbances, such as rapid currents, sudden waves and eddies without apparent cause, and periodic fluctuations in the level, support the belief that it is fed largely by springs. The outlet of the lake is the Motala River, discharging eastward into the Baltic. This river has been canalized, and the Göta Canal connects the lake with Lake Väner, thus making it a link in the transpeninsular waterway. The chief town on Lake Vätter is Jönköping, near its southern extremity.

VAU. See Digamma.

VAUBAN, vō'bän', Sébastien le Prestre de (1633–1707). A French military engineer and marshal, born near Avallon, in Burgundy. When about 17 he joined the Spanish forces under Condé on the frontier of the Belgian Netherlands. He studied military science and engineering while actively a soldier. He was taken by the French in 1653 and joined the French army, where his aptitude won him a commission two years later as a royal engineer. After the cession of Dunkirk by the English Vauban was charged with the task of fortifying it. The renewal of the war (1667) brought him service in Flanders. He received a wound at Douai, which he captured, and laid successful siege to Lille. He was now made Governor of Lille, with charge of all the works in Flanders, and was called upon to inspect and direct work on fortifications in all parts of France. At the invitation of Louvois he wrote his *Mémoire pour servir d'instruction dans la conduite des sièges.* At the siege of Maestricht in 1673 he introduced in western Europe the system of approaches by parallels, by which he reduced the city in 13 days. In 1678 at the conclusion of hostilities he was made commissary general of fortifications for France. Between 1688 and 1693, in the war against the League of Augsburg, he conducted several sieges—Philipsburg, Mannheim, Frankenthal, Mons, Namur, etc. He was made a marshal of France in 1703. In the course of his military life Vauban strengthened 300 old fortresses and built 33 new ones. He took part in 140 battles, including 53 sieges. He wrote several technical treatises, the principal one being *De l'attaque et de la défense des places* (1736). The *Œuvres militaires de Vauban*, edited by Gen. Latour Foissac, were published in 1796. Vauban was interested in economic subjects and advocated a single tax in his *Projet d'une dîme royale* (1707). Consult: Michel, *Histoire de Vauban* (Paris, 1879); Lloyd, *Vauban, Montalembert, Carnot: Engineer Studies* (London, 1887).

VAUCAIRE, vō'kâr', Maurice (1864–). A French poet, novelist, and dramatist, born at Versailles. His verse, delicate in type, includes: *Arc-en-ciel* (1885); *Parcs et boudoirs* (1887); *Est-ce vivre* (1889); *Petits chagrins* (1894). Among his carefully written novels are: *Chipette, ou la dame frivole* and *Demi grand monde* (1897); *La maison de poupées* (1900); *Le masque de sable* (1904); *Le piège* (1907); *Patatras* (1908); *Une vraie jeune fille* (1911). He wrote these successful plays: *Un beau soir* (1892); *Le petit chagrin* and *Les girouettes* (1899); *Valet de cœur* (1903); *Au temps jadis* (1905); *Hans le joueur de flûte* (1910); *Malbrouk s'en va-t-en guerre* (1911).

VAUCLUSE, vō'klŭz'. A department of southeast France, consisting of the Principality of Orange, the County of Venaissin, and other parts of the former Province of Provence (Map: France, S., K 4). Area, 1381 square miles.

The western part belongs to the Rhone valley, while the eastern part is filled with the spurs of the Provençal Alps. The greater part of the department is under cultivation, and large wheat crops are raised. Viniculture is extensively carried on. Potatoes and mangold beets are also raised in large quantities, and the silk culture produces nearly 2,000,000 pounds of cocoons annually. The chief manufactures are paper, silk, alcohol, and chemicals, sulphur being the principal mineral product. Pop., 1901, 236,949; 1911, 238,656. Capital, Avignon.

VAUCLUSE, FOUNTAIN OF. A noted spring in the south of France, in the department and near the village of the same name. It is a circular pool, surrounded by lofty cliffs, which discharges from 117,000 to 350,000 gallons of water per minute. Near by Petrarch lived for a number of years, composing many of his poems to Laura.

VAUD, vō (Ger. *Waadt*). A canton of Switzerland (Map: Switzerland, A 2). Area, 1244 square miles. The interior of Vaud consists chiefly of an elevated plateau. Wines, chiefly white, are produced. Stock raising is well developed. Vaud is a prominent industrial canton. Among its manufactures are watches, musical instruments, cigars, and chocolate. It has many tourists' resorts, and is noted for its numerous educational institutions, patronized to a large extent by foreigners. Pop., 1910, 315,428, largely French-speaking Protestants. Capital, Lausanne (q.v.). The region, after forming part of the Kingdom of Arles, was annexed to Germany early in the eleventh century. It was later ruled by the house of Zähringen, after whose extinction it passed in the thirteenth century to the counts of Savoy. It was gradually acquired by Bern during the fifteenth and sixteenth centuries, under whose rule it remained till 1798, when it became the Canton of Leman in the Helvetic Republic. In 1803 it entered the Confederation under its present name.

VAUDEVILLE, vōd'vĭl; *Fr. pron.* vōd'vēl'. Originally a popular song with words relating to some story of the day, whence it has come to signify a species of drama in which dialogue is interspersed with songs of this description and with more or less of dancing and variety acting. The name "vaudeville" is a corruption of *vau* (i.e., *val*) *de vire*, from *les Vaux de Vire*, the name of two picturesque valleys in the bocage of Normandy. One Olivier Basselin, a fuller in Vire, composed in the fifteenth century a number of very popular humorous and satirical drinking songs; these, with others of the sort, became known all over France by the name of the place where they originated. Jean le Houx published many in the sixteenth century. In Paris *vaux de vire* were sung especially on the Pont Neuf, to airs which therefore were called *ponts neufs;* and as the origin of the name for the songs was forgotten, it was related to the word "ville," and took its present form. As a kind of popular song, the vaudeville lasted through the eighteenth century. At the same time dramatic vaudeville began, at first in the theatres of the public fairs and then in connection with the *opéra comique*, and plays of this kind were composed by Le Sage and other well-known writers. In the nineteenth century Scribe, Desaugiers, and others wrote vaudevilles, and several Parisian theatres have been devoted to their production. In other countries vaudeville is more or less freely patterned after the French style, the number of houses devoted to performance of this type constantly increasing. Consult: Gasté, *Étude critique et historique sur Jean le Houx et le vau de vire à la fin du XVIème siècle* (Paris, 1874); id. (ed.), *Les vaux de vire de Jean le Houx* (with introduction and notes, Paris, 1875); id., *Olivier Basselin et le vau de vire* (Paris, 1887).

VAUDOIS, vō'dwä. See WALDENSES.

VAUDOUX. See VOODOO.

VAUDREUIL, vō'drē'y', LOUIS PHILIPPE DE RIGAUD, MARQUIS OF (1724–1802). A French naval commander, born at Rochefort, grandson of the following. He entered the naval service in 1740, in 1754 became captain, and in 1777 chief of squadron. In the following year he participated in the battle off Ushant and in the early part of 1779 fought with distinction in Senegal. Later in the same year he took part in the capture of Grenada and was present at the siege of Savannah, where he was wounded. He shared in the French victories off Dominica (April and May, 1780), commanded a squadron in the fight between De Grasse and Graves in Chesapeake Bay (Sept. 5, 1781), and participated in the siege of Yorktown. His failure to come to De Grasse's aid in the battle off Santo Domingo (April 12, 1782) possibly gave Rodney the victory, but certainly saved Vaudreuil's own squadron. He sat in the States-General of 1789, showed himself an ardent Royalist, and defended the royal family from the mob at Versailles (Oct. 5, 1789). In 1791 he fled to England, where he remained during the Reign of Terror.

VAUDREUIL, PHILIPPE DE RIGAUD, MARQUIS OF (c.1641–1725). A French Governor of Canada. He was born near Castelnaudary, Languedoc, entered the army, and in 1687 was made brigadier general and sent to Canada. He served under Frontenac and led expeditions against the Iroquois Indians, gaining a notable victory over them in 1693. In 1701 he became Governor of Montreal and in 1703 Governor-General of Canada.

VAUDREUIL-CAVAGNAL, kȧ'vȧ'nyȧl', PIERRE FRANÇOIS, MARQUIS OF (1698–1765). The last French Governor of Canada, born in Quebec, son of the preceding. He entered the army and in 1733 was appointed Governor of Three Rivers. He became Governor of Louisiana in 1742 and in 1755 was made Governor-General of Canada, succeeding Duquesne. Between him and Montcalm (q.v.) much dissension prevailed. After the battle on the Plains of Abraham (1759) decisive action on the part of Vaudreuil might have driven Wolfe's weakened army from Quebec, but his faltering destroyed all chances of recovering the town. In 1760 he surrendered Montreal to the English against the will of General Levis, the military commander. In Paris he was brought to trial for mismanagement of Canadian affairs, but received full justification.

VAUGHAN, vȧn, BERNARD (1847–). An English Roman Catholic clergyman, brother of Herbert and John Stephen Vaughan (qq.v.). He was born in Herefordshire, was educated at Stonyhurst, and became a member of the Society of Jesus. For 18 years he took a conspicuous part in the religious and civic life of Manchester, but in 1901 went to London, where he worked among the poor of Westminster and in the East End. His sermons on "The Sins of Society" in 1906 attracted large audiences. He preached at Montreal in 1910, traveled in Canada, the United States, and Alaska, and lectured in China, Japan, Italy, and France. In 1915 he

became chaplain to Catholic troops of the British expeditionary army on the Continent. His publications include: *The Sins of Society* (1906; 10th ed., 1908); *Society, Sin, and the Saviour* (1907); *Socialism* (1910); *The Our Father, Our Country's Need Today* (1911); *Socialism from the Christian Standpoint* (1913); *What of Today?* (1914).

VAUGHAN, CHARLES JOHN (1816–97). An English clergyman and educator. He was born at Leicester, and educated at Rugby under Dr. Arnold, and at Trinity College, Cambridge, where he took his degree in 1838. He studied law for a time, but turned to theology and was ordained in 1841. He was vicar of St. Martin's, Leicester, until 1844, in which year he was elected head master of Harrow. In 1860 he became vicar of Doncaster, and gave much of his energy to the training of candidates for ordination. From 1869 to 1894 he was master of the Temple in London, and had a widespread influence as a preacher and as a prominent leader of the Broad Church party. In 1894 he was made president of University College at Cardiff. He was also, from 1879, dean of Llandaff, where he died Oct. 15, 1897. He published many books of sermons and commentaries, and *The Church of the First Days* (1864–65; in 1 vol., 1890).

VAUGHAN, HENRY (1622–95), known as The Silurist. An English poet. He was born at Newton-by-Usk, South Wales, and studied law and medicine in London, withdrawing subsequently to his native place, where he became a physician (1650). Among his works are: *Poems with the Tenth Satyre of Juvenal Englished* (1646); *Olor Iscanus* (1651); *The Mount of Olives, or Solitary Devotions* (1652); and *Thalia Rediviva* (1673). His works were edited by Grosart (London, 1871) and by Martin (New York, 2 vols., 1915), and his poems by Chambers (London, 1896). His verse is often quaint.

VAUGHAN, HERBERT (1832–1903). An English Roman Catholic prelate, brother of Bernard and John S. Vaughan. He was born at Gloucester, and studied at Stonyhurst College, at Brugelette in Belgium, and also at the Accademia de' Nobili Ecclesiastici in Rome. After his ordination in 1854 he joined the Oblates of St. Charles, then under Cardinal Manning's direction. In 1862 he left St. Edmund's College, Ware, of which he had been for some time vice president, and devoted himself to missionary work in England and to founding St. Joseph's College at Mill Hill, near London, for training missionaries. He was especially interested in work among the negroes of America, and in 1871 accompanied thither the first detachment of priests sent from the college. He was chosen Bishop of Salford in 1872. After 20 years of work in this diocese he was appointed Archbishop of Westminster to succeed Cardinal Manning, becoming Cardinal in 1893. He was always an active worker on behalf of the cause which he represented: as proprietor of the *Tablet* and the *Dublin Review* he inspired a vigorous defense of the Roman Catholic position, which appeared also in his public utterances, always marked by an uncompromising attitude towards the other religious bodies in England. It was said that the papal decision against the validity of Anglican orders was due to his efforts. His interest in temperance, in work among children, and in commercial education under Catholic auspices (for which he built St. Bede's College) was well known.

VAUGHAN, JOHN STEPHEN (1853–). An English Roman Catholic bishop, brother of Bernard and Herbert Vaughan (qq.v.). He was born at Courtfield, Ross, studied at St. Gregory's College, and at Bruges and Rome, and was ordained a priest in 1876. He spent three years in traveling, lecturing, and missionary work in Australia, then undertook parochial work in London, and in 1898 became canon of Westminster. Between 1890 and 1903 he organized free Catholic lectures in various public halls in London. In 1896 he became domestic prelate to the Papal Court, resided in Rome in 1904–07, and made a preaching tour in the United States and Canada. Created a Bishop in 1909, he settled in Manchester, where after 1912 he was also rector of St. Bede's College. His writings include: *Concerning the Holy Bible* (1904); *Dangers of the Day* (1909); *The Purpose of the Papacy* (1910).

VAUGHAN, ROBERT (1795–1868). A Congregational minister, of Welsh stock, born in the west of England. He was trained for the ministry by an independent divine of Bristol. He became minister of an independent chapel at Kensington (1825), professor of history in London University (1834), and president of the Lancashire Independent College at Manchester (1843). Owing to ill health, he resigned his presidency in 1857, and later took charge of a congregation at Torquay, where he died. In 1845 he founded the *British Quarterly*, which he ably edited for 20 years. Among his works are: *The Life and Opinions of John de Wycliffe, D.D.* (1828); *Memorials of the Stuart Dynasty* (1831); *Causes of the Corruption of Christianity* (1834); *The Protectorate of Oliver Cromwell* (1838); *History of England under the House of Stuart* (1840); *Essays on History, Philosophy, and Theology* (2 vols., 1849); *Revolutions in English History* (3 vols., 1859–63); *English Nonconformity* (1862).

VAUGHAN, VICTOR CLARENCE (1851–). An American pathologist, born at Mount Airy, Randolph Co., Mo. Educated in medicine at the University of Michigan (M.D., 1878), he settled in Ann Arbor and joined the staff of his alma mater, where he held many positions, among them professor of physiological and pathological chemistry (1883–87), professor of hygiene and physiological chemistry (1887–1909), and thereafter dean of the medical department. In 1898 he served as surgeon in the Santiago campaign, during which time he also demonstrated the transmission of typhoid by flies. From 1908–09 he was president of the Association of American Physicians and in 1914 of the American Medical Association, and in 1915 he was elected to the National Academy of Sciences. Among his writings are: *Textbook of Physiological Chemistry* (1879; 3d ed., 1883); *Ptomaines and Leucomaines and Cellular Toxins* (1913), with others; *Protein Split Products* (1913), with others.

VAUGHAN, WILLIAM (1577–1641). A colonial pioneer and author, of an ancient Welsh family settled at Golden Grove, in Carmarthenshire, South Wales. He was educated at Jesus College, Oxford, graduating in 1595, and later traveled on the Continent. He established a colony at his own expense on Trepassey Bay, Newfoundland, and went out himself in or about 1622. While in his colony he wrote a quaint tract in prose and verse called *The Golden Fleece* (published 1626) describing the new land.

Vaughan was also the author of *The Golden Grove moralised, in three bookes: a Work very necessary for all such as would know how to Gouerne themselves, their houses, or their countrey* (1600), and several other books in English and in Latin, some of which are strangely mystical. *The Newlanders Cure* (1630; reprinted in the *North American Review* for March, 1817), dealing with the maladies common in the colony, is prefaced with a short autobiography. Vaughan's colony, owing to the severe climate, eventually failed.

VAULT (OF. *volte, voute, voulte,* Fr. *voûte,* vault, from Lat. *volutus,* p.p. of *volvere,* to roll; connected with Goth. *walwjan,* AS. *wealwian,* Eng. *wallow*). A ceiling or roof constructed of arched masonry: or one having the appearance of being so constructed. The simplest type is the barrel vault, a continuous arch forming a semicylindrical covering over a space bounded by parallel walls: the vaults of sewers and tunnels are of this form. A groin vault is one formed by the intersection of two barrel vaults of equal height; the salient angles in which they meet are the groins. A cloistered vault is composed of four portions of barrel vaulting meeting to form a square or rectangular dome. The most monumental form of vault is the dome (q.v.). An octagonal dome is identical with an octagonal cloistered vault. A ribbed vault is one in which the vaulting surfaces (compartments or fillings) are divided from each other by arched ribs forming a framework which may be both structural and decorative, as in Gothic vaulting. (See FAN VAULTING; GOTHIC ARCHITECTURE; LIERNE RIB; RIB; RIBBED VAULTING.) The looplike or triangular surfaces generated by a small or low vault intersecting one of greater height are called penetrations. Vaults may be built of stone, brick, or tile. The shaping of the individual stones for a vault is a branch of the art of stonecutting and their design is a department of stereotomy (q.v.). The earliest systematic use of vaulting was by the Chaldæans and Assyrians, who employed the barrel vault, of either cylindrical or pointed-arch section, for drains, passages, and corridors or halls, and sometimes also a species of high dome. The Egyptians rarely employed vaulting; and it was not until the Romans adopted it that its architectural possibilities were developed. The earliest Roman vault is the massive barrel vault over the Cloaca Maxima. (See CLOACA.) It was in the temples, palaces, and baths of the Imperial age that they applied vaulting to the covering of spacious interiors, using the barrel vault over corridors, as in the Colosseum and in temples. They developed the groined vault in their thermæ and more complex edifices. Since a groined vault springs from four points at the corners of a square or rectangle, and permits of openings as high as the ridge of the vault, it could be used over large halls with clerestories, and over any desired area by suitably spacing the piers or supports. They also employed the dome. The Byzantines, using brick rather than stone, employed a great variety of vault forms, but their most distinctive architectural feature was the dome on pendentives. (See BYZANTINE ART; DOME; PENDENTIVE.) The ribbed groined vault, which became the most important element in the development of Gothic architecture (q.v.) appears first in the Lombard-Romanesque church of San Ambrogio at Milan (eleventh century). The Romanesque churches of France, before the adoption of this feature, were frequently vaulted with simple barrel vaults. In the twelfth century the four-part and six-part vault came into general use; the latter was, however, soon abandoned, and the four-part vault became universal. By means of the pointed arch, of diagonal or groin ribs (*ogives*) and the use of somewhat convex vault fillings for the compartments, the mediæval builders were able to vault the oblong bays over the central aisle with great simplicity of effect with four-part vaults. The English multiplied the ribs for both structural and decorative effect, and developed highly ornate vaults, culminating in fan vaulting (q.v.) of the perpendicular style (q.v.). The corresponding French flamboyant (q.v.) style retained generally the simpler forms of four-part vaulting. The problem of resisting the outward thrust of the vault gave rise to the device of the flying arch and buttress.

The Renaissance returned to Roman vault forms for the most part, but developed wholly new and splendid types of vault decoration, and added the dome on pendentives, the elliptical barrel vault with penetrations and other special forms. Various forms of vault appear in Mohammedan art (q.v.), especially in Persia and India. Modern architects employ at will all the historic types, and in America they have developed also a wholly new type of light, elastic vaulting with tiles, the Guastavino (q.v.) vault. Consult, for a discussion of the various types of vaulting, with admirable illustrations, "Vault," in Russell Sturgis, *Dictionary of Architecture* (New York, 1905); also Willis, "Essay on Vaulting," in *Transactions of Royal Institute of British Architects* (London, 1842); "Construction" and "Voûte," in Viollet-le-Duc, *Dictionnaire raisonné de l'architecture* (Paris, 1854–68); Haase, *Der Gewölbebau* (Halle, 1900); Porter, *The Construction of Lombard and Gothic Vaults* (New Haven, 1911); Clarence Ward, *Mediæval Church Vaulting* (Princeton, N. J., 1915). See ARCHITECTURE; ROMAN ART.

VAULTING. See VAULT.

VAULTING-SHAFT. A slender column or shaft from which spring the ribs of a Gothic vault. These shafts occur either singly or in clusters, and may spring from the ground or from the main pier cap, or be supported on small corbels in the wall. They are usually engaged, but may be free-standing. Their structural function is more apparent than real, but their æsthetic function is important.

VAULTS, SAFE-DEPOSIT. See SAFES AND SAFE-DEPOSIT VAULTS.

VAUTHIER, GABRIEL JEAN PAUL MOREAU-. See MOREAU-VAUTHIER, G. J. P.

VAUTIER, vō'tyā', BENJAMIN (1829–98). A Swiss-German genre painter. He was born at Morges, on Lake Geneva, studied at Geneva, then at the Düsseldorf Academy under Rudolf Jordan, and for some years devoted himself to the study of peasant life in the Bernese Oberland. After a short sojourn in Paris in 1856 he settled at Düsseldorf and in 1858 achieved success with his "Church Scene," which was followed by a series of characteristic episodes in the life of the Swiss and Swabian peasantry. Some of the most prominent among these pictures, distinctly literary rather than pictorial in character, and often distinguished by good drawing and sympathetic characterization, are: "Peasants at Cards Surprised by their Wives" (1862, Leipzig Museum); "Peasant and Broker" (1865, gold

medal, Paris, Basel Museum); "Funeral Repast in Bernese Oberland" (1865, Cologne Museum); "The First Dancing Lesson" (1868) and "At the Sickbed" (1873, both in the National Gallery, Berlin); "Toast to the Bride" (1870) and "Prodigal Son" (1885, both in the Kunsthalle, Hamburg); "A Breathing Interval at Wedding Dance" (1878, Dresden Gallery); "Arrest of Jewish Usurer" (1879), one of his most remarkable works; and "Forsaken" (1892, Breslau Museum). He also illustrated Auerbach's *Barfüssele*, Immermann's *Oberhof*, Goethe's *Hermann und Dorothea*, and other literary works. For his biography and art consult Rosenberg (Bielefeld, 1897), and Richard Muther, *History of Modern Painting* (Eng. trans., rev. ed., New York, 1907).

VAUVENARGUES, vôv'närg', LUC DE CLAPIERS, MARQUIS DE (1715–47). A French moralist, born at Aix, in Provence. He entered the army at 17 and served in Italy and Bohemia, devoting himself subsequently to literature. He was a man of lofty character and enjoyed the friendship of Marmontel and Voltaire. His *Introduction à la connaissance de l'esprit humain*, with certain *Réflexions* and *Maximes* appended (1746), is famous for its moral aphorisms and appendix. His complete works were edited by Gilbert (1857) and by Plon (1874). In English appeared *Selections from Characters, Reflections, and Maxims of La Bruyère and Vauvenargues* (1903). Consult Paléologue, *Vauvenargues* (Paris, 1890).

VAUX. See WAR IN EUROPE.

VAUX, vąks, CALVERT (1824–95). A British-American architect and landscape gardener, born in London, where he studied under Cottingham. In 1850 he removed to the United States, and became assistant to and later partner of A. J. Downing (q.v.), a well-known American landscape gardener. In 1857 he established himself in New York City, where he entered into partnership with Frederick Law Olmsted (q.v.), Mr. Downing having died in 1852. In association with Olmsted he made plans for Central, Riverside, and Morningside parks in New York City, for Prospect Park in Brooklyn, for parks at Bridgeport, Conn., and Chicago, Ill., and for the New York State reservation at Niagara Falls. He also designed the first structures for the Metropolitan Museum of Art and the Museum of Natural History in New York City. He became landscape architect to the Department of Parks of New York and a member of the consolidation inquiry commission for Greater New York. It was owing to his efforts that Central Park was preserved and developed in accordance with the original landscape designs. In his professional work he displayed artistic faculty, and was an active municipal official. He published *Villas and Cottages* (1857; 2d ed., 1864).

VAUX, RICHARD (1816–95). An American lawyer and politician, born in Philadelphia. He was admitted to the bar in 1836; was later secretary of the American legations at London and Brussels; member of Congress 1890–92; but he is best known as a penologist, contributing largely to the literature on the subject. Among his writings are: *Brief Sketch of the Origin and History of the State Penitentiary for the Eastern District of Pennsylvania* (1872); *Isideout, or Present Prison Systems and their Effects on Society and the Criminal* (1888); *The State and the Prison* (1886).

VAUX, THOMAS, second BARON (1510–56). An English poet, eldest son of Nicholas Vaux, first Baron Vaux of Harrowden, Northamptonshire. His extant lyrics, numbering at least 15, were contributed to Tottel's *Miscellany* (1557) and to *The Paradise of Dainty Devices* (1576). Consult *Fuller Worthies' Library Miscellanies*, edited by A. B. Grosart, vol. iv (London, 1872).

VAUX, WILLIAM SANDYS WRIGHT (1818–85). An English antiquary and numismatist. He was educated at Balliol College, Oxford; in 1841 obtained a post in the department of antiquities of the British Museum; and from 1861 until his resignation in 1870 was keeper of coins and medals. During 1871–76 he catalogued the coins of the Bodleian Library at Oxford. He was particularly expert in Oriental antiquities, and besides an edition for the Hakluyt Society (1854) of *The World Encompassed by Sir F. Drake*, published *Nineveh and Persepolis* (1850; 4th ed., 1855), which presented in popular form the discoveries of Layard and others; and, under the general title, *Ancient History from the Monuments*, the two volumes, *Persia from the Earliest Period to the Arab Conquest* (1875; new ed., by Sayce, 1893) and *Greek Cities and Islands of Asia Minor*.

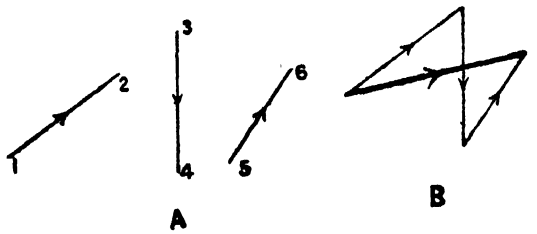
VAUXHALL (vąks'hąl) **GARDENS.** A former place of public amusement on the outskirts of London, on the Thames above Lambeth. It was laid out in 1661, and was originally called the "New Spring Gardens at Foxhall." It was finally closed in 1859, and is now quite covered by modern dwellings.

VAZOFF, vä'zôf, IVAN (1850–). A Bulgarian author and patriot, born at Sopot. He lived in Rumania for a time, participated in revolutionary movements against the Turks in 1875–76, and fought in the Servian War of 1885. During his exile in Rumania he published three volumes of patriotic lyrics, and after the independence of Bulgaria had been gained—he was then elected to the National Assembly of eastern Rumelia—put forth his first prose works and his first drama, *Mikhalaki*. Two more collections of verse appeared in 1883, and then *Italy* (1884) and *Slivnitza* (1885). A member of the Russian party, Vazoff was exiled by Stephen Stambuloff (q.v.), and while living at Odessa wrote *Pod Igoto* (*Under the Yoke*), the novel which made him famous. This was published serially in 1889 upon his return to Bulgaria, and was subsequently translated into most of the European languages (Eng. trans. by Edmund Gosse, 1893; new ed., 1912). His other writings include: *Vagabonds* (1894), his most popular dramatic work; the romances *New Country* (1896) and *The Queen of Kazalar* (1902); and the drama *Ivailo* (1913). Consult: Joseph Angeloff, "Ivan Vazoff," in *Manchester Quarterly*, vol. lxxi (Manchester, 1899); R. A. Tsanoff, "Ivan Vazoff" in *Poet Lore*, vol. xix (Boston, 1908); W. S. Monroe, *Bulgaria and her People* (ib., 1914).

VÂYU, vä'yōō, or VÂTA, vä'tą (Skt., wind). A deified personification of the wind in the Vedic mythology of the Hindus. Both these names are applied to the wind, but Vāyu is rather the divinity and Vāta the element. In epic and Puranic mythology Vāyu occupies only an inferior position. Legend assigns to him a wife Anjana, and their child is the monkey-god Hanumān (q.v.). He is also King of the Gandharvas and regent of the northwest. In the Avesta (q.v.) Vāyu is also a name of the genius of the

air. Consult: W. J. Wilkins, *Hindu Mythology* (2d ed., London, 1900); A. Hillebrandt, *Vedische Mythologie* (Breslau, 1902); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); L. D. Barnett, *Antiquities of India* (London, 1913).

VEBER, vā'bâr', PIERRE (1869–). A French novelist and dramatist, born in Paris. He became Chevalier of the Legion of Honor. His work is rather smartly cynical in tone. Among his novels are: *Les enfants s'amusent* (1894); *Chez les snobs* (1896); *M. et Mme. L'homme* (1898); *L'école des ministres* (1907); *Dans un fauteuil* (1909); *Les retirées* (1912). His plays include: *Julien n'est pas un ingrat* (1898); *Que Suzanne n'en sache rien* (1899); *L'ami de la maison* (1900); *La main gauche* (1901); *La mariotte* (1903); *L'amourette* (1905); *Florette et Patapon* (1906); *Ma fée* (1910); *La gamine* (1911).



VEBI'NUM. See BOVINO.

VEBLEN, vĕb'lĕn, THORSTEIN B. (?–). An American economist. Graduating from Carleton College (Minn.) in 1880, he studied later at Johns Hopkins and at Yale (Ph.D., 1884). He taught political economy at the University of Chicago from 1892 to 1906, and economics at Leland Stanford thereafter till 1909, when he accepted a chair in economics at the University of Missouri. From 1896 to 1905 he was managing editor of the *Journal of Political Economy*. Veblen published *The Theory of the Leisure Class* (1899; new ed., 1912); *The Theory of Business Enterprise* (1904); *The Instinct of Workmanship, and the State of the Industrial Arts* (1914); *Imperial Germany, and the Industrial Revolution* (1915).

VECCHIETTA, vĕk-kyât'tà, LORENZO, properly LORENZO DI PIETRO (c.1412–80). A Sienese painter, architect, and sculptor. Born at Castiglione di Valdorcia, he was a pupil of Sassetta, and is one of the most important painters of the later Sienese school. He was influenced by Donatello and was instrumental in introducing the spirit of the Renaissance into Sienese painting. There are frescoes by him in the Palazzo Pubblico (1461), the Hospital (1448), and the Baptistery (1450–53), in Siena; and a Madonna in the gallery of the same city. In the Uffizi at Florence is an important triptych, "Madonna with Saints" (1457). His best-known work of sculpture, "The Risen Christ," a statue, is in the Church of the Hospital, Siena.

VECELLI, vā-chĕl'lê, TIZIANO. See TITIAN.

VEC'TOR (Lat. *vector*, one who carries or conveys, from *vehere*, to carry, convey). A segment of a straight line of a definite length in a definite direction. It may be represented therefore by a line with an arrow, as shown. A vector quantity is such a physical quantity as can be represented by a vector. Linear displacement, linear velocity, linear momentum, linear acceleration, and force acting on a particle are illustrations. Vector analysis deals with mathematical processes involving vectors. (See QUATERNIONS.) In this science addition, subtraction, and multiplication are defined. Vector addition of two vectors (i.e., geometrical addition), e.g., consists in moving one or both of the vectors, each one parallel to itself, until two ends coincide, they being so selected that the arrows on the two vectors indicate a continuous advance; then in drawing a straight line from the free end of one vector to that of the other, this resultant vector having a direction corresponding to that of the two components. Similarly three vectors may be added. Thus, in Fig. A the vectors 12, 34, 56 may be added as shown, bringing 3 to coincide with 2, and 5 with 4, and then joining the two free ends, as in Fig. B. It is evident from geometry that the

order of the addition is immaterial so long as the arrows indicate continuous action. Thus it would do just as well to make 1 and 4 and 2 and 5 coincide, or 1 and 4 and 6 and 3; the final result is the same as before. See MECHANICS.

VEDA, vā'dà (Skt. *veda*, knowledge, from *vid*, to know; connected with Gk. *Fοῖδα*, *foida*, I know, *Fἰδειν*, *fidein*, Lat. *videre*, OChurch Slav. *vědě*, I know, OHG. *wizzan*, Ger. *wissen*, Goth., AS. *witan*, Eng. *wit*, to know). The collective designation of the ancient sacred literature of India, or of individual books belonging to that literature. At an unknown date, conventionally averaged up as about 1500 B.C., Aryan tribes, according to generally accepted theories, began to migrate from the Iranian highlands on the north of the Hindu Kush into the northwest of India, the plains of the river Indus and its tributaries. The non-Aryan aborigines were easily conquered, but the conquest was followed by gradual amalgamation of the fairer-hued conquerors with the dark aborigines. The Aryans brought with them a primitive pastoral civilization, a language which was a mere dialectic variety of the speech spoken in Iran, and religious beliefs which show close connection with the ancient Persian religion of the Avesta (q.v.), and, to a lesser and more problematic extent, with the beliefs of other Indo-Germanic peoples, such as the Greeks (see GREEK RELIGION) and the Teutons. (See SCANDINAVIAN AND TEUTONIC MYTHOLOGY.) From the very start we are confronted by a poetical literature, primitive on the whole, yet lacking neither in refinement of thought, nor in skill in the handling of language and metre. The literature is throughout religious, and includes prayers and sacrificial formulas, offered to the gods by the priests; charms for witchcraft and medicine, manipulated by magicians and medicine men; expositions of the sacrifice; theological comments and legends; higher speculations, philosophic and theosophic, growing up in connection with the simpler beliefs; and finally rules for conduct in everyday life at home and abroad. This is the Veda as a whole.

At the base of this entire literature of more than 100 books lie four varieties of metrical compositions known as the four Vedas in the narrower sense. These are the *Rig-Veda*, the *Yajur-Veda*, the *Sama-Veda*, and the *Atharva-Veda*. These four names come from a somewhat later time, and do not coincide exactly with the earlier names, nor do they correspond with the contents of the texts themselves. The earlier names are *ṛcaḥ*, stanzas of praise, *yajūṃṣi*, liturgical stanzas and formulas, *sāmāni*, melodies, and *atharvāṅgirasaḥ*, blessings and curses. The col-

lection known as the Rig-Veda contains not only "stanzas of praise," but also "blessings and curses," as well as most of the stanzas which form the basis of the *sāmāni*. The Atharva-Veda, likewise, contains *ṛcaḥ* and *yajūṁṣi*, as well as "blessings and curses." The Yajur-Veda also contains many "blessings and curses," in addition to its main topic. The Sama-Veda is merely a collection of a certain kind of "stanzas of praise" which occur for the most part in the Rig-Veda, but are here set to music by means of definite musical notations.

The Rig-Veda is on the whole the most important as well as the oldest of the four collections. A little more than 1000 hymns, equaling in bulk the surviving poems of Homer, are arranged in 10 books called *maṇḍala*, or circles. Six of them (ii–vii), the so-called family books, form the nucleus of the collection. Each of these is the work of a different seer and his descendants, as can be seen from the hymns themselves. The eighth book and the first 50 hymns of the first book, belonging to the family of Kanva, are arranged strophically in groups of two or three stanzas. The most marked peculiarity of these hymns is that they form the bulk of the stanzas sung with melodies in the Sama-Veda. The hymns of the ninth book are addressed directly to Soma (q.v.). The remainder of the first book and the entire tenth book are more miscellaneous in character and problematic as to arrangement. On the whole they are of later origin, for themes foreign to the narrower purpose of the *ṛcaḥ*, such as theosophic hymns and witchcraft hymns, appear in considerable number. The poems of the latter class frequently reappear, usually with variations, in the Atharva-Veda.

Generally speaking the Rig-Veda is a collection of priestly hymns addressed to the gods of the Vedic pantheon during sacrifice. This sacrifice consisted of oblations of intoxicating *sōma* (q.v.) and melted butter or ghee (q.v.) which was poured into the fire. The ritual of the Veda is advanced in character, by no means so simple as was once supposed, though not as elaborate as that of the Yajur-Veda and the Brahmanas. (See below.) The chief interest of the Rig-Veda lies in the gods themselves and in the myths narrated in the course of their invocation. The mythology represents an earlier, clearer stage of thought than is to be found in any other parallel literature. Above all it is sufficiently primitive to show clearly the process of personification by which natural phenomena developed into gods. (See the subsection *Vedic Religion* under INDIA; NATURE WORSHIP.) The original nature of the Vedic gods, however, is not always clear; some of them are so obscure in character as to make an analysis of them a difficult and important chapter in Vedic philology. But on the whole the keynote of Rig-Vedic thought is the nature myth.

The Yajur-Veda represents the growth of ritualism or sacerdotalism; its *yajūṁṣi*, liturgical stanzas and formulas, are in the main of a later time, and are partly metrical, partly prose. The materials contained in the Rig-Veda are freely adapted, with secondary changes of expression, and without regard to the original order of their composition. The main object is no longer devotion to the gods themselves. The sacrifice has become the centre of thought; its mystic power is conceived to be a thing per se, and every detail has become all-important. A crowd of priests (17 is the largest number) conducts a vast, complicated, and painstaking ceremonial, full of symbolic meaning even in its smallest minutiæ. From the moment the priests seat themselves on the sacrificial ground and proceed to mark out the altars (*vēdi*) on which the sacred fire is built, every act has its stanza or formula, and every utensil is blessed with its own fitting blessing. These formulas are no longer conceived as prayers, but as magic. The words as well as the acts have inherent power. If the priest chants a formula for rain while pouring a certain sacrificial liquid, rain shall and must come. In fact, and in brief, the Yajur-Veda means the deification of the sacrifice in every detail of act and word.

The Sama-Veda is the least clear of all the Vedas. Its stanzas, or rather groups of stanzas, are known as *sāmāni*, melodies. The *sāman* stanzas are preserved in three forms. First, in the Rig-Veda, as ordinary poetry, accented in the same way as other Vedic poetry. Secondly, in the *ārcikas*, a kind of libretto forming a special collection of *sāman* verses, most of which, though not all, occur also in the Rig-Veda. Here also there is a system of accents, peculiar in its notation, but purely with reference to the unsung *sāmans*. In the third *sāman* version, the *gānas*, or song books, we find the real sung *sāmans*. Here not only the text, but the musical notes, are marked. Still this is not a complete *sāman*. In the middle of the sung stanzas appear exclamatory syllables, the so-called *stōbhas*, such as *ōm*, *hāu*, *hāi*, *hōyi*, or *him*: and at the end certain concluding words, such as *atha*, *ā*, *īm*, *nām*, and *sāt*. The Sama-Veda is devoted chiefly to the worship of Indra (q.v.). It seems likely, therefore, that it is the civilized version of savage Shamanism (q.v.), an attempt to influence the natural order of things by shouts and exhortations, for the Brahmans as a rule blended their own hieratic practices and conceptions with what they found among the people. The *sāman* melody and the exclamations interspersed among the words may, therefore, be the substitute for the self-exciting shouts of the Shaman priests of an earlier time.

The oldest name of the Atharva-Veda is, as stated above, *atharvāṅgirasaḥ*, a compound formed of the names of two semimythic families of priests, the Atharvans and Angirases. At a very early time the former term was regarded as synonymous with holy charms, or blessings; the latter with witchcraft charms, or curses. In addition to the name Atharva-Veda there are two other names, practically restricted to the ritual texts of this Veda: *bhṛgvaṅgirasaḥ* or "Bhrigus and Angirases," in which the Bhrigus, another ancient family of five priests, take the place of the Angirases; and *Brahma-Veda*, probably Veda of the Brahma, or holy religion in general. (See BRAHMA.) The Atharva-Veda is a collection of 730 hymns, containing some 6000 stanzas, divided into 20 books. About one-sixth of the mass, including two entire books (xv and xvi), is written in prose, similar in style to that of the Brahmanas (see below), the rest being poetry in the usual Vedic metres. These, however, are handled with great freedom, often betraying either ignorance or disregard of the metrical canons, as they appear in the Rig-Veda. The Atharva-Veda did not attain to perfect canonicity until the period of classical Sanskrit, simply on account of the nature of its contents, which are somewhat apart from the hieratic worship of the gods and the sacerdotalism of the

other three Vedas. The contents of the Atharva-Veda are popular rather than hieratic, and superstitious rather than religious. It is a picture of the lower life of ancient India, painted on a very broad canvas. It exhibits the ordinary Hindu not only in the aspect of a devout and virtuous adherent of the gods, and performer of pious practices, but also as the natural, semi-civilized man: rapacious, demon-plagued, and fear-ridden, hateful, lustful, and addicted to sorcery.

The themes of the hymns of the Atharva-Veda may be grouped as follows: charms to cure disease and possession by demons; prayers for long life and health; imprecations against demons, sorcerers, and enemies; charms pertaining to women; charms pertaining to royalty; charms to secure harmony, influence in the village assembly, and the like; charms to secure prosperity in house, field, cattle, business, gambling, etc.; charms in expiation of sin; prayers and imprecations in the interest of Brahmans; and wedding and funeral stanzas. Curiously enough, the Atharva has a large number of cosmogonic and theosophic hymns, being in this respect a more significant precursor to the Upanishads (q.v.) than is the Rig-Veda itself.

The redactions of these four Vedas, called *saṁhitas* by the Hindus, have been handed down in various schools, branches, or recensions, which present a given Veda in forms differing not a little from one another. The school differences of the Rig-Veda are of no importance, except as they extend also to the Brahmanas and Sutras. (See below.) There are two Sama-Veda redactions, that of the school of the Kauthumas and the Ranayaniyas; and two of the Atharva-Veda, ascribed to the school of Saunakiyas and the Paippaladas. The Yajur-Veda especially is handed down in recensions that differ from one another very widely. There is first the broad division into White Yajur-Veda and Black Yajur-Veda. The most important difference between these two is that the Black Yajur schools intermingle their stanzas and formulas with the prose exposition of the Brahmana, whereas the White Yajur schools present their Brahmana in separate works. The White Yajur-Veda belongs to the school of the Vajasaneyins and is subdivided into the Madhyandina and Kanva schools. The important schools of the Black Yajur-Veda are the Taittiriyas, Maitrayaniyas, Kathas, and Kapishthalas. Sometimes these schools have definite geographical locations. For example, the Kathas and the Kapishthalas were located, at the time when the Greeks became acquainted with India, in the Punjab and in Kashmir. The Maitrayaniyas appear at one time to have occupied the region around the lower course of the river Narmada, and the Taittirivas, at least in modern times, are in the south of India.

The poetic stanzas and the ritualistic formulas of the Vedas collectively go by the name of *mantra*, pious utterance, or hymn. These were followed at later periods by a very different literary type, viz., the theological treatises called *brāhmaṇas*. (See BRAHMANA.) Aside from the light which these texts throw upon the sacerdotalism of ancient India, they are important because they are written in connected prose, the earliest in the entire domain of Indo-Germanic speech. They are especially important for syntax, representing in this respect the oldest Indian stage even better than the Rig-Veda, owing to the restriction imposed upon the latter by its poetic form. The Brahmanas also were composed in schools or recensions, but the various Brahmana recensions of one and the same Veda differ at times even more widely than the Samhitas of the Mantras. Thus the Rig-Veda has two Brahmanas, the Aitareya and the Kaushitaki or Sankhayana. The Brahmana matter of the Black Yajur-Vedas is given together with the hymns themselves; but the White Yajur-Veda treats its Brahmana matter separately, and with extraordinary fullness, in the famous *Śatapatha-Brāhmaṇa*, the Brahmana of the Hundred Paths, so called because it consists of 100 lectures. Next to the Rig-Veda and Atharva-Veda this work is the most important production in the whole range of Vedic literature. Two Brahmanas belonging to independent schools of the Sama-Veda have been preserved, that of the Tandins, usually designated as the *Pancaviṁśa-Brāhmaṇa* and that of the Talavakaras or Jaiminiyas. To the Atharva-Veda is attached the very late and secondary *Gōpatha-Brāhmaṇa*, though its contents are in reality foreign to the spirit of the Atharvan hymns.

A later development of the Brahmanas are the *Aranyakas*, or Forest Treatises. (See BRAHMANA and BRAHMANISM.) Their later character is indicated both by the position they occupy at the end of the Brahmanas and by their theosophical character. The two important Aranyakas are the Aitareya and the Taittiriya, belonging, of course, to the Vedic schools of these names. The chief value of the Aranyakas is that they form in contents and tone a transition to the Upanishads, which are either embedded in them, or, more usually, form their concluding portions. See UPANISHAD.

Both Mantra and Brahmana are regarded as part of revelation (*śruti*); the rest of Vedic literature as tradition (*smṛti*) derived from holy men of old. This literature has a characteristic style of its own, being written in the form of brief rules, or *sūtras*. (See SUTRA.) They are, in the main, of three classes, each of which is associated with a particular Vedic school, reaching back, as a rule, to the school distinctions of the Samhitas and Brahmanas. The first class of Sutras are the *Śrāuta* or *Kalpa Sūtras*, which may be translated Sutras of the Vedic Ritual. They are rule books compiled, with the help of oral priestly tradition, from the Brahmanas. They are brief manuals of the Vedic sacrifices, as distinguished from the more diffusive Brahmanas, whose ritual acts are interrupted by elaborate explanation and illustrative legends. To the Rig-Veda belong two Srauta Sutras corresponding to its Brahmanas, the Asvalayana to the Aitareya Brahmana, and the Sankhayana to the Brahmana of the same name. To the White Yajur-Veda belongs the Srauta Sutra of Katyayana, closely adhering to the Satapatha Brahmana. No less than six Srauta Sutras belong to the Black Yajur-Veda, but only two of them have as yet been published, that of Apastamba, belonging to the school of the Taittiriya, and the Manava, belonging to the school of the Maitrayaniya. The Sama-Veda has two Srautas, that of Latyayana and Drahyayana, belonging respectively to its two schools of Kauthuma and Ranayaniya; and the Atharva-Veda has the late and inferior Vaitana.

Of far greater, indeed of universal, interest is the second class of Sutras, the *Gṛhya Sūtras*, or House Books. These are treatises on home life which deal systematically with a well-defined

body of facts connected with the everyday existence of the individual and the family. Though composed at a comparatively late Vedic period, they contain practices and prayers of great antiquity, and supplement most effectively the contents of the Atharva-Veda. They also are distributed among the four Vedas and their schools. The Rig-Veda has the Grihya Sutras of Asvalayana and Sankhayana; the White Yajur-Veda that of Paraskara; the Black Yajur-Veda a large number, as those of the schools of Apastamba, Hiranyakesin, and Manava; the Sama-Veda has the Gabhila and the Khadira; to the Atharva-Veda belongs the important Kausika Sutra, which, in addition to the domestic ritual, deals with the magical and medicinal practices specially characteristic of that Veda.

The third kind of Sutras are the *Dharma Sūtras*, or Law Sutras, which also deal to some extent with the customs of everyday life, but are engaged for the most part with religious and secular law. These Sutras also are either attached to the body of canonical writings of a certain Vedic school, or are shown by inner criteria to have originated within such a school. The oldest legal Sutras are the Apastamba and Baudhayana, belonging to the Black Yajur schools of the same name, the Gautama belonging to the Sama-Veda, the Vishnu belonging to the Katha school of the Black Yajur-Veda, and the Vasishtha (q.v.) of less certain associations. The earliest metrical law books, written in classical Sanskrit, are also based on lost Sutra collections of definite Vedic schools. The most famous of these, the *Mānava Dharma Śāstra*, or Law Book of Manu (see MANU), is founded upon the Dharma Sutra of the Manava, or Maitrayaniya school of the Black Yajur-Veda, while the briefer Law Book of Yajnavalkya derives its origin from a school of the White Yajur-Veda. See BRAHMANISM; HINDUISM.

Bibliography. Consult the bibliography of the article SANSKRIT LITERATURE, especially A. A. Macdonell, *History of Sanskrit Literature* (London, 1913). For English translations, see Max Müller, *Sacred Books of the East* (Oxford. 1879 et seq.; *Index* by Winternitz, 1910), in which parts of the Rig-Veda are translated by Müller himself (vol. xxxii) and Oldenberg (vols. xlvi and xlviii); the Atharva-Veda by Bloomfield (vol. xlii); the Satapatha Brahmana by Eggeling (vols. xii, xxvi, xli, xliii, and xlv); seven of the Grihya Sutras by Oldenberg (vols. xxix and xxx); the old Dharma Sutras by Bühler and Jolly (vols. ii, vii, and xiv); and the Law-Book of Manu by Bühler (vol. xxv). Also: Maurice Bloomfield, "The Atharvaveda," in *Grundriss der indoarischen Philologie* (Strassburg, 1899); E. V. VEDANGA, vā-däng'ā (Skt., *Vēdāṇga*, member of the Veda). The name of six Sanskrit works, whose object is to teach how to read and understand correctly Vedic texts, and how to apply them correctly to sacrificial purposes. The first four of the six Vedangas are philological in character and the other two deal with the sacrifice and its season. The names and scope of the six are as follows: (1) *Siksa*, or phonetics. It is represented by a short treatise of 35, or, in another recension, of 59 verses, which explains the nature of letters, accent, and pronunciation, and is ascribed to Panini (q.v.). (2) *Chandas*, or metre, which is ascribed to Pingala. (3) *Vyākaraṇa*, or grammar, by which native authorities understand the celebrated work of Panini. (4) *Nirukta* (q.v.), or etymology. (5) *Jyōtiṣa*, or astronomy, as employed in fixing the days and hours of the Vedic sacrifices. (6) *Kalpa*, or works on the Vedic ceremonial, which systematize the ritual taught by the Brahmana portion of the Veda, omitting, however, all legendary or mystical detail (see KALPA-SŪTRA). They are composed in the Sutra style. (See SUTRA.) The Vedanga was edited in Bombay, 1902. Consult: Weber, *History of Indian Literature* (Eng. trans., Boston, 1878); Henry, *Les littératures de l'Inde* (Paris, 1904); Winternitz, *Geschichte der indischen Literatur* (Leipzig, 1908 et seq.); A. A. Macdonell, *Sanskrit Literature* (London, 1913).

VEDANTA, vā-dän'tā (Skt. *Vēdānta*, conclusion of the Veda, later interpreted as ultimate aim of the Veda). The second great division of the *Mimamsa* (q.v.) school of Hindu philosophy. It is chiefly concerned in the investigation of Brahma (q.v.), or the Supreme Spirit, and the relation in which the universe, and especially the human soul, stands to it; and in contra-

distinction from the *Pūrvamīmāṁsā*, or the investigation of the former part of the Vedas, especially the *Brāhmaṇas* (see BRĀHMAṆA; BRAHMANISM; VEDA), it is also called *Uttaramīmāṁsā*, or the investigation of the latter part of the Vedas, the *Araṇyakas* and *Upanishads* (q.v.), which treat of Brahma, the Supreme Spirit. Sometimes the name given to it is *Śārīrakamīmāṁsā*, or the investigation of embodied Brahma. In its method the Vedanta differs from the Nyāya (see NYĀYA; VAIŚĒSHIKA) by endeavoring to explain the universe as a successive development from one ultimate source or principle, and it is distinct from the Sānkhya (see SANKHYA; YOGA), inasmuch as that system is based on the assumption of a duality of principles whence the universe derives its origin.

The object matter of the Vedanta is the proof that the universe emanates in a successive development from a Supreme Spirit, or Atman, which is also called Brahman, or paramātman; that the human soul is therefore identical with Brahma; that the separate existence of the human soul is the result of its ignorance of this identity; and that its final liberation from metempsychosis (q.v.) is attained by a removal of this ignorance, i.e., by a proper understanding of the truth of the Vedanta doctrine. In essence, therefore, Vedanta is an idealistic monism. Its first beginnings are found in the early Upanishads (q.v.), but as a completed system it dates from about the time of our era, being later than the Yoga. It is referred to Badarayana (eighth century), whose *Brahma-Sutra*, as explained by Sankara, is the authoritative work of the Vedantists, although the interpretation of Ramanuja (twelfth century) differs in some important particulars from that of Sankhara. The former teaches that the individual soul is ever distinct from the Supreme Soul, whereas Sankara holds that when *avidyā*, or ignorance, is removed, the individual soul becomes one with the Supreme, according to the doctrine of nonduality.

According to the Vedanta, as thus interpreted by Sankara, Brahma is both the efficient and material cause of the world, creator and creation, doer and deed. It is one, self-existent, supreme, as truth, wisdom, intelligence, and happiness; devoid of the three qualities of darkness, passion, and truth, in the sense in which created beings possess them; and at the consummation of all things the whole universe is resolved or absorbed into it. From Brahma individual souls emanate, as innumerable sparks issue from a blazing fire. The soul, therefore, is of divine substance, and as such infinite, immortal, intelligent, sentient, true. Its separate existence, as distinct from Brahma, is the cause of its ignorance; and this ignorance, which consists in regarding the world as a reality capable of subsisting without Brahma, has the double power of enveloping and projecting. By means of the former it makes the soul liable to mundane vicissitudes, such as the sensations of pleasure and pain. The projective power of ignorance, when encompassing the soul in its condition of pure intellect, produces out of the darkness which then prevails the five subtile elements: ether, which is the substratum of the quality sound; air, which arises from ether, the substratum of touch; from air, fire or light, the substratum of color; from light, water, the substratum of savor; and from water, earth, the substratum of smell. From these subtile elements are then produced 17 subtile bodies and the five gross elements. The former, also called *liṅgaśarīra*, are the five organs of perception, the organs of hearing, touch, sight, taste, and smell, which arise severally from the pure or inactive particles of each of the subtile elements. There are, further, two intellectual organs, which are produced from the mingled pure or inactive particles of the subtile elements, *buddhi*, understanding, the function of which is to arrive at a certainty or conclusion, and *manas*, an organ of volition and imagination. Lastly, there are the five organs of action, the voice, the hands, the feet, the organ of excretion, and that of generation, which are severally produced from the active particles of each of the subtile elements; and the five vital airs, which are produced from the mingled active particles of the subtile elements, the air breathed forth, which has its place in the fore part of the nose; the air breathed downward, which has its place in the lower intestines; the air which circulates through the whole body; the ascending air, which has its place in the throat; and the descending air in the middle of the body, which causes assimilation and digestion of food, produces semen, excrements, etc. Later Vedantists postulate 10 such vital airs, assuming in addition to those already mentioned, the airs which severally cause retching, winking, hunger, yawning, and fattening. The five gross elements are the five subtile elements, when they have become so divided and combined that each of them retains a preponderating portion of itself, and consequently of the quality of which it is the substratum, and also contains smaller portions of the other subtile elements, and the qualities of which they are the substrata. From these gross elements then arises the world. The soul, when existing in the body, is incased in a succession of sheaths. The first or interior sheath consists of buddhi, associated with the organs of perception; the second, of manas, associated with the organs of action; and the third, of the vital airs, together with the organs of action. These three sheaths constitute the subtile body of the soul, which attends the soul in its transmigrations. The collective totality of such subtile bodies is the supreme soul, as regarded in its relation to the world. The fourth and exterior sheath of the soul is composed of the gross elements; and the collective aggregate of such gross bodies is the gross body of the deity. This whole development being the result of ignorance, the soul frees itself from its error by understanding that the different stages in which this development appears do not represent real or absolute truth; and when its error has completely vanished it ceases to be reborn, and becomes reunited with Brahma, whence it emanated. The difference between esoteric and exoteric Vedanta consists in the ability or nonability to recognize that Brahma is impersonal, without attributes, and that every soul is all Brahma. This knowledge alone is liberating; but the empiricist, who cannot understand this, may be put in the way of attaining enlightenment by moral and religious practices, such as are enjoined by the Pūrvamīmāṁsā, as explained above. The doctrine of *bhakti*, or faith, does not belong to the older Vedanta; it is, however, an interesting feature of the later periods of this philosophy (see VAISHNAVAS); and the same observation applies to the doctrine

of *Māyā*, or illusion, according to which the world has no reality whatever, but is merely the product of imagination; for the older Vedanta merely teaches that the world is not the truth, but does not deny its material reality.

The oldest work on this philosophy, attributed to Badarayana or to Vyasa (q.v.), called the *Brahma-Sūtra*, consists of four *adhyāyas*, or lectures, each subdivided into four *padas*, or chapters, each pada containing a number of Sutras. The number of the latter is 558, and that of the *adhikaraṇas*, or topics treated in them, 191. The most important commentary on this work is the *Śārīraka-bhāṣya*, by Sankaracarya; and this commentary in its turn has been commented on by a great variety of writers. Originally edited at Calcutta in 1818, the text of the Sutras with this commentary were reëdited by Vidyaratna in 1863 (with a gloss on the commentary by Govindananda, ib.), and translated into German by P. Deussen (Leipzig, 1887). The most popular elementary treatise on the Vedanta, the *Vēdāntasāra*, by Sadananda, with the commentary of Tīrtha, was edited in 1829 (Calcutta); with this and another commentary by Nrisinhasarasvati in 1849 (ib.); edited and translated by Ballantyne, in *A Lecture on the Vedānta* (Allahabad, 1850); and edited by Jacoby (Bombay, 1894). A very useful compendium of the *Adhikaraṇas* is the *Adhikaraṇamata*, by Bharatitirtha, which, with the commentary of Anandachandra-Vedantavagisa, was edited in 1862 (Calcutta), and as an appendix to the Brahma-Sutras, with extracts from this commentary in the *Bibliotheca Indica* (ib., 1863). Thibaut published the *Sūtras* with a valuable introduction in the *Sacred Books of the East* (vols. xxxiv, xxxviii, and xlviii, Oxford, 1890–1904), and the system has been explained by Deussen in his *System des Vedanta* (Leipzig, 1883; Eng. trans., Chicago, 1912), to which may be added the explanation in Müller, *Six Systems of Indian Philosophy* (New York, 1899). Max Müller, *Introduction à la philosophie Vedanta* (Paris, 1899); Tripārthi, *Sketch of Vedanta Philosophy* (2d ed., Bombay, 1901); Deussen, *Allgemeine Geschichte der Philosophie* (2d ed., Leipzig, 1906); *Das angeblich von Rāmānuja verfasste Vedāntatattvasāra* (ed. and trans. into German by E. von Voss, ib., 1906); *Bodhasār, a Treatise on Vedānta with Commentary by Narahari* (ed. by S. Dayanand, Benares, 1906); M. Walleser, *Der ältere Vedānta* (Heidelberg, 1910); P. D. Shāstrī, *The Doctrine of Māyā in the System of the Vedānta* (London, 1911); and the publications of the Vedanta Society.

VED'DAS. A people of southeastern Ceylon, who have sometimes been regarded, chiefly upon somatic and osteological grounds, as a separate race of mankind. They are one of the most primitive of human types, representing, perhaps, the original stock which, traveling to the north, produced the Dravidian peoples of southern Hindustan, and going to the south gave rise to the Australians. The features of the Veddas are Hindu rather than Negroid or Mongoloid; the hair is jet black, wavy, or curly, but never kinky. They are somewhat darker in color than the neighboring Singhalese, and are of slender build, erect carriage, and small stature (full-grown males about 5 feet). A noteworthy characteristic is their monogamous form of marriage. They are praised for honesty, hospitality, morality, and good nature. The Veddas have primitive songs and dances, their religious ideas centre in a cult of the dead. They use the fire drill and make bows and arrows, but obtain arrow heads and axes from the Singhalese, with whom the more secluded Veddas traffic by a sort of dumb show. From the Singhalese also they have written charms, and occasionally a palm-leaf book serving as an oracle or fetish. The Village Veddas are largely vegetarians, but the Rock Veddas hunt birds and animals. Those still existing are divided into three classes. The Coast Veddas of Batticaloa, who have some civilization, associate freely with their Singhalese neighbors, devote themselves to fishing, and in appearance only differ from the primitive Singhalese of the same region. The Village Veddas of the wooded lowlands (Bintenne) are nomadic harvesters of the jungle products, build rude huts, and collect into family groups. The most primitive and secluded are the Rock Veddas, so called from their cave life in the jungles of the Badulla and Nilgala hills. They live chiefly by hunting, and do not associate in a tribal life, but band together only in small family groups. Nevertheless the Saligmanns have discovered a clan system with maternal descent. At the basis of the marriage regulations lies the institution of cross-cousin unions, i.e., of cousins related through parents of opposite sex. A woman's son thus marries his mother's brother's daughter, but under no conditions his mother's sister's or his father's brother's daughter. Consult: Virchow, *Ueber die Weddas von Ceylon* (Berlin, 1881); Sarasin, *Die Weddas von Ceylon* (Wiesbaden, 1891); Deschamps, *Au pays des Veddas* (Paris, 1892); C. G. and B. Z. Seligmann, *The Veddas* (Cambridge, 1911).

VED'DER, ELIHU (1836–). An American painter and illustrator. He was born in New York City, and after some instruction under T. H. Mattison, at Sherburne, N. Y., he studied with Picot in Paris. In 1857 he went to Italy, and he remained chiefly in Florence till the outbreak of the Civil War in 1861, when he returned to the United States. Not being permitted to enlist, by reason of a defect in his left arm, he remained in New York City and Boston until December, 1865, when he again went to Paris, and in 1867 he settled in Rome. He was elected to the National Academy of Design (1865) and the American Academy of Arts and Letters. A man of original, powerful, and weird imagination, Vedder is known for work pregnant in meaning, with a significance beyond the mere artistic. It is characterized by classical tendency in form and composition, simplification of detail, and accentuation of the mysterious forces of nature. Although his use of color is limited, it has, in the main, a large and decorative quality. His figures, although usually small in scale, are of heroic mien. Among his best-known oil paintings are: "Roman Girls on the Seashore," the "Phorcydes," the "Cumean Sibyl," "Venetians on the Main," a "Crucifixion," the "Lair of the Sea Serpent," "Lazarus," "The Sphinx," and "The Fisherman and the Djinn" (all in the Boston Museum); "The African Sentinel" and "The Pleiades" (Metropolitan Museum, New York); "The Keeper of the Threshold" (Carnegie Institute, Pittsburgh); "Storm in Umbria" (Art Institute, Chicago); "Allegorical Subject" (Brooklyn Museum). His mural decorations include a panel in Bowdoin College; five panels illustrating "Good and Bad Govern-

ment" and a mosaic "Minerva," in the Congressional Library at Washington. His dignified and sympathetic illustrations of FitzGerald's translation of Omar Khayyam (1884) gained him a wide reputation. In 1910 he published *The Digressions of V*, and in 1914 *Miscellaneous Moods in Verse.*

VEDDER, HENRY CLAY (1853–). An American Baptist church historian. He was born at De Ruyter, N. Y., graduated at the University of Rochester in 1873, and at Rochester Theological Seminary in 1876. He was an associate editor of the *Examiner* in 1876–92, and its chief editor from 1892 to 1894, when he became professor of Church history in Crozer Theological Seminary, Chester, Pa. He edited the *Baptist Quarterly Review* in 1885–92. His publications include: *Baptists and Liberty of Conscience* (1883); *A Short History of the Baptists* (1891; new ed., 1907); *The Higher Criticism* (1892); *American Writers of To-day* (1894; new ed., 1910); *A History of the Baptists of the Middle States* (1898); *Balthasar Hübmaier: the Leader of the Anabaptists* (1905); *Christian Epoch Makers* (1908); *Church History Handbooks* (4 vols., 1909); *Socialism and the Ethics of Jesus* (1912); *The Reformation of Germany* (1913); *The Gospel of Jesus and the Problems of Democracy* (1914).

VEDRINES, ve-drēn', JULES. A French aviator. See AËRONAUTICS, *Aviation*, Speed Records.

VEEN, vān, MARTIN VAN. See HEEMSKERK, MARTIN VAN.

VEERE, vâr', or **CAMPVERE,** or TER-VERE. A small fortified town of the Netherlands, situated on the east coast of the island of Walcheren, in the Province of Zealand, 4 miles northeast of Middelburg (Map: Netherlands, B 3). The town has fallen into decay; but its former prosperity is indicated by the town hall of white freestone, with an elegant tower, and by the large and beautiful cathedral, which is no longer used, both of which rank among the finest architectural relics of former centuries in Holland. It was the first town to proclaim William III, Prince of Orange, General Stadtholder. The town effectually repelled the attack of the Spaniards in 1572.

VEERY. The tawny or Wilson's thrush (*Turdus* or *Hylocichla fuscescens fuscescens*), one of the best-known thrushes (q.v.) of the eastern and middle United States. It is about 7½ inches long, nearly uniformly cinnamon brown above, white beneath, tinged with buff, the sides of breast and throat with small wedge-shaped brown spots. The veery is a notable songster, but the notes, though of peculiar attractiveness and resembling somewhat the rhythmic continued ringing of a bell, are perhaps impossible to describe in words. The nest is of bark, rootlets, and leaves, and is built on or near the ground, and the eggs are usually four and greenish blue. The veery is found in cold, damp woods, and in some northerly places is the most numerous of the thrushes. It feeds largely upon insects, destroying many cutworms, beetles, and grasshoppers. See Plate of EGGS OF SONG BIRDS.

VEFIK PASHA, vĕ'fĭk pä-shä'. See AHMED or ACHMET, VEFIK PASHA.

VEGA, vā'gä, GARCILASO DE LA. See LASO DE LA VEGA, GARCÍ.

VEGA (EL INCA), GARCILASO DE LA. See LASO DE LA VEGA (EL INCA), GARCÍ.

VEGA, GEORG, BARON (1765–1802). An Austrian mathematician, born at Sagoritza, Carniola, and educated at Laibach. In 1780 he became teacher of mathematics in a regiment of artillery. He served with distinction in the wars against the Turks and the French, and rose to the rank of colonel. Vega is especially known for his *Logarithmische, trigonometrische und andere Tafeln* (1783, and many subsequent editions), and similar tables, which are still useful. He also wrote: *Hydrodynamik* (2d ed., 1819); *Anleitung zur Zeitkunde* (1801); *Natürliches Mass-, Gewichts- und Münzsystem* (1803). Consult Kaučič, "Georg Freiherr von Vega," in *Organ der militärwissenschaftlichen Vereine*, vol. iii (Vienna, 1886).

VEGA CARPIO, vā'gä kär'pê-ô, LOPE FELIX DE, generally called Lope de Vega (1562–1635). The most ingenious dramatic poet of Spain, surnamed El Fenix de España, and called by Cervantes *mónstruo de la naturaleza*, because of his productivity. Born in Madrid, Nov. 25, 1562, he received his elementary training there at the Imperial College under the Jesuits. Two of the earliest of his extant plays, *El verdadero amante* and *Los hechos de Garcilaso de la Vega*, were written when he was 12 years old. He took part in an expedition against the Azores (1582). His *Hermosura de Angélica* (1602), a long poetical continuation of the *Orlando Furioso* of Ariosto (far inferior to the work of the Italian), was practically finished while he served with the Armada. After his return from the scene of Spain's naval humiliation, Lope wrote the *Arcadia* (1598), a pastoral novel, in mingled prose and verse, which, under fictitious names, introduces love episodes in which the author and some of his friends had figured. The epic *La Dragontea* (1598) is an attack upon Sir F. Drake. In 1599 appeared a religious poem, the *San Isidro*, in which he celebrated the life and deeds of the patron saint of Madrid. To 1602 may be ascribed the *Rimas*, a collection of sonnets, and to 1604 the prose romance *El peregrino en su patria*. The *Peregrino* contains also four *autos* (religious dramas) and a list of more than 200 plays that he had already composed. With the *Jerusalén conquistada* (published 1609) he undertook to surpass Tasso; but the epic of the Italian is in every way superior to Lope's poem.

After some works of minor importance, such as the *Soliloquios* published under the name of Gabriel Padecopeo, there came his beautiful religious pastoral, *Pastores de Belén*. After the death of his second wife (1612) he took holy orders in 1614. His piety appears to have been sincere even if his life was not blameless, and he gave renewed expression to his religious feelings in the *Triunfo de la fé en el Japón* (1618). He essayed the prose tale in four stories, *Las fortunas de Diana*, *La desdicha por la honra*, *La prudente venganza*, and *Guzmán el Bravo*. The *Triunfos divinos* is a collection of religious lyrics, and the *Corona trágica* (1627) is a religious epic intended as a defense of Mary Stuart, Queen of Scots. As a poetical catalogue and eulogy of more than 300 Spanish poets, he composed his *Laurel de Apolo*, which can hardly be considered as a model of just criticism. The *Dorotea* (1632) is a prose romance in dramatic form, in which the author undoubtedly embodied many personal experiences; on this account its biographical value has been somewhat stressed. It was a favorite

work with Lope himself. Under the pseudonym of "the licenciado Tomé Burguillos" he produced in 1634 certain *Rimas* and the mock-heroic poem *Gatomaquia*. This is both witty and interesting.

Lope was a poet of great versatility. He essayed nearly every kind of writing, but it is in the drama that his genius showed itself in many ways unexcelled. While his dramatic work is impaired by many imperfections, his faults are atoned for by his exuberant invention, by the skill with which he develops character, and by the unfailing spiritedness of his dialogue. His fertility is unparalleled. He is supposed to have written between 1500 and 1800 plays (*comedias*), in addition to several hundred *autos* (religious pieces) and *entremeses* (interludes). Of these there are extant 431 *comedias* and 50 *autos*. In the comic and the tragic vein Lope treated all manner of subjects—historical, legendary, picaresque, religious, and those that have to do with everyday life. It was he who gave the greatest development to the stock comic character called the *gracioso;* and he first gave dramatic emphasis to the *pundonor*, or point of honor, as an all-pervading principle of Spanish cultured life. By refusing to be bound by the pseudo-classic unities Lope did for Spain what Shakespeare did for England—gave it a national theatre. Of his many pieces the following may be given special mention: *El castigo sin venganza; Porfiar hasta morir; La estrella de Sevilla*, which is one of the best of all; *El mejor alcalde el Rey; El acero de Madrid; La esclava de su galán; El perro del hortelano; La boba para los otros y discreta para sí; Los cautivos de Argel; Si no vieran las mujeres; El príncipe perfecto; Los Tellos de Meneses;* and *La fuente Ovejuna*.

For printed editions of Lope's works, consult the *Colección de las obras sueltas de Lope de Vega* (21 vols., Madrid, 1876–79); the plays and other works contained in vols. xxiv, xxxiv, xxxviii, xli, and lii of the *Biblioteca de autores españoles* (ib., 1859 et seq.); *Comedias inéditas*, vol. vi of the *Libros españoles raros ó curiosos* (ib., 1873); *La Dorotea, acción en prosa* (ib., 1886); and especially the definitive edition of his *Obras, publicadas por la Real Academia Española*, which, begun at Madrid, 1890, has prefixed to its first volume the *Nueva biografía* of C. A. de la Barrera, and, carried on under the editorship of Marcelino Menéndez y Pelayo, who prepared the *Observaciones preliminares*, had already reached the fifteenth volume when Menéndez y Pelayo died. VEGA DE ARMIJO, vā'gà dā är-mē'hō, MARQUÉS DE LA. See AGUILAR Y CORREA, ANTONIO.

VEGETABLE COLORS. A term for natural vegetable dyes as distinguished from mineral colors and those prepared by chemical processes such as the coal-tar colors. They include heartwoods, barks, roots, dried leaves and berries, lichens, etc., and though not as much employed as before the introduction of artificial coloring substances, they still are extensively used. The more important colors will be found under their own heads. These include: *red*, brazilwood, sandalwood, madder, safflower, archil, and kermes; *yellow*, old fustic and young fustic, quercitron, arnotto, and turmeric; *blue*, indigo, woad, logwood, and litmus; *green*, chlorophyll; *brown*, catechu and kino. These dyestuffs must be extracted, and for that purpose the dyewoods are cut or ground into small chips or powder and then cured or fermented, or the dye extracted by heating with water or boiling; in some cases the coloring matter is subsequently concentrated. These processes are also apt to involve chemical treatment of some kind. For the use of vegetable colors, see DYEING, especially the table of natural dyestuffs with the artificial coloring matters that have in many cases displaced them.

VEGETABLE GELATIN. See AGAR AGAR.

VEGETABLE IVORY. See IVORY, VEGETABLE.

VEGETABLE MARROW. A variety of squash highly esteemed as a summer esculent.

VEGETABLE ORANGE. See MUSKMELON.

VEGETABLE OYSTER, OR OYSTER PLANT. See SALSIFY.

VEGETABLES (Lat. *vegetabilis*, enlivening, animating, from *vegetare*, to quicken, animate, from *vegetus*, lively, from *vegere*, to be active). As each vegetable and its culture are treated in separate articles on the individual crops, as beans, beets, cabbage, potatoes, peas, etc., this article is confined to the food value of vegetables.

The various parts of plants eaten include roots (turnips, salsify); bulbs (onion, garlic); tubers (potato, etc.); stems (sea kale, asparagus); leaf buds (Brussels sprouts); leaves (lettuce, cabbage); flower buds (cauliflower, capers); flowers (artichoke); fruits, green (cucumbers, okra); fruits, ripe (tomato, melon); seeds, unripe (corn, peas); seeds, mature (lentil, bean). Few vegetables are eaten entire; they generally contain some inedible matter as seeds, skin, etc., and when prepared for the table some edible material is also commonly lost; this varies with different vegetables, different specimens of the same vegetable, and with methods of preparation. The pods of fresh beans

and peas constitute on an average about 50 per cent of the entire weight of the unshelled vegetable, and the cob of corn somewhat over 50 per cent. When potatoes, carrots, sweet potatoes, and parsnips are peeled the material removed constitutes about 20 per cent of the original weight, fresh vegetables losing usually less than withered ones. The following table shows the average percentage composition of the edible portion of various vegetables:

The mineral matter of ash consists chiefly of salts of various organic acids, and also phosphates and chlorides. Vegetables contain various organic acids, ethers, and other similar bodies which are not estimated separately in proximate analysis like those quoted above, but are included in the group nitrogen-free extract. They are largely accountable for flavors, though various salts and sugars also have a similar influence. In few cases have these flavors been

AVERAGE COMPOSITION OF EDIBLE PORTION OF VEGETABLES

VEGETABLES	Water	Protein	Fat	Nitrogen-free extract	Crude fibre	Ash	Fuel per pound
FRESH	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Per cent*	*Calories*

*The figures printed between the columns "nitrogen-free extract" and "crude fibre" indicate the sum total of these two ingredients, which in some instances have not been determined separately.

It will be seen that (excepting the dry legumes mentioned above, or other dry vegetables) vegetables have a high water content and a comparatively low percentage of nutrients in proportion to bulk. The principal nutrients are carbohydrates, including nitrogen-free extract (starch, sugar, etc.) and crude fibre. Some vegetables, notably the legumes, contain fairly large amounts of protein. The fat (or ether extract) consists of coloring matters, wax, etc., in addition to true fat or oil. This group is not abundant in vegetables commonly eaten.

studied chemically. (See FOOD.) When vegetables are cooked the chief change in percentage composition is in the water content. They may become drier if baked or fried, or more moist if stewed or boiled. The various chemical bodies are modified by cooking—albumens coagulated, starches to some extent broken down into simpler substances, and other changes brought about which are not so well understood. Besides the loss in paring and otherwise preparing vegetables, there may be a loss during cooking. For instance, when cabbage is boiled the water

extracts nearly half of the total food material, which, ordinarily thrown away, is lost. When potatoes are boiled the loss may be considerable, being greatest when they are peeled and soaked before boiling and least when they are boiled with the skins on. The materials lost in boiling vegetables are albuminoid and nonalbuminoid nitrogen, mineral matter, and sugars. Little starch is lost, except by abrasion. In vegetables like carrots, which contain a fair proportion of sugar, the amount extracted in boiling has been found to be nearly 1 pound of sugar in a bushel. In the ordinary household such losses are not important.

Although fresh vegetables contain a high percentage of water, they are nevertheless of value as nutriment. Like other bulky foods, they are eaten in large quantities and may furnish a considerable proportion of the total nutrients. This is especially true of vegetables, like potatoes, which contain large amounts of starch. Combined with concentrated foods, especially those which contain protein (eggs, cheese, meat, etc.), vegetables contribute to a well-balanced diet. They are also important for iron and other mineral matters. Vegetables owe their laxative properties in part at least to the mild organic acids they supply (as citric acid in tomatoes) and in part to their mineral salts. Vegetables, like fresh fruits, are an important source of vitamins and similar physiologically active substances.

From a number of statistics collected in connection with nutrition investigations conducted by the United States Department of Agriculture it appears that vegetables (other than dried legumes) furnish about 21 per cent of the total food, 6 per cent of the total protein, and 13 per cent of the total carbohydrates in the diet of the average American family. Their cost varies with the season, rarity, distance from market, and other factors. High-priced vegetables may increase the cost of living out of all proportion to the nutrients they furnish, though this use may be justified on the ground that they render the diet more attractive. A great variety of vegetables is probably not necessary to health, and the man of limited means may provide as wholesome a diet with the aid of seasonal inexpensive vegetables as one who can afford to purchase delicacies. Vegetables frequently stimulate the appetite for other foods. The variety of fresh vegetables eaten, as well as the quantity, has been increased in recent years, owing to increased facilities for growing out of season, marketing, transportation, and storage. Canned vegetables are essentially cooked vegetables in which fermentation is prevented by sterilization and the exclusion of air. Evaporated vegetables, which are also popular, especially for camps and expeditions, are practically concentrated foods which need only water and cooking. Many of them are used for soups, etc. Besides being used as food, various vegetables, e.g., tomato, onion, garlic, and garden peppers green and ripe (both sweet and sharp), are employed for flavoring and for garnishing. (See HERBS, CULINARY, AND SEASONING VEGETABLES.) Some, like potatoes, are used for the manufacture of starch.

Consult United States Department of Agriculture, Office of Experiment Stations, Bulletin 28 (revised), *Composition of American Food Materials* (Washington, 1899); Bulletin 43, *Losses in Boiling Vegetables* (ib., 1897); Farmers' Bulletin 121, *Beans, Peas, and Other Legumes as Food* (ib., 1900).

VEGETABLE SILK. See SILK.

VEGETABLE SPONGE. The netted fibrous interior of the mature fruit of several species of *Luffa*, more particularly of *Luffa ægyptiaca* and *Luffa acutangula*. See GOURD.

VEGETABLE TALLOW. See TALLOW TREE.

VEGETABLE TISSUE. The structural substance of plants. It is composed of cells which have a common origin and law of development and may consist of one or more of the tissue elements such as parenchyma and its various subdivisions and prosenchyma and its diverse forms.

VEGETARIANISM. The practice or doctrine of living upon foods obtained from the vegetable world, to the exclusion of animal food.

On physiological grounds it is urged that the formation of the teeth and the intestines in man prove that he was not intended to be a carnivorous but a fruit and vegetable eating animal. The length of the intestine shows him to be midway between the herbivora and the carnivora, and neither fitted for digesting grasses, which require a long intestine, nor flesh, which needs a short one, but nearer akin to the fruit-eating apes. It is maintained that a vegetable diet is best for man physically, intellectually, and morally; that with it life is longer, more enjoyable, and bodily strength and symmetry superior; that the use of animal food stimulates, begets a fierce disposition, and a carelessness about life; whereas a vegetable diet has very opposite effects. It is further contended that all the elements necessary for perfect nutrition are contained in vegetables, and that a proper dietary can be selected which is not open to objection on account of bulk. As to economy it is urged that a diet of meals and grain can be purchased for much less than one of meat, and confers more working power; that a given acreage of land will support more people if devoted to growing grain and vegetables than if used for the raising of cattle or sheep. On moral grounds it is contended that it is wrong to slaughter animals unnecessarily, and that the constant killing and eating of animals reacts unfavorably on man's higher nature. Lastly, it is pointed out that animal food is often the means of communicating disease to man, e.g., tuberculosis, trichiniasis.

Scientific opinion is not favorable to vegetarianism. The structure of man's stomach and intestines, and the variety of intestinal juices are held to prove that nature intended him for an omnivorous animal, his digestive organs being fitted to derive nourishment from every kind of food. The possession of biting, tearing, and grinding teeth (incisor, canine, and molar) is also suggestive. It has been a matter of almost universal experience that, although a vegetable diet may keep a man in apparent health for some time, it eventually results in loss of strength and general resisting power against disease. That a mixed diet (i.e., one including meat) enables the individual to do more physical work and increases the staying powers has often been proved. While there are some races that live almost exclusively on a vegetable diet, and others that exist wholly on animals (e.g., the Eskimo), it cannot for a moment be contended that these are the equals of peoples living on a mixed diet.

As a matter of fact vegetarians are apt to sup-

plement their diet with animal proteids—milk, eggs, cheese, etc. Of late years the vegetarian propaganda, for a long time based largely on moral, religious, or sentimental grounds, has sought the aid of science and has evinced a disposition to depart from sectarian and fanatical doctrines. As a curative agent a vegetable diet is sometimes indicated for longer or shorter periods; and the temperance practiced by the vegetarian in other directions is doubtless beneficial. Buttner describes a vegetarian as one who does not habitually make use of flesh food, in contradistinction to the habitual meat eater. Some experiments by Benedict and Roth, who used the resources of the Nutrition Laboratory of the Carnegie Institution at Washington, and of the Battle Creek Sanitarium, demonstrated that the basal gaseous metabolism, both in men and women vegetarians, did not differ markedly from that of nonvegetarians of similar height and weight, thus refuting the contention sometimes put forward by enthusiasts, that their chosen diet confers exceptional endurance and capacity for work. It also contradicts the belief that vegetarians live on a somewhat lower metabolic plane than flesh eaters. Consult: J. L. Buttner, *A Fleshless Diet; Vegetarianism as a Rational Dietary* (New York, 1910); Benedict and Roth, "The Basal Caloric Output of Vegetarians as Compared with that of Nonvegetarians of Like Weight and Height" in the *Proceedings of the National Academy of Science* (Washington, 1915); M. McI. Gillmore, *Meatless Cookery* (New York, 1914); H. W. Wiley, *Not by Bread Alone* (ib., 1915). See DIET.

VEGETATIVE PROPAGATION. One of the three ways by which plants produce new individuals. It is distinguished from reproduction by spores and by sexual cells in that only ordinary vegetative cells are involved. Historically it is the oldest method of reproduction among plants, but it is a very common method throughout the plant kingdom. In fact, any node of a vascular plant, when put in proper soil conditions, can strike root, which enables the branch developed by the bud to become an independent plant. Advantage is taken of this power of nodes in artificial propagation by cuttings, slips, layering, etc. Many plants, as the strawberry, develop special branches (stolons) which strike root; and most creeping plants multiply by producing new plants at the nodes. The term "brood bud" or "brood body" is often employed to designate the initial buds in such propagation.

VEGETIUS, vē-jē'shĭ-ŭs (FLAVIUS VEGETIUS RENATUS). A Roman military writer of the fourth or fifth century. He was the author of *Rei Militaris Instituta*, or *Epitoma Rei Militaris*, which rests on good sources. Although confused and unscientific the work is an interesting and valuable exposition of the Roman art of warfare. It is usually divided into four books, of which the first treats of the levying and training of recruits; the second, of the different classes into which soldiers are divided, and the organization of the legion; the third, of strategy; and the fourth, of the attack and defense of fortresses and of marine warfare. The work was much studied in the Middle Ages, and was then frequently translated. It has been edited by Schwebel (1767) and by Lang (2d ed., 1885). A work on veterinary art, entitled *Mulo Medicina*, is usually ascribed to the same author. It is printed in Schneider's *Scriptores Rei Rusticæ* (4 vols., Leipzig, 1797). Consult Seeck, *Die Zeit des Vegetius* (Berlin, 1876); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. iii (6th ed., Leipzig, 1913); M. Schanz, *Geschichte der römischen Litteratur*, vol. iv, part i (2d ed., Munich, 1914).

VEGLIA, vĕl'yȧ. An island belonging to the Province of Istria, Austria, situated southeast of Triest, in the Gulf of Quarnero, in the Adriatic (Map: Austria, D 4). Area, 145 square miles. It forms an administrative district with a population (1910) of 20,975. It has forests, and exports grain, wine, silk, and marble. The capital, Veglia, is on the southwest coast, and has a cathedral interesting for its architecture.

VEHMGERICHTE, fām'ge-rĭK'te, or **FEMGERICHTE** (Ger., tribunals of punishment). Westphalian courts of justice which had considerable influence in Germany during the latter part of the Middle Ages. They arose by natural development from the courts of freemen. When they had reached their fullest development the Vehmgerichte included a vast body of free judges (*Wissende*, i.e., initiated) who constituted a secret society, scattered all over Germany. They met sometimes in secret and received complaints, to answer which they had the right to summon any one in Germany, though the trial itself took place ordinarily in Westphalia only. The death penalty was inflicted by means of hanging. The chairman of these courts, which were to a great extent held in the open country, was known as the Freigraf, i.e., the free count. Their importance was due to the fact that in the time of turmoil and petty courts, controlled by robber barons, the Vehmgerichte were tribunals which at least made an effort to render impartial judgments. Consult: Thomas Lindner, *Die Veme* (Münster, 1888); Friedrich von Thudichum, *Femgericht und Inquisition* (Giessen, 1889); Thomas Lindner, *Der angebliche Ursprung der Vemgerichte aus der Inquisition* (Paderborn, 1890); Paul Wigaud, *Das Femgericht Westfalens* (2d ed., Halle, 1893).

VEI, vī, or VAI. A tribe of negroes on the west coast of Africa from Monrovia northward. They are the only negroes who possess a form of writing, developed by a native in the form of a syllabary by adaptations of Roman letters. They are pagans, of Mandingan race and speech. Consult Sir Harry Johnston, *Liberia* (London, 1906). See AFRICAN LANGUAGES, *Negro;* MANDINGO.

VEII, vē'yī. An ancient city, the Etruscan city nearest to Rome, and in early times its most formidable rival. Its site was at Isola Farnese, a village about 12 miles north of Rome. According to Roman historians the struggle between the two cities began as early as the time of Romulus, and continued under each of the kings, except Numa, and always to the advantage of the Romans. The Veientines had their revenge under Porsena (q.v.); but after his time, being repeatedly defeated, they had recourse to the plan of sheltering themselves behind their walls on the approach of the Roman legions, and of sallying out on predatory expeditions as soon as they had retired. To relieve the Republic from this annoyance, the Fabian clan, to the number of 306, with their followers, probably 10 times as numerous, undertook to garrison a fortress near Veii, and to act as a guard against the marauders. They were, however, enticed into an ambuscade, and

cut off to a man at the Cremera. (See FABIUS.) For the next 60 years hostilities often broke out, followed by ill-observed truces. At last the Romans determined to rid themselves of their rival by a siege. The city held out for 10 years, but was finally taken by Camillus (c.396 B.C.). After its fall it was gradually deserted; and although, in later times, a colony was planted there by Cæsar, and another by Augustus, it always remained an insignificant place. There are scanty remains of the Etruscan and also of the Roman city. Consult: L. Canina, *L' antica città di Veio* (Rome, 1847); George Dennis, *Cities and Cemeteries of Etruria*, vol. i (London, 1883); R. A. Lanciani, *Pagan and Christian Rome* (Boston, 1893).

VEIL (Fr. *voile*, Lat. *velum*, the former signifying sail as well as veil; and the latter, curtain also). A cloth, net, gauze, or lace head drapery worn by women and usually covering the face. The veil is symbolic of privacy of married life and of fidelity to the marital vows, as is illustrated among Christians by the phrase "take the veil" employed when a virgin becomes "the bride of Christ," otherwise a nun. When Mohammedan women go out in public, they protect the face from the gaze of strange men by a veil of muslin reaching to the feet, and leaving only the eyes exposed. When the women of ancient Rome married, they assumed a veil with red stripes. Among Spanish women the veil is almost as important a part of costume and of self-decoration and flirtation as the fan, inviting rather than repelling masculine attentions. Among other women of Europe and America, the veil is affected mostly by the fashionable, sometimes to protect the face from sun or wind or dust, but often for style or smartness only. Sacramental veils are those that cover the ecclesiastic vessels in the celebration of Holy Communion.

VEIL, GREMIAL. See COSTUME, ECCLESIASTICAL, *Vestments, Episcopal.*

VEIL, HUMERAL. See COSTUME, ECCLESIASTICAL, *Vestments, General;* HUMERAL VEIL.

VEILE, vā'y'-le. A port and the capital of the District of Veile in Jutland, Denmark, situated in a beautiful hilly and forested region, at the mouth of the Veile, and at the head of the Veile Fiord, 16 miles northwest of Fredericia (Map: Denmark, C 3). Fisheries principally engage the attention of the people. Pop., 1901, 14,592; 1911, 17,261.

VEILED PROPHET OF KORASSAN, kō'-rās-sän', THE. See HAKIM IBN ALLAH.

VEILLER, vāl'ẽr, LAWRENCE (?–). An American pioneer in housing reform. He published: *Housing Conditions and Tenement Laws in Leading American Cities* (1900); *Housing Reform, a Handbook for Practical Use in American Cities* (1910); *A Model Tenement House Law* (1910); *A Model Housing Law* (1914). With R. W. De Forest, he edited *The Tenement House Problem* (2 vols., 1903).

VEIN (OF., Fr. *veine*, from Lat. *vena*, blood vessel, from *vehere*, to carry, convey). In anatomy, a blood vessel which conducts the venous (or blue) blood from the capillaries back to the heart. The exceptions to this description are the pulmonary veins, which return the red, oxygenated blood from the lungs to the heart; the portal veins, which receive the blood from the pyloric, gastric, cystic, superior mesenteric, and splenic veins, and, entering the liver, break up into small branches which pass through all parts of that organ; and the umbilical veins, which convey the blood from the fœtus to the mother's placenta. The veins enlarge as they proceed, gathering blood from their tributaries, and finally pour it through the ascending and descending venæ cavæ into the right auricle of the heart. (See CIRCULATION.) Their coats are similar to those of the arteries, but much thinner, and even transparent. The internal coat consists of an epithelial layer, supported on several laminæ of longitudinal elastic fibres. The middle or contractile coat consists of numerous alternating layers of muscular and elastic fibres, the muscular fibres being disposed circularly round the vessel. The muscular fibres are wanting in some parts of the venous system, and specially developed in others. In the venæ cavæ and pulmonary veins near the heart, striped muscular fibres may be detected, continuous with those in the auricles. The external or areolar fibrous coat consists of connective or areolar tissue and of longitudinal elastic fibres; within some of the larger veins, as the inferior vena cava, through its whole length, the external iliacs, the azygos, etc., there is also a longitudinal network of unstriped muscular fibres. Valves are most numerous in the veins of the extremities, especially the lower ones, these vessels having to act against the force of gravity more than most others. They are absent in the venæ cavæ, the hepatic, portal, renal, pulmonary, and some other large veins, and in very small veins generally. The veins are nourished by nutrient vessels, or vasa vasorum, like the arteries; but except in a few instances (including the inferior vena cava), nerves are not distributed to them.

The chief diseases of the venous system have been already sufficiently described in the articles JUGULAR VEIN; PHLEBITIS, OR INFLAMMATION OF THE VEINS; PHLEBOLITE; PHLEGMASIA ALBA DOLENS, OR MILK LEG; THROMBOSIS; and VARICOSE VEINS.

VEINS. In geology, those mineral aggregates that have been deposited from solution or by sublimation in fissures or cracks and that consequently have a rather regular form with parallel walls. They are the work of underground waters and to some extent of the heated gases and vapors given off by uncooled igneous magmas in the depths of the earth. The minerals in veins include both metallic and nonmetallic kinds, the two being usually intermixed; the valuable ingredients constitute the ore and the rest is called the gangue. Veins vary in size from very small bodies that can be seen in a hand specimen to those hundreds of feet wide and reaching to unexplored depths in the earth. They constitute one of the more important types of ore deposits, and are sources of gold, silver, and other metals. See ORE DEPOSITS.

VEINSTONE, PHLEBOLITE, or PHLEBOLITH. A concretion sometimes found in obliterated veins and formed by the deposit of lime in the degenerated clot. See PHLEBOLITE.

VEIT, fīt, PHILIPP (1793–1877). A German historical painter, born in Berlin. First instructed by Friedrich Matthäi at the Dresden Academy, he continued his studies in Vienna until 1813, when he entered the German army, and fought in the War of Liberation. In 1815 he went to Rome, where he identified himself with the Nazarenes (see PRE-RAPHAELITES) and helped to decorate the Casa Bartholdi (frescoes

now in the National Gallery, Berlin) and the Villa Massimi. Among his other works at Rome were the "Triumph of Religion," in the Museo Chiaramonti, Vatican, and the "Immaculate Conception," in Trinità de' Monti. In 1830 he was appointed director of the Städel Institute at Frankfort. To this period belong the portraits of Charlemagne, Otho the Great, Frederick II, and Henry VII, for the Römer, and the great triptych in fresco, "Introduction of the Arts into Germany through Christianity," with "Italia" and "Germania" (1836, Städel Institute). In 1834 Veit resigned his position and in 1853 was called to Mainz as director of the gallery. To this period belong the "Two Marys at the Sepulchre"; the water-color "Frederick William of Prussia Awaiting the Last Judgment" (Berlin Gallery); the "Assumption" (1846, in the Liebfrauenkirche, Frankfort); and the cartoons for a cycle from sacred history for the cathedral at Mainz, subsequently executed by his pupils. Veit was less ascetic and possessed a stronger sense of color than his fellow Nazarenes, but remained all his life true to their principles. Consult Spahn, *Philipp Veit* (Bielefeld, 1901).

VEITCH, vēch, JOHN (1829–94). A Scottish philosopher and author, born in Peebles and educated at the University of Edinburgh. He served as professor of logic, rhetoric, and metaphysics at St. Andrews (1860–64), and as professor of logic and rhetoric at Glasgow from 1864 till his death. Among his works pertaining to philosophy are the *Memoir of Dugald Stewart* (1857); *Memoir of Sir William Hamilton* (1869); *Knowing and Being* (1889); and *Dualism and Monism* (ed. by R. M. Wenley, 1895). To general literature he contributed the excellent *Feeling for Nature in Scottish Poetry* (1887) and the still more valuable *History and Poetry of the Scottish Border* (1893). After his death his widow prepared for the press *Border Essays* (1896). Consult the *Memoir* by Mary R. L. Bryce (Edinburgh, 1896).

VEJER DE LA FRONTERA, vā-hâr′ dā lā frŏn-tā′rà. A town of the Province of Cadiz, Spain, on the right bank of the river Barbate, 28 miles southeast of Cadiz, and 5 miles east of Cape Trafalgar (Map: Spain, B 4). The surrounding country is covered with orchards and orange groves. Pop., 1900, 11,309; 1910, 13,388.

VELA, vā′là, VINCENZO (1820–91). An Italian sculptor, born in Ligornetto, Canton of Ticino, Switzerland. He studied under Sabatelli and Cacciatore at Milan, and was strongly influenced by Bartolini. In 1838 he took the first prize for sculpture at Venice, and at the Milan exhibition in 1851 gained immediate fame with his "Spartacus," now in St. Petersburg. In 1852 he became professor in the Academy of Turin, where he produced most of his important works, including many lifelike statues of prominent personages, such as Carlo Alberto (Royal Palace, Turin) and Cavour (Exchange Genoa); and harmoniously conceived ideal figures, of which the best known are "Harmony in Tears" (1855), for the tomb of Donizetti in Santa Maria Maggiore, Bergamo; "France and Italy"; "Primavera"; "Columbus and America," a colossal bronze group at Vera Cruz, Mexico; and "Desolation" (Lugano). His masterpiece is the "Dying Napoleon," at Versailles (replica in the Corcoran Gallery, Washington). Among his latest works is the Zolaistic relief "Victims of Toil" (National Gallery, Rome). Vela was one of the principal representatives of the Realistic school in Italy during the nineteenth century. Consult the monograph by Manzoni (Milan, 1906).

VELA′BRUM. A low, marshy district of ancient Rome between the Palatine and Capitoline Hills, reaching from the Vicus Tuscus to the Forum Boarium.

VELÁZQUEZ, or **VELÁSQUEZ,** vā-läs′kāth, DIEGO (c.1460–c.1522). A governor of Cuba, born in Cuéllar, Spain. He accompanied Columbus on his second voyage, and later participated in the conquest of Hispaniola. In 1511 Diego Columbus, Governor of Hispaniola, sent him with a force of 300 men to conquer Cuba. This, with the assistance of reinforcements brought by Pánfilo de Narváez (q.v.), he easily accomplished, and then threw off the authority of Diego Columbus. He founded Baracoa, Báyamo, Trinidad, Puerto Príncipe, Santiago de Cuba, Havana, and other places. In 1517 a slave-catching expedition which went out with his approval discovered Yucatan. In the following year Velázquez sent out an expedition under Juan de Grijalva, and when this commander brought back word of the riches of Mexico, he sent out the expedition under Hernando Cortés. Before Cortés sailed, Velázquez, fearing that he might prove too independent, revoked his commission, but Cortés disregarded his authority and went to Mexico. Velázquez later sent the force under Narváez to seize Cortés, but Cortés captured Narváez. Velázquez died shortly afterward, in 1522 or 1523, as a result, it is said, of vexation over the loss of his riches.

VELAZQUEZ (VELASQUEZ), DIEGO RODRÍGUEZ DE SILVA Y (1599–1660). The chief painter of the Spanish school, one of the greatest masters of all times. He was born at Seville, June 5, 1599, the son of Juan Rodríguez de Silva, of Portuguese descent, and of Doña Gerónima Velazquez, both of the petty nobility (hidalgos). After attending school till his thirteenth year he was apprenticed to the painter Herrera, but, unable to endure that master's ferocious temper, he left him after a year to study with Pacheco. From the former he acquired little besides a taste for genre subjects and a tendency towards naturalism, but with the latter he remained five years. Although a poor painter, Pacheco was an excellent teacher, and the influence of his sound precepts may be seen in the wonderful sureness of Velazquez's drawing and the thoroughness of his work.

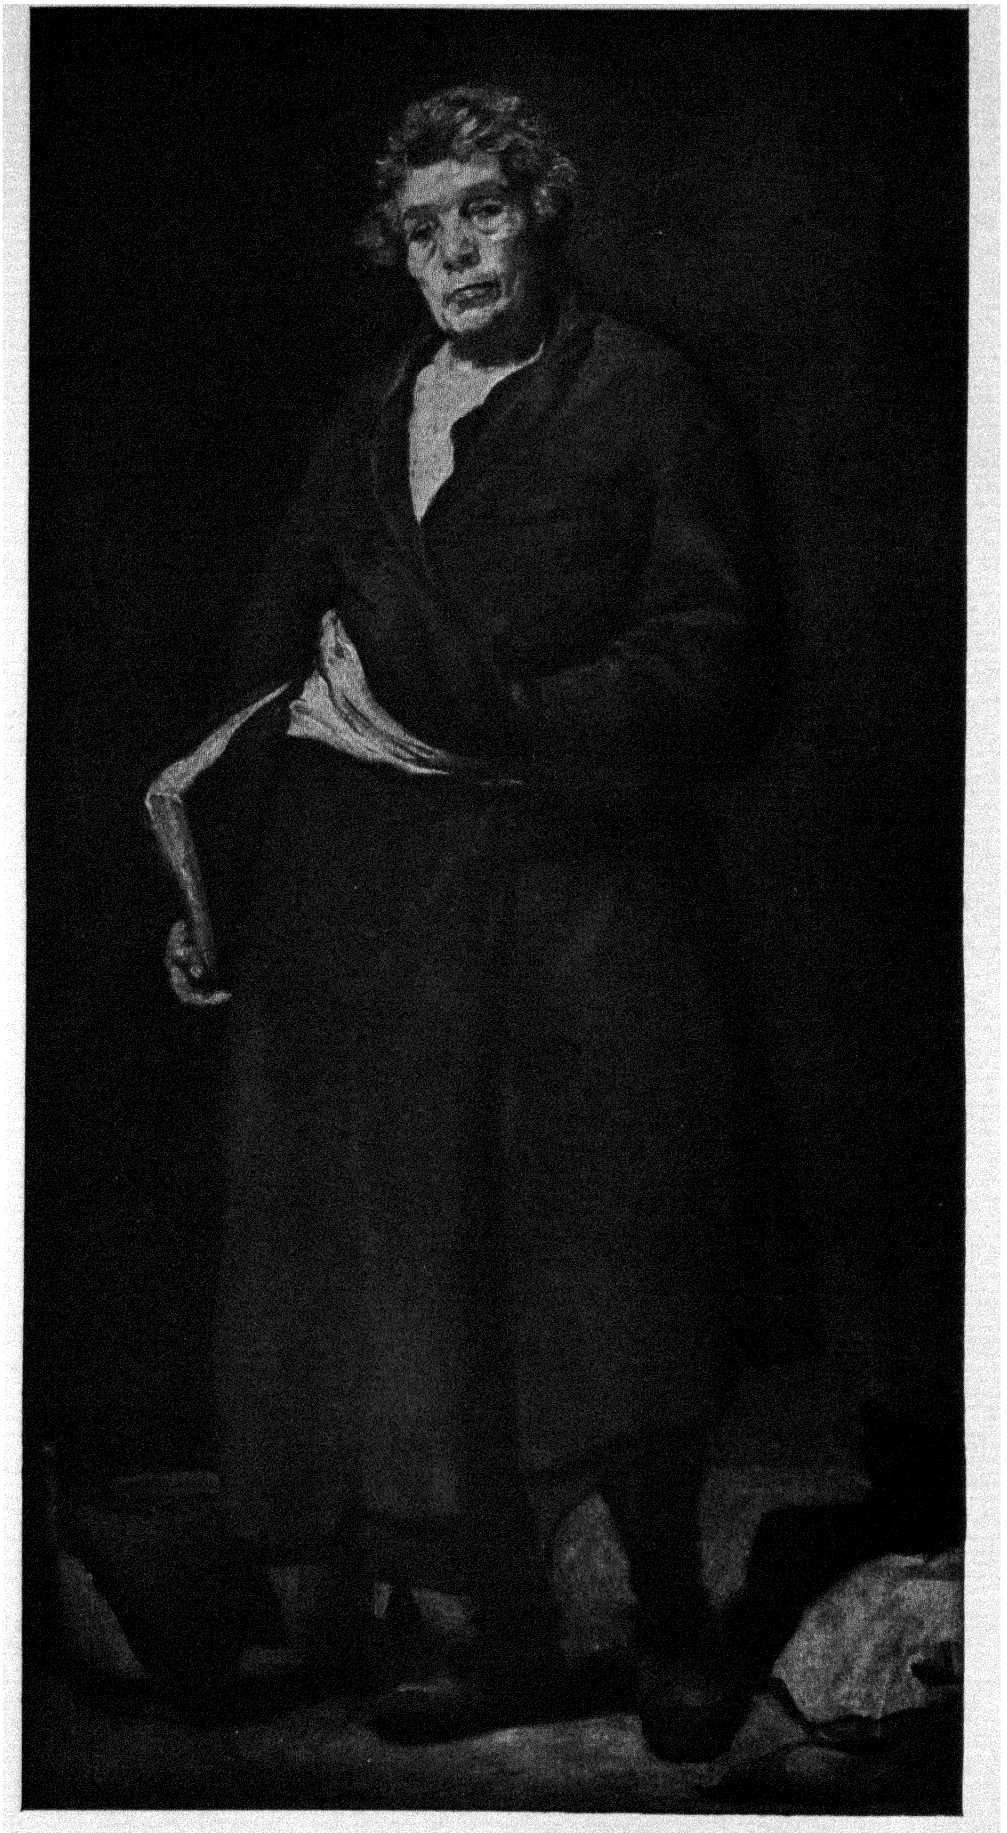
The earliest works of Velazquez are in the style of the Spanish Naturalists, and yield no evidence of the prevalent Italian influence. They show a sombre color scheme, vivid contrasts of light and shadow, sure but hard outlines, and trenchant Naturalistic characterization. With the exception of the single portrait of an unknown man in the Prado, Madrid, such as survive are genre and religious subjects, and the principal are the "Water Carrier of Seville" (Apsley House, London); "The Musicians" (Berlin); "Breakfast" (Hermitage, St. Petersburg); "Old Woman Cooking Eggs" (Sir Francis Cooke); "Adoration of the Magi" (Prado, Madrid); "Christ in the House of Martha" (National Gallery, London).

In 1618 Velazquez married Pacheco's (q.v.) daughter, and in 1622 he went for the first time to Madrid. Although he did not succeed at first in obtaining the royal patronage, he made the friendship of the Sevillian, Fonseca, Gentleman Usher to the King. His portrait of Fonseca won him the favor of Philip's all-powerful Min-

ister, the Count-Duke Olivarez, who, in 1623, summoned him to Madrid to portray the King. His success was such that he was appointed court painter, with the exclusive privilege of portraying the King, and given a pension and a studio in the Alcâzar. His success was insured by his brilliant victory in a competition with the three Italian painters in the King's service, the subject being "The Expulsion of the Moriscos" (1627), destroyed by fire.

From now on the life of Velazquez was spent in the service of the King. Most of the early portraits of his great patron, Olivarez, have disappeared. One is preserved in the well-known plate of Paul Pontius, with emblematic design by Rubens, and there is a full length in Dorchester House. The earliest surviving portrait of Philip IV is probably the bust (a study for the full-length portrait executed in 1623) in the Prado Museum. The full-length portrait of Don Carlos, Philip's brother (Prado), the finest of this period, was executed in 1627.

The visit of Rubens as ambassador of Isabella, Regent of the Netherlands, to Madrid in 1628, was not without influence upon Velazquez, for it was through Rubens's advice and intercession with the King that he obtained the coveted leave to visit Italy. Before his departure (1629) Velazquez executed the masterpiece of his early manner, the subject of which may betray Flemish influence, though this is not evident in the execution. In "Los Borrachos" (The Topers) (Prado, Madrid), more properly entitled "Bacchus," the wine god sits on a cask amidst a band of weather-beaten drinkers, crowning a soldier of the party with vine leaves. His figure is a wonderful example of the artist's treatment of the nude, while the expression and animation on the faces of the topers perhaps surpass anything else in this particular genre.



After a short stay in Venice, where he admired Titian and copied Tintoretto, he visited Ferrara, and in 1630 made Rome his headquarters. The Spanish Ambassador leased for him the Villa Medici, to which he was attracted by the antique statuary; delightful mementos of his own stay there are the two sketches of the Medici gardens (Prado). At Rome he learned the art of uniting harmoniously all the elements of a picture. The influence of Guido Reni and his school is evident in his chief picture of the period, the "Forge of Vulcan" (Prado), which shows great advance over his previous treatment of the nude in the five fine figures of the smithy, among whom Vulcan listens with indignant amazement to Apollo's account of his wife's follies. To the same period belongs probably the fine youthful portrait of himself in the Capitoline Museum, executed with a few masterly brush strokes. In 1630 Velazquez was summoned to Naples to portray the King's favorite sister, the Infanta María (Prado), who was about to become Queen of Hungary. While there, he probably met his compatriot Ribera, head of the Italian Naturalists.

For the next 18 years (1631–49) he remained in constant attendance on the King and was in the strictest sense a court painter. Philip IV was a mighty hunter; Velazquez portrayed him in a hunting costume, fowling piece in hand, with his favorite dog, as he did also his brother, the Cardinal-Prince Ferdinand, and Don Balthasar, his little son and heir, with two splendid dogs—all in the Prado Museum. No one painted dogs better than Velazquez. The "Boar Hunt" (National Gallery) and the "Stag Hunt" (Prado) show with admirable realism and fine landscape effect how such courtly pageants—for they were nothing more—were conducted.

To the fact that both the King and Olivarez were excellent horsemen we owe Velazquez's splendid series of equestrian portraits. No one could paint a horse better than he. It was always the heavy Andalusian breed, seemingly round and clumsy, but in reality as swift as they were strong. These are his most celebrated portraits. In the portrait of Philip IV (1635) the King and his horse move as one being in the impressive Castilian uplands. The Queen's horse moves with measured, stately tread, while Prince Balthasar gallops across the plain on his chestnut pony in the fresh spring morning. His green velvet jacket and his gold embroidered red scarf are fine bits of color in the green landscape, and the pony is foreshortened with such consummate skill as to present the outlines of a ball. Fourth in the great series is Olivarez, in shining armor, charging at full speed at the head of a troop of cavalry. Here, too, there is fine foreshortening—the horse gallops from us and we see the Duke's head over his shoulder. All of these august personages were of course painted many other times—the little Prince in his riding school (two copies in England) and as a suitor (Vienna and Buckingham Palace). During the King's military expedition to Aragon (1644) Velazquez painted him in brave military array, the gay colors of which form a pleasing contrast to the usual sombre hues of his costume.

Among other famous portraits of the middle period are those of "An Unknown Man" (Apsley House, London), the sculptor Martinez Montañez (Prado), the Duke of Modena (Modena Gallery), Don Antonio Pimentel (Prado), and Don Diego del Corral (Prado). Although he portrayed women less often than men, he did it with rare charm, as may be seen in the supposed portrait of Doña Juana Pacheco (Prado), a true Spanish type, and the "Lady with a Fan" (Wallace collection, London).

By superintending the decoration, Velazquez was of great assistance to Olivarez in the construction of Buen Retiro, a county seat designed to surprise the King. For it he painted his principal historical and perhaps most celebrated picture, the "Surrender of Breda," more widely known under the name of "Las Lanzas" (1639–41, Prado), the most decorative of all his works and unusually bright in color. The subject, an incident in the war against the Netherlands, furnished the occasion for an admirable contrast between the Germanic and Latin races from the point of view of the latter. Of the two religious pictures belonging to this period, the remarkable "Crucifixion" (Prado) depicts the youthful and symmetrical body of Christ upon the cross, in the midst of black space, but without any attempt to render the agony, which forms the chief theme of his "Christ at the Column" (National Gallery, London). The supposed influence of Tintoretto upon his work during this period is in reality to be ascribed to El Greco. This appears in his cool color schemes, use of silvery grays and carmines, and even the occasionally elongated form of the head and figure. Of the landscapes in the Prado attributed to him the "View of Saragossa," though touched up considerably by Velazquez, and the "Fortunes of Pamplona" are probably by his son-in-law Mazo.

VELAZQUEZ

"ÆSOP," FROM THE ORIGINAL IN THE PRADO MUSEUM, MADRID

On the fall of Olivarez, in 1643, Velazquez continued to portray and honor him, notwithstanding the general execrations. Nor did he lose the King's favor on this account, but as director of the partial reconstruction of the Alcâzar he received the coveted leave to revisit Italy in 1649. Most of his time was occupied with his task of buying paintings and statuary for the new apartments; but while in Rome he found time for two magnificent portraits—one of his slave, the mestizo Juan de Pareja (Earl of Radnor), a preparatory exercise for his portrait of Pope Innocent X in the Doria Gallery, Rome. One of his supreme masterpieces, it seems molded by a broad and masterly brush rather than painted, and it foreshadowed his third style, characterized by maximum effect with minimum effort, perfection of naturalism, and light effects to the point of optical illusion. A powerful study is in the Hermitage, St. Petersburg, and there are doubtful versions in the Gardner collection, Boston, and Apsley House, London.

Soon after his return to Spain, in June, 1651, Velazquez was appointed aposentador mayor (marshal of the palace), with a yearly salary of 3000 ducats and quarters in the Alcâzar. The position involved the grave responsibility of looking after the quarters of the royal family at home and on its numerous journeys. He had long administered the royal galleries, which owed their chief attractiveness to him. In 1659 he received the cross of Santiago, the highest honor attainable by a Spanish nobleman. As aposentador he arranged the Spanish part of the gorgeous festivities at the marriage by proxy of Philip's sister to young Louis XIV of France, on the Isle of Pheasants in the river Bidassoa, on the northern boundary of Spain. His exertions and responsibilities in this connection resulted in a fever, of which he died after his return to Madrid, Aug. 6, 1660. He was noble and courteous in manner, kind and generous in disposition, and loved by all. Among his pupils, the chief were his son-in-law Juan Bautista del Mazo, who succeeded him as painter to the King; Juan de Pareja, a former slave; José Leonardo, a more gifted pupil; Carreño de Miranda.

Among the many portraits of Velazquez's last period are those of Philip's last queen, Marianna of Austria (Prado and Vienna), in the absurd court costume of the day; the little Infanta Margarita (Louvre and Vienna); and Philip IV in his old age (Prado, National Gallery, etc.). The so-called "Las Meninas" (Prado) represents Margarita and her maids of honor being painted by Velazquez. The artist also appears in the so-called "Family of Mazo," a group of nine persons. "Las Hilanderas" (the Spinners, Prado) represents a scene in the royal tapestry manufactory with such consummate treatment of light and atmosphere, that, according to the painter Raphael Mengs, "it was not painted by the hand, but by pure force of the will." To this period also belong most of the portraits of the court fools, dwarfs, imbeciles, etc. (Prado), in which the painter has achieved an apotheosis of the ugly. Such are the jesters, known as "Barbarossa," "Don Juan de Austria," and "Pablillos de Valladolid"; the dwarfs, Sebastian de Morra and "El Primo"; the idiots, "El Bobo de Coria" and "El Niño de Vallegas." Perhaps in the same category belong two old beggars, whom the artist has dubbed "Æsop" and "Menippus"—wonderful examples of a broad treatment. Velazquez also attempted mythological subjects, among which were a rather unsuccessful "Mars" (Prado), the imaginative "Mercury and Argus" (Prado), and the beautiful and important "Venus with a Mirror" (National Gallery, London). Near the close of his life he painted two fine religious pieces (Prado): the dignified and noble "Coronation of the Virgin," in which, of all his works, the Italian influence is most predominant, and "The Anchorites," probably his last work, representing two gray-beards, Saints Anthony and Paul the Hermit, in a desolate landscape of sublime grandeur.

In the public collection of the United States Velazquez is represented in the Hispanic Society of America by portraits of Olivarez, Cardinal Pamfili, and a young girl, supposed to be the artist's granddaughter, all excellent examples; in the Metropolitan Museum, New York, "Christ and the Pilgrims of Emmaus" (an early work) and Philip IV of Spain (both in the Altman collection), and the Infanta María Teresa (Morgan collection); in the Boston Museum by "Don Baltazar Carlos and his Dwarf," and a doubtful Philip IV. He is also represented in several private collections including the Gardner collection, Boston, the Frick collection, New York, and the Widener collection, Philadelphia.

When the portrait of Juan Pareja was exhibited in the Pantheon at Rome, it was the general opinion of painters that "all else seemed painting, this alone truth." The work of Velazquez could not be better characterized, for it was perhaps the most consummate naturalism the world has ever seen. He made no imaginative effort, nor did he ever attempt to render a mental image, but painted only what he saw. He is the most objective of painters; the subject itself tells the whole story. This wonderful naturalism was achieved by his mastery of light, shadow, and atmosphere. In the purely technical qualities of painting he has never been surpassed, if, indeed, he has ever been equaled. His draftsmanship was firm, his modeling delicate, and he possessed a good knowledge of form. His subdued color scheme enabled him to use occasional patches of bright color with telling effect, and no man has ever rendered values more exactly. His brush was light and sure, never a stroke too many or too few. Small wonder, then, that he has been termed the painter's painter, "le peintre le plus peintre qui fût jamais," as Bürger puts it. His influence on the realistic and especially the impressionistic painting of the nineteenth century was wholesome and profound.

Bibliography. The chief historical sources for the life of Velazquez, besides the original documents, are his father-in-law's (Pacheco) *Arte de la pintura* (Seville, 1649); Palormino, *Museo pictórico* (Madrid, 1724; Eng. trans., 1739); and Bermúdez, *Diccionario* (Madrid, 1800). By far the best of the earlier works on Velazquez, and still authoritative on historical points, is that of Carl Justi, *Velazquez und sein Jahrhundert* (2 vols., Bonn, 1888; Eng. trans., London, 1889). The conceded authority on Velazquez is the painter A. de Beruete, whose monograph (London, 1906) is the best from a critical point of view. Consult also: Sir Walter Armstrong, *The Art of Velasquez*, and id., *The Life of Velasquez*, in "Portfolio Artistic Monographs," Nos. 28, 29 (New York, 1896); *Masters in Art*, vol. i (Boston, 1900), containing a bibliography; H. Stokes, *Velazquez and his Works* (London, 1902); R. A. M. Stevenson,

Velasquez, in "Great Masters in Painting and Sculpture" (ib., 1902); John La Farge, "Velasquez," in "Great Masters" (New York, 1903); Richard Muther, "Velasquez," in *Die Kunst*, vol. xxiii (Stuttgart, 1905); Walther Gensel, "Velazquez," in *Klassiker der Kunst*, vol. vi (ib., 1905); Hermann Knackfuss, "Velazquez," in *Künstler-Monographien*, vol. vi (Bielefeld, 1905); C. L. Hind, *Days with Velasquez* (New York, 1906); Calvert and Gallichan, *Velazquez* (ib., 1908); Aman-Jean, *Velazquez* (Paris, 1913); Randall Davies, *Velasquez* (London, 1914).

VELBERT, fĕl'bĕrt. A manufacturing town in the Rhine Province, Prussia, situated on a rocky elevation 15 miles northeast of Düsseldorf. Small iron and brass wares are produced, and cast iron articles and brick are shipped out. Pop., 1900, 16,689; 1910, 23,134.

VELDE, vĕl'de, VAN DE. A celebrated family of Dutch artists.—ESAIAS (1590–1630), born at Amsterdam, lived chiefly at Haarlem, and painted landscapes with figures, a favorite subject being attacks and combats of brigands.—JAN (c.1595–1652), probably his brother, was an engraver and etcher, a pupil of Matham, and a member of the Painters' Guild of Haarlem.—WILLEM the Elder (c.1611–93) was a marine painter, born at Leyden and chiefly active at Amsterdam. He was appointed by the States-General to sail with De Ruyter's fleet to commemorate the victories over the English. In 1675 he removed to London, having been appointed marine painter to Charles II, and afterward to James II. The Museum of Amsterdam and the gallery of Hampton Court are richest in his works.—His son and pupil, WILLEM the Younger (1633–1707), born at Amsterdam, was probably the foremost marine painter of the Dutch school. He studied also under Simon de Vlieger and, accompanying the Dutch fleets, created his best works in portraying their victories over the English. From 1679 until his death he lived in England. His pictures are perfectly executed, the tone is usually silver and gray, and a fine harmony pervades them. The English galleries and the Museum of Amsterdam are especially rich in his works, the latter possessing the "Cannon Shot." Thousands of his drawings survive, the Museum of Rotterdam alone possessing over 600.—ADRIAEN (1635–72), youngest son of Willem the Elder, was one of the principal animal and landscape painters of Holland. He was a pupil of his father and of Jan Wynants and was influenced by Potter and Wouverman. A little of the Italian influence is evident in his work. The figures in his landscapes are painted with great finesse, and he succeeded especially well in composition, and in the subtle gradation of neutral tints. Above 200 of his pictures survive. He was also one of the best etchers of the Dutch school. Consult: Franken and Van der Kellen, *L'Œuvre de Jan de Velde* (Amsterdam, 1883); Michel, *Les Van de Velde* (Paris, 1892); Wilhelm Bode, *Great Masters of Dutch and Flemish Painting* (New York, 1909); C. Hofstede de Groot, *Catalogue Raisonné of the Works of the Most Eminent Dutch Painters of the Seventeenth Century*, vol. iv (Eng. trans., New York, 1912).

VELDEKE, fĕl'de-ke, HEINRICH VON. A German poet of the twelfth century, whose home was near Maestricht, on the Lower Rhine. He is known as the father of Middle High German courtly poetry, for though he wrote in his native dialect, which had an excellent standing with the educated, his verses, with the exception of *Servatius*, were rewritten in the former idiom. The *Servatius* (Bormann's edition, Maestricht, 1858) is a weak rendering of the legend of St. Servatius. A more important work was the *Eneide* (editions: Ettmüller, Leipzig, 1852; Behaghel, Helbronn, 1882), rather closely following the French poem of Benoît de Sainte-More. He wrote also *Von Salomo und der Minne*. But it is from his lyrics that we learn his character. He took the last step in the introduction of pure rhyme into German poetry. Consult: Foa, *Enrico di Veldeke e la sua Eneide* (Parma, 1892); Kraus, *H. von Veldeke und die mittelhochdeutsche Dichtersprache* (Halle, 1899); and Scherer, *Deutsche Studien*, vol. ii, p. 71.

VÉLEZ, vā'lâs. A town of the Department of Santander, Colombia, 103 miles north of Bogotá (Map: Colombia, C 2). It produces a wide variety of fruits and is noted for its manufacture of sweetmeats and preserves. It is difficult of access and this fact made it of importance, as a place of refuge, during its early history. It was the second city founded in New Granada, dating from 1539. In the vicinity are many natural curiosities. Pop., 1912, 8637.

VÉLEZ DE GUEVARA, vā'lâth dâ gā-vä'rä, LUÍS (1579–1644). A Spanish lawyer, poet, dramatist, and novelist, born at Ecija, in the Province of Seville. He owed his position in the King's favor to the brilliance and wit with which he conducted his cases. He was long a member of the literary coterie of Philip IV, and became Court Chamberlain. Of his 400 plays (written in the style usual in Spain's Golden Age) the names of only some 80 survive. The best are two tragedies *Más pesa el Rey que la sangre* and *Reinar despues de morir* (perhaps the best ever written concerning the two heroic legends of which they treat), and the comedy *La luna de la sierra*. Guevara's most remarkable work, however, is the satirical novel *El diablo cojuelo* (1641), which served as the germinal idea for Lesage's *Diable boiteux*. Consult the edition by Adolfo Bonilla y San Martín, vol. ii of the *Sociedad de Bibliófilos Madrileños* (Madrid, 1910); Th. G. Ahrens, *Zur Charakteristik des spanischen Dramas im Anfang des XVII Jahrhunderts* (Halle, 1911).

VÉLEZ-MÁLAGA, vā'lâth-mä'lä-gä. A town of the Province of Malaga, Spain, 40 miles southwest of the city of Granada, on the left bank of the river Vélez (Map: Spain, C 4). The town is irregularly built on account of its uneven surface. The ancient Church of San Pedro is its most famous structure. The harbor is well protected and has an excellent anchorage. Raisins form an especial article of export, and the oil produced here has a ready sale in foreign markets. Municipal pop., 1900, 23,492; 1910, 24,140. Vélez-Málaga, called the key of Andalusia, was captured by Ferdinand the Catholic in 1487.

VEL'IGER (Lat., sail bearing). The free-swimming larval stage through which gastropod mollusks pass. The veliger is so called from two sail-like flaps (*velum*) on each side of the head, by means of which they move or rotate through the water. Each circular flap is edged with coarse cilia, by whose movements the larva is propelled. See MOLLUSCA.

VELIZH, vâ-lyĕzh'. A district town in the

Government of Vitebsk, Russia, situated on the Düna, 54 miles northeast of Vitebsk (Map: Russia, D 3). It manufactures brick, pottery, and leather. Pop., 1910, 15,778.

VELLA, vĕl'lȧ, GIUSEPPE (c.1750–1820). Chaplain of the Order of St. John of Jerusalem, known chiefly by his literary forgeries. He was born on the island of Malta. In 1782 he met at Palermo the Ambassador from Morocco to the court of Ferdinand I, Muhammed ibn Uthman, and accompanied him to the convent of San Martino. Having learned from Luigi Moncada that it was commonly believed in Sicily that there was an Arabic work of great importance in the convent library, Vella stated, after Muhammed's departure, that the visitor from Africa had found this work, containing a correspondence between the Arabic governors in Sicily and their sovereigns in Africa. Subsequently he announced that he had been in correspondence with Muhammed ibn Uthman, who had told him of a second manuscript, like the one in San Martino, which had been found at Fez, and later still had reported the discovery of another manuscript and a number of medallions corroborating the historical statements. Vella found a patron in Alfonso Airoldi, Archbishop of Heraclea (Torre di Capo Bianco), and judge of the apostolic legation and the Kingdom of Sicily. Under his auspices there appeared between 1789 and 1792 six volumes of the *Codice diplomatico di Sicilia sotto il governo degli Arabi.* To the alleged translation by Vella, Airoldi added an extensive introduction and notes. When doubts were expressed as to the authenticity of the original text, Vella published at Palermo in 1793 the first volume of the pretended manuscript, with the Italian translation, under the title *Kitab divan Misr* or *Libro del consiglio d'Egitto.* King Ferdinand I paid the expenses. Simone Assemani (q.v.) and Joseph Hager detected the imposture, and Vella himself finally confessed the forgery. He was sentenced in 1796 to 15 years in prison. Silvestre de Sacy has given an account of this extraordinary case in *Magasin encyclopédique,* V, tome 6, pp. 330–356; VI, tome 5, pp. 328–339.

VELLEIUS PATERCULUS, GAIUS. See PATERCULUS, G. V.

VELLETRI, vĕl-lā'trê. A city in the Province of Rome, Italy, situated on the slope of the Alban Hills, 26 miles by rail southeast of Rome (Map: Italy, D 4). The chief features include the seventeenth-century Cathedral of San Clemente, the see of a Cardinal-Bishop, the interior of the Palazzo Ginatti, and the public library with 36,000 volumes. An excellent quality of wine is produced here. Pop. (commune), 1901, 19,574; 1911, 21,843 (town, 19,834). Velletri, the Volscian *Velitræ,* was captured by the Romans in 338 B.C.

VELLORE, vĕl-lōr'. A city and military cantonment in the North Arcot district, Madras, British India, 80 miles west by south of the city of Madras, on the Palar River, here spanned by a handsome bridge (Map: India, D 7). One of the Hindu temples is noted for its magnificent sculptures and carvings. The eleventh-century fort is of considerable historic note, the mausoleums containing the remains of the family of Tippu Sahib. There is also an American missionary college. The manufacture of perfumery is the leading industry. Pop., 1901, 43,537; 1911, 45,863.

VELLUM. See PARCHMENT AND VELLUM.

VELOCIPEDE. See BICYCLE.

VELOCITY (Lat. *velocitas,* from *velox,* swift; connected with *volare,* to fly), LINEAR. A term used in mechanics (q.v.) to express linear speed in a particular direction, linear speed being the distance a particle goes in a unit of time if the motion is uniform, or the distance it would go in the next unit of time if during that time its motion were not to change. A particle moving northward with a speed 10 is said to have a velocity 10, north. A linear velocity has evidently the same properties as a straight line of definite length drawn in a definite direction, viz., direction and numerical value; therefore, a velocity is a vector quantity and can be pictured by such a line. (See VECTOR.) Angular velocity is angular speed around a particular axis, angular speed being the angle rotated through by a body turning on an axis in a unit of time if the angular motion is uniform; or, if the motion is irregular, the angle which would be turned through in the next unit of time if the motion were to remain unchanged for that length of time. To express the angular velocity of a body three things are necessary: a line to coincide with the axis, this line to be pointed in such a direction as to indicate the sense of the rotation—right or left handed—and the line to have a length equal or proportional to the angular speed. A straight line like this, of a definite length, direction and position, is called a rotor or a localized vector.

VELOCITY OF LIGHT. This quantity through the efforts of many experimenters has been determined with a high degree of precision and plays an important part in both theoretical and practical optics and astronomy. The values obtained by various experimenters are given in the following table:

	Kilometers per second
Foucault, 1862	298,000
Cornu (1), 1874	298,500
" (2), 1878	300,400
Cornu, discussed by Listing	299,990
Young and Forbes, 1880–81	301,382
Michelson (1)	299,910
" (2)	299,853
Newcomb (selected results)	299,860
" (all results)	299,810

A detailed description of the methods will be found in the article LIGHT in the paragraph on *Velocity of Light.* Consult: Cornu, in *Reports of International Congress of Physics* (Paris, 1900); Thomas Preston, *Theory of Light* (3d ed., London, 1901); and A. A. Michelson, "The Velocity of Light," in *Decennial Publications University of Chicago,* vol. ix (Chicago, 1902).

VELOCITY OF PROJECTILES, ETC. See BALLISTICS.

VELPEAU, vĕl'pō', ALFRED ARMAND LOUIS MARIE (1795–1867). A French surgeon. Born at Brêche (Indre et Loire), he studied medicine at Tours and Paris (M.D., 1823) and settled in the French capital. There he was connected with several hospitals, and was professor of clinical surgery in the Faculty of Medicine (1834–67). In 1842 he became a member of the Institute. Although he made no great discoveries in surgery, he gained a lasting influence as writer and teacher. His principal works are: *Traité d'anatomie chirurgicale* (1825); *Traité complet de l'art des accouchements* (1829; 2d ed., 1835; Eng. trans., Philadelphia, 1831); *Nouveaux éléments de médecine opératoire* (1832; 2d ed., 1839; Eng. trans., 1847); *Traité des maladies du*

sein (1853; 2d ed., 1858), based upon a personal experience covering 2000 observations.

VELVET (It. *velluto*, Fr. *velours*, Ger. *Sammt*). Velvet, like damask, is primarily a silk weave developed on the shuttle loom in China. (See SILK.) The pile surface is formed by an extra set of warp threads looped over wires, so that the loops rise in relief. When the pile is to be a cut pile the wires have a knife at the end which cuts the loops as it is withdrawn. Plain velvets have a uniform surface of cut pile of solid color. The more elaborate figured velvets can be profitably made only on hand looms. Many of them have pile figures that contrast boldly with flat satin, twill, or taffeta ground. Some of the early Venetian velvets had figures still further elaborated by cutting the pile two different heights. The Genoese velvets were distinguished for contrasts of cut with uncut pile. Plain velvets are often woven double on the machine loom, without wires, the pile being formed by special warps that pass back and forth between the upper and the lower parts of a double cloth. The cutting of this common pile produces two velvets with a minimum of effort, and some of these double-woven velvets, by a process originated and developed in America, have figures produced by bringing only part of the pile warps to the surface in the ground. The result is a two-tone velvet, suggesting damask as closely as a cut-pile surface can suggest a flat surface. Velvets are also figured by printing and embossing after the fabric leaves the loom. See PLUSH.

VELVET ANT. Any one of the hymenopterous insects of the family Multillidæ. They resemble the true ants in general shape, but lack the scale on the peduncle of the abdomen. They do not form communities and are more closely allied to digger wasps than to ants. The body is often clothed with hairs, hence the name velvet. The hair is frequently bright colored, in some species red, contrasted with black. The males only are winged. There are about 160 North American species, most numerous in the South, the largest of which is the Texan horse ant, or cow killer; it burrows in the ground and provisions its tunnels with insects. Velvet ants sometimes enter bee hives and do considerable damage. Other species have been found in Europe in the nests of bumblebees, and in the United States in the nests of certain burrowing bees. Probably all the velvet ants are parasitic in this way. Many of the females stridulate. These insects sting viciously. See HORSE ANT.

VELVET BEAN. *Stizolobium deringianum* and several allied species, important annual leguminous plants extensively grown in Florida and the Gulf States, as well as in many tropical countries for forage, as cover crops, and for soil improvement. The Florida velvet bean, which is the best known, is a rapidly growing long-season vine with numerous purple flowers which are succeeded by black velvety pods, 2 to 4 inches long, each containing two to five marbled or speckled seeds. There are a number of other species which have pubescent but not black velvety pods. They differ also in the color of the beans and length of growing season. Formerly the velvet beans were included in the genus *Mucuna*, the species of which have woody perennial stems.

VELVET GRASS. See SOFT GRASS.

VELVETLEAF. See CISSAMPELOS; SIDA.

VENABLE, vĕn'ȧ-b'l, FRANCIS PRESTON (1856–). An American chemist and educator, born in Prince Edward Co., Va. He graduated at the University of Virginia in 1879; studied at Bonn, and at Göttingen (Ph.D., 1881); and in 1880–1900 was professor of chemistry at the University of North Carolina. This institution he served as president from 1900 to 1915, when he resumed his work as a professor. Venable was president of the American Chemical Society in 1905. His larger works include: *Manual of Qualitative Analysis* (1883); *Short History of Chemistry* (1894); *Development of Periodic Law* (1896); *Inorganic Chemistry According to Periodic Law* (1898), with J. L. Howe; *Study of the Atom* (1904).

VENA'TIO. See CIRCUS; GLADIATOR.

VENA'TION (from Lat. *vena*, leaf). The arrangement of veins in foliage leaves. The venation is very important in determining the general contour and margin of the leaf, and it is so consistently developed in different groups that it furnishes important characters in classification. See LEAF.

VENDÉE, vän'dā'. A department of west France, forming a part of the former Province of Poitou, and lying on the Bay of Biscay (Map: France, N., D 6). Area, 2690 square miles. The surface is low and marshy along the coast, becoming hilly and wooded in the east. The department is essentially agricultural, though considerable quantities of coal and salt are produced. Nearly the whole area is arable, though much is in pasture land, and large numbers of cattle are raised. The normal wheat crop amounts to over $7,000,000 annually, and the production of oats, potatoes, and beets as well as of wine is also considerable. Pop., 1901, 441,311; 1911, 438,520. Capital, La Roche-sur-Yon.

During the French Revolution the Vendée and the neighboring regions (Poitou, Anjou, Brittany) were the scene of a great Royalist uprising of the peasants, who were actuated in part by religious motives. The immediate cause of the insurrection, which broke out in March, 1793, was the proposed levy of 300,000 men by the Revolutionary government. The war was characterized by frightful massacres; villages were ravaged and burned, and prisoners tortured and killed. The officers sent by the Convention were wholly incompetent and there was a lack of unity of action and definite plans, with the result that the Vendeans under Cathelineau, Larochejacquelein, and Charette de la Contrie (qq.v.) were at first almost universally successful. In the fall of 1793, however, a more vigorous campaign was inaugurated on the part of the government. The Vendeans suffered a great defeat at Le Mans on December 12 at the hands of Westermann and Marceau, and a few days later sustained another blow at Savenay. The backbone of the insurrection was broken. Frightful atrocities were perpetrated at Nantes by the orders of Carrier, the deputy of the Convention (see CARRIER, J. B.), and Turreau with his "infernal columns" laid waste the rebellious districts. Charette and other Vendean leaders made terms with the Convention in 1795. The war was, however, soon renewed, but order was finally restored by Hoche in 1796, although the complete pacification of the region was not effected until several years later. (See CHOUANS.) In 1815, during the Hundred Days, there was a Vendean insurrection against Napoleon, and in 1832 an abortive attempt was made to excite a rising in favor of the Duchess of Berry.

VENDÉMIAIRE, vän'dā'myâr' (Fr., from Lat. *vindemia,* vintage, from *vinum,* wine + *demere,* to remove, from *de,* down, away + *emere,* to take, buy). The first month in the French revolutionary calendar. It ran from September 22 to October 21 in the years I–III and V–VII; from September 23 to October 22 in the years IV, VIII–XI, XIII, and XIV; and from September 24 to October 23 in the year XII.

VENDET'TA (It., feud, vengeance). A family feud, having for its object blood revenge for an injury by the nearest of kin. The next of kin of the dead assume responsibility for punishment, but if the offender escapes, his nearest relatives are held responsible. Families have been in a state of siege often for years. The vendetta is held by the Corsican to be one of the most positive of family obligations. Sometimes the feuds are harmonized by mediators (*paro-lanti*) and an oath is taken to forego vengeance. Private wars for blood revenge have characterized barbarism and the early stages of civilization among many peoples, but, owing to the isolation of Corsica and its peculiarly primitive social conditions, the practice has survived there in its completeness. An analogous custom is found among mountaineers of eastern Kentucky and Tennessee and western Virginia, who have reverted to many primitive customs under the influence of isolation. In Montenegro and among the Albanians, Bedouins, Druses, and many less civilized peoples this is found in a greater or lesser degree. The vendetta seems to have its origin in the idea of clan or tribal responsibility and patriarchal rule, preceding the development of the state and of a system of public justice. See AVENGER OF BLOOD; BLOOD FEUD.

VENDÔME, vän'dôm'. The capital of the arrondissement of Vendôme, in the Department of Loir-et-Cher, France, on the right bank of the Loir, 20 miles northwest of Blois (Map: France, N., G 5). The town is attractive for its charming specimens of architecture. The church of the Trinity (12th–15th century) has a remarkable transition belfry and a fine Flamboyant façade. The ruins of the Renaissance abbey (1030) to which it belonged lie near. La Madeleine has a stained-glass window (1529) and a handsome spire. On the left bank of the Loir are the ruins of the eleventh-century castle of the counts of Vendôme. There are a hôtel de ville, a museum, a library rich in manuscripts, a lyceum with a flamboyant chapel (1623–39), and a bronze statue of the poet Ronsard. The manufactures are gloves, cotton goods, leather, and cheese. Pop., 1901, 9457; 1911, 9804. Christianity was introduced here as early as the fifth century. The Dukedom of Vendôme was created by Francis I for a prince of the Bourbon family in 1515. It finally fell into the hands of Henry IV. He bestowed it on one of his natural sons, who founded the house of Vendôme.

VENDÔME. A noble house of France, founded by César, a son of Henry IV of France, by Gabrielle d'Estrées, who was legitimatized. César, born in 1594, received the Duchy of Vendôme in 1598, and under Louis XIII played a conspicuous part in politics as one of the most inveterate intriguers against Richelieu, suffering, in return, imprisonment and exile. After joining the party of the Fronde against Mazarin, he made his peace with the court and fought against his former friends. He became Admiral of France, and in 1655, the year of his death, defeated the Spanish fleet before Barcelona. His son Louis (1612–69) became Viceroy of Catalonia, married Laure Mancini, one of the nieces of Mazarin, and after her death, in 1656, entered the Church and rose to be Cardinal. Louis left two sons, Louis Joseph, Duke of Vendôme (q.v.), and Philippe (1655–1727), the last of the line. The latter entered the Order of the Knights of Malta, and became grand prior. In the wars of Louis XIV he attained the rank of lieutenant general.

VENDÔME, PLACE. A square in Paris, laid out under Louis XIV. It has borne the names Place des Conquêtes, Place des Piques, and Place Vendôme (from a former palace of the Duke de Vendôme). In it stands the Vendôme Column, built at the command of Napoleon, in 1806–10, to commemorate his 1805 Russian victories. This column is of masonry, incrusted with bronze plates obtained by melting down 1200 captured cannon. These plates, in a spiral nearly 300 yards in length, picture scenes of that campaign. The column is 142 feet high, and was designed by Denon, Gondouin, and Lepère, after Trajan's Column at Rome. In May, 1871, the column was thrown down by the Communists. The fragments, however, were preserved, and in 1875 it was reërected, with slight alteration, upon its original site.

VENDÔME, FRANÇOIS DE. See BEAUFORT, DUC DE.

VENDÔME, LOUIS JOSEPH, DUKE DE (1654–1712). A French general, the son of Louis, Duke de Vendôme. He was born in Paris, July 1, 1654, served during the Dutch campaign of 1672, and afterward under Turenne in Germany and Alsace, and under Créqui in Flanders. After the Peace of Nimeguen (1678) he retired to his château of Anet, near Dreux, until the outbreak of war in 1688. He fought under Luxembourg in the Low Countries, and later commanded the left wing of Catinat's army at the battle of Marsaglia (Oct. 4, 1693). In 1695 he was assigned to the head of the army in Catalonia, and achieved a series of brilliant successes, closing with the capture of Barcelona. After the outbreak of the War of the Spanish Succession he succeeded Villeroy in Italy (1702), won the victories of Ustiano and San Vittoria, and compelled the temporary retirement of Prince Eugene. In 1703 he carried on a successful campaign against the Austrians, and in the summer of 1706 he was recalled to supersede Villeroy in the Low Countries. His quarrels with the Duke of Burgundy, who had received a command under him, led to the defeat of the French at Oudenarde (q.v.). After the capitulation of Lille he was recalled. In 1710 Vendôme was sent, at the urgent request of Philip V, to Spain, where the British and Austrians were carrying all before them. His appearance brought together a numerous army of volunteers, and Philip was restored to his capital before the close of the year. Stanhope and the British troops were defeated at Brihuega, December 9, and on the following day Starhemberg and the Austrians were routed at Villaviciosa. The King raised his deliverer to the rank of a prince of the blood royal. Vendôme was an excellent soldier and a man of keen intellect, but indolent and grossly immoral. He died at Vinaroz, Catalonia, June 15, 1712. Saint-Simon, in his *Mémoires,* gives a highly

colored and unfriendly picture of the man. Consult also De Bellerive, *Les dernières campagnes de Louis Joseph de Vendôme* (Paris, 1714), and Voltaire, *Le siècle de Louis XIV*.

VENDOR'S LIEN. In the law of real property, the right of the vendor to compel a sale of the property to satisfy the unpaid purchase price, or any balance thereof. This right is of equitable origin and is effective against subsequent purchasers with notice, as well as others who, with either actual or constructive notice of the vendor's rights, acquire an interest in the land. The most effective way of giving notice to the public is to begin an action in equity to enforce the lien, and at the same time file a lis pendens (q.v.) against the property. It does not actually become a specific lien against the property until its existence and validity are established by the decree of a court. This lien may be waived by taking security on which a third person is liable, but not by merely taking a note or other obligation of the vendee alone. In code states the common method of enforcing a vendor's claim for unpaid purchase money is by a single action in equity to enforce the lien and incidentally to recover the amount due. In the law of sales of personal property the term is employed to denote the right of a seller of goods and chattels to retain possession thereof until the purchase price is paid, where no credit is given, even though the title has passed to the purchaser. In some states the seller is given the right to sell and apply the proceeds to the payment of the purchase price without further formality. See STOPPAGE IN TRANSITU; LIEN; SALE.

VENEER. Pieces of richly grained or colored wood, often as thin as paper, glued to furniture and woodwork to produce a surface more beautiful than that of the wood forming the frame. Sometimes the veneer is applied in large sheets, as in Empire furniture; sometimes in tiny pieces cunningly fitted together in floral and other decorative forms, as in Dutch and French marquetry. See MARQUETRY.

VENER, LAKE. See VÄNER, LAKE.

VENERABLE BEDE. See BEDE.

VENEREAL (vē-nē'rē-*a*l) **DISEASE.** See GONORRHŒA; SYPHILIS; HYGIENE, *Military Hygiene*.

VE'NESEC'TION (from Lat. *vena*, blood vessel + *sectio*, a cutting, from *secare*, to cut), PHLEBOTOMY, BLOODLETTING, or BLEEDING. An incision into a vein for the abstraction of blood. Although the operation may be performed on many of the superficial veins, it is usually restricted to the median basilic vein at the bend of the elbow. While venesection was extensively practiced everywhere up to the middle of the nineteenth century, it is now practically obsolete, though there has been a tendency to revive its application in a few diseases and conditions, notably in the first stages of lobar pneumonia. Other conditions benefited by venesection are active congestion with hæmorrhage, especially when occurring in the lungs and brain, i.e., pulmonary and cerebral hæmorrhage. The value of bleeding in eliminating toxins from the blood has been pointed out by Maragliano; and Bouchard has shown that 500 grams of blood abstracted from the vein of a patient suffering from uræmia contains 8 grams of extractive matters—approximately equivalent to the amount thrown off by the kidney in 24 hours. A large amount of blood, 1000 c.c. or more, may be withdrawn, if it is replaced by an infusion of normal saline solution. Consult H. Stern, *Theory and Practice of Bloodletting* (New York, 1915).

VENETIAN (vē-nē'shan) **SCHOOL OF PAINTING.** One of the most important of the Italian schools. It excelled all others in color. Bright without being gaudy, always harmonious, and with full allowance for all the subtle effects of light and shade, Venetian color has never been surpassed. All other qualities, such as form, ideas, illustration, were subordinated. The Venetian dealt with the beautiful only as it appealed to the eye, with the fullness of material life, with purely pictorial effects. He tended to avoid dramatic action and to portray restful subjects fraught with the joy of living. Even his religious subjects were worldly, the figures being Venetian nobles. He especially delighted in the pageantry of the powerful Venetian state and in mythological representations. He also brought the landscape, though used primarily as a background, to high perfection.

The color note in Venetian painting is chiefly due to its Byzantine origin, and was promoted by the gorgeous play of natural color in the island city. Until far into the fifteenth century the Byzantine style of painting with gold backgrounds and stiff hieratic figures prevailed. The first painters to show emancipation were the so-called Vivarini (q.v.) family of Murano. Through the more important family of the Bellini the Paduan influence entered Venetian painting. Giovanni Bellini (1430?–1516) first evolved the essentially Venetian style and trained the succeeding generation. Of his pupils, Giorgione (1478–1510) introduced the high Renaissance and Titian (1477–1576) achieved the most perfect flower of Venetian painting. During the sixteenth century, while art declined elsewhere, it produced at Venice such geniuses as Tintoretto and Paul Veronese. It flourished even in the seventeenth century, and during the eighteenth flowered in Tiepolo. From the early sixteenth century Venetian painting dominated the painting of the tributary cities of the mainland, such as Brescia, Bergamo, and Verona. It also influenced practically all other European schools—Spanish and Flemish during the seventeenth century, and English during the eighteenth century through Reynolds. For a more detailed account of the history, see PAINTING, *Renaissance*, the articles on the individual artists mentioned.

Bibliography. Bernhard Berenson, *Venetian Painters of the Renaissance* (New York, 1898); E. M. Phillipps, *The Venetian School of Painting* (London, 1912); Crowe and Cavalcaselle, *History of Painting in Northern Italy*, ed. by Borenius (ib., 1912–13); the standard and most detailed history is L. Testi, *Storia della pittura veneziana* (Bergamo, 1909, 1915); for the origins, Paul Flat (Paris, 1899) and Lionello Venturi (Venice, 1907).

VENEZUELA, vĕn'ē-zwē'lȧ, *Sp. pron.* vā'nȧ-thwā'lȧ *or Amer. Sp. pron.* vā'nȧ-swā'lȧ (It., Little Venice, so called from the pile dwellings seen by the early explorers on the Maracaibo). A republic on the north coast of South America. Its area is estimated at 393,976 square miles.

Topography. Venezuela is divided into four topographical regions: (1) the mountainous district of the northwest and north; (2) the Maracaibo region; (3) the *llanos;* and (4) the Guiana highlands. The mountains of the first region may be classed under two great systems.

The first, the Venezuela Andes, starts from the Nido de Pamplona in Colombia and runs northward in two branches. The westernmost, passing directly north, forms the boundary between Colombia and Venezuela and ends in the Goajira Peninsula, its highest point being in the Sierra de Perija (10,000 feet); the other runs to the northeast, subdividing north of the highlands of Trujillo into the two chains of the Coro system. This eastern range has the loftiest mountains of Venezuela, with five peaks above the limit of perpetual snow, the highest, the Sierra Nevada de Mérida (Picha Concha), attaining an altitude of 15,400 feet. The eastern range of the Venezuelan Andes is separated by the valleys of the Yaracui and Cojede rivers from the Caribbean Mountains—the other system of this region—which run eastward from Lake Maracaibo, with a break at the plain of Barcelona, to the Paria Peninsula. These mountains form two parallel ranges—the Coast Range (Sierra de Mar) proper (in many places rising precipitously from the sea), and a somewhat more southerly range, paralleling it about 30 miles distant. Between these two ranges run spurs inclosing valleys and lakes, of which Lake Valencia is the most important. The western portion contains the highest peaks—Naiguata (9127 feet) and Silla; the largest peak of the eastern portion is Turumiquire.

The Maracaibo region lies between the two ranges of the Venezuelan Andes, and comprises Lake Maracaibo and the surrounding lowlands. The chief agricultural districts of the Republic are found in the Maracaibo and the mountainous regions. The *llanos* (q.v.) extend south and southeast from the Cordillera and Caribbean systems to the Orinoco River. This vast region consists of grassy plains, reaching to an altitude of about 650 feet, broken here and there by trees along the river courses. It is largely unexplored and the chief occupation of the inhabitants is cattle raising. The Guiana highlands, the fourth region, belong topographically to Guiana, and consist of plateaus (about 1000 feet above the sea) and generally low mountains, which reach in Roraima an altitude of over 8000 feet, and are varied by open areas and forests. This region is largely unexplored. A considerable part of the Brazilian boundary is formed by the Parima and Pacaraima mountains. There are no active volcanoes among the mountains of Venezuela, but destructive earthquakes are common. Carácas, La Guaira, Barquisimeto, and Mérida were destroyed by earthquake in 1812, and other severe disturbances occurred in 1868 and 1894. The coast line of Venezuela is some 1700 miles long, with numerous gulfs and bays, of which Maracaibo, Paria, and Coro are the most important. The north coast is generally short and steep, but the plains of Maracaibo and Coro are low and in some places marshy. Of the numerous islands belonging to Venezuela, Margarita (q.v.) is the only one of importance.

Hydrography. The fluvial system of Venezuela, with six rivers navigable for large vessels, is probably the most important of South America. Of its 1000 or more streams the larger number are affluents of the Orinoco (q.v.), which, with its great tributaries—the Apure, Meta, and Negro (the latter united by the Cassiquiare to the Amazon system)—forms the great outlet for the interior of Colombia, as well as of Venezuela. The other important drainage areas are those of the Caribbean Sea, of Lakes Maracaibo and Valencia, and the Gulf of Paria. In addition to the lakes mentioned, there are about 200 others of small importance. Few countries are so well watered as Venezuela.

Climate. The climate of Venezuela is affected more by the altitude than by the latitude, and the country, though in the tropics, is divided into hot, temperate, and cold zones. The hot zone, or the *Tierra caliente*, ranges from the sea level to an elevation of 1915 feet. It has a mean annual temperature varying from 74° F. to 91° F. The heat of the coast region is tempered by the trade winds. Scattered cases of yellow and pernicious fever occur in this region, especially around Lake Maracaibo, but epidemics are unknown. On the llanos the rainy season—from April to October—is likely to engender fevers, but in general the warm lands of Venezuela are fairly healthful, much more so than most portions of the Caribbean coast. The temperate zone, or the *Tierra templada*, lies between 1915 and 7030 feet above the sea level. It extends broadly from the limit of the cocoa palm and cacao to that of the banana and sugar cane, and has a delightful and salubrious climate. The rainy and dry seasons divide the year here as in the lower zone, but with much less definiteness. The mean annual temperature ranges from 50 to 77 degrees. Above an altitude of 7030 feet is the cold zone, or *Tierra fria*, with a mean annual temperature ranging from 60° to 0° F. The line of perpetual snow begins at about 14,000 feet.

Flora and Fauna. In a general way the flora may be said to resemble that of Brazil, with a wide variety on account of the presence of lofty mountains. Extensive forests of full tropical luxuriance, overgrown with air plants and lianas, and harboring many vegetal types of striking appearance and economic importance (lignum-vitæ, brazilwood, coral trees, numerous palms, etc.), are found on the slopes of the northern mountains and in the south and southwest near the Brazilian and Colombian borders. Above 3000 feet begins the plant life of the temperate zones. The llanos are generally covered with long grass, interspersed near the marshy regions with clumps of trees; but in the dry districts cactus, agave, and hardy shrubs are found. Mangrove swamps are common at the mouth of the Orinoco. The forest products comprise rubber, vanilla, brazilnuts, tonka beans, various fibrous plants, dye and cabinet woods, and drugs, but as yet the forest wealth of the country is little utilized. The fauna includes the various species of the neotropical region of South America (howling and other monkeys, jaguar, puma, spectacled bear, peccary, sloth, anteater, armadillo, tapir, lamantin; a vast variety of birds of fine plumage, including the flamingo, heron, cock of the rock, umbrella bird, bell bird, puff bird, toucan, quezal, nightjar, and the guacharo or oilbirds; anaconda and boa, rattlesnake, crocodile, cayman, etc.), and many of the elements of the north and south temperate regions.

Geology and Mining Interests. The Andean ranges of the southwest are for the most part of plutonic formation in which granite and gneiss predominate, with lateral ridges of upper green sandstone and limestone. The valleys and plains on either side of these ranges are covered by detrital deposits. The northernmost range of the coast system is of crystalline formation, but the lower southern chain is largely com-

posed of stratified Cretaceous rocks. The soil throughout this whole region is very deep and fertile, making it one of the richest agricultural centres of the continent. The llanos and the lowlands of Maracaibo are largely made up of Tertiary and Quaternary deposits, composed chiefly of marl, sand, shingle, and conglomerate mixed with alluvial deposits. The Guiana highland is one of the oldest members of the Archean system, composed of gneisses, hornblende schists, and granites, overlaid in part by red and white sandstones, conglomerate, and red shale. The mineral resources are supposed to be of great value, but are at present little developed. The greatest yield of gold is found in the Territory of Yuruari, though the exports of that metal from this region have fallen off greatly since the early eighties, when the annual yield averaged nearly 200,000 ounces. The salt mines of the Araya Peninsula, worked since the sixteenth century, have been leased by the state to a company which pays an annual rental of $675,000. Copper, silver, and iron are abundant in the other mountainous regions of the Republic. An inferior quality of coal is found near Barcelona and at the head of the Gulf of Paria. Rich deposits of asphalt are known to exist in the Maracaibo region and in the State of Bermúdez, and petroleum of fine quality in the State of Los Andes. Excellent granite is found near Carácas and marble is common.

Agriculture and Stock Raising. Venezuela's chief industry is agriculture. However, only about one-third of the area is estimated as cultivable, and of this cultivable portion only about one-third is tilled. Coffee easily ranks first, both as an agricultural product and as an article of export. The coffee exports in 1913 amounted to about $15,000,000. Cacao is an important product, for which the warm moist lands of the coast are especially adapted. Sugar cane is extensively grown, owing to the duties, which exclude foreign sugars, but the product is almost wholly consumed at home, largely in the distillation of native spirits. For domestic consumption cereals, beans, potatoes, manioc, fruits, and vegetables are produced, but the demand for wheat exceeds the home supply. Tobacco thrives in the lowland regions, though the present grades are inferior. Copaiba, vanilla, and caoutchouc are gathered for the purpose of exportation. Balata, a gum similar in qualities to India rubber, is the most valuable of the forest products, and the value of the product averages about $2,000,000 per annum, most of it sent to the United States. Tonka beans are also an important product. Vanilla beans are gathered for exportation chiefly to Europe. Cattle raising has always been an important industry, and in the northwest the raising of sheep and goats has become important also. The 1915 estimates of live stock, given in round numbers, are as follows: cattle, 2,180,000; horses, 200,000; goats, 1,683,000; sheep, 177,000; hogs, 1,683,000; mules and asses, 407,000.

Manufactures. In the large cities there are establishments for cotton weaving and the making of shoes and hats, agricultural implements, and furniture, also breweries, distilleries, soap, candles, glass, and several small cotton mills.

Transportation and Communication. The Orinoco, with its great tributaries, the Apure and the Meta, affords excellent communication with the interior. The roads, away from the vicinity of the larger cities, are mere mule tracks. The first railroad, joining Carácas with its seaport, La Guayra, was completed in 1883, at a cost of $100,000 per mile. Though a narrow-gauge road, its construction was a difficult engineering feat, on account of the steep grades involved. In 1914 there were in operation 539 miles of railway. Venezuela has cable communication with the outside world through a French line. Most of the railway lines are constructed with English capital.

Commerce. La Guayra and the other ports of Venezuela are connected with the United States and Europe by several lines of steamers, giving the Republic frequent communication with the outside world. The coasting trade of Venezuela (local only) was carried on in 1913 by 8 steamers and 15 sailing vessels, the tonnage of the steamers being 2046 and the sailing vessels about 2500. The Orinoco Steamship Company has a virtual monopoly of the steamship business of that river. The local trade is largely in the hands of German, English, and Spanish merchants. The principal ports are La Guayra, Puerto Cabello, Maracaibo at the north and Ciudad Bolívar on the Orinoco. The total number of ships entering the ports of the Republic with foreign cargoes during the fiscal year 1913–14 was 1089, with a tonnage of 1,057,878. The principal exports during 1914 were as follows: coffee (largely to the United States, France, Holland, and Germany), $12,343,000; cacao (mainly to France, England, the United States, and Spain), $3,918,000; cowhides and goatskins (chiefly to the United States), $1,752,000; rubber (chiefly to the United States, France, Germany, and England), $126,679; asphalt (mainly to the United States), $289,000; and gold, $613,000. Other exports are fustic, divi-divi, tobacco, cattle (to Cuba), copaiba, balata gum, lumber, and sugar. The exports to the United States in the fiscal year 1914–15 amounted to $9,361,000, and the imports from the United States amounted to $6,082,000. The total imports in 1914–15 were valued at $13,992,000, of which about 45 per cent came from the United States, about 20 per cent from Great Britain, 11 per cent from Germany, and the rest principally from France, Spain, the Netherlands, and Italy. The exports in that year were $21,423,000. The following table shows (United States dollars) the changes in the commerce of the Republic:

	1909–10	1914–15
Imports	12,458,000	13,992,000
Exports	18,103,000	21,423,000

Among the principal imports from the United States are cotton goods, iron goods, petroleum, provisions, and chemicals; from Great Britain, cotton and linen manufactures, woolens, jute goods, and ironware; from Germany, hardware and beer; from France, wines and oils.

Government. The Constitution of Venezuela, adopted in 1830 and amended in 1864, 1881, 1901, 1904, and 1909, was changed again in 1914. By this last change Venezuela is divided into 20 states, 2 territories, and a federal district. The Congress consists of two bodies, and its members elect the President, whose term is seven years. The capital is Carácas.

Finances. The budget of Venezuela for the year 1913–14 balanced at $10,237,000. About one-half of the revenue is derived from customs. The chief expenditures are for the Finance and the War and Marine departments. The foreign

debt in 1915 was computed at $21,083,000; the outstanding internal debt was $11,287,000. The Bank of Venezuela and the Bank of Carácas are the leading financial institutions, with a combined capital of 18,000,000 bolivars. The former is the main bank of issue, and to some extent transacts the business of the government. The metric system is in legal force, but the Spanish weights and measures are commonly employed.

Army. In 1915 the standing army consisted of 20 battalions of infantry, of 400 men each, and 7 batteries of artillery, of 200 men each; total, 8400 men. There is a national militia, unorganized, and of unknown strength. See under NAVIES.

Population. The population in 1913 was estimated at 2,755,685. There has been no census since 1891. The following table showing the area and population of the divisions of the country is estimated for 1909 based on this census.

DIVISIONS	Square kilometers	1909
Federal District	1,930	113,204
Anzoátegui	43,300	134,064
Apure	76,500	29,937
Aragua	5,600	94,994
Bolívar	238,000	55,744
Carabobo	4,650	169,313
Cojedes	14,800	87,935
Falcón	24,800	139,110
Guárico	66,400	183,930
Lara	19,800	189,624
Mérida	11,300	88,522
Miranda	7,950	141,446
Monagas	28,900	74,503
Neuva Esparta	1,270	40,197
Portuguesa	15,200	96,045
Sucre	11,800	92,020
Táchira	11,100	101,709
Trujillo	7,400	146,585
Yaracuy	7,100	85,844
Zamora	35,200	62,696
Zulia	65,500	150,776
Delta-Amacuro *	40,200	7,222
Amazonas *	281,700	45,097
Total	†1,020,400	2,323,527

* Territory. † 393,976 square miles.

The estimated population of Carácas is 73,000, Maracaibo 50,000, Valencia 40,000, Barquisimeto 32,000, Puerto Cabello 14,000, La Guaira 12,000. Marriages in 1912 numbered 9365, births 75,892, deaths 65,729, immigrants 9672, emigrants 7991. In no South American country has there been such a complete admixture of the Spanish, native, and negro elements. There are very few pure native whites or pure negroes. Most of the population is gathered in the agricultural and mountainous sections of the northwest.

Education and Religion. The early culture of the people of Carácas, commented upon by Humboldt, gained for that city the title of "the Paris of Latin America," and Venezuelan writers have occupied a brilliant position in the Spanish-American literary field. (See SPANISH-AMERICAN LITERATURE.) In 1870 education was made free and compulsory. In 1911 the reorganization of primary education was undertaken, with the purpose of creating larger schools in the villages. The town schools are fairly well kept up, but in the country districts there is a great indifference shown toward education. Possibly 25 per cent of the population can read and write. For primary instruction there are 1408 federal and 150 state schools. There is a central university at Carácas and there are five universities in other parts of the Republic. The University of Carácas has a school of engineering and other professional schools, an observatory, and a national library. The state religion is Roman Catholicism, but other forms are tolerated, though most of the Protestants are foreigners.

History. The coast of Venezuela was first sighted by Columbus during his voyage of 1498, and a year later Ojeda and Vespucius examined it more carefully, giving to it the name of Little Venice. The first settlement was made at Cumaná in 1520, but real colonization began under Juan Ampues in 1527 with the founding of Coro. The seat of government remained at Coro until 1576, when it was transferred to Carácas. Charles V, whose European wars had obliged him to borrow extensively, agreed, in 1527, with the Augsburg banking and merchant firm of the Welsers to grant them the entire Province of Venezuela, in return for advances of money. In 1528 Ambrose Alfinger sailed for the colony, with a force of 400 adventurers, representing the new rulers. Disappointed in the expectation of finding mines of gold ready to be exploited, he and his successor, George Spira, who brought over another body of retainers in 1533, raided the interior regions for produce, enslaving the natives, and demoralizing the whole country, so that in 1545 Charles V rescinded the grant. The rest of the sixteenth century was marked by exploring expeditions, the founding of settlements and cities, and wars with the natives. In order to break up smuggling, revive commerce, and bring larger revenue to the crown, Venezuela was granted in 1728 to a Biscayan merchant organization, Compañía Guipuzcoana. While this monopoly created considerable popular opposition, yet the plan worked fairly well for some time, but eventually the Compañía found it more profitable to enter into arrangements of mutual advantage with the Curaçao merchants. This arrangement was so unpopular that civil war was threatened in 1748, but the Compañía maintained its hold until 1778. The nominal government was in the hands of a captain general, subordinate to the royal audiencia at Santo Domingo, for most of the time down to 1786, when an independent audiencia was established at Carácas.

The history of the war for independence against Spain in Venezuela is to a great extent the record of the careers of Miranda and Bolívar. A popular uprising gave the revolutionists command of the capital, and on April 19, 1810, the cabildo of Carácas deposed the royal Governor and selected a junta or council to rule during the regency in Spain. The next year Bolívar led a popular demonstration which culminated in a formal manifesto or declaration of independence (July 5, 1811), and the proclamation of a republican constitutional government. Meanwhile, Domingo Monteverde took command of the royalist forces and gradually gained the upper hand over the patriots. The fortress of Puerto Cabello was betrayed to him, and Bolívar was forced to retire to La Guayra. Miranda, unable to maintain an army in the field, concluded a peace, July 29, 1812, and joined Bolívar, by whom he was arrested and handed over to the Spanish commander. Bolívar took refuge in Cartagena, raised an army, and in August, 1813, reëntered Carácas in triumph. In 1815 General Morillo arrived from Spain with 10,000 troops and Bolívar was forced to retire to Haiti. In January, 1817, he returned, established a gov-

ernment at Angostura, and had himself elected President or Dictator, a position which he succeeded in making secure by December, 1819, when the Congress at Angostura elected him President of Colombia, representing a new republic embracing Venezuela and New Granada. On June 24, 1821, the decisive victory of Bolívar and Paez (q.v.) at Carabobo over the Royalist army practically ended the Spanish domination in this part of South America. In 1829 Venezuela, under the influence of Paez, seceded from Colombia and constituted itself an independent republic. The subsequent history of the country was uneventful until 1846, when an era of insurrections and civil wars began between the conservative and liberal factions, which lasted, with scarcely a break, down to 1870. In 1854 a law for the abolition of slavery was enacted. In 1864 a federal constitution was adopted. In 1870 Guzmán Blanco became Dictator, was made constitutional President in 1873, and controlled the country until 1892. He imposed heavy taxes, fostered public works and railways, and established a stable currency. His régime was followed by new revolutions.

When the Republic succeeded to the title of Spain, in 1821, the boundary between Venezuela and Guiana was somewhere between the Essequibo and the Orinoco. Spain claimed to the former river. English and Dutch settlers had established themselves throughout the region drained by the lower Essequibo, bringing that section practically under the British government. In 1839–40 a British agent, Schomburgk, traversed this country and mapped it, laying down a boundary line which gave to Guiana the larger part of the territory. Venezuela promptly protested, and in 1844 England claimed the Schomburgk line was unofficial and only preliminary to further negotiation. All attempts of Venezuela to secure arbitration failed, as Great Britain insisted on the recognition of the Schomburgk line as a prerequisite of arbitration. Numerous efforts of the United States to have her good offices accepted by the parties likewise failed. In 1886 England occupied the main mouth of the Orinoco and fortified her position there. Venezuela promptly broke off all diplomatic relations. Realizing the hopelessness of contending with Great Britain in arms, the Venezuelan government decided to resort to public opinion. An agent was sent to the United States, who spread abroad pamphlets and statements, and interviewed newspaper men and politicians, and in December, 1894, President Cleveland recognized the widespread public interest in the dispute by an allusion to it in his annual message to Congress. This was followed by a resolution of Congress recommending arbitration and by Secretary Olney's strong note (July 20, 1895), to England, which marks the widest extension of the Monroe Doctrine (q.v.). The British government having notified the United States that it had nothing to arbitrate with Venezuela, a special message, sharp in its tone with regard to Great Britain, was sent by Cleveland to Congress, leading that body to appropriate funds ($100,000) for a commission to investigate "the true divisional line between Venezuela and British Guiana." In November, 1896, before the commission had reported, Great Britain yielded to the demand of the United States for arbitration. Eventually, in February, 1897, an agreement was reached and a treaty of arbitration duly signed. The arbitration tribunal made its award on Oct. 3, 1899, drawing a compromise line, which gave Great Britain rather the larger share of the disputed area and with which Venezuela was somewhat dissatisfied.

Immediately following the election of General Ignacio Andrade to the presidency in September, 1897, a revolt under General Hernández broke out, but was crushed at once. Owing to the weak and vacillating policy of Andrade, General Cipriano Castro began a revolt in the summer of 1899, defeated the government troops in a series of sharp engagements, and in October entered Carácas at the head of an army and proclaimed himself provisional President. Andrade fled and the revolutionary government was securely established, but hostilities were continued throughout 1900. In March, 1901, Castro was elected President by the Venezuelan Congress to fill out Andrade's unexpired term. Numerous insurrections, directed by the Conservative leader, Matos, broke out in 1901 and the fighting continued with varying success into 1902. In September of that year the Castro government appeared to be on the point of falling, but after a three days' battle near Victoria on October 13 the revolutionists were signally defeated and their army dispersed. Almost immediately the international complications which had been threatening for several years reached a crisis. For some time France, Germany, Great Britain, and other countries had been pressing for the satisfaction of certain claims, resulting from a great variety of causes, including losses to the property of foreign residents through the successive revolutions, and the nonpayment of principal and interest on debts contracted for public works. During the summer a settlement was arranged with France. But the British and German governments became more importunate in their demands, and reached an agreement to act together, and to take means to collect their debts forcibly if they were not at once satisfied. The British and German ministers filed the ultimatums of their governments and left Carácas. On December 10 the allies instituted what they termed a peaceful blockade of the Venezuelan ports. On December 11 Italy became a party to the blockade. On December 13 the allies bombarded Puerto Cabello, and Castro, convinced of the hopelessness of resistance, requested Herbert W. Bowen, the American Minister, to begin negotiations for a settlement. On Jan. 21, 1903, Fort San Carlos was bombarded by the allies. On February 13 negotiations, which had been removed to Washington, were concluded by the signing of protocols by Mr. Bowen and the representatives of the Allied Powers, submitting to The Hague Tribunal the question as to whether the claims of the three Powers were entitled to preferential treatment as against those of other nations. At the same time the amount to be paid to the three Powers was to be determined by mixed tribunals at Carácas. In February, 1904, The Hague Tribunal pronounced in favor of the Allied Powers. In 1904 a radical revision of the constitution was effected, which allowed Castro to be reelected for the term 1905–11. Castro pursued a dictatorial policy and was obliged to face numerous minor revolts. In addition he succeeded in getting into trouble with various foreign nations. In 1908 Castro was involved in difficulties with Colombia, France, Great Britain, Netherlands, and the United States. Diplomatic relations were broken with the United States, and the

Dutch made a naval demonstration in Venezuelan waters. Venezuelan commerce was practically ended by the quarantine enforced against Venezuelan ports by the foreign countries.

In the midst of these difficulties, Castro departed for Europe (December, 1908) and left the Vice President, Juan Vicente Gómez, as acting President. The reaction against the despotic policy of Castro took the form of a popular demonstration in Carácas. In view of this event, Gómez, who was not in sympathy with the existing foreign policy, dismissed Castro's cabinet, assumed control of the situation, and took steps to renew friendly relations with the various Powers. Early in 1909 Castro was accused of instigating an attempt to assassinate Gómez and was deposed. Gómez became provisional President, and, although Castro tried to return and assume his powers, he was unsuccessful. A new constitution, based on that of 1864, was promulgated in November, 1909, and in April, 1910, Gómez was chosen constitutional President. During the celebration of the centenary of independence in 1911, Castro planned to start a revolt, but was frustrated by the seizure of his ships as piratical vessels by the government of Haiti. Gómez pursued an energetic policy as President and endeavored to better the conditions of the country, so long disturbed by revolutionary movements. During 1913, some difficulties with France were adjusted and a new naturalization law was enacted. Two minor revolts were suppressed after Gómez had assumed dictatorial powers. In 1914 V. Marquez Bustillos was made provisional President, in order that General Gómez, who became commander in chief of the army, might be reëlected to the presidency for another term. A new constitution was adopted on June 19, 1914. During this year new revolts took place, the principal one being led by General José María Hernández (El Mocho), but they were suppressed without much difficulty. On May 3, 1915, General Gómez was elected by Congress for the presidential term 1915–22. During 1914–15 laws were enacted providing for compulsory education, public works, sanitation, and a new electoral system. Venezuela was greatly affected by the European War and new revenue and tariff measures were adopted to relieve the financial difficulties.

VENEZUELA, GULF OF, or GULF OF MARACAIBO. An inlet of the Caribbean Sea in northwest Venezuela (Map: Venezuela, C 1). It is confined between the peninsulas of Goajira and Paraguana, which approach so as to leave an opening 50 miles wide. Within this the gulf has a length of 165 miles from east to west, and a width of 50 miles. In the south it communicates by a narrow passage with the Lake of Maracaibo, which occupies a portion of the same lacustrine basin, the two sheets of water being separated by very low peninsulas.

VENGEANCE, vän'zhäns', LE. A French frigate of 54 guns, disabled by the *Constitution* under Commodore Truxtun in 1800.

VENGEROV, vĕn-gyô'rôf, SEMION AFANASIEVITCH (1855–). A Russian literary critic and historian. Besides holding the chair of Russian literature at St. Petersburg University, his alma mater, he lectured in a number of other educational institutions and edited a *History of Russian Literature* for a Russian encyclopædia. His publications include: *Russian Poetry* (7th ed., 1897–1901), an anthology; *A Critical and Biographical Dictionary of Russian Authors* (6 vols., 2d ed., 1915), which comes down to 1900; *Outlines of the History of Russian Literature* (2d ed., 1907); *A History of the Newest Russian Literature* (2d ed., 1909), ably supplementing the six-volume work above mentioned; and *The Heroic Character of Russian Literature* (1911), which deals with the martyrology of Russian authors. Vengerov edited the collected works of Schiller, Shakespeare, Byron, Pushkin, and Belinsky. His own collected works appeared in five volumes at St. Petersburg in 1911–12.

VE'NIAL SIN (OF. *venial*, Fr. *véniel*, from Lat. *venialis*, pardonable, from *venia*, pardon). A term denoting, in Roman Catholic theology, the less heinous class of offenses against the law of God, as distinguished from those which are called mortal. (See MORTAL SIN.) Venial sins only weaken and diminish, but do not utterly extinguish sanctifying grace in the soul. Sins may be venial either objectively or subjectively; objectively, when the object of the law, or what is technically called the matter of the sin, is light or trivial, as in the case of a petty theft, a slight departure from truth, or a passing ebullition of impatience or anger; subjectively, when, even though the matter or object is grave, there is but imperfect advertence, or not full consent, on the part of the subject or agent, as in the case even of a grievous injury done without full knowledge or intention on the part of the agent, or without full and deliberate consent. It is held that venial sins, on repentance, may be re-

mitted by prayer or by the use of sacramentals (q.v.), without recourse to the sacrament of penance, which is ordinarily necessary in the case of mortal sin. Catholics hold that persons dying in a state of venial sin are not excluded forever from heaven; but the soul departing from life so stained with venial sin is compelled to undergo a purification in purgatory.

VENICE. A port of Italy, the capital of the Province of Venice, 164 miles by rail east of Milan, situated on 120 small islands in the lagoon between the mouths of the Piave and the Po (Map: Italy, D 2). The railway enters over a causeway 2⅓ miles long. The city is 7 miles in circumference. A long narrow line of low sand dunes (*lidi*, fortified by masonry) protects it from the open sea on the east. The lagoons are classed as *lagune vive*, where the tide rises and falls a little over two feet, and the shallow *lagune morte*, where the water remains about at one level and is somewhat stagnant. At times the winds cause the waters to rise several feet, so that even the main squares of Venice are submerged. The climate is warm in summer and more or less raw and foggy in winter. The mean annual temperature is 56½° F.

Venice is unique and the most beautiful of cities. It outwardly and richly reflects the fact that it had a great school of art, and represents in full flower the transition from the Byzantine ideals to the Renaissance through the Romanesque and the Gothic in its numerous notable palaces, public edifices, and churches. These structures are distinguished by their many loggie and colonnades, by their wealth of exterior decoration and incrustations of marble; while the interiors are enriched by the brushes of the superb Venetian colorists—Bellini, Giorgione, Palma Vecchio, Titian, Paris Bordone, Tintoretto, and Paul Veronese. Venice yielded but slowly to the rococo invasion. Sansovino, Sammicheli, and Palladio were the prominent figures among the Venetian architects of the Renaissance.

The city, with its weather-stained façades, its many decaying edifices, and indolent existence, affects one with an indefinable but fascinating sadness and lethargy. It contains about 16,000 buildings on pile foundations. Over 150 canals curve among its houses and serve for streets and are spanned by some 400 bridges, nearly all of stone. The famous black gondolas and small steamers take the place of horses and vehicles. But the city is also thoroughly penetrated by paved streets and tortuous, picturesque lanes, and abounds in small squares (campi). Venice mainly lies in a compact form, with the Grand Canal (q.v.) zigzagging magnificently through its centre from the railway station in the northwest to the Doge's Palace in the southeast. A large arm of the city extends east. Along the south side of the city, and separated by the wide Canale della Giudecca (nearly a quarter of a mile in breadth), is a long inhabited island called the Giudecca.

The great centre of interest is the far-famed Piazza of St. Mark (for illustration, see ST. MARK'S), with the cathedral and also the Doge's Palace occupying its eastern end. West of the Doge's Palace is the open space called the Piazzetta, an arm of the Piazza extending south to the water. The long Procuratie Nuove (or, in its extended form, the royal palace) occupies the south side of the Piazza; along the north side extends the long Procuratie Vecchie, and the west end is closed by the Atrio, dating from 1810. This Piazza represents notably three distinct types of architecture, Byzantine (the cathedral), Italian Gothic (the Doge's Palace), and Renaissance (the Procuratie). The Procuratie were the residences of the nine Procurators, high dignitaries of the ancient city. The old wing dates from 1496, the new from 1584. Along these two buildings and the Atrio (Nuova Fabbrica) runs a continuous arcade containing shops and cafés. At night the square is occupied by a picturesque throng of promenaders, and when the band plays and there is moonlight the whole seems like an enchanted dream. A feature of the Piazza by day is the immense flock of pigeons which throng about any one willing to feed them. The most conspicuous feature of the whole city from a distance is the famous Campanile of St. Mark, standing in the Piazza near the corner of the Library, a detached square bell tower, 322 feet high. It was begun in 874, completed in 1150, and remodeled in 1517. It suddenly fell in ruins July 14, 1902, but has since been reerected in its original completed form. Less conspicuous from a distance, but far more important artistically and historically, is the cathedral, commonly called the Basilica of St. Mark, the richest monument of Byzantine art next to Hagia Sophia at Constantinople, the shrine and centre of the devotion of Venice. This edifice, reputed to contain the body of St. Mark, brought to Venice in 828, was erected in 1047–71, enlarged and embellished repeatedly in later centuries. It is described under the title ST. MARK'S CHURCH (q.v.). Both externally and internally it is a notable museum of Mediæval and Renaissance art.

At the cathedral end of the Old Procuratie is a curious clock tower, built in 1496, and forming the portal over the entrance to the busy Merceria. On its top, in the open, are two bronze colossi which strike the hours on a large bell. The Royal Palace is interesting for the section which formerly contained the library, a superb edifice, facing the Piazzetta, the work of Giacopo Sansovino. It is distinguished by the magnificent handling of its arcaded orders, its sculptured spandrels, metopes, and, in the fine interior, the ceiling frescoes by Venetian masters. In front of the cathedral stand three Renaissance bronze bases, supporting masts which formerly bore the colors of the Republic. Adjacent, on the north side of St. Mark's, is the tomb, supported by lions, of Manin, President of the Republic of 1848. On the front gallery of St. Mark's stand the four beautiful gilded bronze horses ascribed to Nero's triumphal arch in Rome. They were carried off by Napoleon to Paris, but restored in 1815. On the south side of the cathedral, in the Piazzetta, are two ancient square pilasters with Greek inscriptions, which have stood here since the middle of the thirteenth century. The Pietra del Bando is near, a block of porphyry whence the decrees of the Republic were announced. At the opposite end of the Piazzetta rise the two granite columns brought from the Orient in 1180, surmounted by figures of St. Theodore on a crocodile and the Winged Lion of St. Mark.

The Doge's Palace (q.v.) holds many of the finest pictures in Venice. In the rear of the palace, and crossing a narrow canal from the third story, is the noted Bridge of Sighs (q.v.), connecting with the prison. The bridge was completed in 1605, and is architecturally attrac-

tive. The prison is used nowadays, but the horrible places of confinement under the palace ceased to exist in 1797. The mole separating the palace from the lagoon connects with the wide and busy Riva degli Schiavoni. This marble quay, a favorite place of the Venetians, extends easterly some distance, lined by hotels, shops, etc., on one side, and the water on the other. Not far to the northeast of the cathedral is Santa Maria Formosa, famous for Palma Vecchio's masterpiece, "St. Barbara"—an altar picture. The district abounds in palaces. Still farther north, near the lagoon and adjacent to the excellent municipal hospital, is the large and splendid church of Santi Giovanni e Paolo, of the fourteenth century, a domed and columned structure in Italian Gothic. It is one of the principal attractions of Venice. It was the funeral church of the doges, and holds a number of their imposing tombs. Some of these monuments are rare examples, the finest perhaps in the city being that of A. Vendramin. Northeast is the Scuola di San Marco, now a hospital, a fine structure of the early Venetian Renaissance. In the vicinity stands the lofty and splendid bronze equestrian statue of Bartolommeo Colleoni. This monument, by Andrea Verrocchio, shares with that of Gattamelata, in Padua, by Donatello, the honor of being unsurpassed in the world. To the east, towards the arsenal, is San Giorgio degli Schiavoni, with the Carpaccio paintings, which are elaborately described by Ruskin. In this eastern arm of Venice are the arsenal and the public gardens, the former dating from the beginning of the twelfth century. The arsenal, long the finest in the world, employs 6000 men, and has been extended and largely improved. Its museum is interesting for a model of the system of piling on which the city stands and for the model and slight remains of the famous Bucentaur—the sumptuous craft of state from which the Doge on Ascension day cast the ring into the waters, in the act of wedding the city to the sea. The public gardens are small but attractive. Adjacent is the church of San Pietro di Castello, which was the cathedral of Venice until 1807. Hence islands extend eastward in the direction of the fashionable sea resort of the Lido, one of the finest beaches in the world.

Following the course of the Grand Canal from the Royal Garden by the Piazzetta to the railway station, there may first be noted the imposing church of Santa Maria della Salute, begun in 1631 by Longhena (q.v.). It rises into a dome, with a smaller dome and two campanili, and contains good works by Titian. The adjacent Seminario Patriarcale includes in its small art collection one of the two (putative) Giorgiones left in Venice. Farther on comes the renowned Academy of Fine Arts. It presents a series of Venetian canvases from the earliest down to those of Tiepolo. The great masters of color are here seen to good advantage. Bellini is represented by his "Madonna of the Trees"; Titian by his masterpiece the "Assumption of the Virgin," and the "Presentation in the Temple"; Paul Veronese, with the "Supper in the House of Levi"; Tintoretto, with his "Miracle of St. Mark"; Paris Bordone, with his "Fisherman and the Doge"; and Carpaccio, with his remarkable series of "Scenes from the Story of St. Ursula and her Virgins." The Palazzo Rezzonico, with columned balconies, where Browning died; the Palazzo Mocenigo, where Byron lived; the splendid Palazzo Grimani, a Renaissance structure by Sammicheli; the Palazzo Loredan, whose praises were sung by Ruskin—are noted along the canal before reaching the celebrated Rialto Bridge.

The Rialto (q.v.) is lined with shops, and is a scene of busy interest. The district is identified as the original site of the city. Beyond, continuing the course of the Grand Canal, are seen the markets, the celebrated Ca' d' Oro; the Vendramin Palace, with an imposing façade, where Wagner died; and the Fondaco de' Turchi opposite, with the Municipal Museum, which contains specimens of the art industries of Venice, antiquities, some good pictures, etc. Diagonally opposite the railway station is the small but pleasant Papadopoli garden. The baroque church of the Scalzi and the Labbie Palace with frescoes by Tiepolo are near the railway station. In the region to the north are found the old and new ghetto, the church of the Madonna dell' Orto, with admirable pictures; and the baroque Jesuit church, containing Titian's "Martyrdom of St. Lawrence."

The district of the Merceria—the principal shopping street connecting the Piazza of St. Mark with the Rialto—is full of interest. To the north is the Renaissance church of San Giovanni Crisostomo containing good altarpieces by Bellini and Sebastiano del Piombo. To the southwest of the Merceria are the famous theatres, the classic Fenice, the Rossini, the Goldoni—the first seating 3000 persons, but open only between Christmas and Lent; and the fine domed church of San Salvatore, finished in 1534 and containing Titian's "Annunciation." Directly west of the Piazza of St. Mark is the Calle San Moisè, a lively shopping street.

In the large section of the city south and west of and beyond the edifices bordering the Grand Canal there may be mentioned the church of San Giovanni Elemosinario, with Titian's striking altarpiece of the same name, and the great and handsome Gothic church of the Frari, one of the wonders of Venice, begun in 1260 and reconstructed in 1330. It is noted especially for its fine altarpieces and for its monuments of many important personages, including Canova and Titian. The pictures include Titian's renowned "Madonna of the Pesaro Family" and Bellini's charming "Madonna and Saints." The monastery of the Frari holds the Venetian archives—a very rare collection, with several million documents, some dating from the close of the ninth century. Farther on is the attractive Scuola di San Rocco, dating from 1517, striking for its architecture and for its mural paintings by Tintoretto. His masterpiece, the "Crucifixion," is here.

Some distance to the south is Santa Maria del Carmine, and southwest, near the Canale della Giudecca, is San Sebastiano, notable for altarpieces by Paul Veronese, and for his tomb. To the southeast stretches the long and straight Fondamenta delle Zattere. The Giudecca district opposite has the island of San Giorgio Maggiore at its northeast end, opposite the Doge's Palace. On this island is the fine domed church of the same name, a creation of Palladio in the middle of the sixteenth century. Its beautiful campanile affords one of the best views to be had in Venice. On the island of the Giudecca is another noteworthy church by Palladio, the Redentore, of much interest to architects for special features. Interesting excursions can be made to the island

environs of the city. Murano (q.v.) lies to the north, beyond the island of the cemetery. Torcello (q.v.) merits a visit. About two miles southeast of the city is the island of San Lazzaro, the seat of an Armenian archbishopric and monastery with which are connected extensive educational and publishing institutions.

Industries and Commerce. The manufactures, commerce, and wealth of Venice have latterly greatly increased. It manufactures heavy machinery, clocks, cotton and woolen goods, and chemical fertilizers. Shipbuilding and the manufacture of torpedoes are also prominent industries. (The arsenal is mentioned above.) The glassware and glass-bead industries, once so flourishing and then so inferior, are now prosperous, and are increasing both in the amount and the variety of their products. The fine artistic goods of Venice—its famous lace, brocades, tapestries, wood carvings, mosaics, bronzes, jewelry, etc.—are once more becoming prominent in the world's markets. The glassware is manufactured on the island of Murano, the lace chiefly on the island of Burano—both north of the city. The Venetian shops are among the most famous in Europe. In 1913 there entered and cleared 8077 vessels of 4,602,783 tons. Imports of merchandise in 1913 were valued at 266,940,000 lire, and exports at 146,453,000 lire. Venice is the third Italian port in the value of its foreign trade. Vessels drawing 24 feet can enter at the city's quayage, which is large and constantly being extended. In the western part of Venice is situated the excellent modern maritime station, lined by moles and having basins, warehouses, customhouses, railway connections, etc. Important enlargements are to be made to these facilities. Inland navigation is being promoted. The sea channels have also been greatly improved.

Administration. For administrative purposes the city is divided into six districts. The budget has constantly gained in surplus, and the municipal debt is insignificant. Since 1880 the rebuilding and restoration of the decayed and unhealthful sections and houses of the city have been carried on, and improvements of every kind have been made. Important new streets have been built. The hygienic conditions have been carefully tested and are constantly watched and improved. An aqueduct passing under the lagoon provides good drinking water.

Population, Education, Charities. The population at the census of June 10, 1911, was 160,719; as estimated for Jan. 1, 1914, 164,202. It was over 200,000 in the period of the city's greatness, and fell to less than 100,000 about 1800. Venice is now the tenth Italian city in size. Among the educational institutions not already mentioned are the Manin Institute, a patriarchal seminary, the Scuola Superiore di Commercio, and a Protestant house for boys. There are many private educational institutions. Venice has a royal academy of fine arts, a gallery of modern art, and other permanent exhibitions. The International Art Exhibition is held biennially. The charitable institutions number about 180. Some 30 are managed by the municipality, the rest by the clergy.

History. The islands which later formed Venice served as a refuge for the inhabitants of Aquileia, Padua, and the neighboring cities during the barbarian migrations. The invasion of Attila (452), the campaigns of Belisarius against the Goths, and the invasion of the Lombards (568) drove many fugitives to the lagoons. The date commonly assigned for the foundation of Venice is 452, but the beginnings of its history are veiled in obscurity. In 466, 12 tribunes were chosen for the 12 principal islands; in 568, 4 bishops established their sees on the islands; and in 584, 12 additional tribunes were elected with greater power than the 12 previously chosen. For the next century Venice was practically independent of, although formally subject to, the Eastern Empire. It had continually to fight against the Slavic pirates of the Dalmatian coast and the Lombards on the Italian mainland. These wars and internal dissensions led to the appointment of a common head, the first Doge, in 697. During the following century the islands were still disturbed by internal dissensions, but the danger caused by the attack of Pepin, son of Charles the Great, in 810, brought unity and led to the choice of the Rialto, in the midst of the lagoons, as the seat of government. In 828 the reputed body of St. Mark, who became the patron saint, was brought to Venice from Alexandria. Attacks by Saracens in 836 and by Hungarians in 900 were repulsed. Orseolo II, who became Doge in 991, made a commercial treaty with the Saracens, thus beginning the long-continued policy of Venice of trading with the Mohammedans rather than fighting with them. Orseolo's reign was marked by a great expansion. He conquered the Dalmatian pirates and assumed the title of Duke of Dalmatia. This victory was celebrated annually by the *Sposalizio del mar* (espousal of the sea), in which the Bucentaur (q.v.) was later the central feature. The family of Orseolo attempted to make the dogeship hereditary, and this led to a revolution. Two privy councilors (later six) were appointed to assist the Doge, and the latter was compelled to invite (*pregare*) the assistance of prominent citizens. This was the germ of the *Pregadi* or Senate. The Crusades greatly promoted the growth of Venice as a commercial state. Under Enrico Dandolo (q.v.) she played the leading rôle in the Fourth Crusade, which ended in the conquest of Constantinople in 1204. She received a large share of the Eastern Empire, and became the strongest power in the Mediterranean. Constitutionally the period was marked by the creation of the Grand Council in 1189, destined to curb the power of both the Doge and the people in the interest of the wealthy citizens. In the thirteenth century the Doge's power was lessened and in 1297 by the closing of the Grand Council to newcomers the oligarchy of nobles secured supreme power. The conspiracy of Tiepolo in 1310 against the rule of the oligarchy led to the appointment of an executive committee, the Council of Ten, which was made a permanent body in 1335. The Ten, although renewed by election each year, became the real governing force in the state. With some changes and additions the government retained the form then fixed until the fall of the Republic. The Grand Council may be said to have contained the whole body politic. The roll of the noble families who were entitled to representation in the council was called the Golden Book. (See LIBRO D'ORO.) Above it were the Senate or *Pregadi* of 160, the chief legislative body, and the Council of Ten with executive and judicial functions. Still higher in power was the college or cabinet of sages, who prepared the state business for the Senate of the Ten. Above the college were the six ducal coun-

cilors, who really performed the chief duties of the Doge. The Doge presided over all these bodies. His position was magnificent; his powers were strictly limited. The history of Venice in the thirteenth and fourteenth centuries was marked by struggles with her colonies, with Genoa, and with the Carrara family, who held Padua. Her colonies were reduced to subjection; her great rival, Genoa, was humbled by the war of Chioggia (1378–80); the Carrara were finally forced to become vassals. In these struggles, some of which were almost fatal to her existence, Venice was forced to build up a land empire in the north of Italy as a base of food supplies. By 1405 she held Treviso, Padua, Vicenza, Verona, and the adjacent lands. Brescia and Bergamo were soon after annexed. In 1420 she acquired Friuli. In 1488 Cyprus came under Venetian dominion. At this time Venice was the leading maritime state of Christendom. She traded with the whole civilized world. The state owned 3300 vessels, manned by 36,000 men. Venice had become a city of merchant princes, who lavished their wealth upon magnificent palaces and the patronage of painters and sculptors. But her success on the mainland aroused new enemies; after the fall of Constantinople in 1453 the Republic had to face a struggle with the Turks, in which she lost gradually most of her possessions in the Morea and the Archipelago; the discovery of the sea route to India by way of the Cape of Good Hope (1497–98) gave a fatal blow to her commerce, and corruption began to appear in the city itself. Outwardly this was the most splendid period in her history; in reality her power was already waning. The decisive blow came in 1508, when the German Emperor, the Pope, France, and Spain combined against Venice in the League of Cambrai to divide her dominions among themselves. In the struggle Venice at one time had lost all of her possessions on the mainland, but by diplomacy she detached one power after another from the League, and in 1516 she again held all her former possessions; but she never regained her former power. From this time, protected by the impregnable position of the capital, she exerted herself by diplomacy merely to retain her position. Only in the East did Venice show her old energy. There, almost single-handed, she struggled against the Turks, but in vain. In 1571 she lost Cyprus, although she and her allies won the naval battle of Lepanto. In 1669 Crete was lost after a war of 25 years. In 1718, by the Peace of Passarowitz, the Morea, after having been for a short time again in the possession of the Republic, was ceded to Turkey. The morals of the citizens declined steadily, and in the eighteenth century Venice was a city of pleasure for the rest of Europe, and was marked by its constant fêtes and extravagant life. In 1797 the Venetian Republic was extinguished by Bonaparte, and in the Peace of Campo Formio (q.v.) most of its possessions (including Istria and Dalmatia) were transferred to Austria, France taking the Ionian Islands. In 1805 Austria was compelled to cede her Venetian dominions to the Kingdom of Italy. She regained them in 1814, and in 1815 Venetia and Lombardy were constituted the Lombardo-Venetian Kingdom. In 1848 Venice revolted under Daniele Manin (q.v.), but in 1849 Austrian dominion was reestablished. In 1866 Austria relinquished Venetia, which was incorporated with Italy. During the war which began in 1914 Venice was bombarded from the air by the Central Allies. See SEVEN WEEKS' WAR; WAR IN EUROPE.

VENICE. A city in Los Angeles Co., Cal., 4 miles south of Santa Monica, on the Pacific Electric Railway (Map: California, G 9). Venice, formerly called Ocean Park, is one of the largest amusement resorts on the Pacific coast. Planned after the city of Venice, Italy, it has a system of street canals, and a unique "Ship Café," modeled after the famous Spanish bark *Cabrillo*. Venice is both a summer and winter resort, being noted for its excellent surf bathing. Pop., 1910, 3119.

VENICE PRESERVED. The greatest work of Otway, a tragedy produced at Dorset Gardens in 1682 and published the same year. The plot was drawn from the Abbé St. Réal's *Conjuration des Espagnols contre la Venise en 1618*. The play offered De la Fosse the foundation of his famous *Manlius*, which Voltaire is said to have preferred to the original.

VE'NI CREA'TOR SPIRI'TUS. An ancient and very celebrated hymn of the Roman breviary, which occurs in the offices of the feast of Pentecost, and is used at other times as a solemn invocation of the Holy Spirit. Its author is not known with certainty. It is ascribed by some to Charlemagne, or to Rabanus Maurus (q.v.), but its correct classical metre and the purity of its language bespeak an earlier age. It is sometimes assigned to Pope Gregory I. A translation (ascribed to Cranmer) forms a part of the Anglican ordination service. The *Veni Creator Spiritus* must not be confounded with another hymn, *Veni Sancte Spiritus*, which somewhat resembles it. The latter belongs not to the breviary, but to the missal, in which it forms a sequence in the mass of Whitsunday. It is not in classical metre, but in rhyme, and its language is plainly of a later age. The

author of the *Veni Sancte Spiritus* is believed to be King Robert of France. Consult S. A. W. Duffield, *Latin Hymn-Writers and their Hymns* (New York, 1886); Julian, *Dictionary of Hymnology* (2d ed., ib., 1907).

VENIRE FACIAS, vē-nī'rē fā'shĭ-ăs (Lat., cause to come). A common-law writ directed to a sheriff, commanding him to summon a certain number of acceptable citizens of his county to serve as jurors. Formerly the selection of persons legally qualified to serve as jurors was made by the sheriff in his discretion, but in England and most of the United States to-day the requisite number is drawn by lot from a list of persons competent to serve, and the sheriff thus summons the persons whose names are thus drawn. Where a sufficient number do not respond, or are excused from attendance, the above writ may still be used in a number of States to fill up the panel. Where a trial was a nullity for some fatal defect or irregularity, the writ issued to summon a new jury was known as a *venire facias novo.* See JURY; TALESMEN.

VENIZELOS, vā'nē-zā'lŏs, ELEUTHERIOS (1864–). A Greek statesman and diplomat, born in the island of Crete. After studying in the schools of Canea and Athens, he entered the University of Athens, where he graduated in law in 1886. He returned to Crete, soon making a reputation as a brilliant lawyer. At 25 he was chosen a deputy to the Cretan legislature. He rendered conspicuous service during the Cretan revolution of 1890–92, and in 1899 was appointed Minister of Justice, in which office he reorganized the laws of the island. Known for his consistent work for the political union of Crete and Greece, in 1908 he led the movement which aimed to accomplish this. In 1910 he was chosen Premier of Crete, but shortly afterward removed to Athens at the request of the Military League, which was leading a movement for constitutional reform in Greece. In the work of revising the constitution Venizelos had a prominent part. From 1910, when King George requested him to accept the premiership, he was the central figure in the stirring events in the Balkans. He was largely instrumental in organizing the Balkan League which waged war on Turkey in 1912 (see BALKAN WAR), and at the London Conference which closed the war he was the moving spirit among the Balkan delegates. At the outbreak of the second Balkan War he again led in the formation of the league against Bulgaria; at its close he was prominently identified with the drafting of the Treaty of Bucharest.

In 1914, at the beginning of the great war (see WAR IN EUROPE), Venizelos championed the cause of the Triple Entente allies and urged that Greece join them. With a view to reviving the old Balkan League he advocated a revision of the Treaty of Bucharest by which concessions of territory would be made by Greece and Servia to Bulgaria. This suggestion was vigorously opposed by King Constantine, and in March, 1915, Venizelos resigned, and declared his intention to retire from politics. Some months later, however, at the urgent request of his supporters, he resumed the leadership of the liberal party. In August, 1915, the King was again forced to call Venizelos to form a ministry, but the views of the King and his minister as to the wise policy for Greece to pursue were so divergent that it was evident that they could not work in harmony. When, in September of this year, the Bulgarian army was mobilized, the Premier, despite the opposition of the King, insisted upon the mobilization of the Greek forces, and finally, when Bulgaria declared war upon Servia, he demanded that Greece carry out her treaty agreement and join forces with Servia. Constantine having refused his sanction, in October Venizelos once more resigned, although he had the strong support of the deputies. He criticized the King severely for opposing a ministerial policy which clearly had popular approval. In the elections to the new Chamber in December Venizelos requested his supporters to refrain from voting, with the result that only about one-third of the normal vote was cast. In May, 1916, he was elected deputy for Mytilene, receiving 98 per cent of the possible vote; but none of the Liberals then elected took their seats. Venizelos is to be ranked as one of the greatest European statesmen of his time. Consult A. G. Gardiner, *The War Lords* (New York, 1915), and G. Kerofilos, *Eleutherios Venizelos, his Life and Work* (Eng. trans., ib., 1916).

VENLO, vĕn-lō'. A town of the Netherlands, in the Province of Limburg, on the right bank of the Meuse, 41 miles by rail northeast of Maestricht (Map: Netherlands, E 3). The streets are narrow and irregular. The sightly town hall dates from the close of the sixteenth century. Manufacturing is active. Tobacco, tannery products, and swine are prominent shipments. Pop., 1899, 14,399; 1909, 16,556.

VENN, JOHN (1834–). An English logician and antiquary, born at Hull, Yorkshire, and educated at Caius College, Cambridge. He became fellow of Caius College, where in 1862 he was appointed lecturer in moral science and in 1903 president. In logic he wrote the valuable manuals, *Logic of Chance* (1866; 3d ed., 1888), *Symbolic Logic* (1880; 2d ed., 1894), and *Empirical Logic* (1889). His later literary activity was antiquarian; he is a fellow of the Society of Antiquaries, and edited the Parish Register of St. Michael's, Cambridge, for the period 1588–1837 (1891), and is author of a *Biographical History of Gonville and Caius College* (3 vols., 1897–1901). He published also *Hulsean Lectures* (1869) and *Early Collegiate Life* (1913).

VENOM. See SNAKE; TOXICOLOGY.

VENOSTA, EMILIO, MARCHESE VISCONTI-. See VISCONTI-VENOSTA, MARCHESE.

VENOUS BLEEDING. See BLEEDING.

VENTADOUR, vän'tä'dōōr', BERNART DE. A Provençal poet, born early in the twelfth century at Ventadour, in Limousin. He wandered to Normandy, perhaps even to England, and celebrated Eleanor of Aquitaine, the wife of Henry II. Afterward he is found at the court of Raimond V, Count of Toulouse. The collections of his songs by Raynouard and Mahn are the best. Consult Bischoff, *Biographie des Troubadours Bernhard von Ventadour* (Berlin, 1873); Carducci, "Un poeta d'amore del secolo XII," in the *Nuova Antologia*, vols. XXV and XXVI.

VEN'TILA'TION. See HEATING AND VENTILATION; MINING.

VENTIMIGLIA, vĕn'tē-mēl'yä. A seaport and fortified frontier town in the Province of Porto Maurizio, Italy, 94 miles southwest of Genoa, on the Ligurian Sea. The Gothic cathedral occupies the site of a temple to Juno. The town hall has a collection of interesting relics. Viticulture and floriculture are important industries. Pop. (commune), 1901, 11,500; 1911, 14,086 (town, 3517).

VENTRE DE PARIS, vän'tr' de pȧ'rē', Le (Fr., the belly of Paris). One of Zola's Rougon-Macquart novels (1873).

VEN'TRICLE. See Heart.

VENTRICULITES, vĕn-trĭk'ū-lī'tēz (from Lat. *ventriculus,* ventricle, stomach, dim. of *venter,* stomach, womb). A fossil hexactinellid sponge of funnel or cup shape with wide central opening and thin convoluted walls, and the base pointed and provided with roots of siliceous fibres, common in the Middle and Upper Cretaceous rocks of Europe. See Sponge.

VENTRIL'OQUISM. See Voice.

VENTU'RA. A city and the county seat of Ventura Co., Cal., 80 miles by rail west-northwest of Los Angeles, on the Santa Barbara Channel; on the Southern Pacific Railroad and the Pacific Coast Steamship Company's line (Map: California, F 8). The mission, founded in 1782, is still in a good state of preservation. Pop., 1900, 2470; 1910, 2945.

VENTURI (vĕn-to͝or'ē) **METER.** A form of water meter (q.v.). Its action is based on the fact that when there is a reduction in the cross-sectional area of a pipe containing flowing water, there occurs an increase in velocity and decrease in pressure.

VEN'UE (OF. *venue,* arrival, from Lat. *venire,* to come; confused in meaning with OF. *visne,* from Lat. *vicinia,* neighborhood, vicinity). In its original and more restricted meaning, the place or locality where the acts or transactions out of which an action arises occur; but the term is more commonly employed to-day to denote the county or judicial district in which an action is to be tried and the jurors selected. For the purpose of determining the proper venue, actions are classified as local and transitory. A local action is one which, from its nature, could only have arisen in a certain district, as a trespass on land. Criminal prosecutions and practically all actions relating to real property are considered as local actions, and must be tried in the county in which the facts occur or the real estate is situated. Where a cause of action is based upon facts which might easily have happened in any jurisdiction, as a contract, it is said to be transitory, and usually may be tried in any county. The English Judicature Acts practically abolish the above distinction in that country, but it still obtains in many of the United States. In most jurisdictions the defendant may make a motion for a change of venue for the convenience of his witnesses, or because he believes there could not be a fair trial in the jurisdiction in which the action is brought. In some instances, as where neither of the parties reside in the county where the venue is laid, a change of venue if promptly applied for will be granted as a matter of right. Generally, however, the matter rests in the discretion of the court, but the fact that most of the witnesses reside in a distant county, and any other reasonable argument, will be considered in deciding the motion. In criminal cases the prejudice of the community against the defendant and the consequent difficulty of obtaining impartial jurors are frequently made the basis of a motion for change of venue. The whole matter is regulated by statute in most States. Where the objection is that the action is not brought in the proper court, or that for some other reason the court has no jurisdiction over the subject matter of the action, the proper practice is generally by way of demurrer or motion to dismiss the complaint or declaration rather than for a change of venue. Consult the authorities referred to under Pleading; Practice.

VE'NUS (Lat.; compare the common Latin noun *venus,* love, desire; connected with OHG. *wini,* friend, *wunna,* Ger. *Wonne,* joy, Goth. *wunan,* to enjoy, Skt. *van,* to hold dear, wish, win), or Aphrodite. In classical mythology, the goddess of love, in the widest sense. The Greek Aphrodite very probably represents a borrowed cult. The name is still unexplained, but the goddess is clearly the Eastern goddess of fertility and reproduction, the Phœnician Ashtoreth (or Astarte), Babylonian Ishtar, and Arabian Alilat, whose cult was prominent throughout the Semitic world. Her worship was orgiastic, and sacred prostitution was practiced at many of her temples. This goddess was especially honored at Cyprus by Greeks and Phœnicians, and thence Aphrodite seems to have come to the Greek world. Cyprus, especially Paphos, and Cythera, likewise an early Phœnician trading post, gave the goddess two of her common surnames, Cypria and Cytherea. In Greek legend, however, Aphrodite preserved little trace of her foreign origin. In Homer she is daughter of Zeus and Dione, and completely at home in the Olympian circle. In Hesiod is found the legend, which later became more popular, that she was sprung from the sea foam which gathered about the mutilated member of Uranus (q.v.). The new divinity landed on Cyprus, attended by nymphs and tritons. Under her feet flowers sprang to birth and all nature rejoiced. Other legends told of her love for the mortal Anchises, to whom she bore Æneas (q.v.), and of her amour with Ares (see Mars), which was detected and punished by Hephæstus, her husband. It should be said that there are many indications of a union of Ares and Aphrodite in cult, and in some places we hear of an Aphrodite Areia, Aphrodite Nicephoros (Bringer of Victory), and of armed statues of Aphrodite, though anything warlike is utterly removed from the ordinary conception. In general Aphrodite appears as the goddess of sexual love, the inspirer of passion, and the enemy of chastity, although the cult had a better side in which she was honored as a goddess of married life and chaste love, as at Sparta and near Athens. Plato and later writers sought to distinguish these two sides as the worship of the Aphrodite Urania (heavenly love) and Aphrodite Pandemus, but the distinction will not hold. Aphrodite appears also as a goddess of vegetation, especially of flowers. And this side appears in the festival connected with Adonis (q.v.), who, according to an eastern legend, was a youthful favorite of the goddess. From the East, too, seems to have come her worship in many towns, especially on the coast, as a goddess of sailors, who gives them fair weather and prosperous voyages. This seems merely a borrowing from the honor paid to their great goddess by Phœnician sailors. In art we find at a very early date primitive images of the eastern goddess, sometimes draped, but frequently nude. In the classical art the goddess was regularly clothed until the time of Praxiteles (q.v.), whose famous Cnidian statue first represented her as nude. This type became very popular later and developed into such works as the Capitoline and Medicean statues of Venus. A clothed type is seen in the so-called Venus Genetrix of the Louvre, which probably is derived

from the famous Aphrodite in the Garden of Alcamenes. Another famous statue was the Aphrodite Epitragia (Venus riding on a he-goat) of Scopas in Elis, known to us only from its appearance on coins.

In Rome Venus seems to have been originally a goddess of vegetation, especially of fruit and flowers, brought to Rome at an early date from Ardea, where she was a prominent divinity of the Latin league. Her name does not appear in the early calendars, but she was early identified with a very different goddess, Libitina (q.v.), whose name was now connected with *lubido* (lust). Later, the identification with Aphrodite was completely carried out by the introduction into Rome of the worship of Venus Erycina, from the great sanctuary on Mount Eryx in Sicily. Sulla especially honored Venus Felix as a goddess of good fortune, and her worship became prominent in his colony at Pompeii. Pompey built a temple to Venus Victrix, and a great increase in the honor of this goddess developed with the Empire, since the Julian family traced their descent to Ascanius, son of Æneas, and grandson of Aphrodite. In 46 B.C. Julius Cæsar dedicated a temple to Venus Genetrix in his new Forum, and her worship was connected with that of Mars, father of Romulus, in Augustus' temple of Mars Ultor, and with that of Roma in Hadrian's temple of Venus and Rome. Consult the articles "Aphrodite" and "Astarte," in W. H. Roscher, *Lexikon der gricchischen und römischen Mythologie*, vol. i (Leipzig, 1884–90); the article "Aphrodite," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. i (Stuttgart, 1894); L. R. Farnell, *Cults of the Greek States*, vol. ii (Oxford, 1896); W. W. Fowler, *Roman Festivals* (London, 1899); Otto Gruppe, *Gricchische Mythologie und Religionsgeschichte*, 2 vols. (Munich, 1906); A. Fairbanks, *A Handbook of Greek Religion* (New York, 1910); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912); and the articles "Aphrodite" and "Venus," in Friedrich Lübker, *Reallexikon des klassischen Altertums* 2 vols. (8th ed., Leipzig, 1914).

VENUS. A planet whose orbit is between those of the earth and Mercury. Her mean distance from the sun is 67,200,000 miles. The eccentricity of her orbit is smaller than that of any other planet, being only 0.00682; and therefore her greatest and least distances from the sun differ by only about 940,000 miles. She performs her sidereal revolution in 224.7 days, in an orbit whose plane is inclined 3° 23½′ to that of the ecliptic, but her synodical revolution requires much more time, 584 days. Between inferior conjunctions and the next superior conjunction Venus is a morning star, and between superior conjunction and the next inferior conjunction she is an evening star. Her diameter is about 7700 miles; so that her volume is about 0.90 of that of the earth, and her mass is nearly 0.82 of that of the earth. In the telescope Venus presents phases similar to those of our moon, varying from a mere sickle of light to a complete circle. The brilliancy of the planet is at times very great, rendering her visible easily in daylight. The maximum brightness occurs 36 days on either side of inferior conjunction, the condition of maximum depending on the planet's phase and proximity to the earth.

The rotation period is still much in doubt, for the surface markings are inconspicuous, and it is only by showing these markings that we can fix the period. Some astronomers (Schiaparelli and Lowell) think the period is one of 225 days, the same as the orbital period, and that Venus, like our moon, always turns the same side towards the centre of the orbit. Other astronomers fix the period as approximately equal to that of the earth, viz., 24 hours. Venus probably has some sort of an atmosphere, but no satellites are known. See PLANETS; SOLAR SYSTEM; TRANSIT OF VENUS.

VENUS ANADYOMENE. See ANADYOMENE.

VENUS AND ADO'NIS. An early love poem in stanzas of six lines, by Shakespeare, licensed and published in 1593, but probably written as early as 1589. It was dedicated to Henry Wriothesley, Earl of Southampton, and in the dedication is described by the author as the "first heir of my invention."

VENUSBERG, vā'nụs-bĕrK (Ger., mountain of Venus). A name given as early as 1337 (in the *Children of Limburg*) and often afterward to mountains in Swabia, elsewhere in Germany, and even in Italy. But it usually refers to the Hörselberg near Eisenach. Here Venus was supposed to hold court, not inaccessible to favored mortals, who led with her a life of delight at the risk of eternal damnation. To warn them Eckhart sat at the entrance and, according to some legends, the torments of some visitants had already begun and their lamentations might on occasion be heard. This legend results from superimposing Christianity on German mythologic belief in the Earth Mother, known with various attributes as Hel, Hilda, Hulda, Holda, and Berchta. To her attendant train of elves, wise women (now become witches), and fallen heroes, Christian superstition added unbaptized infants. The tale was further modified by the needs of the homilist into an allegory against several of the deadly sins. The first mortal visitor to the Venusberg known to literature is Heinrich von Limburg in the already named Low German chronicle (about 1337); the most famous is Tannhäuser (q.v.).

VE'NUS CLAM (so called in allusion to the shape of the closed lunule). Any bivalve of the family Veneridæ, which consists of heavy, globose pelecypods, represented on all shores, and often beautifully colored and corrugated. The American hard clam (*Venus mercenaria*) (see Colored Plate of CLAMS) is a typical example. Some, when viewed in section, present an outline like that of the ace of hearts, and are called heart cockles.

VENUS' HAIR STONE. See ROCK CRYSTAL; RUTILE.

VENUS OF MEDICI. A celebrated statue in the Tribuna of the Uffizi (Florence), by Kleomenes, son of Apollodorus of Athens, a sculptor of the New Attic school, who probably lived in the time of Augustus. It represents the Greek goddess Aphrodite, entirely nude, as she arises from the foam of the sea. Both the face and form are of great youthful charm and beauty; but the motive is that of a maiden conscious of her charms almost to affectation. The hair was formerly gilded and the eyes were blue. The fine effect of the original is much impaired by the injudicious polishing of the marble's surface, and by a wretched modern

restoration of the arms and hand. The statue is probably a free copy of the Cnidian Aphrodite by Praxiteles (q.v.). It was found at Rome in the sixteenth century and brought to Florence from the Villa Medici in 1678. During the transportation it was broken into 11 fragments, which, however, were perfectly fastened together.

VENUS OF MILO, mē'lō, or **ME'LOS.** The most celebrated and beautiful of surviving statues of the Greek goddess Aphrodite, and perhaps the most priceless treasure of the Louvre. It is named from the isle of Melos, in. the Ægean Sea, where it was found by accident in 1820. Purchased by the Marquis de Rivière, French Ambassador to Constantinople, and presented to Louis XVIII, it was given by the latter to the Louvre. It has suffered much from time and rough treatment. Both arms are gone, and the body, which is nude to the waist, and the draperies are much battered. But so chaste and noble is the ideal and so wonderful the technical execution, that the effect is incomparable to anything else in art. Moreover, the Venus is a woman of beauty and the majestic incarnation of all-powerful love.

The position of the goddess and the date of the origin of the statue are matters of dispute. The most likely explanation seems to be Furtwängler's that the advanced left foot rested upon a helmet and the goddess regarded herself in a shield supported on the left thigh. The statue belongs to the Hellenistic period, the last half of the second or the first century B.C. It is an adaptation of the Aphrodite by Scopas and the Melian Tyche, but under direct inspiration of the Phidian epoch. Numerous monographs and articles have been written on the subject; but the best discussion is by Adolf Furtwängler, *Masterpieces of Greek Sculpture;* English translation by Eugénie Sellers (London, 1894).

VENUS OF WILLENDORF. See PALEOLITHIC PERIOD.

VENUS'S-COMB. See CHERVIL.

VENUS'S-FLOWER-BASKET. Any of various vitreous sponges, which have a more or less fenestrated and urn-shaped form; especially one of the Oriental genus *Euplectella.*

VENUS'S-LOOKING-GLASS (*Specularia perfoliata*).

VENUS'S-FLYTRAP. See CARNIVOROUS PLANTS; DIONÆA.

VENUS'S-GIRDLE. See GIRDLE OF VENUS.

VENUS'S-LOOKING-GLASS (*Specularia*). A small genus of low annual herbs belonging to the family Campanulaceæ. The best-known species, the common Venus's-looking-glass (*Specularia speculum*), is a native of Europe and has long been a favorite in flower gardens on account of its brilliant purple or white blossoms. *Specularia perfoliata,* a native of North America, occurs as a weed on sterile and sandy ground, and is also cultivated. It produces purple-blue flowers from May to August. Specularias thrive in any garden soil and are readily propagated by seeds sown in the spring. They often reproduce themselves from self-sown seeds.

VÊPRES SICILIENNES, vâ'pr' sē'sē'lyĕn' (Fr., Sicilian Vespers), LES. An opera by Verdi (q.v.), first produced in Paris, June 13, 1855; in the United States, Nov. 7, 1859 (New York).

VERA, vā'rà, AUGUSTO (1813–85). An Italian philosopher, born at Amelia, in Umbria. He studied at first in Rome and then in Paris. Afterward he taught literature and filled various professorships of philosophy, notably at Strassburg and Paris. In 1860 he received a professorship of philosophy in Milan, and the next year a similar post in Naples. He published several philosophical works in French, Italian, and English, and some translations from Hegel, whose philosophy he introduced into France and Italy. These include: *Problème de la certitude* (1845); *Aristotelis et Hegelii de Medio Termino Doctrina* (1845); *Introduction à la philosophie de Hegel* (1855); *L'Hégélianisme et la philosophie* (1861); *Philosophie de la nature de Hegel* (3 vols., 1863–65); *Philosophie de l'esprit de Hegel* (2 vols., 1867–69); *Problema dell' assoluto* (4 parts, 1872–82); *Strauss et l'ancienne et la nouvelle foi* (1873); *Cavour et l'église libre dans l'état libre* (1874); *An Introduction to Speculative Philosophy and Logic* (1875); *Platone e l'immortalità dell' anima* (1881); *Saggi filosofici* (1885).

VERACINI, vâ'rà-chē'nē, FRANCESCO MARIA (1685–1750). An Italian violinist and composer, born at Florence. His first appearance in 1714 was attended with such phenomenal success that Tartini (q.v.), in order to maintain his reputation, retired for some time for the purpose of practicing. In the same year Veracini visited London, and for two seasons was engaged to play between the acts at the opera. From 1717 to 1722 he lived in Dresden as chamber virtuoso, and until 1736 in Prague. In that year he settled in London, where he wrote three operas. In the meantime, however, Geminiani (q.v.) had become the lion of the hour, and in 1745 Veracini returned to Italy. He died in rather reduced circumstances near Pisa. His compositions, showing a strong individuality, comprise 12 violin sonatas, several violin concertos, and symphonies for string orchestra.

VERA CRUZ, vĕr'à krōōz, *Mex. Sp. pron.* vā'rà krōōs. A Gulf state of Mexico (Map: Mexico, L 8). Area, 29,201 square miles. The narrow strip along the coast is, in general, flat and sandy, with a gradual rise towards the interior. The central portion is mostly mountainous, with an altitude of over 18,000 feet in the volcano of Orizaba, on the borders of Puebla. In the northern part of the state the interior retains the general character of the coast land, while in the south it is more mountainous. The coast is lined with numerous lagoons, including the navigable Tamiahua. The state is intersected by many short rivers, mostly unnavigable. The natural conditions are very favorable for agriculture. The products include ixtle, coffee, tobacco, cacao, cereals, cotton, sugar, and fruits. There is some stock raising, and manufactures are numerous, especially of textiles, in which industry the state ranks next to Puebla. Mining is undeveloped, but the petroleum fields are exploited. Pop., 1910, 1,124,368, of whom about one-half are mestizos. Capital, Jalapa (q.v.).

VERA CRUZ. The most important port of Mexico, in the State of Vera Cruz, situated 193 miles (by rail 263) east of the capital of the Republic, on the Bay of Campeche (Map: Mexico, L 8). The city extends in a semicircle along the coast for nearly a mile, facing the fortress of San Juan de Ulúa on a rocky islet ½ mile from the shore. The harbor consists of a rather narrow channel with three openings, only two of which are available for vessels of ordinary draft. Improvements have given the harbor ample dock facilities and rendered it safe in all sorts of weather. The city is unhealthful, as it is surrounded by sand dunes and stagnant marshes. The climate is enervating at all seasons of the year, and because of the prevalence of yellow fever Vera Cruz is called the City of the Dead. Harbor improvements, new sewage and water systems, the reclaiming of waste lands, and modern pavements have done much, however, to remove this reputation. Architecturally the old walled city presents a pleasing appearance with regular streets and plazas, and houses generally of two stories, with variegated walls and a suggestion of Moorish style. The city is provided with an artillery school, a national school of seamanship, and a public library. The Hospital Gutiérrez Zamora is one of the finest in the country. In the Paseo de la Libertad there is a copy of the Bartholdi statue in New York harbor.

Fisheries and commerce employ the major portion of the inhabitants; in addition there are manufactures of cigars, preserved fruits, confectionery, furniture, brooms, and toys. The imports in 1912–13, consisting of textiles, machinery, iron and steel manufactures, coal and firearms, were valued at $40,896,390; and the exports, including ores, coffee, chicle gum, tobacco, sugar, rubber, hides, and dyewoods, amounted to $42,287,370. Pop., 1900, 29,164; 1910, 40,000.

In 1519 Cortés established the municipality of Villa Nueva de la Vera Cruz. In 1599 the settlement was transferred to its present site, where during the period of Spanish rule Vera Cruz remained the only gulf port of New Spain. The Castle of San Juan de Ulúa was begun in 1582 and completed at a cost of 40,000,000 pesos. The city was sacked by buccaneers in 1653 and 1712. Previous to 1810 it was a centre of revolutionary activity, and later occupied a prominent position in the various civil wars that desolated Mexico. Because of its vigorous but unsuccessful defense against the French in 1838 and in 1862, and against the Americans in 1847, it gained the title "Thrice Heroic." During the war between Mexico and the United States, General Scott, with an army of about 12,000, landed in the vicinity of Vera Cruz on March 9, 1847, and immediately invested the city, which, together with the Castle of San Juan de Ulúa, contained a garrison of about 4500. The city was subjected to a terrific bombardment by the fleet (March 22–25) and the Mexicans surrendered on the 29th. From Vera Cruz, in 1859, Benito Juárez promulgated his laws of reform, which made possible a free church within a free state. In 1914 the city was seized by the United States forces and held for several months (see MEXICO, *History*).

VERAGUA, vâ-rä'gwȧ, DUKES OF. The title borne by the successors of Columbus, bestowed originally upon Luís Colón (Columbus), the grandson of the discoverer. The male line became extinct in 1578 on the death of Diego, son of Luís, and the succession was settled on the descendants of Luís's sister, and in 1733 on those of Diego's sister. Cristóbal Colón de la Cerda, the Duke of Veragua at this time, was received with great honor in the United States on the occasion of the World's Columbian Exposition, 1893.

VERAN'DA (either from OSp., OPortug. *varanda*, balcony, railing, from *vara*, Lat. *vara*, rod, stick, from *varus*, bent, stretched, knock-kneed, awry). An exterior balcony, gallery, or platform sheltered by a roof borne on light columns or posts; a piazza, in the American sense. The veranda originating in the necessities of a warm climate, especially in the Mediterranean countries of Europe and the West Indies, has been developed into one of the most characteristic features of American suburban and rural domestic architecture, of which it forms a picturesque as well as convenient element. In European practice it is usually of light construction, narrower than the American piazza, furnished with a painted metal roof and apron or lambrequin, and considered an adjunct rather than an essential feature of the building. The term is not generally applied to the entrance porch unless this is of considerable extent.

VERANDRYE, vâ'rän'drê', PIERRE GAUTIER DE VARENNES DE LA (1685–1749). A Canadian explorer, born at Three Rivers, Quebec. After military service in France he returned to Canada and became distinguished as a pioneer. He built Fort St. Pierre, west of Lake Superior, in 1731, erected Fort St. Charles on the Lake of the Woods in 1732, and in 1733 established Fort de la Reine on the site of Portage La Prairie, near Lake Winnipeg. His subsequent expeditions extended as far west as the Rocky Mountains and as far north as the Forks of the Saskatchewan River, where he built Fort Dauphin in 1749.

VERATRINE, vê-rā'trĭn *or* -trēn. See ALKALOIDS.

VERA'TRUM. See HELLEBORE.

VERAZZANO. See VERRAZANO.

VERB (Lat. *verbum*, word; connected with Lith. *ĩvardas*, name, OPruss. *ĩvirds*, word, Ger. *Wort*, AS., Eng. *word*). In grammar, a word denoting an assertion or declaration. In most languages, especially in those of the Indo-Germanic and Semitic groups, the verb is sharply distinguished from the noun not only by its function, but by its inflection (q.v.). On the other hand, the verb possesses certain affinities with the noun and the adjective, particularly in the infinitives and participles, which are nouns and adjective respectively in form, but verbs in force. In many languages, as in ancient Egyptian and the Vei of the Mande Negro group, there is no distinction in inflection between the noun and the verb, as Egyptian *mḥ-a*, I fill; *mḥ ten*, ye fill; *pera-a*, my house; *per-ten*, your house; Vei *i-ro*, thou sayest; *mu-ro*, we say. Certain remnants of this identity seem to survive even in Indo-Germanic, as Latin *amamini*, to be loved, a participle (compare the Greek passive participle in *-μενος* and the Sanskrit in *-māna*), and the occasional occurrence even in Latin of a direct object of a noun, as the Plautine *quid tibi hanc tactiost*, why do you touch her? In the American Indian languages the verb tends to absorb within itself the objects and the pronouns, as in the

Tarascan *hopo-ni*, to wash; *hopo-ku-ni*, to wash the hands; *hopo-ndu-ni*, to wash the feet; *hopo-ngari*, to wash the face. The verb is normally inflected for mood, tense, voice, person, and number, and in some language groups, as in Semitic, for gender. The number of all these categories may vary greatly in different languages, and numerous subconjugations, as causative, reflective, negative, and passive, are also found. In English, as in the other languages of the Indo-Germanic group, verbs are conventionally divided into transitive and intransitive, the former class requiring an object, and the verbal force of the latter being complete in itself. The mood of a verb denotes the degree of certainty of its action, while the tense expresses the time of action. If a verb forms its tenses according to one of the usual systems in a language, it is said to be regular, as in English *love, loved*, but otherwise it is called irregular, as *swim, swam, swum*. A verb is said to be active, passive, or middle (reflexive, deponent) in voice if the subject is an actor, or is the recipient of an action by another, or performs an act which affects himself. Person denotes whether the subject is the person or persons speaking, or spoken to, or spoken of, and number shows whether the subject is one, or more than one. Auxiliary verbs are those necessary to complete the meaning of other verbs, especially in the formation of periphrastic tenses and moods, and impersonal verbs are those which, apparently at least, have no subject. See GRAMMAR; INDO-GERMANIC LANGUAGES; LANGUAGE; PHILOLOGY; SEMITIC LANGUAGES; ETC.

VERBECK, vĕr-bĕk′, GUIDO FRIDOLIN (1830–98). An American missionary to Japan. He was born in Zeist, Holland, was educated there in the Moravian Seminary, at the Utrecht Polytechnic, and after going to New York, in 1852, at Auburn Theological Seminary, where he graduated in 1859. In the same year he went as a missionary of the (Dutch) Reformed church in America to Nagasaki, Japan, whence he was transferred in 1868 to Tokyo. There he was superintendent of teachers and instruction in the Imperial University in 1869–73. He returned to missionary work in 1879, was prominent in the translation of the Bible into Japanese, taught (1891–98) in the Meiji Gakuin, and was a very successful and tactful missionary. He made many important translations, mostly legal, in behalf of the Japanese government, and wrote a *History of Protestant Missions in Japan* (1883). Consult W. E. Griffis, *Verbeck of Japan* (New York, 1900).

VERBE′NA, VER′VAIN (Lat., foliage, herbage, sacred bough, plant used as a cooling remedy). A genus of about 75 species of annual or perennial herbs or shrubs of the family Verbenaceæ, mostly natives of tropical and subtropical America. A number of native species are distributed through the United States, growing as weeds in waste or cultivated ground. The flowers, borne in terminal spikes, may be seen during nearly the whole summer. The cultivated varieties, which are derived from several species and their hybrids, have creeping or spreading stems and dense spikes of large and showy flowers. They vary greatly when grown from seed and represent a wide range of color. The European verbena (*Verbena officinalis*) is a common weed, native of Europe, but has become naturalized in North America. It is an annual with small purplish blossoms in slender panicled spikes. *Verbena teucrioides*, a species cultivated in gardens for its large pinkish white flowers, sweet scented at night, is a native of Brazil.

A CULTIVATED VARIETY OF VERBENA.

Verbena venosa, also from Brazil, produces lilac flowers from June to October, and is frequently grown in beds or groups with other plants. Verbenas flourish in light garden soil, especially when fertilized with well-rotted manure. They are commonly propagated by seeds. The hard seeds of some species are steeped in warm water for an hour or two before sowing to cause a more rapid germination. The stems pegged down to the soil produce shoots from the axils of the leaves.

VER′BENA′CEÆ (Neo-Lat. nom. pl., from Lat. *verbena*, foliage, herbage, sacred bough, plant used as a cooling remedy). A family comprising about 75 genera and 1300 species of herbs, shrubs, and some tropical trees, widely distributed in temperate and warm regions. Some of the best-known genera in cultivation are *Verbena* and *Lantana*, while *Tectona* yields the well-known Indian teak. The common genera of the North American flora are *Verbena* (vervains), with about 25 species; and *Lippia* (fog-fruits), with about 10 species. Both genera are characteristically American, but chiefly represented in tropical and subtropical America.

VERBITSKAYA, vĕr′bĭt-skä′yȧ, ANASTASIA ALEXEIEVNA (1861–). A Russian writer.

From 1883 she figured prominently in magazines. In book form the following collections have appeared: *Life's Dreams* (1899), *Emancipated* (1902), *The Crime of Maria Ivanovna* (1902), and *Happiness* (1905). Among her novels *The Story of a Life* and *The Keys of Happiness* were most popular. Her dramas include *The Spirit of the Age*, dealing with the revolutionary days of 1905, and *Useless Sacrifices*. A summer idyl, *Elena Pavlovna and Seriozha*, appeared in 1915. Feminism and the economic independence of woman constitute the dominant themes of her work, especially her novels.

VERBOECKHOVEN, vĕr'bo͝ok-hō'ven, EUGÈNE JOSEPH (1799–1881). A Belgian animal painter and etcher. He was born at Warneton, West Flanders, was the son and pupil of the sculptor, Barthélemy Verboeckhoven (1759–1840), and also studied under Ommeganck. He visited England, Germany, France, and Italy, and settled at Brussels, where he painted numerous animal pieces, chiefly sheep, to be seen in Amsterdam, Berlin, Munich, and various other galleries of Europe and America. They were very popular in his day, and are correctly drawn and smoothly executed, but lack realism, force, and variety. He also published numerous etchings and lithographs of animals and landscapes.

VERCELLI, vĕr-chĕl'lē. An episcopal city in the Province of Novara, Italy, situated in a low fertile plain, on the Sesia, 44 miles by rail west-southwest of Milan (Map: Italy, B 2). It is a thriving manufacturing and commercial town. It has retained its narrow, winding streets, but its ancient walls have given place to boulevards, those on the northwest commanding magnificent views of the Alps. The seventeenth-century cathedral has a library containing a collection of valuable manuscripts. (See VERCELLI BOOK.) The thirteenth-century Romanesque-Gothic San Andrea, and the San Cristoforo, with a fine altarpiece by Gaudenzio Ferrari, are worthy of note. There are manufactures of silk, machinery, matches, silverware, and surgical instruments. The flour and rice mills are important and Vercelli is one of the chief export centres in Italy for rice and other cereals. Vercelli was the scene of Marius's victory over the Cimbri in 101 B.C. After having been ruled by the Visconti of Milan, it passed to Savoy in 1429. Pop. (commune), 1901, 31,154; 1911, 31,903 (town, 17,936).

VERCELLI BOOK, or CODEX VERCELLENSIS. The name given to a valuable collection of Old English or Anglo-Saxon sermons and poems preserved in the library of the cathedral at Vercelli, Italy. This manuscript book was discovered in 1822. How it reached Italy is uncertain. It may have been taken out of England by Cardinal Guala, who in the reign of Henry III was prior to St. Andrew's, Chester. On his return to Italy the Cardinal built the Monastery of St. Andrew, in Vercelli. It is to be noted that the longest poem in the manuscript is *Andreas, or the Legend of St. Andrew*, one of the best of the Old English religious epics. Consult the facsimile copy of the *Codex Vercellensis*, by R. Wülker (Leipzig, 1894); and see EXETER BOOK.

VER'CINGET'ORIX. The most famous of the Gallic chieftains who fought against Cæsar. He was the leader of the Arverni tribe and carried on war against Cæsar with great ability in 52 B.C. He fell into Cæsar's hands at the fall of Alesia and was taken to Rome, where he was put to death after participating in his conqueror's triumph. The seventh book of Cæsar's *Commentaries on the Gallic War* treats of the war against Vercingetorix.

VERDANT GREEN, THE ADVENTURES OF MR. A college story by Cuthbert Bede (Rev. Edward Bradley), published, with illustrations by the author, in 1853. It was continued in *Tales of College Life* (1856) and *Mr. Verdant Green Married and Done For* (1856).

VERDE, vĕrd, CAPE. See CAPE VERDE.

VERDE ANTIQUE, vĕrd ăn-tēk' (OF. *verd antique*, Fr. *vert antique*, It. *verde antico*, ancient green, abbrev. from *porfido verde antico*, green antique porphyry). A variety of augite-andesite porphyry (see ANDESITE), quarried in ancient times at Marathonisi, on the Gulf of Kolokythia, in Greece, and much employed as an ornamental stone. It has a dark green base, or ground mass, in which are lighter green porphyritic feldspar crystals, their color due to alteration processes. The name is also given to serpentine marble, a mixture of serpentine and calcite, used for indoor ornamental work and sometimes called ophiolite or ophicalcite.

VERDEN, fâr'den. A town in the Prussian Province of Hanover, 21 miles southeast of Bremen, on the Aller and on the Hanover-Bremen line of the Prussian State Railway (Map: Germany, C 2). Its manufactures include especially agricultural machinery, cigars, and soap. Pop., 1910, 10,064. At this place 4500 Saxons were executed by Charlemagne. Verden became a Swedish duchy in 1648, in 1719 was joined with Hanover, and in 1866 annexed to Prussia.

VERDI, vĕr'dē, GIUSEPPE (1813–1901). The greatest Italian composer of the nineteenth century. He was born at Roncole, a small town in the Duchy of Parma, Oct. 9, 1813. At seven he received instruction from Baistrocchi, the organist of the village church. The boy's progress was rapid, and (about 1823) his father decided to give him a liberal education, sending him to the academy at Busseto. Two years later, upon completion of the course, he was apprenticed to Antonio Barezzi, president of the Philharmonic Society of Busseto. Provesi, the conductor of the society, instructed him in composition and orchestration. When Provesi retired Verdi was unanimously chosen his successor. When Verdi had reached his sixteenth year Barezzi and Provesi sent him to the conservatory at Milan. The director, Francesco Basili, rejected him for lack of musical ability, but the young man applied to Vincenzo Lavigna, then conductor at La Scala. Lavigna detected his talent and confined his instruction chiefly to the practical side of operatic composition. Of the pieces written at this time none has been published, although Verdi used some in his earliest operas.

When Provesi died in 1833 Barezzi asked Verdi to come back to Busseto as conductor of the Philharmonic Society. Verdi returned, and bound himself for three years at a salary of 300 francs. On the expiration of this he went back to Milan. There Verdi met a young poet, Solera, who wrote for him the text of his first opera, *Oberto, Conte di San Bonifacio*, which was produced with a splendid cast on Nov. 17, 1839. Ricordi offered the young composer 2000 lire for the score of *Oberto*, and guaranteed 4000 lire for each of three operas to be written at intervals of eight months. Verdi at once

began work on a book furnished by Merelli, *Un Giorno di Regno*, a comic opera. But the death of his children and his wife in succession so affected him that the opera was a failure. Reluctantly, Merelli released him. After two years' retirement, Verdi brought out a new opera, *Nabuccodonosor* (1842). Its success made him a celebrity. In the following year *I Lombardi* appeared, and thereafter Verdi was regarded as the foremost composer of Italy. In 1844 *Ernani* was produced at Venice, and proved a great success.

Verdi's genius seemed now to suffer an eclipse, for of the operas written between 1844 and 1851 none rises above mediocrity; some were failures. These works are: *I due Foscari* (1844), *Giovanna d'Arco* and *Alzira* (1845), *Attila* (1846), *Macbeth* and *I Masnadieri* (1847), *Il Corsaro* (1848), *La Battaglia di Legnano* and *Luisa Miller* (1849), *Stiffelio* (1850). With the *Stiffelio* closes the first period of Verdi's career.

In 1849 Verdi married the famous prima donna Giuseppina Strepponi, who had appeared in several of his operas. His second period began with *Rigoletto* (1851), followed at the end of 1852 by *Il Trovatore*, and only a few weeks later by *La Traviata*. The success of each of these was phenomenal and carried his name over the civilized world. For the Paris Exposition of 1855 Verdi was commissioned to write a festival opera. This was *Les Vêpres Siciliennes*, produced with moderate success at the Grand Opéra. Still more coolly the next work, *Simone Boccanegra* (1857), was received. *Un Ballo in Maschera* (1859) once more was an emphatic success, whereas *La Forza del Destino* (1862) was received with less favor. The next five years Verdi revised and partly rewrote older operas. Another French opera, *Don Carlos*, was written for and produced during the Paris Exposition of 1867. The score of this is carefully written and there is less evidence of Verdi's chief faults. These operas constitute the composer's second period. All of them show the influence of the style of the Paris Grand Opéra, but instead of being influenced by the grace and esprit of this school, Verdi seems to have been attracted chiefly by its worst qualities, as shown in its violent contrasts, commonplace melodies, distorted rhythms, and an instrumentation which is either overloaded or too meagre. But in spite of these faults the works of this period are full of passages which show Verdi's great creative genius.

Although he wrote little between 1860 and 1870, he was not idle, for he devoted his time to study of the great Italian masters, perfecting his own technic and educating and refining his artistic taste. Close upon the age of threescore Verdi turned his back upon the style that had made him famous and wealthy. *Aida* (1871), written for the Khedive of Egypt, was the first opera produced in accordance with his newly acquired artistic convictions. The success of this new work was most emphatic. Verdi had a still greater surprise in store for the musical world when he came out with the *Manzoni Requiem* (1874). Verdi was now silent for 13 years, but in 1887 *Otello* appeared, a work which surpasses all his previous efforts and which is a real drama. On the same lines is constructed his last and perhaps greatest work, *Falstaff* (1893). It is remarkable that Verdi, whose only comic opera had been a signal failure, should close his career with the greatest musical comedy which the world possesses, with the single exception of Wagner's *Meistersinger*. The list of Verdi's works is completed by the mention of a dramatic cantata *Inno delle Nazioni* (1862), a string quartet (1873), several romances, a *notturno* for three voices with flute obligato, and his last composition, *Quattro Pezzi Sacri* (1898).

In 1874 Verdi was made Senator. In 1898 he donated the sum of 2,000,000 lire to the city of Milan for the purpose of erecting a home for old and invalid musicians of both sexes. The last years of his life were spent in retirement at his villa, Sant' Agata near Busseto. He died in Milan, Jan. 27, 1901. Consult: F. Crowest, *Verdi, Man and Musician* (New York, 1897); C. VERDICT. The finding of a jury upon the issues tried before it. It is the function of the jury to determine from the conflicting evidence and testimony before them what facts they consider to have been established and to make a proper application of the law relating thereto as charged by the court. Where a court wishes to reserve the application of the law to itself, it may direct the jury to find the facts only, and such a finding is known as a special verdict. A verdict must be the result of the fair and unbiased consideration of all the jurors, and if it is arrived at in any other way it may be set aside. For example, if the jurors differ as to the amount of damages to be awarded to a plaintiff, and in order to reach an agreement add together the various sums contended for by each, and divide the total by 12, such a quotient or compromise verdict may be set aside. A verdict which is the result of chance or lot is also illegal and void. In civil proceedings, if the verdict is against the weight of evidence or illegal for any reason, it may be set aside. In criminal proceedings a verdict of acquittal is conclusive, but in case of a disagreement the accused may be tried again. A verdict must be unanimous, and it has been held that in trials for felony the accused cannot waive the right to the verdict of 12 jurors. Thus, even if the defendant expressly consents to be tried by 11 jurors the verdict will be a nullity. The courts in many States may receive a verdict on Sunday. An accused person has the right to be present in court when the verdict is rendered, and in many of the States he is required to be present or the proceedings will be illegal. If it is not convenient for a judge to receive a verdict at the hour the jurors arrive at their conclusion, he may authorize them to write it out, affix their signatures to the paper, seal it up securely, and deliver it to a court officer for custody until they assemble again in court to announce it. Such a verdict is known as a sealed verdict. This is often done where the verdict is determined upon late at night, especially on the eve of a holiday. There is no fixed rule as to the time allotted within which the jury must either agree or pronounce a disagreement. The court

has a discretionary right to send the jury back for further deliberations until it is satisfied that it is highly improbable that a verdict will be agreed upon. The verdict of a jury is announced by its foreman and must be in a proper form to answer the issues presented. For example, a general verdict is for the plaintiff or for the defendant, specifying the amount of recovery, and in criminal cases, guilty or not guilty. In Scotland the peculiar and unsatisfactory form of verdict not proven is permitted in criminal cases. This does not exonerate the prisoner, but is a bar to a second trial. Consult Sir J. F. Stephen, *Commentaries on the Law of England* (14th ed., London, 1903); *New York Code of Civil Procedure;* and the authorities referred to under PLEADING. See JURY; SPECIAL VERDICT.

VERDIGRIS, vĕr'dĭ-grēs (OF. *verd de gris, vert de gris,* Fr. *vert-de-gris,* verdigris, green of the Greeks). A green pigment consisting of basic copper acetates in varying proportions. It was known to the ancient Romans, and is prepared by exposing thin sheets or strips of copper to the action of acetic acid developed in the marcs or residues from wine factories, and is produced largely in the wine districts of France. After a few weeks, the surface of the copper becomes coated with a crust of verdigris, which is then detached and levigated. A better process of production consists in interposing cloths saturated with acetic acid between copper plates. Verdigris finds its chief use as a pigment, especially when mixed with white lead. It is also used in dyeing and calico printing, and for the preparation of Schweinfurt green and other copper paints. Verdigris has long been employed in medicine in the form of an ointment or liniment, chiefly as a caustic application to warts. Taken internally it is an irritant poison, and the free administration of the white of eggs and milk is its best antidote.

VER'DIN. A bird. See GOLDTIT.

VERDUN, vâr'dĕN' (officially *Verdun-sur-Meuse*). A fortified town of the first class, capital of an arrondissement in the Department of Meuse, France, on the right bank of the Meuse, 43 miles by rail west of Metz (Map: France, N., L 3). The river separates here into five branches. Since the Franco-Prussian War it has been made the strongest town of east France. The forts on the right bank are connected with a series of forts reaching to Toul. Among the noteworthy buildings is the cathedral, built in the eleventh and twelfth centuries, and altered in the fourteenth and seventeenth. Other features are the Hôtel de Ville, the Palais de Justice, the new college, and the Bishop's Palace. There is a valuable public library. Hardware, rope, leather, liqueurs, and famous confectionery (dragées de Verdun) are manufactures. Verdun, the Roman Verodunum, was included in the Kingdom of Austrasia. In the ninth century it became part of Lorraine and remained a German town till the Reformation, rising to the position of a free Imperial city. The surrounding district was ruled by the bishops of Verdun, with whom the citizens had to wage long struggles. In 1552 Henry II of France seized the town and the bishopric, which were formally relinquished by the German Empire in the Peace of Westphalia (1648). In 1870 Verdun surrendered to the Prussians after a severe bombardment. Pop., 1901, 21,360; 1911, 21,701. See VERDUN, TREATY OF.

In the War of 1914 it served as the right flank of the allied armies in the battle of the Marne, then forming the eastern limit of the gap (Paris-Verdun) into which the Germans were compelled to pass in order to reach the allies. As such, it was an advanced point thrust into the entire German mass from Alsace to Paris, and thus became the centre of most desperate fighting. Taught a lesson by the fall of Liége, Namur, and Maubeuge respectively, the French authorities, there is reason to believe, altered its characteristics from that of fortress pure and simple to that of fortress in relation with a defending army in the field, and thus enabled it, in 1916, to offer the most pertinacious resistance to the most tremendous effort yet made by the enemy to win a decision at some point in the adversary's line. See WAR IN EUROPE.

VERDUN. A town in Jacques Cartier Co., Quebec, Canada, and a residential suburb of Montreal. Pop., 1901, 1898; 1911, 11,629.

VERDUN, TREATY OF. The peace concluded on Aug. 10, 843, by Louis the German, Charles the Bald, and the Emperor Lothair, the three sons of Louis the Pious, by which the Frankish Empire was divided among them. By the terms of the treaty Lothair retained the honorary title of Emperor, with Italy and the country between the Rhine on the east, and the Rhone, Saône, Meuse, and Scheldt on the west; Aix-la-Chapelle was given to him as his capital. Louis received the countries east of the Aar and the Rhine, also the gaus of Speier, Worms, and Mainz. Charles received the countries west of the Rhine, including Neustria and Aquitaine, with western Burgundy and the Spanish March. See CAROLINGIANS.

VERDY DU VERNOIS, vâr'dē' dụ vâr'nwä', JULIUS VON (1832–1910). A German strategist. He entered the Prussian infantry in 1850, served on the staff of the Second Army in the war against Austria in 1866, and as one of Moltke's chief assistants served on the general staff during the Franco-Prussian War in 1870–71. After the war he continued in the office of the general staff, and was promoted to major general in 1876, lieutenant general in 1881, and general of infantry in 1888. He became Governor of Strassburg in 1887, and Minister of War in 1889, but retired in 1890. His writings include: *Teilnahme der zweiten Armee am Feldzuge, 1866* (1866); *Ueber praktische Felddienstaufgaben* (6th ed., 1890); *Studien über Truppenführung* (1870; new ed., 1892; Eng. trans., 1906); *Studien über den Krieg auf Grundlage des deutsch-französischen Krieges* (1892–96); *Im grossen Hauptquartier, 1870–71* (1895; Eng. trans., 1897); *Im Hauptquartier der zweiten Armee, 1866* (1900); *Studien über den Krieg* (1901–06).

VERE, vā'rē. See VEERE.

VERE, vēr, SIR AUBREY DE and AUBREY THOMAS DE. See DE VERE.

VERESAEV, vyĕ'rĕ-sä'ĕf, VIKENTY (1867–). A Russian writer, born at Tula, his real name being Vikenty Smidovitch. He practiced medicine before devoting himself to literature; hence several of his works, notably *The Memoirs of a Physician* (Eng. trans., New York, 1916), deal with incidents connected with his medical experiences. Besides this work, he wrote *Astray,* an ultra-revolutionist novel; *At the Front,* a grim picture and psychological study of war; and *The End of Andrei Ivanovitch,* dealing with the transformation of peasantry into

dwellers of the city. His *New Life*, a study of Tolstoy and Dostoyevsky, drew attention to Veresaev as a literary critic. His collected writings were published at St. Petersburg (4 vols., 1913). Consult S. Persky, *Contemporary Russian Novelists* (Boston, 1913).

VERESHTCHAGIN, vĕ'rĕsh-chä'gĕn, VASILI (1842–1904). A Russian military painter. He was born at Tcherepovets, Government of Novgorod, and studied at the St. Petersburg Academy, and later removed to Paris, where in 1864 he began his work with Gérôme at the Ecole des Beaux-Arts. In 1867 he joined the expedition against Samarkand, and after a sojourn in Paris went in 1869 to Siberia. Later he spent two years in Munich. For four years he traveled in China and India. In 1877 he left Paris, whither he had gone to live, to join the Russian army in the Russo-Turkish War. Afterward he abandoned war, and became its severest denouncer. He gathered his material at first hand, and while on such a mission he lost his life, going down on the Russian battleship *Petropavlovsk*, in the harbor of Port Arthur, April 13, 1904. Striving to teach his detestation of war by depicting its horrors, he recoiled from no realism of subject. Technically, his pictures, which are mostly of colossal size, are crude in color, but they are filled with figures, contributing much to the history of the subject. Among the most striking are: "The Pyramid of Skulls," "Forgotten," "The Road after Plevna," "Skobelev in the Shipka Pass," "The Emir of Samarkand Visiting the Trophies." His war pictures are in cycles, among which are an Indian series; a series representing Napoleon's campaign in Russia, and another on the Spanish-American War. He held repeated exhibitions in the United States, where a number of his works are in public and private possession, including three in the Brooklyn Museum. He is best represented in the Tretyakov collection, Moscow, by Indian and Central Asiatic subjects and his best-known battle pieces. Selections from his memoirs have been published in English under the title *Vereshtchagin, Painter, Soldier, Traveler* (New York, 1888); as has also been his *Napoleon I in Russia* (London, 1899).

VERGA, vĕr'gà, GIOVANNI (1840–). An Italian novelist and dramatist, born at Catania, Sicily. His greatest works are *I Malavoglia* (1881) and *Mastro Don Gesnaldo* (1889), the latter of which has been favorably compared to the *Madame Bovary* of Flaubert. Of Verga's numberless tales *Cavalleria rusticana* is most famous as the libretto of Mascagni's opera. One of the greatest interpreters of Italian regional life Verga shares with Capuana the leadership of the Sicilian *veristi*. Consult B. Croce, "G. Verga," in *Critica*, vol. i (Bari, 1903), which contains a bibliography.

VERGE BOARD. See BARGEBOARD.

VERGENNES, vĕr'zhĕn', CHARLES GRAVIER, COUNT DE (1717–87). A French statesman, born at Dijon. After serving for nearly a quarter of a century in various diplomatic capacities, first as Minister to Treves, then as Ambassador to Turkey, and finally as Ambassador to Sweden, he was made Minister of Foreign Affairs by Louis XVI in 1774. He arranged an alliance with the Swiss Confederation; and the negotiations that brought France into alliance with the new United States of America were conducted by him. Largely as a result of negotiations conducted by him, also, Spain joined in the war against Great Britain in 1779. Consult Bonneville de Marsangy, *Le chevalier de Vergennes* (Paris, 1894–98).

VERGENNES, CLAIRE ELISABETH JEANNE GRAVIER DE. See RÉMUSAT, COUNTESS DE.

VERGIL, vĕr'jĭl, POLYDORE (?1470–?1555). An English ecclesiastic and historian, of Italian origin, born at Urbino, Italy. He studied at Bologna and Padua; at the latter became secretary to the Duke of Urbino, and there wrote *Proverbiorum Libellus* and *De Inventoribus Rerum*, two books which went through several editions and translations, and established his fame. He was appointed chamberlain to Pope Alexander VI, and about 1501 was sent to England as collector of Peter's pence (the last holder of this office). He became naturalized, and excepting three visits to the Continent, remained in England almost to his death. He received successively the rectorship of Church-Langton, the archdeaconry of Wells, and prebends in the cathedrals of Hereford, Lincoln, and St. Paul's, London. On a charge of libeling Wolsey he was imprisoned in 1515, but was soon released. After nearly 50 years in England, he returned to end his days in his native land, with permission to hold his archdeaconry, and his Hereford prebend. His principal work, written at the instigation of Henry VII, is *Polydori Vergilii Urbinatis Anglicæ Historicæ Libri XXVI* (1534), which comprises a history of England from the earliest times to the end of the reign of Henry VII; it went through numerous editions, and in 1844–46 an Old English translation of the first eight books was edited and published for the Camden Society. His *De Inventoribus Rerum*, translated by John Langley and edited by W. A. Hammond, with an "Account of the Author and his Works," was published for the Agathynian Club of New York in 1868.

VERGIL (PUBLIUS VERGILIUS MARO) (70–19 B.C.). One of the most celebrated of Roman poets. The orthography Vergilius is established beyond question by the evidence of inscriptions, as well as by the earlier manuscripts and the Greek transliterations Οὐεργίλιος and Βεργίλιος, and is now generally employed. The form Virgilius appears for the first time in the fifth century, and became current during the Middle Ages. It was due to popular etymology, which connected the name with *virga*, wand, on account of the association of Vergil with magic rites (see below), and perhaps also through association with *virgo*, either on account of the purity of his character, or because of the belief in later times that he was born of a virgin. Donatus (Suetonius) tells us that he was called in ancient times Parthenias because of the purity of his life; this name suggests the Greek word *παρθένος*, maiden (cf. Parthenon, the temple of the maiden goddess Athena). Among modern nations the spelling varies between Vergil and Virgil. The former is, strictly speaking, correct, but conservatism has preserved the latter in many cases, especially in England and America.

Unlike his friend and contemporary Horace (q.v.), Vergil gives us but little information about himself in his own writings. Our knowledge of his life is derived from casual allusions in other Roman writers, and from various ancient biographies, of which the best is that ascribed to Ælius Donatus, a grammarian of the fourth century of our era. The account of Donatus is doubtless based on the *De Viris Illustribus* of

Suetonius, and derived from good sources, but it has been amplified and distorted in many particulars. Some few details may, however, be regarded as authentic. For the ancient biographies of Vergil, consult H. Nettleship, *Ancient Lives of Vergil* (Oxford, 1879); E. Diel, *Die Vitæ Vergilianæ und ihre antiken Quellen* (Bonn, 1911); J. Brummer, *Vitæ Vergilianæ* (Teubner, 1912).

Like nearly all, if not all, the great Roman writers, Vergil was not a native of Rome, and he was not even a Roman citizen by birth; yet no Latin writer is more intensely patriotic or more thoroughly Roman in spirit than he. He was born in Cisalpine Gaul, near Mantua, in the District of Andes (Andes appears to have been the name of a people rather than that of a town). He was thus a fellow countryman of Catullus (q.v.), for whom he had a warm admiration, of Cornelius Gallus (q.v.), and of Nepos (q.v.); the same region afterward produced Livy, the Plinys, and perhaps Tacitus. His parentage was humble and obscure. His father was said by some to have been a potter, by others the hired laborer of a certain Magius, whose daughter, Magia Polla, he took to wife. In any event, Vergil's father became an independent landholder, and he acquired a competency from farming and bee keeping. He certainly gave his son a thorough education in the usual curriculum of grammar, rhetoric, and philosophy. Vergil studied first at home and in the neighboring town of Cremona. On his sixteenth birthday he assumed the manly gown (*toga virilis*), and went to Mediolanum (Milan) for further instruction. He continued his studies at Naples under Parthenius, who taught him Greek, and finally, in the year 53 B.C., he went to Rome, where he studied rhetoric and philosophy. Here the teacher who had the most influence on him seems to have been the Epicurean Siro. Through him, probably, Vergil became acquainted with the work of Lucretius (q.v.), by which he was strongly influenced. He also acquired a love of philosophical study which lasted throughout his life and helped to give him that psychological insight which characterizes all his work. At Rome he seems to have busied himself also with the study of mathematics, natural philosophy, and medicine. At this period in his life we lose sight of Vergil for about 10 years. Being of a delicate constitution and a retiring disposition, he did not follow the usual military or political career, but appears to have returned to his native place, where he devoted himself to the management of his paternal estate and to study. Throughout his life he was a diligent student, and read widely in Greek literature, as well as in that of his own country. After the battle of Philippi (42 B.C.) Vergil's property was included in the proscriptions which were made in Cisalpine Gaul for the benefit of the veterans of Antony and Octavian. The details of the affair, as reported by ancient authorities, are somewhat confused and uncertain. According to one view, the influence of C. Asinius Pollio, who held an important military command in that region, and took a friendly interest in the gifted young man, saved the estate for a while. After Pollio was succeeded by Alfenus Varus, although the latter was also a friend of Vergil's, the poet was driven from his home, and he is said to have had a narrow escape from death at the hands of one of the soldiers. He did not recover his property, but he received another estate by way of compensation, perhaps the one which he is known to have possessed near Nola in Campania. For another view, see below, the paragraph on the *Eclogues*. On the question of Vergil's experiences with respect to his paternal estate, consult the Conington-Nettleship edition of Vergil, vol. i, 108, 109 (4th ed., London, 1881). At the advice of his friend Cornelius Gallus, Vergil moved to Rome, where he made the acquaintance of Mæcenas and of Octavian. He soon became a member of the former's circle of literary friends, into which he afterward introduced Horace. The patronage of Mæcenas relieved him of financial cares and allowed him to devote himself wholly to literary pursuits and to study. In 19 B.C. Vergil set out on a journey to Greece and Asia, with the intention of spending three years in a revision of the *Æneid*, which he had already completed substantially in the form in which it is known to us, and of then devoting the rest of his life to philosophical studies. In Athens he met Augustus, who prevailed on him to accompany him on his return to Italy. When he embarked, Vergil was ill with a fever caused by a visit to Megara on an intensely hot day, and, shortly after landing at Brundisium, in Italy, he died. He was buried near Naples, where his tomb is said to have been marked with the following epitaph, which briefly sums up his life and works:

Mantua me genuit: Calabri rapuere: tenet nunc
Parthenope: cecini pascua, rura, duces.

These lines, however, cannot be regarded as having been written by Vergil himself, to whom tradition ascribed them, and the exact location of his place of burial is unknown.

Vergil's life was singularly quiet and uneventful. He suffered much from ill health, particularly dyspepsia and headache, but in all other respects he was fortunate. He counted among his friends the most distinguished men of his day, both in literature and in political life; his own position in the world of letters was generally and cordially recognized during his own lifetime. He accumulated a considerable fortune from the generosity of his patrons, and he possessed several country places as well as a house on the Esquiline Hill at Rome. On account of ill health he spent the greater part of his time in Campania and in Sicily. He never married. He left his property to his half brother, Valerius Proculus, and to his literary executors, Varius and Tucca, with legacies to Mæcenas (q.v.) and to Augustus.

In appearance he is described by Donatus (Suetonius) as of a large frame, a dark complexion, and a rustic air. No bust of the poet which can be regarded as genuine has been preserved, and the numerous portraits which appear in the editions of his works have little or no claim to authenticity, with the exception of some miniatures which are found in the earlier manuscripts, and two mosaics, one discovered at Treves in 1884, the other at Susa, in Africa, in 1896. The latter, which seems to belong to the first century of our era, and probably gives us our best representation of the poet, shows him seated between the muses of tragedy and of history, holding in his hands a scroll, partly unrolled, on which are the words:

Musa, mihi causas memora, quo numine læso
Quidve. . . . (*Æn.*, i, 8.)

The face and figure, while less attractive than

those shown in some of the spurious portraits, agree much more closely with the description of Donatus than the portraits do. Vergil's most marked characteristics seem to have been modesty and gentleness. The prominence which came to him early in life was a genuine cause of distress to him, and he is said to have taken refuge in the nearest shop or doorway to avoid what Horace glories in, being pointed out by the finger of the passer-by.

Like nearly all the poets of the Augustan age except Horace, Vergil was strongly influenced by the Alexandrian school of Greek writers. (See ALEXANDRIAN AGE; ALEXANDRIAN LIBRARY; ALEXANDRIAN SCHOOL. See, too, below, the paragraph on the *Georgics*.) His acquaintance with them doubtless began at the time of his studies at Naples under Parthenius. This influence gave his works their cosmopolitan and modern tone, which with their pathos, that note of brooding pity, as Mackail happily expresses it, makes them mark a new era in the history of Roman literature. To these characteristics also their general and lasting popularity is in a great measure due. But, though a master in his treatment of the passion of love, he does not belong to the followers of Alexandria on whom Horace vents his scorn. As Cicero in oratory avoided the extremes of the Asiatic and of the Attic schools, and developed a characteristic style of his own, so Vergil combined the best features of the Alexandrian poets with those of what we may term the national school of Roman writers. During his early life Vergil is said to have written some short poems, which he appears afterward to have suppressed; these will be considered later. His first serious work was in a field as yet untried by Roman poets, that of pastoral poetry. He is said to have taken this up at the suggestion of Asinius Pollio, although his fondness for country life and his love of nature made the task a thoroughly congenial one. The 10 poems which have come down to us, the *Eclogues* or *Bucolics* (*Eclogæ*, *Bucolica*), were written between the years 43 and 37; they were published at first separately, but afterward in a body. The arrangement, which is not strictly chronological, is doubtless that of the poet himself. They fall into two general classes—the purely pastoral poems, in which he sings of the life and the loves of shepherds, and those in which Vergil himself and his contemporaries appear in the guise of country folk. To the former class belong the second, third, fifth, seventh, and eighth Eclogues. The second Eclogue sings of the hopeless love of Corydon for Alexis, his master's favorite. The others all represent contests in song between shepherds: in the third and the seventh the singers are rivals who contend before a judge for a prize; in the fifth two shepherds meet and sing in turn the praises of Daphnis, the ideal shepherd, with many compliments to each other; and in the eighth two friends sing of unrequited love. Of the other class the first and ninth have to do with Vergil's loss of his paternal estate, and present not a few difficulties of chronology and of interpretation. The ninth, which seems to be the earlier, refers to his expulsion from his property and is supposed to have been designed to secure the aid of Alfenus Varus in recovering it; the first represents the poet as restored to his home and sings the praises of his benefactor, Octavian. The famous fourth Eclogue celebrates the birth of a child, whom it seems impossible to identify, who is to bring back the Golden age. The child is variously supposed to be the unborn child of Octavian and Scribonia, the offspring of Antony and Octavia, and Asinius Gallus, the son of C. Asinius Pollio. The first view seems on the whole the most probable, although the last is supported by such high authority as Ribbeck and Sellar. On this Eclogue consult J. E. Church, "The Identity of the Child in Vergil's Pollio," in *University of Nevada Studies*, vol. ii (Reno, 1911); id., "The Identity of the Child in Vergil's Pollio: An Afterword," ib., vol. iii (ib., 1911); id., "Sex Prophesying among the Ancients: Its Basis," ib., vol. iii (ib., 1911). In Christian times this Eclogue was regarded as containing a prophecy of the coming of the Messiah. In the sixth two shepherds capture Silenus by a clever stratagem, and compel him to sing to them. It is supposed to have the object of justifying a refusal to celebrate the exploits of his friend Alfenus Varo on the plea that Apollo bids him devote himself to the humble field of pastoral poetry. The tenth condoles with his friend Cornelius Gallus for the faithlessness of his mistress. It represents Gallus as dying of love and singing of his woes to the Arcadian shepherds.

The *Eclogues* are modeled closely on the *Idylls* of Theocritus (q.v.). The names of the personages who figure in the poems are taken from the Greek poet; and the scenery is in part Sicilian, in part Italian. Yet Vergil succeeded in giving to the *Eclogues* a national character, and the pathos which is characteristic of all his work appears in the feeling descriptions of the miseries caused by the civil wars. The interpretation of the poems of the first of the two classes mentioned above, which follow Theocritus most closely, presents no special difficulty. The allegorical poems, on the other hand, are full of puzzling contradictions and inconsistencies. In spite of their highly imitative character, the *Eclogues* take a high rank in the history of Roman literature.

The seven years which followed the publication of the *Eclogues* were spent by Vergil in the composition of a poem on agriculture, the *Georgics* (*Georgica*). This, published in 29 B.C., represents the perfection of Vergil's work from the point of view of finish. The subject is said to have been suggested by Mæcenas and Augustus, with the purpose of arousing a greater interest in rural life, in the hope that, if agriculture should be made more attractive to the Roman people, the farms which had been abandoned and laid waste during the civil wars would be restored to cultivation. Here again, however, the task was a congenial one, and the subject was one in which the poet was deeply interested and which he was thoroughly competent, through personal experience and knowledge, to handle. Although Vergil was the first Roman writer to compose a poem on agriculture, the topic was at all times a popular one, and he had an abundance of material at hand in his native language, the translation of the treatise of the Carthaginian Mago (q.v.), the works of Cato the Censor (q.v.), and of Varro (q.v.), and probably those of Hyginus (q.v.), besides an abundance of Greek sources. Vergil styles himself the Roman Hesiod (q.v.), but there is little in common between the *Works and Days* of Hesiod and the *Georgics;* Vergil owes much more to the Alexandrian poets, especially Nicander and

Aratus. Though strictly speaking a didactic poem, the *Georgics* are not a complete treatise on agriculture, but handle selected topics. The first book deals with the management of fields, the second with the culture of trees, the third with the rearing of horses and cattle, and the fourth with bee keeping, concluding with the episode of Aristæus (q.v.). Ancient authorities declare that the last book contained originally a panegyric of Cornelius Gallus (q.v.), which was stricken out at the request of Augustus after the downfall of Gallus in 27 B.C.; in its stead the Aristæus episode was inserted. The poem was composed slowly and deliberately, and refined and polished to the highest degree. There is nothing in it of the dryness of a didactic work; even the most commonplace details are presented in an attractive form. There are numerous highly poetic digressions, such as the praise of spring and of Italy, and each book closes with such a digression. It has justly been called the most finished poem in the Latin language, and Addison termed it the most finished of all poems. As in the case of the *Eclogues*, Vergil undoubtedly followed his Greek and Roman sources closely, but he nevertheless stamped the work with his own individuality.

In spite of the literary perfection of the *Georgics* and the unfinished state in which Vergil left the *Æneid*, the latter has always rightly been regarded as the greatest of Vergil's works. The idea of writing a great national epic is one which he seems to have formed early in life, but he had postponed the undertaking until he should feel himself competent for it. He was doubtless hastened somewhat in carrying out his plan by requests for such a work from authority which it was impossible to resist. In this field Vergil was not a pioneer, for the works of Nævius (q.v.) and Ennius (q.v.) had already connected the destiny of Rome with that of Troy and had outlined a plan for a national epic from which it would have been difficult to depart in any radical way. Vergil undoubtedly made much use of the work of his predecessors, so far as contents were concerned, but the *Æneid* was so far superior to them in every way that it entirely supplanted them, and at once took a position as the national epic, from which it was never displaced. Besides the Roman writers, Vergil had at his command an abundance of Greek models, the *Iliad* and the *Odyssey*, the Cyclic Poets (q.v.), and Apollonius Rhodius (q.v.), and on these and others he drew with a freedom which would today be called plagiarism. In order to form a fair estimate of the rank of the *Æneid* as an epic poem, it must be borne in mind that it is an epic of a different type from the Homeric poems and hence cannot fairly be compared with them. The *Iliad* and the *Odyssey* are the greatest of primitive epics, and as such defy imitation. But the *Æneid* is an historical epic, written with a definite purpose, the glorification of Rome and of the Julian line. In its own class it must hold a high rank, if not the highest. In the *Æneid* the stories of the gods and goddesses and many of the mythological details are of the nature of epic machinery, though Vergil himself appears to have had a deeply religious nature; and, though his philosophical studies probably prevented him from accepting the ancient belief in its entirety, a desire to effect a revival of the old Roman reverence for the gods doubtless formed part of his plan, and was thoroughly in accord with the wishes and the policy of Augustus. The task which Vergil had undertaken was a great one, and he never completed it to his own satisfaction, although, as Mackail says, it is easy to see within what limits any changes or improvements would have been made, and the poem is substantially complete. Donatus (Suetonius) tells us that Vergil first wrote a version in prose and then turned this into poetic form, taking up the various topics and parts of the work, in no special order. Such a method of composition would account for various inconsistencies that are found in the poem, which would doubtless have been removed in the final revision which Vergil had in mind; though strict consistency is not demanded of a poet. So dissatisfied was Vergil himself with the *Æneid*, says Donatus (Suetonius), that on his deathbed he gave directions that it should be destroyed; but by the command of Augustus it was published, with only such revision as was absolutely necessary, by Varius and Tucca.

The fact that Vergil was engaged on a national epic soon became known, and the appearance of the *Æneid* was awaited with great expectancy, to which Propertius gives expression in the well-known lines (ii, 34, 65–66):

> Cedite Romani Scriptores, cedite Graii;
> Nescio quid maius nascitur Iliade.

In 26 Augustus, who was absent in Spain, wrote asking to see a first draft of the poem or some part of it; but Vergil was not yet ready and spoke of himself as having been mad to undertake such a task. A few years later, however, he read three books to Augustus, including the sixth, in which he inserted lines 860–886 in memory of the young Marcellus (q.v.). When the poet, who is said to have been a very effective reader, finished the beautiful lines, Octavia, mother of Marcellus, who was present, swooned, and on her recovery presented Vergil with 10,000 sesterces (about $500) for each line of the tribute.

The outline of the *Æneid* is in brief as follows. The poem begins with the voyage of Æneas from Sicily to Italy in the sixth year after the fall of Troy. Juno (q.v.), the relentless foe of the Trojans, persuades Æolus, king of the winds, to raise a great storm, which destroys one ship of the fleet and scatters the rest far and wide over the sea. Æneas (q.v.) with seven ships takes refuge in a harbor on the African coast within the territory ruled by Dido (q.v.), Queen of Carthage. His mother, Venus (q.v.), who has appealed to Jupiter and has received from him assurance of her son's great mission and its fulfillment, appears to Æneas in the guise of a huntress and advises him to seek the protection of Dido. He does so, and on reaching her palace finds messengers from the rest of his ships, which have all been saved but one. Venus meanwhile induces Cupid to inspire Dido with a passion for Æneas. Dido receives the Trojans kindly and entertains them at a magnificent banquet. Here Æneas tells the story of the capture of Troy by the stratagem of the wooden horse, of the sack of the city and his escape (Book ii). He tells of his attempts to found a city in Thrace and in Crete, and of the oracles and portents which pointed to Italy as his destined goal, of his meeting with Helenus and Andromache in Epirus, of his adventure with the Cyclops, and of his final arrival in

Drepanum, where he lost his father, Anchises, by death (Book iii). Then the story goes on from the night of the banquet. Æneas lingers for some time in Carthage, forgetful of his mission, beguiled by Dido's love. At last by the command of Jupiter he sets sail for Italy. Dido kills herself and as she dies prays that there may be everlasting hatred between the Carthaginians and the descendants of Æneas (Book iv). He is driven by contrary winds to Sicily, where he is welcomed by his countryman Acestes, and celebrates funeral games on the anniversary of his father's death. During the games the Trojan women, weary of their apparently endless wanderings, set fire to the ships, but the flames are extinguished by rain sent in answer to the prayers of Æneas. After leaving with Acestes those of his companions who wish to remain behind, Æneas sails to Cumæ (Book v). By the aid of the Sibyl he gains access to the lower world, and consults his father Anchises (q.v.), who tells him the glorious destiny of the race which he is to found (Book vi). Æneas then proceeds to the mouth of the Tiber, where Latinus, King of that region, receives him hospitably, forms an alliance with the Trojans, and promises to their leader Æneas his daughter Lavinia in marriage. Juno now makes a last attempt to prevent Æneas from carrying out his purpose. She involves the Trojans in a quarrel with the people of Latinus, while at the same time Turnus (q.v.), King of the Rutuli, one of Lavinia's disappointed suitors, prepares to make war on them. The result is that Turnus forms a coalition against the Trojans, who are aided by Evander, an Arcadian king who has founded a city called Pallanteum on the site afterward occupied by Rome. A long struggle follows with varying fortunes. The Trojans are finally victorious and Turnus is slain in single combat by Æneas (Books vii–xii).

The *Æneid* is unequal in its execution and in its interest for the general reader. Certain episodes stand out prominently from the rest of the work. The last six books, in which the numerous battle scenes demanded by literary tradition are somewhat tedious, are less generally known than the rest of the poem. They are, however, full of beautiful episodes (such as the Nisus-Euryalus episode, ix, 314–449), and the greatness of Vergil's achievement can be fully appreciated only when the *Æneid* is carefully studied as a complete work of art. Æneas, the hero of the poem, is throughout the man of destiny, with whom everything else is subordinated to his mission of founding a mighty empire. The episode of the unhappy Dido, which has most strongly appealed to the readers of all times, has many of the elements of a Greek tragedy. She, too, has her great task to perform, and love forms no part of her plans, but to save Æneas she is made the victim of the wiles of Venus. Although she knows from Æneas' story of his wanderings that the gods have willed that he should fulfill his destiny on Italian soil, she attempts to turn him aside from his purpose, not of her own will, but through the influence of a mighty power. His desertion of her is, according to ancient thought, justified and even praiseworthy, since it is the result of submission to the command of the king of gods and men. Further, the episode furnishes a tragic motive for the Punic Wars, that titanic struggle for the mastery of the world which took so strong a hold on the imagination of the successors of the victors. On this episode consult N. De Witt, *The Dido Episode in the Æneid of Vergil* (Toronto, 1907); E. K. Rand, "Vergil and the Drama," in *The Classical Journal*, vol. iv (Chicago, 1908); H. H. Yeames, "On Teaching Vergil," in *The School Review*, vol. xx (Chicago, 1912). Æneas typifies the old Roman virtues, which Horace celebrates in the first six odes of his third book of Odes, and his escape from the wiles of the enchantress must have recalled to the Romans of the Augustan age, by contrast, the yielding of Antony to the charms of Cleopatra. The struggle for supremacy in Italy was that of the higher civilization against semibarbarism. The antitype of Æneas is the violent and godless Turnus, allied with Mezentius, the *contemptor divorum*, and other such men. So far as the outward form of the poem is concerned, it is generally agreed that in the *Æneid* Vergil brought the hexameter, "the stateliest measure ever molded by the lips of man," to the highest degree of perfection of which it was capable. Even in his earliest works he surpassed his predecessors, Ennius, Lucretius, and Catullus, in the handling of the hexameter, and his progress in the mastery of his chosen verse was constant, reaching its culmination in the last six books of the *Æneid*. He is particularly successful in adapting sound to sense; the swing of the Cyclops' hammers, the trampling of horses and the like are imitated, not only in single lines, but in longer passages. A recent critic says: "He has been perhaps more successful than any other poet in fusing together the expressed and the suggested emotion; he has discovered the hidden music which can give to every shade of feeling its distinction, its permanence, and its charm."

The *Æneid* was hailed with acclamation immediately on its publication, and its author was regarded as the inspired bard of his native land, the Roman Homer. A few feeble voices were raised in opposition to the general chorus of praise, but without effect. The influence of the poem was widespread and lasting, not only on the later Roman poetry, but on prose as well, and strongly affected even such writers as Livy and Tacitus. No later Roman poet ventured to handle the same theme, but the later epic writers for the most part drew heavily on Vergil for inspiration and material, and fully acknowledged his preëminence. His works became textbooks in the Roman schools at an early period, and lines from the *Æneid* have come to light which were scribbled by schoolboys on the walls of Pompeii. No Latin works were more extensively quoted. They came to be regarded as canons of grammatical and stylistic usage; they are extensively cited and discussed by such writers as Gellius, Nonius Marcellus, and Macrobius, and numerous commentaries were written on them. That of Servius (q.v.), which embodies much of the work of his predecessors, has come down to us. In the estimation of the Christians Vergil held a position unique among the pagan writers of Rome. St. Augustine, e.g., vividly describes the charm which the *Æneid* had for him. Vergil was even thought to have received some measure of divine inspiration, and a meaning was read into his works which was entirely foreign to them. The writers of the decline, not content with imitating Vergil, busied themselves with the composition

of *centos*, composed of lines and half lines taken from his works and arranged in such a way as to give in many instances a sense very different from that which they had in their context. (See CENTO.) With diabolical ingenuity some grossly obscene poems were constructed in this way from lines which had no suggestion of impropriety, such as parts of the *Epithalamium* of Ausonius (q.v.). The writing of Vergilian centos became a regular form of literary production, and there were even those who improvised them.

With the revival of learning Vergil's influence became very great in most of the countries of Europe, and from that time until the present day the greatest poets have nearly all shown traces of his inspiration. Dante, Ariosto, and Tasso, Chaucer, Spenser, Milton, Dryden, and Tennyson may be mentioned as striking examples. His works have been translated into most of the languages of Europe. It was not until early in the nineteenth century that Vergil's claims to greatness began to be questioned, especially in Germany. Since then he has been criticized and defended with equal lack of discrimination by many of his opponents and champions. The most common charges brought against him are lack of originality and the inferiority of the *Æneid* to the Homeric poems. The latter point has already been discussed. The former criticism is in a sense justified, so far as material and even phraseology are concerned, but there can be no doubt that Vergil had in common with many other great poets the power of making what he borrowed his own, as is shown by the fact that he was able to inspire imitation as well as to imitate. A fair estimate must rank him among the greatest poets of ancient times, and among the great poets of the world's history.

At an early period a series of mythological legends began to be associated with the name of Vergil. The ancient biographies assert that his birth was attended with prodigies prophetic of his future greatness, and the reputation for vast learning, which he gradually acquired, and the belief in his prophetic powers, increased the veneration in which he was held and the mystic atmosphere which surrounded him. As early as the second century the custom of consulting the *sortes Vergilianæ* became current, i.e., the *Æneid* was opened at random, and an omen was drawn from the words of the first passage on which the eye fell. This custom, which the *Æneid* shares only with the Bible and the Homeric poems, lasted for many centuries. Charles the First of England is said to have consulted the *sortes Vergilianæ* and to have opened the *Æneid* at iv. 615–621. Still earlier Silius Italicus, as the Younger Pliny tells us, used to make an annual pilgrimage to Vergil's tomb, which he approached with as much reverence as if it were a temple, and this practice also became a current one. By the Middle Ages we find in legend and literature a mythical Vergil, a seer and a man profoundly acquainted with the secrets of nature. Among the common people of Naples he came to be regarded as a necromancer or wizard, and the most grotesque legends were associated with his name, in which chronology was entirely disregarded. He was said to have made a bronze fly which kept all other flies away from the city, a butcher's block on which meat kept fresh for six weeks, as well as other marvelous and curious things, and his name was associated with numerous adventures of a more or less disreputable character. These tales were carried by travelers to other countries and found their way into the romantic literature of the day and even into Latin works of a learned character.

Besides the works which are known to be Vergil's a number of minor poems have come down to us under his name, which are included in many editions. Three of these, the *Culex*, *Ciris*, and *Moretum*, belong to the class of the *epyllion*, or "little epic." In the first, which is a poem of about 400 hexameter lines, a gnat (*culex*) stings a sleeping shepherd and thus saves his life from a serpent. The shepherd as he awakens kills his preserver. The ghost of the gnat comes from the lower world, of which a full description is given, and reproaches his murderer with his untimely fate. The second, of about 500 hexameters, tells the story of Scylla (q.v.) and Nisus, and takes its name from the bird into which the former is changed. The third, a charming little poem of 124 hexameters, describes a farmer preparing his breakfast, which consists of bread, which he prepares and bakes, and a rustic salad (*moretum*). Besides these there is a poem of 38 lines in the elegiac distich, the *Copa*, "Mine Hostess," which represents a Syrian woman dancing in the doorway of her wayside inn and inviting the wayfarer to enter; and a collection of 14 shorter pieces in various metres called *Catalepton* (Ποιήματα Κατὰ Λεπτόν, "Minor Poems"). The authorship of these poems has been much discussed. Donatus and Servius attribute a number of minor poems to Vergil. Both enumerate among these *Culex*, *Diræ*, *Ætna*, *Ciris*, *Catalepton*, *Priapeia*, and *Epigrammata;* Servius adds a *Copa*. An *Ætna* and *Diræ* have also been preserved, but it is the general consensus of scholars that they cannot have been written by Vergil. The rest of the list corresponds exactly with the poems which have come down to us as youthful works of Vergil, for the *Priapeia* and *Epigrammata* are both represented among the *Catalepton;* but we have only to assume that the poems were collected and ascribed to Vergil in the time of Nero, a belief which is held by some scholars, to make the testimony of Donatus and Servius, and even that of Statius and Martial, who refer to a *Culex* by Vergil, seem to have very little weight.

The testimony of Lucan to a Vergilian *Culex* is more difficult to dispose of. On the other hand, the contrary evidence is not very convincing. Much has been made of certain metrical features of the poems, but these, which were really the only strong argument against a Vergilian authorship, have recently been declared by F. Skutsch to be of no great weight, at least in the case of the *Culex* and the *Ciris*. The latter has been generally regarded as the work of an unknown poet belonging to the circle of M. Valerius Messala, the patron of Tibullus, but Skutsch claims the poem for Cornelius Gallus, and regards the lines which the *Ciris* has in common with Vergil's works as original with the former. There is little to show that the *Culex* may not have been a youthful work of Vergil's. Chronologically it belongs to that period, and with reference to the triviality of the theme and the inferiority of the poem to Vergil's later productions, which are offered as arguments against its genuineness, one may recall the words of Lucan, when com-

paring his early efforts with those of Vergil, which are quoted by Suetonius:

et quantum mihi restat
Ad Culicem?

There is still less ground for skepticism in the case of the *Moretum*, and the only reason for rejecting the *Copa* is its entire unlikeness to Vergil's manner, which, as Mackail says, might tempt one into the paradox of its authenticity. The question is a very difficult one and cannot be regarded as settled; nor is it likely, without more evidence than is at present available, that unanimity of opinion will ever be reached. The majority of scholars regard the whole collection as spurious, with the possible exception of some of the *Catalepton*, though most express this opinion more decidedly in the case of some of the poems than of others. The brilliant work of Skutsch, though not very convincing in its main thesis, rather increases the probability that the poems are the work of Vergil by disposing of the metrical arguments and some of the chronological difficulties. If the objection of unlikeness to the Vergilian manner is a valid one, it applies with more or less force to the entire collection. The whole question is comparatively unimportant, so far as Vergil's position in literature is concerned, but it is of great interest as regards the development of his genius. On the general subject consult: F. Skutsch, *Aus Vergils Frühzeit* (2 vols., Leipzig, 1901–06); J. W. Mackail, "Vergil and Vergilianism," in *The Classical Review*, vol. xxii (London, 1908); T. Birt, *Jugendverse und Heimatpoesie Vergils* (Leipzig, 1910); S. E. Jackson, "The Authorship of the Culex," in *The Classical Quarterly*, vol. v (London, 1911); J. W. Mackail, *Lectures on Poetry* (ib., 1911); *The Classical Weekly*, vol. vi, 110 (New York, 1913); W. G. D. Butcher, in *The Classical Quarterly*, vol. viii (London, 1914). Of great importance, too, in this connection, as affording a sound basis for the study of Vergil's language, is M. N. Wetmore, *Index Verborum Vergilianus* (New Haven, 1911), reviewed by C. Knapp, in *The Classical Weekly*, vol. vi (New York, 1913).

Vergil's popularity during the time of the Roman Empire and throughout the Middle Ages led to the preservation of his works in an unusual number of old and good manuscripts. Of these not less than four, together with three sets of fragments, are written in capitals or uncials and may be assigned to the fourth or fifth century. These are among the oldest manuscripts of Latin writers which have come down to us. The *editio princeps* was published at Rome about the year 1469. The standard critical edition is that of Ribbeck (Leipzig, 1859–68), containing his famous *Prolegomena*. There is a later edition, without the *Prolegomena* (ib., 1894–95). The best English edition is that of Conington and Nettleship (3 vols., 4th ed., London, 1881–83). There are numerous good editions published in America and abroad, of which the following may be mentioned: Forbiger (4th ed., Leipzig, 1872–75); Kappes (5th ed., ib., 1893); Benoist (2d ed., Paris, 1876); Papillon and Haigh (Oxford, 1892); Sidgwick (Cambridge, 1894–97); Greenough-Kittredge (Boston, 1899); and Knapp (Chicago, 1902). Especially valuable is the edition of *Æneid*, Book vi, by E. Norden (Leipzig, 1903). There is also an edition of Servius' commentary by Thilo and Hagen (Leipzig, 1881–87). The translations of Vergil into English are very numerous. The earliest is that of Dryden. The *Æneid* has been translated by Conington into prose (London, 1872) and into verse (ib., 1873), as well as by William Morris, Cranch, Kennedy, Mackail, Rhodes, Williams, and others. The *Georgics* have been translated by Rhodes, Blackmore, and Williams, and the *Eclogues* by Calverley, Palmer, and Williams. Consult also: C. A. Sainte-Beuve, *Etude sur Virgile* (2d ed., Paris, 1870); Henry Nettleship, *Ancient Lives of Vergil* (Oxford, 1879); id., *Lectures and Essays* (ib., 1885); R. Y. Tyrrell, *Latin Poetry* (New York, 1895); J. W. Mackail, *Latin Literature* (ib., 1895); D. Comparetti, *Virgil in the Middle Ages* (Eng. trans. by E. F. M. Benecke, London, 1895); Gaston Boissier, *The Country of Horace and Vergil* (New York, 1896); W. T. Sellar, *Roman Poets of the Augustan Age: Vergil* (3d ed., Oxford, 1897); C. G. Glover, *Studies in Virgil* (2d ed., ib., 1912); Heinze, *Vergils epische Tecknik* (3d ed., Leipzig, 1915); E. Norden, *Ennius und Vergilius* (ib., 1915). See also general works, such as W. S. Teuffel, *History of Latin Literature* (Eng. trans. of 5th ed., by G. C. W. Warr, London, 1891); J. W. Duff, *A Literary History of Rome* (ib., 1909); Martin Schanz, *Geschichte der römischen Litteratur*, vol. ii, part i (3d ed., Munich, 1911); the article "Vergilius, 2," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

VERGNIAUD, vâr'nyō', PIERRE VICTURNIEN (1753–93). An orator of the French Revolution, born at Limoges. He studied law and practiced his profession at Bordeaux. In 1789 he was a member of the general council of the Department of the Gironde, and in 1791 he was sent as a deputy from Bordeaux to the Legislative Assembly and was recognized as a leader of the Girondists. He voted for the condemnation of the King and it was his duty as President of the Convention to announce the verdict and the sentence. He, however, steadily opposed Robespierre and the Mountain, and when the latter became supreme and undertook to do away with opposition Vergniaud shared in the fall of the Girondists (June 2, 1793). After remaining in concealment for some days he was seized, brought to trial, condemned, and guillotined Oct. 31, 1793, with 20 of his fellow Girondists. Consult Vatel, *Vergniaud: Manuscrits, lettres et papiers* (2 vols., Paris, 1875), and Touchard-Lafosse, *Histoire parlementaire et vie intime de Vergniaud* (Paris, 1848).

VERHAEREN, vĕr-hä'ren, EMILE (1855–). A Belgian poet, born at St. Amand, near Antwerp. He studied at Ghent and later at the University of Louvain. He was admitted to the bar in 1881, but gave up law to devote his time to the two reviews *La Jeune Belgique* and *L'Art Moderne*. Verhaeren came to be known as the national poet of Belgium, and particularly of Flemish Belgium. Although he began as one of the Parnassians (q.v.), he belongs really to no school, and might be called an impressionist rather than a symbolist. In wealth of imagery, breadth of conception, and magnificence of language he has been compared

with Victor Hugo. Identified with the *jeune Belgique* (Young Belgium) group of writers, to which belonged Maeterlinck and Rodenbach (qq.v.) and to which the Belgian literary revival is to be credited, Verhaeren first published *Les flamandes* (1883). This was received with a storm of protest because of its boldness of expression. Some critics, however, recognized genius in the new poet and encouraged him. There followed *Les moines* (1886) and a famous trilogy, written mostly in England, and giving vent to the author's suffering and despair when suffering from a disease that he thought would affect his mind—*Les soirs* (1887), *Les débâcles* (1888), and *Les flambeaux noirs* (1890). Afterward he wrote: *Au bord de la route* (1890); *Les apparus dans mes chemins* (1891); *Campagnes hallucinées* (1893); *Villages illusoires* (1894); *Les villes tentaculaires* (1895); *Les heures claires* (1896); *Les visages de la vie* (1899); *Les petites légendes* (1900); *Les forces tumultueuses* (1902). In 1904 he began the series, *Toute la Flandre* (All Flanders), in which he voices his affection for his native country. The series comprises: *Les tendresses premières* (1904); *La guirlande des dunes* (1907); *Les héros* (1908); *Les villes à pignons* (1909); *Les plaines* (1911). In 1912 and 1913 appeared *Les blés mouvants*. Verhaeren wrote in drama: *Les aubes* (1898); *Le cloître* (1900); *Philippe II* (1901); and *Hélène de Sparte* (1912). His *La Belgique sanglante* (1914; Eng. trans., *Belgium's Agony*, 1915) deals with the German invasion at the beginning of the European War. His *Œuvres* were published by the *Mercure de France* in two series (1912 and 1914). Most of Verhaeren's work has been translated into English, a list being available in Stefan Zweig, *Emile Verhaeren* (Boston, 1914). Consult also: L. Bazalgette, *Emile Verhaeren* (Paris, 1907); H. B. Samuel, *Modernities* (London, 1913); Amy Lowell, *Six French Poets* (New York, 1915).

VER'IFICA'TION (from Lat. *verificare*, to verify, make true, from *verus*, true + *facere*, to do, make). Under the common-law system of pleading, an averment in an answering pleading containing new matter, to the effect that the pleader is ready to establish the truth of the facts pleaded therein. Where the new matter is merely negative a verification is not necessary. The common form of such a verification is: "*And this the said A. B. is ready to verify.*" In code pleading, the verification is an affidavit generally annexed to the pleading itself that the facts alleged in the pleading are true except as to the statements alleged on information and belief and that as to these the deponent believes them to be true. The verification is genrally made by the party, but in special instances, such as the absence of the party, may be made by the attorney. Its function under modern codes is to attest the good faith of the action or defense. See PLEADING.

VERKAUFTE BRAUT, fĕr-kouf'te brout', DIE (Ger., The Bartered Bride). An opera by Smetana (q.v.), first produced in Prague, May 30, 1866; in the United States, Feb. 19, 1909 (New York).

VERLAINE, vâr'lân', PAUL (1844–96). A French poet, born at Metz. Little is known of his early life. Before the Franco-Prussian War he had published *Poèmes saturniens* (1865); *Les fêtes galantes* (1869); *La bonne chanson* (1870). After 1870 Verlaine, who had led the traditional Bohemian life in Paris, disappeared for 11 years. In 1881 he reappeared in the public eye as a quasi-Catholic with his *Sagesse*, perhaps his best-known volume. It is a remarkable product of a devout religious mysticism.

From this time to his death in Paris in 1896, Verlaine remained, with the exception of sojourns in England, Belgium, and Holland, among the cafés of the Latin Quarter, drinking absinthe, carousing, and writing verse and journalistic articles. The disordered habits of this modern Villon often led to serious misdemeanors which occasioned his imprisonment, or to long illnesses which confined him in hospitals—experiences which he characteristically described in *Mes prisons* (1893) and *Mes hôpitaux* (1891). During this period he published several volumes of verse, all of them rather small and containing only short poems; *Jadis et naguère* (1885); *Romances sans paroles* (1887); *Amour* (1888); *Bonheur* (1891); *Parallèlement* (1889); *Chansons pour elle* (1891); *Chair: dernières poésies* (1896). In prose he put forth *Les poètes maudits* (1884)—interesting sketches of his literary companions of the new school, notably Mallarmé and Rimbaud; also *Confessions* and *Les hommes d'aujourd'hui.*

Verlaine is classed with the Symbolists (q.v.). In his mystic worship of God and of the flesh he appeared by turns avowedly orthodox and hopelessly sensual. As for ideas and the gifts of a concrete imagination, he had none, but he was an exquisite master of verse. He found new nuances, and new variations, and his pages exhibit a suffusing mobility of which French poetry had scarcely been thought capable. He usually wrote impeccably according to the strictest forms; but, like a Symbolist, he indulged at times in lines of 11 and 13 feet, ignored the interlacement of rhymes, etc. Altogether Verlaine is by far the greatest French poet Symbolism has yet to claim.

Bibliography. Jules Lemaître, *Les contemporains*, vol. iv (Paris, 1889); Delille, in *Fortnightly Review* (London, 1891); George Moore, *Impressions and Opinions* (ib., 1891); Max Nordau, *Degeneration* (New York, 1893); Ferdinand Brunetière, *L'évolution de la poésie lyrique en France*, vol. ii (Paris, 1894); Wilfrid Thorley, *Paul Verlaine* (London, 1914); Frank Harris, *Contemporary Portraits* (New York, 1915). Verlaine's *Works* are collected in five volumes (Paris, 1900).

VERLAT, vâr'lâ', MICHEL CHARLES (1824–90). A Belgian historical, animal, and portrait painter. He was born in Antwerp and studied at the academy there and under De Keyser. From 1850 to 1869 he lived in Paris, where he was influenced by Courbet, and from 1870 to 1874 was director of the academy at Weimar. He was known as a versatile painter of portraits, animals, and historical and genre scenes, when in 1875 he visited Palestine, and on his return painted a series of religious pictures which by their brutal, primitive realism stimulated the hitherto conventional Belgian artists to turn to the study of nature and character. Verlat had no eye for landscape and his color is glaring. Good examples of his work are in the Antwerp and Brussels galleries.

VER MACAQUE, vâr mà'kàk' (Cayenne name). The larva of a botfly (*Dermatobia noxialis*), which attacks human beings in South America. The back and shoulders are especially subject to attack. The adult fly lays its eggs or

larva on the skin, and the young grub penetrates and causes at first a swelling. It grows rapidly, and unless destroyed will cause a large lump with an apical orifice. Painful ulcers frequently result. On reaching full growth the larva issues and falls to the ground to transform. See BOT, OR BOTFLY.

VERMEER, vĕr-mār′ (VAN DELFT), JAN (JOHANNES) (1632–75). One of the foremost of Dutch genre and landscape painters. He was born at Delft in October, 1632, and spent the whole of his life there. He studied painting with Karel Fabritius, and in 1653 entered the guild of St. Luke, of which he was four times a warden. By his wife Catherina Bolnes he had eight children, and although both at different times inherited property, they lived in humble circumstances, and at the time of his death Vermeer was insolvent. He worked deliberately, selling few pictures, for which he obtained prices equal only to those paid Gerard Dou. Thirty-three of these paintings survive, nearly all genre of small size, and most of them single figures. He is the most modern of Dutch genre painters, and consequently the most appreciated at the present time. Unlike other Dutchmen, he attained tone by a subtle adjustment of color values, instead of subordinating local color to a prevailing hue. He used cool colors over a blue or green ground, instead of the usual warm hues, and excelled especially in a marvelous treatment of light and atmosphere, which play about his figures with finest plastic effect. But two of his rare landscapes survive: a "View of Delft" (The Hague Gallery) and a "Street Scene in Delft" (Six collection, Amsterdam). They are unique in Dutch art, and the first has had no little influence on the landscape painting of modern Holland. Both belong to his early period as do also the two subjects, one religious and one mythological, "Mary and Martha" (Scamarole Castle, Scotland) and "Diana at Her Toilet" (The Hague), and also the life size "Procuress" at Dresden. Among other important paintings are: "Young Woman Writing a Letter" and "A Maid Servant Pouring out Milk" in the Rijks-Museum, Amsterdam, which possesses three of his works; "Young Lady with a Pearl Necklace," Berlin Museum (2); "The Coquette," Brunswick; "Lady Reading a Letter," Dresden; "The Astronomer," Frankfort; two versions of a "Lady at the Spinet," National Gallery, London; "The Lace Maker" and "The Astronomer" in the Louvre; "The Painter in his Study," a late work, Czernin collection, Vienna; and portraits of women at The Hague, Brussels, and Budapest. In the United States he is represented by "Young Girl Asleep," the very fine "Woman at a Casement," and "Lady Writing" (J. P. Morgan), all in the Metropolitan Museum, New York; in the Frick collection by two examples; and by others in the Gardner collection, Boston, and the Johnson and Widener collections, Philadelphia.

Bibliography. The best monograph is a large folio, with excellent illustrations of all his works and text by C. Hofstede de Groot, *Jan Vermeer van Delft en Carel Fabritius* (Amsterdam, 1909). Consult also *Masters in Art*, vol. v (Boston, 1904), containing a bibliography; monographs by Gustave Vanzype (Brussels, 1908), Eduard Pliezsch (Leipzig, 1911), and P. L. Hale (Boston, 1913).

VERMEER VAN HAARLEM. See VAN DER MEER.

VERMEJO, vĕr-mā′hō. See BERMEJO.

VERMES, vēr-mēz (Lat., worms). The name, now practically discarded, given by Linnæus to one of the classes in his zoölogical system, in which he included all the invertebrate animals except Insecta, whether of wormlike form or not. Since Linnæus's time the name has been more or less widely used, but in an ever-narrowing and more restrictive sense. At the present time it comprises all nonchordate (see CHORDATA) animals which are not unicellular (see PROTOZOA), are not provided with jointed appendages (see ARTHROPODA), are not radially symmetrical, and have a well-marked body cavity, and have no mantle, shell, or creeping foot. The Vermes, excluding the group Platodes, are by a late authority (R. Hertwig) divided into two phyla, i.e., Rotifera and Cælhelminthes, the latter embracing six classes: Chætognathi, Nematelminthes, Annulata, Polyzoa, Phorinda, Brachiopoda. See WORM.

VER'MICEL'LI. See MACARONI.

VERMIC'ULAR ACTION. See PERISTALTIC MOTION.

VER'MIFORM APPEN'DIX (from Lat. *vermis*, worm + *forma*, shape). A long, narrow, worm-shaped portion of gut about the diameter of a quill, or larger, and varying in length from 3 to 6 inches. It springs from the posterior and inner aspect of the head of the colon, near its lower end. It is the rudiment of a lengthened cæcum found in all mammals excepting some of the higher apes and the wombat. In structure it resembles closely that of the large gut. It is hollow to its tip, and its cavity communicates with that of the large bowel. It is entirely covered by the peritoneum, being frequently attached by a fold of this membrane to the back of the large intestine. Rarely it has its own mesentery. Its functions are probably unimportant. Situated in the right side of the abdominal cavity, in the right iliac region, it hangs suspended from the large gut. Its blood supply in the male is a twig from the mesenteric arterial system. In the female, besides the mesenteric supply a branch of the right ovarian artery is distributed to its distal extremity.

Appendicitis. The appendix is not uncommonly the seat of processes accompanied by inflammation, perforation, and abscess. Attacks of this kind are termed "appendicitis." The exciting causes are mechanical or chemical irritation and bacteria. The disease is most common in individuals between 10 and 30 years of age, though it has been seen in an infant under one year and in patients over 70. About 80 per cent of the cases occur in males, because of their greater exposure to weather and injury, and because the female appendix has a greater arterial supply. The varieties of this ailment are: Acute appendicitis, including catarrhal, intestinal, ulcerative, and gangrenous forms; and chronic appendicitis, including catarrhal, interstitial, and obliterating forms. In most varieties the appendix is larger, longer, and firmer than normal, œdematous and filled with fluid or semifluid secretion, the lumen opening into the cæcum being closed. In the interstitial form there is a dense cellular infiltration of the retiform tissue of the mucous membrane, pathological alterations involving also the submucous, muscular, and subserous coats, and dilation of the blood vessels existing. Abscesses may develop in the submucous and subserous layers. The lymphoid follicles are the seat of serous

infiltration, and new lymphoid cells develop in small collections, afterward becoming necrotic. In the severer forms the final process is ulcerative, following extensive distention and necrosis, and the purulent contents of the appendix are discharged into the peritoneal cavity, together with fæcal material in many cases. In the chronic forms ulceration does not take place. Attacks may recur from time to time and be unrecognized. One-third of all adult bodies reveal diseased appendices at autopsy.

The three principal symptoms are pain, tenderness, and rigidity of the lower part of the abdominal wall on the right side. The pain resembles that of colic and is generally referred to the neighborhood of the umbilicus, yet it may be felt in any part of the abdomen. A special diagnostic corroborative sign for the physician is tenderness on pressure at McBurney's point, midway between the anterior superior spine of the ilium and the navel. There are also gastrointestinal disturbances, elevation of temperature, increased rapidity of pulse and of respiration, vomiting, nausea, distention of the abdomen, and muscular rigidity. A blood count shows a moderate leucocytoses, i.e., increase in the proportion of white cells to red. The physician can sometimes find the appendix by palpation. Ulceration and perforation with peritonitis may occur in three or four days, or may occur on the first day upon which any symptoms have been noticed by the patient. An interval of comparatively good health may elapse, and then a recurrence take place. In the chronic forms the most constant symptom is pain in the right iliac fossa, moderate at times, frequently recurring, and at times of great severity. The danger in these cases lies in the possibility of a sudden acute exacerbation going on to ulceration, gangrene, and fatal peritonitis. Various other disorders present similar symptoms and conditions to those of appendicitis, and the diagnosis is often difficult.

The treatment is determined by the fact that it is a surgical affection from the start. Removal of the appendix is the only conservative, safe, and justifiable treatment. The medical treatment of the case is confined to the periods before and after the operative procedure, and includes attention to diet, local applications, laxatives, rest, and stimulation. Early and active purgation in suspected appendicitis is imperative, whether diarrhœa be present or not. Opium should never be given under any circumstances.

It was formerly thought that appendicitis was due to the lodgment in the appendix of foreign bodies, such as seeds, fecal concretions, and the like. These may indeed be occasionally present, but the inflammation is always due to bacteria reaching it either from the intestine or through the blood. In the latter case it has been shown that bacteria from the pus pockets about the teeth or in diseased tonsils may obtain entrance to the blood stream and set up appendiceal inflammation, as well as infection in other parts of the bowel. Consult: McBurney, "Indications for Early Operation for Appendicitis," in *Annals of Surgery*, xiii (1891); Deaver, *A Treatise on Appendicitis* (Philadelphia, 1900); G. E. Brewer, *A Textbook of Surgery* (New York, 1915).

VER'MIFUGE. See ANTHELMINTIC.

VERMIGLI, vĕr-mē'lyē, PIETRO MARTIRE (PETER MARTYR) (1500–62). A Protestant Reformer. He was born in Florence; became an Augustinian monk at Fiesole in 1516; and rose to be visitor-general of the order (1541), but adopted the views of the reformers. Having avowed his conversion at Lucca, he was compelled to flee to Switzerland, whence he passed to Strassburg, and became professor of theology there (1542). Invited by Cranmer to England, he was, in 1547, appointed by Edward VI regius professor of divinity at Oxford. Driven from England under Queen Mary, he resumed his chair at Strassburg (1553), where he taught till 1556, when he became professor of Hebrew at Zurich. Many of his numerous publications, which are in Latin, were translated into English. To his *Commonplaces* (London, 1583) is prefixed the original *Life* by Josias Muler. For Latin biographies consult C. Schmidt (Elberfeld, 1858). He shared in the preparation of the *English Book of Common Prayer*, issued in 1552.

VERMILION, vĕr-mĭl'yŭn (OF., Fr. *vermillion*, from *vermeil*, bright red, from Lat. *vermiculus*, little worm, kermes insect, from which crimson or carmine was obtained, dim. of *vermis*, worm). A name applied to cinnabar, or native mercuric sulphide, but more generally to the artificial sulphide used as a pigment, the mineral not being of sufficient purity to be used directly as a pigment. By the Dutch process the vermilion of commerce is prepared by heating together mercury and sulphur in an iron pan with constant stirring. This results in the formation of the black sulphide, which is afterward sublimed in clay retorts yielding the bright red pigment. A more modern process, known as the wet process, consists in agitating a mixture of mercury, sulphur, and aqueous potassium hydroxide together with iron balls in a revolving drum and heating to about 46° C. (115° F.), when the mixture gradually assumes a red color. It is said that about 85 pounds of mercury are required to produce 100 pounds of vermilion. Vermilion is a permanent pigment, and may be used with water or oil, but cannot be used in enamel, as it volatilizes at a red heat. It possesses great body, weight, and opacity. Numerous red pigments known as vermilionettes consisting of coal-tar colors thrown on a lead body, such as the oxide or carbonate, have largely taken the place of the true vermilion as a pigment, as they have a permanent red color, stand exposure well, and change to a lighter color with age instead of darker, as is the case with vermilion. Chinese vermilion is made by the Dutch process and English vermilion largely with the wet process. American vermilion is not a mercury compound, but basic lead chromate prepared by boiling white lead with a solution of neutral lead chromate.

VERMILION. A city and the county seat of Clay Co., S. Dak., about 70 miles (direct) south of Sioux Falls, on the Missouri and Vermilion rivers, and on the Chicago, Milwaukee, and St. Paul Railroad (Map: South Dakota, H 5). It is the seat of the University of South Dakota. Pop., 1900, 2183; 1910, 2187.

VERMILION FLYCATCHER. A very beautiful flycatcher (*Pyrocephalus rubineus mexicanus*) of the southeastern United States and Mexico, grayish brown above and with brilliant scarlet crown and underparts. It places a nest of delicate materials in a low tree, and lays eggs marked as shown on the Plate of EGGS OF SONGBIRDS.

County Towns ⊙ Railroads ——

A North Atlantic State of the United States, belonging to the New England group. It lies between lat. 42° 44′ and 45° 0′ 43″ N. and long. 71° 33′ and 73° 25′ W. The entire eastern boundary is formed by the Connecticut River, and more than half of the western boundary by Lake Champlain, most of the islands in that lake, including Grand Isle, North Hero, and Isle La Motte, and the Alburg peninsula, projecting southward from Canada, belonging to Vermont. The State measures 158 miles from north to south and 41 to 90 miles from east to west. Its area is 9564 square miles, including 440 square miles of water. In size it ranks forty-second among the States.

Topography. The Green Mountains, entering the State from Canada and trending southwest, divide Vermont into two portions. On the north there are two ranges, but near the forty-fourth parallel they unite and continue through New England as a single range. Much of the surface of the State is irregular and the scenery romantic and beautiful. The entire State is well above sea level, while large areas have an elevation of 1000 feet or more. There are 21 peaks over 3500 feet high. Mount Mansfield, the loftiest, is 4389 feet in height.

Hydrography. These mountains form a continuous watershed between the tributaries of the Connecticut River on the east and those of the Hudson and Lake Champlain on the west. The chief branches of the Connecticut are the West and the White rivers. Four streams of considerable size enter Lake Champlain (the Missisquoi, Lamoille, Winooski, and Otter), and a fifth (the Poultney) forms part of the State boundary. The Hudson receives two small streams from the southwestern corner of the State, while the Black River in the north flows into Lake Memphremagog, a portion of which extends south of the boundary line. There are no large lakes within the State, but ponds are numerous in all parts of the State.

Climate. The climate of Vermont is rigorous, but healthful and bracing. The summers are cool and generally pleasant. The winters are severe and prolonged, with a heavy snowfall. Lake Champlain is generally frozen during February, though the climate on the lake shore is milder than in the rest of the State. At Burlington the normal mean temperature for January is 18° and for July 70.4°. At Northfield, in the centre of the State, the mean is 15.5° for January and 66° for July. The maximum rarely exceeds 90° and is generally about 80°, but at times is as high as 98°; the minimum is generally −15°, but in the mountains may fall more than 30° below zero. The average rainfall ranges between 40 inches in the north and south to 33 inches in the west-central portion.

Geology. Throughout the mountain region and over a considerable part of the State the rocks are metamorphic, gneiss, schist, and slate, though there are here and there beds of siliceous limestone and quartzite. In the Champlain valley unaltered stratified beds occur, and all the headlands of the lake are of these rocks. They are Cambrian and Ordovician schists, sandstones, and limestones and have yielded many fossils. These rocks have in many places been greatly folded, faulted, and cut by dikes. Resting directly upon these paleozoic beds are heavy deposits of drift, and most of the exposed ledges are scored by glacial action.

Soil and Vegetation. Much of the soil is sandy and stony, but in the valleys and near the lake there is abundance of rich land. The hills and valley slopes, as well as the summits of most of the mountains, are covered with rich herbage, and there are large forests of pine and hemlock, with spruce and fir on the higher slopes. On the lower lands are also forests of deciduous trees, the sugar maple being one of the most common trees.

Mineral Products. In 1914 Vermont ranked thirty-third among the States of the Union in the production of minerals. The total value of the output of stone was $6,635,477. The value of the marble output of that year was put at $3,490,971, or 42.98 per cent of the value of the total output of the United States. The quarrying of granite is one of the chief sources of income, and in the production of this mineral Vermont ranks first among the States, producing over 15 per cent of the total output of the United States. The output of granite in 1914 was valued at $3,120,457. A considerable amount of slate is also produced, the output of which in 1914 was $1,414,247. Other minerals of importance are talc and soapstone, of which the output was valued at $363,465, and lime, which was produced to the value of $142,034 in that year. The total value of the mineral production in 1914 was $8,665,867.

Agriculture. The total land area is approximately 5,839,360 acres. The area in farms in 1910 was 4,663,577 acres, of which 1,633,965 was improved. The total value of farm property, including land, buildings, implements, and machinery, domestic animals, poultry, and bees, was $145,399,728. The number of farms was 32,709, the average number of acres per farm 42.6, the value of all property per farm $4445, and the average value of farm land per acre $12.52. Of the total number of farms 28,701 were operated by owners and managers. Of the total number of farm operators 28,968 were native whites, 3721 foreign-born white, and 20 negro and other non-whites. Of the foreign-born white farmers 2463 were born in Canada.

The following table shows the acreage, production, and value of the principal crops in 1915 as estimated by the United States Department of Agriculture.

CROPS	Acreage	Prod. bu.	Value
Corn	47,000	2,256,000	$1,895,000
Wheat	1,000	30,000	32,000
Oats	81,000	3,483,000	1,846,000
Potatoes	24,000	2,592,000	2,100,000
Hay	970,000	*1,310,000	20,305,000
Barley	12,000	420,000	315,000
Tobacco	100	†130,000	14,000
Buckwheat	8,000	216,000	177,000

* Tons. † Pounds.

The leading crops in the order of their importance in 1909 were hay and forage, oats, corn, barley, and buckwheat. In 1909 hay and forage had an acreage of 1,030,618 and a production of 1,502,730 tons, valued at $16,335,530; oats, an acreage of 71,510 and a production of 2,141,357 bushels, valued at $1,169,223; corn, an acreage of 42,887 and a production of 1,715,133, valued at $1,102,222; barley, an acreage of 10,586 and a production of 285,008 bushels, valued at $225,803; buckwheat, an acreage of 7659 and a production of 174,394

bushels, valued at $122,050; dry edible beans, an acreage of 2390 and a production of 26,395 bushels, valued at $72,873. The total acreage of potatoes and other vegetables was 35,408 and the value of such products $2,615,000. Excluding potatoes, the acreage given to vegetables was 8548 and the value of the products $872,000.

Strawberries, by far the most important of the small fruits grown in Vermont, had a total acreage of 276, and the production amounted to 615,820 quarts, valued at $68,690. The total acreage of small fruits in that year was 469 and the production 826,122 quarts, valued at $92,030. Considerable attention is given to the raising of orchard fruits, especially apples. There were 1,492,299 bushels of orchard fruits, valued at $801,365, produced in 1909. The production of maple sugar and sirup is important. The combined value of these products in 1909 was $1,086,933.

Live Stock and Dairy Products.—The total value of live stock on farms in 1909 was $21,990,630. On Jan. 1, 1916, the number of horses on the farms was estimated by the United States Department of Agriculture to be 89,000 and their value $11,570,000; the milch cows, 273,000, valued at $14,742,000; the cattle other than milch cows, 170,000, valued at $3,961,000; the sheep, 100,000, valued at $590,000; the swine, 113,000, valued at $1,164,000.

The value of the milk, cream, and butter fat sold and butter and cheese made on farms in 1909 was $12,128,365. There were sold in the same year 33,998,934 gallons of milk, valued at $4,108,228, and there were made 15,165,692 pounds of butter, valued at $4,185,028. The total number of fowl of all kinds in 1910 was 938,524, valued at $607,787.

Forest Products. Measured by number of establishments, the lumber industry is the most important in the State. In average number of wage earners employed and in value of products it is second only to the marble and stone work industry. The production of rough lumber was, in 1909, 351,571 M feet B. M., of shingles 24,001, and of laths 7249. Of the total timber cut the soft woods represented 242,930 M feet and the hard woods represented 108,641 M feet B. M. Of all the soft woods cut spruce constituted 123,164 M feet, hemlock 62,345 M feet, and white pine 43,274 M feet B. M. Of the hard woods, birch represented 33,450 M feet, maple 27,533 M feet, and oak 11,463 M feet B. M. In addition to the above there were produced on the farms forest products valued at $3,638,537.

Manufactures. Vermont in 1909 ranked thirty-eighth with regard to the total value of manufactured products. The total value per capita of such products was $192. The following table gives the more important figures with regard to the manufactures as a whole and with regard to the five leading industries.

SUMMARY OF MANUFACTURES FOR 1914, 1909, AND 1904

THE STATE — FIVE LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)	Expressed in thousands			
All industries	1914	1,772	37,217	32,704	$79,811	$18,617	$76,811	$34,256
	1909	1,958	38,580	33,788	73,470	17,272	68,310	33,487
	1904	1,699	37,015	33,106	62,659	15,221	63,084	30,654
Marble and stone work	1909	342	11,545	10,411	17,243	6,404	12,395	9,877
	1904	229	8,839	8,097	14,467	4,455	9,570	7,560
Lumber and timber products	1909	593	5,720	4,790	8,989	2,013	8,598	4,467
	1904	493	6,392	5,614	7,845	2,343	9,477	4,821
Butter, cheese, and condensed milk	1909	186	699	519	1,795	292	8,112	1,056
	1904	220	658	419	1,053	223	6,416	600
Woolen, worsted, and felt goods and wool hats	1909	17	2,371	2,204	6,906	1,043	4,497	1,618
	1904	17	2,350	2,235	5,660	923	4,698	1,904
Flour-mill and gristmill products	1909	133	350	156	1,552	76	4,133	605
	1904	109	338	185	1,320	91	3,206	334

Of marble and granite Vermont has an almost unlimited supply. The State has for years ranked first in output of marble and now ranks first in the production of granite. (For details regarding the lumber industry, see *Forest Products.*) In value of dairy products Vermont ranks tenth in the Union. Butter furnishes about three-fourths of the value of these products. The most important flour and grist mill products are corn meal and corn flour, which together constitute over one-half of the total output. The most important woolen and worsted goods are the all-wool woven goods, the cotton woven goods, and the cotton-mixed woven goods, each of these products being about of the same importance.

Of the total number of wage earners in 1909, 38,788 were males over 16 years of age. The wage earners under 16 years of age numbered only 211. For the great majority the hours of labor varied from 54 to 60 hours per week.

The three cities with a population of 10,000 or more—Burlington, Barre, and Rutland—contained, in 1910, 18.8 per cent of the average number of wage earners and produced 19.5 per cent of the total value of the manufactures. Burlington, the most important manufacturing centre, gave employment in 1909 to 2371 wage earners and turned out products valued at $6,800,400. Barre in the same year gave employment to 2340 wage earners and turned out products valued at $3,852,177. The marble and stone work contributed about nine-tenths of the value of all its manufactured products. Rutland in the same year gave employment to 1636 wage earners and turned out products valued at $2,679,528. See articles on these cities.

Transportation. There are few rivers on which navigation is feasible, the only water transportation being confined practically to Lake Champlain. The railroad facilities, however, are quite adequate, and in 1914 the mileage of steam roads was 1073. The most important roads are the Rutland, the Central Vermont, and the Boston and Maine.

Banks. The opposition to banks was so strong in Vermont at the end of the eighteenth and the beginning of the nineteenth century that there were no banks until 1806. In that year a State bank was established, which was owned and managed by the State. The conditions imposed upon it were so stringent that it had little success, and a law was passed to wind up its affairs in 1812, but the final settlement came only in 1845. In 1817 the first private State bank was chartered, and by 1827 there were 10 of them. The Act of 1831 introduced a safety-fund system for the purpose of guaranteeing the circulation. A free banking Act was passed in 1851, allowing note issue only on deposits of reliable State securities. All these measures put the banks on a very sound foundation, and Vermont did not suffer any serious bank calamities. The introduction of the national banking system gradually reduced the number of State banks, and none were known to exist after 1890. In 1915 there were 48 national banks, with capital, $4,985,000; surplus, $2,039,000; cash, etc., $1,157,000; deposits, $21,735,000; and loans, $20,-000,000. There were 20 mutual savings banks, with total deposits amounting to $53,559,000.

Government. The constitution of the State as it now stands is the original constitution adopted on July 9, 1793, as amended in 1828, 1836, 1850, 1870, 1883, and 1913. Every tenth year dating from 1910 the Senate may by a vote of two-thirds of its members make proposals of amendment to the constitution. If agreed to by a majority of the members of the House of Representatives, they are referred to the next following General Assembly. If they are accepted by a majority of this body, they are then referred to the people, and if approved become a part of the constitution.

Legislative.—The Senate and House of Representatives form the General Assembly of the State of Vermont. The Assembly meets biennially on the first Wednesday after the first Monday of January dating from 1915. Representatives must have resided in the State for two years. Every town is entitled to one representative in the Assembly. The Senate is composed of 30 members who are elected and have attained the age of 30 years. Senators are apportioned to the several cities according to the population, and a new apportionment is made following every census of the United States.

Executive.—The supreme executive power is vested in the Governor. The Governor and Lieutenant Governor must have resided in the State for four years preceding the day of their election. Other executive officers are the Treasurer, Secretary of State, and Auditor of Accounts. They are all elected for terms of two years.

Judiciary.—The judicial system includes the supreme court, superior court, county courts, probate courts, and city and municipal courts. The supreme court consists of five justices, elected biennially. The superior court consists of six justices. Judges of probate are elected by the voters of their respective probate districts. Justices of the peace are also elected.

Suffrage and Elections.—Every male citizen of the United States of the age of 21 years who has resided in the State for one year prior to the election of Representatives is entitled to vote. The Australian system of voting is employed except in municipal elections. The Legislature of 1915 passed, amongst other election legislation, a measure providing for the election of United States Senators.

Local and Municipal Government.—The units of local government are the town and county. In each county is a county court, and in the cities, municipal courts. Towns are governed by annual town meetings at which selectmen and other officials are chosen.

Miscellaneous Constitutional and Statutory Provisions.—There is a workmen's compensation law and a State railway commission. The State is under local option for the regulation of the sale of liquor.

Finances. Income in the early history of the State was derived mainly from a general tax on property and partly from the sale of public property. In 1841 this brought in $68,000 out of a total budget of $85,000. The Civil War and the expenses resulting from it forced an issue of bonds, amounting in all to $1,650,000. These were very rapidly redeemed, and by 1870 there were only $841,000 of bonds outstanding. By 1880 the total funded debt did not exceed $140,000, almost all of which the treasury owed to its own college fund. There is a small direct tax laid annually for school purposes and another for highways. Other sources of income are corporation and inheritance taxes, licenses, fees, etc. The satisfactory condition of the State finances is in no small degree due to the fact that there were never undertaken any considerable public improvements. The receipts for the fiscal year ending July 12, 1915, amounted to $1,876,652; the balance on July 12, 1914, was $252,721, and the disbursements for the year $1,916,680, leaving a balance in the treasury of $212,693.

Militia. The males of militia age in the State in 1910 numbered 73,685. The organized militia on Jan. 1, 1915, was composed of 776 enlisted men and 76 officers. It included a regiment of infantry, a squadron of cavalry, and a detachment of sanitary troops.

Population. The population at each Federal census was as follows: 1790, 85,425; 1800, 154,-465; 1810, 217,895; 1820, 234,981; 1830, 280,-652; 1840, 291,948; 1850, 314,120; 1860, 315,-098; 1870, 330,551; 1880, 332,286; 1890, 332,-422; 1900, 343,641; 1910, 355,956; 1915 (est.), 362,452. The average number of people to the square mile in 1910 was 39. Along with other New England States, Vermont has lost rather heavily by emigration to the West. Foreign immigration in recent years has to some extent offset the outflow. The urban population, i.e., that in towns of 2500 or more, was 168,943; the rural population, 187,013. Of the total population, 229,382 were native whites of native parents. The native whites of foreign or mixed parentage numbered 75,055, the foreign-born whites 49,861, and the negroes 1621. More than one-half (52.3 per cent) of the foreign born come from Canada. By sex the population was divided into 173,388 females and 182,568 males. The males of voting age numbered 113,506. There were in 1910 three cities of over 8000. These with their population for 1910 and 1915 (est.) follow: Burlington, 20,468 and 21,432;

Rutland, 13,546 and 14,624; Barre, 10,734 and 11,973.

Education. Vermont in 1910 enjoyed the lowest rate of illiteracy among all of the New England States. There were in that year 10,806 persons of 10 years of age or over, who were unable to read or write, 3.7 per cent of the entire population. Among persons of native parentage the percentage in 1900 was 1.2, and among foreign-born whites 13.1. There were, in 1910, 94,701 persons of school age (ages, 6 to 20), of which 66,845 attended school. The total enrollment in the public schools in 1915 was 65,095. The total number of teachers was 3018. The total school expenditures in that year amounted to $2,325,214.

In 1912, on recommendation of Governor Fletcher, an educational commission was appointed, with a duty of inquiring into public education in the State. This commission carried on investigations for two years and made many important recommendations in its report rendered Oct. 5, 1914.

On June 20, 1914, there were 57 high schools of the first class. The total number of students in all schools of the secondary class was 8068. Medical inspection is in operation in several cities. There are normal schools at Castleton and Johnson. The institutions of collegiate rank in the State are the University of Vermont and State Agricultural College at Burlington, Middlebury College at Middlebury, and Norwich University at Northfield. The first two are coeducational, the last is for men only.

Charities and Corrections. The charitable and correctional institutions include the State Prison at Windsor, the House of Correction at Rutland, the State Asylum for the Insane at Waterbury, the Soldier's Home at Bennington, the State Industrial School at Vergennes, the State Sanatorium at Pittsford, and the State Institution for Feebleminded at Brandon. There are in addition 10 hospitals under State control. There is no board or commission of State charities having general supervision over these institutions. There is a State Board of Penal Institutions.

Religion. Somewhat more than one-half (82,272) of the reported church members were Roman Catholics. The membership of the Protestant denominations combined numbered 63,895. Some of the principal denominations in order of numerical strength are Congregationalists (22,109), Methodists (17,471), and Baptists (8450).

History. The first explorer of this region was Champlain (q.v.), who in 1609 sailed up the lake which bears his name. The country was said to be inhabited by the Iroquois, but this is doubtful. No settlements were made until 1665, when the French built Fort St. Anne on Isle la Motte. Frequent French incursions were made through "the Wilderness" against New England and New York, and in 1696 seigniories were granted. Massachusetts built Fort Dummer in 1724 on the site of Brattleboro, and in 1728 a trading house was opened here. French forts were built at Chimney Point and Crown Point in 1730–31, and much loss was inflicted on the English settlers by roving bands who used these posts as headquarters. English blockhouses were built and many battles were fought after 1744. The French abandoned all posts in 1757 except Isle aux Noix, and this was taken the next year. In 1732 Col. John Henry Lydius bought of the Mohawks a tract of land corresponding nearly to the present counties of Addison and Rutland, and this purchase was confirmed by Governor Shirley, of Massachusetts, in 1744. New Hampshire claimed the territory to a line drawn 20 miles east of the Hudson River, i.e., as far as the border of the Massachusetts territory, and after 1749 Governor Wentworth, of New Hampshire, made lavish grants, and small settlements sprang up everywhere. New York, though she had acquiesced in the Massachusetts boundary, claimed this territory to the Connecticut River. Proclamations and counterproclamations were issued, but in 1764 a royal order was issued declaring the Connecticut the boundary between New Hampshire and New York. The New York government considered this to mean that the New Hampshire Grants were annulled, and ordered the settlers to repurchase from New York. This was generally refused, and the settlers secured in 1767 another royal order forbidding the granting of disputed lands until further instructions. New York continued, however, to grant the lands not previously sold. A convention of settlers was held at Bennington, and they determined to resist by force any processes of the New York courts. The grand jury at Albany in 1770 indicted some of them as rioters, and several were arrested in 1771. Committees of safety were organized in the several towns, and it was decreed that no New York officer should take any one out of the district without consent of the committee. To enforce these rules the Green Mountain Boys were organized under Ethan Allen (q.v.) and others, and they prepared to resist a reported expedition under Governor Tryon, who, however, ordered all prosecutions stopped until the matter might be submitted to the King. Nevertheless some grantees were dispossessed. The New York Assembly offered a reward of £100 for Ethan Allen or Remember Baker in 1774, but to no effect. At Westminster in the east a contest between a sheriff's posse and citizens resulted in the Westminster Massacre on March 13, 1775. In April a convention met there and proclaimed the territory independent of New York, but declared itself willing to await the King's pleasure as to whether it should become a separate province or be annexed to some other province.

During the Revolution the colonists waged practically a separate war against the British and Indians. The capture of Ticonderoga, May 10, 1775, was almost entirely the work of the Green Mountain Boys. In January, 1776, a convention at Dorset sent a commission to Congress, which, however, would not consider the proposition of making a new State. On Jan. 15, 1777, another convention met at Westminster, declared the territory an independent State with the name New Connecticut, and asked for admission. The present name was substituted in June, at the advice of Dr. Thomas Young, of Philadelphia, and a constitution similar to that of Pennsylvania was adopted, but with a clause prohibiting slavery. The government went into effect March 12, 1778, and 16 towns east of the Connecticut River were united to the State in June, but the union was dissolved the next year, because of the resentment of New Hampshire, which now began to press its claim to the territory. New York also renewed its claims. No action was taken by Congress, and in retaliation Vermont extended its jurisdiction over the

New Hampshire towns and over New York east of the Hudson, but, owing to the advice of Washington, the claim was given up Feb. 22, 1781. After the close of the Revolution a gradual change in feeling took place in New York, and on July 15, 1789, a commission to treat with Vermont was appointed. In October, 1790, it was agreed that New York should cease opposition to the admission of Vermont to the Union on payment of $30,000 for disputed land claims. This was soon paid, and the State became a member of the Union March 4, 1791, the first State admitted under the Constitution.

The State was more democratic from the beginning than any other of the New England States. There were no rich and no aristocracy. The capital was laid out at Montpelier, the geographical centre of the State, in 1808. The University of Vermont was incorporated in 1791 and the first class graduated in 1804. There was considerable emigration after 1825, but there has been a gradual settlement of French Canadians to replace those departing. The State furnished more than its quota during the Civil War. Some Southern sympathizers from Canada invaded the town of St. Albans in October, 1864, and this was made a point in the Geneva Arbitration. The Fenian operations against Canada, in 1866 and 1870, had their base in this town. The State adopted a prohibitory amendment to the constitution in 1852, but abandoned the policy of prohibition in 1902, when the voters of the State declared for high license. This measure, amounting to local-option regulation, became law in 1903.

In 1792, 1796, and 1800 the State was carried for Federalist electors, but was Democratic-Republican thereafter to 1824. In that year, and again in 1828, the Adams Republicans were successful. In 1832 the vote was cast for the Antimasonic candidate. After that time it was steadfastly Whig to 1852 and has been Republican ever since.

In the presidential election in 1908 Taft received 39,552 votes and Bryan 11,496. George H. Prouty, Republican, was elected Governor. In 1909 there was a notable celebration of the tercentenary of the discovery of Lake Champlain. President Taft, ambassadors from Great Britain and France, and other notable persons took part in this celebration. In 1910 John A. Mead, Republican candidate, was elected Governor. For President in 1912 Taft received 23,305 votes, Roosevelt 22,070, and Wilson 15,350. Vermont was one of the two States carried by Mr. Taft in this election. Allen N. Fletcher, Republican, was elected Governor in 1912. In 1914 Charles W. Gates, Republican candidate, was elected Governor.

VERMONT, UNIVERSITY OF. A coeducational institution of learning at Burlington, Vt., founded in 1791. The Vermont Agricultural College, chartered in 1862, was incorporated in 1865 with the university, under the title of the University of Vermont and State Agricultural College. The work of instruction is organized in four colleges as follows: first, the college of arts and science, with a classical course leading to the degree of A.B., a literary scientific course leading to the degree of Ph.B., and courses in general science, chemistry, commerce, and economics and education, all leading to the degree of B.S.; second, college of engineering, with courses in civil, mechanical, and electrical engineering all leading to the degree of B.S.; third, college of agriculture with courses lead-

ing to the degree of B.S. in agriculture; fourth, the college of medicine granting the degree of M.D. as an institution in Class A of the American Medical Association rating. Certificates from approved preparatory schools are accepted for admission. The curricula are partially elective. Military theory and drill are required of all male students. The university offers a number of scholarships and prizes and maintains a loan fund for the benefit of needy students who are residents of Vermont. The attendance in all departments in 1915–16 was 594. The faculty numbered 118. The endowment is about $935,000, and the annual income about $200,000. The university conducts a summer school. The library has about 95,000 volumes. The president in 1916 was Guy Potter Benton, D.D.

VER'NAL GRASS (Lat. *vernalis*, relating to the spring, from *ver*, Gk. ἔαρ, *ear*, ἦρ, ĕr, spring), SWEET (*Anthoxanthum odoratum*). A sweet-scented grass common in meadows, woods, and pastures throughout Europe and the Western Hemisphere. It is about a foot high, with a spiked oblong panicle. It has little value, as stock do not eat it readily, and in some countries it has become a pest. See Plate of GRASSES.

VERNA'TION. The arrangement of leaves in the bud (q.v.).

VERNE, vârn, JULES (1828–1905). A French novelist, born at Nantes. His novels, in the original, and in translations in various languages, delighted an immense audience, especially of young people. Stories of extraordinary voyages—to the heavenly bodies, under the sea, etc.—were his specialty, and their fantastic improbabilities or impossibilities he based upon explanations which he would have his readers accept as scientific, and which gave his fiction an air of plausibility. After studying law, Verne turned to a literary career, and wrote repeatedly for the stage, but without success. In 1863 he made an attempt in fiction with his *Five Weeks in a Balloon*, in which he struck for the first time the vein which he was later to work to his own abounding profit and the applause of the public. His novels, most of which are available in English translations, include, in addition to his first success, above mentioned: *A Voyage to the Centre of the Earth* (1864); *From the Earth to the Moon* (1865); *Twenty Thousand Leagues under the Sea* (1870); *The Mysterious Island* (1870); *Around the World in Eighty Days* (1872); *The Green Ray* (1882); *Christopher Columbus* (1883); *The Southern Star* (1884); and *The Carpathian Château* (1892). *Around the World in Eighty Days* and *Michael Strogoff* (1876) were dramatized, and produced and reproduced in France and abroad with a success that paralleled the success of his best novels; and *Dr. Ox* (1874) was turned into an opera. The interest of Verne's stories depends chiefly on incident; the character drawing in them is insignificant; their style is rapid and marked by picturesqueness and verve. Despite the extravagance of his inventions, his imagination anticipated startling discoveries in the fields of aërial and submarine navigation. He was not without influence upon English fiction, as certain novels of H. G. Wells and Rider Haggard sufficiently attest. His translated *Works* in 15 volumes were published in New York in 1911.

VERNER, vĕr'nĕr, KARL ADOLF (1846–96). A Danish philologist. He was born at Aarhus, and was educated at the University of Copenhagen. After a visit to Russia in 1871–72 he returned to his old home, where he developed the law of Indo-Germanic accent that bears his name. In 1876 he was appointed an assistant in the university library at Halle, where he remained until 1883, when he became docent in Slavic languages at the University of Copenhagen, being made professor in 1888. The Berlin Academy awarded him the Bopp Prize, and Heidelberg University made him Ph.D. (1887). He published little besides the famous article on his law (see VERNER'S LAW). Consult Holgar Pedersen, "K. A. Verner," in *Indogerman Forschungen Anzeiger*, vol. viii (Strassburg, 1897), and *Afhandlinger og Breve udgivne af Selskab for germansk Filologi, med Biografi ved Marius Vibæk* (Copenhagen, 1903).

VERNER'S LAW. A phonetic law of the Germanic group of the Indo-Germanic languages, which was enunciated in 1875 by Karl Adolf Verner (q.v.). It was the result of an investigation begun to explain certain apparent irregularities in the operation of Grimm's law, and was not only important in itself, but established the principle of phonetic laws on a scientific basis, thus marking an epoch in the development of philology. The law may be stated as follows. The surd Germanic spirants, *þ*, *f*, *h*, *hw*, and *s*, which represent Indo-Germanic *t*, *p*, *k* (or *q*), *qu*, and *s* respectively, became the sonant spirants, *d*, *b*, *g*, *gu*, and *r*, when the vowel immediately preceding them did not, according to the original Indo-Germanic accent system, bear the primary accent of the word. The sonant spirants, excepting *z*, thus arising, are subject to the same changes in the various Germanic dialects as those which represent Indo-Germanic *dh*, *bh*, and *gh*. The sonant *z*, however, is represented in German and Icelandic by *r*, while the sound groups *sp*, *st*, *sk*, *ss*, *ft*, *fs*, *hs*, and *ht* throughout the Germanic group were exempt from the operation of the law. The following examples of Verner's law from Gothic and Old High German may be cited, together with the corresponding changes according to Grimm's law: Skt. *pitár*, Gk. πατήρ, Goth. *fadar*, OHG. *fatar*, father, but Skt. *bhrâtar*, Gk. φράτηρ, Goth. *brōþar* OHG. *bruoder*, brother; Skt. *saptá*, Gk. ἑπτά, Goth. and OHG. *sibun*, seven, but Gk. κλέπτειν, Goth. *hlifan*, to steal, Skt. *nápāt*, OHG. *nefo*, grandson; Skt. *daśát*, Gk. δεκάς, Goth. *tigus*, OHG. *-zug*, decade, but Skt. *dáśa*, Gk. δέκα, Goth. *taihun*, OHG. *zehan*, ten; Pre-Ger. **segunis* (cf. Skt. *agní*, fire, *vṛṣṇí*, ram), Goth. *siuns*, appearance, but Gk. λείπειν, to leave, Goth. *leihwan*, OHG. *līhan*, to lend; Skt. *marśáyāmi*, Goth. *marzja*, OHG. *merr(i)u*, I disturb, but Skt. *násatē*, unite, Goth. *ganisan*, OHG. *ginesan*, to be healed. Verner's law seems to have been operative after the completion of the first Germanic sound shifting, probably between 250 B.C. and 400 A.D. The uniformity of its action has been greatly disturbed by analogy (q.v.), but enough traces of it survive to justify the important deduction that as late as the beginning of the Christian era the Germanic languages retained the Indo-Germanic system of free accent, according to which the primary accent might fall, as in Vedic Sanskrit, Greek, Lithuanian, and Russian, on any syllable of the word, in contrast to the Germanic accent law established long before the earliest literary records, which confines the main accent to the root syllable. A possible analogue has been sought in the change of Indo-Germanic *s* to *r* in

Latin and Umbrian, but to *z* in Oscan (see ITALIC LANGUAGES), as Latin *dearum*, of goddesses, Umbrian *urnasiaru*, of urn feasts, but Oscan *egmazum*, of things. Consult Verner, "Eine Ausnahme der ersten Lautverschiebung," in Kuhn, *Zeitschrift für vergleichende Sprachforschung*, vol. xxiii (Berlin, 1875), and Conway, *Verner's Law in Italy* (London, 1887). See GRIMM'S LAW; PHILOLOGY; PHONETIC LAW; TEUTONIC LANGUAGES.

VERNES, vârn, MAURICE LOUIS (1845–). A French biblical scholar, born at Nauroy (Aisne). He studied theology at Montauban and Strassburg, and went to the Sorbonne in 1877 as lecturer on philosophy in the Protestant faculty of theology. In 1886 he became director of the department of religious sciences in the Ecole Pratique des Hautes Etudes. He devoted himself particularly to the comparative study of religion, and published: *Le peuple d'Israël et ses espérances* (1872); *Histoire des idées messianiques depuis Alexandre jusqu'à l'empereur Adrien* (1874); *Histoire du peuple israélitique* (1881); *L'histoire des religions: son esprit, sa méthode et ses divisions* (1887); *Du prétendu polythéisme des Hébreux* (1891); *Essais bibliques* (1894); *Histoire sociale des religions* (1911); *Les emprunts de la Bible hébraïque au grec et au latin* (1914).

VERNET, vâr'nâ. A celebrated family of French painters. The earliest member to attain prominence, JOSEPH (1714–89), a marine and landscape painter, was born at Avignon and was a pupil of his father, ANTOINE VERNET (1689–1753), a decorative painter, and then studied in Italy under Fergioni and Manglard. He combined landscape and marine, and excelled in depicting storms and moonlight and sunset effects, excellent examples of all of which are in the Louvre. His best-known work is a series of 15 paintings of the ports of France (1754–65) commissioned by Louis XV, now in the Musée de la Marine (Louvre). Though in the classic style of the school of Claude Lorraine, his works are more animated and show a simpler and truer observation of nature than those of most contemporaries. His son and pupil, ANTOINE CHARLES HORACE (1758–1836), usually called CARLE VERNET, was born in Bordeaux and studied also under Lépicié. He was best in genre works, usually comic in character, though he also painted Napoleonic battle pieces, portraits, and hunting scenes, and made good designs for lithography; he is, indeed, one of the founders of French caricature. Though weak in color, his paintings are skillful in design. He is represented in the Louvre and the Metropolitan Museum, New York.

Carle's son, HORACE VERNET (1789–1863), battle painter, the most celebrated member of the family, was born in Paris. A pupil first of his father, then of Moreau and Vincent, he worked as a youth with facility with crayon, burin, or brush. He was popular at the court of Napoleon and in 1814 he helped defend the Barrière de Clichy, receiving as a reward the Cross of the Legion of Honor from the Emperor. The incident was later pictured by Vernet and is now in the Louvre. During the Restoration he helped to popularize the Napoleonic legend by numerous engravings, lithographs, and paintings, which were refused by the Salon. He subsequently won the favor of Charles X, for whom he painted the battles of Bouvine and Fontenoy (Versailles). In 1826 he was elected to the Institute, and from 1828 to 1833 was director of the French Academy at Rome. Louis Philippe commissioned him to paint pictures of the battlefields of Friedland, Jena, and Wagram for the great gallery of battle pieces at Versailles, and later he produced, from sketches made in Algiers, a series of pictures celebrating the conquest of that country, to decorate the Salle de Constantine, the "Sinalah d'Abd el Kader" being the best. Scenes of soldiery or battle appealed most strongly to him, though he executed historical subjects, landscapes, and portraits, among his sitters being the painter Isabey (Louvre), Napoleon I, Louis Philippe, Emperor Nicholas, Napoleon III, and many of the marshals of France. His immense productiveness resulted in over 800 canvases. His works display facility of invention, faithful representation, and fiery energy; but their execution is hasty, and they are without depth of feeling and are deficient in color. Consult the works on *Les Vernets* by Charles Blanc (Paris, 1845), Lagrange (ib., 1864), Durande (ib., 1865), Clément (ib., 1876), and Dayot (ib., 1898); also Lagrange, *Joseph Vernet et la peinture au XVIIIème siècle* (ib., 1861); Bertholon and Lhoto, *Horace Vernet à Versailles, au Luxembourg et au Louvre* (ib., 1863); Salvator, "Joseph Vernet," in *French Art from Watteau to Prud'hon* (London, 1906).

VERNHEUIL, vĕr'nĕ'y', ARISTIDE AUGUSTE STANISLAS (1823–95). A French surgeon. He was born and educated in Paris, where he became connected with several hospitals, in 1868 being appointed professor of pathology at the Pitié and in 1872 professor of surgery. In 1888 he became a member of the Institute. His principal work is *Mémoires de chirurgie* (1877–88). In 1881 he founded with others the *Revue de Chirurgie* (Paris), of which he was the editor.

VERNIER, vĕr'nĭ-ēr. A scale invented by the French geometrician Pierre Vernier (q.v.), by which linear or angular magnitude can be read with a much greater degree of accuracy than is possible by mere mechanical division and sub-

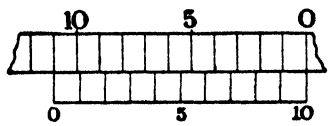

FIG. 1. RETROGRADE OR REVERSE VERNIER.

division. The principle is essentially shown by the following examples: Fig. 1 is a portion of a graduated scale of equal parts with a vernier below, which is made to slide along the edge of the scale, and is so divided that 10 of its subdivisions are equal to 11 of the smallest divisions of the scale; then each division of the vernier is equivalent to 1.1 of a scale division; and consequently if the zero point of the vernier (Fig. 1) be opposite 11 on the scale, the 1 on the vernier is at 9.9 (1.1 to the left of 11), 2 on the vernier is at 8.8 (2.2 to the left of 11), etc. Also, if the vernier be moved along so that 1 on it coincides with a division on the scale, then 0 on the vernier is one-tenth to the left of the next division of the scale; if 4 on the vernier coincides with a division on the scale, the 0 is four-tenths to the left of a division as in Fig. 2. The vernier is applied to instruments by being carried at the extremity of the index limb, the zero on the vernier being taken as the index point; and when the reading is to be performed, the position of the zero point, with reference to the

divisions of the scale, gives the result as correctly as the mechanical graduation permits, and the number of the division of the vernier which coincides with a division of the scale supplements this result by the addition of a fractional part of the smallest subdivision of the scale. Thus

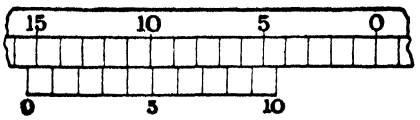

FIG. 2. RETROGRADE VERNIER SHOWING METHOD OF READING.

in Fig. 2 suppose the scale divisions to be degrees, then the reading by the graduation alone gives a result between 15° and 16°; but as the fourth division of the vernier coincides with a graduation on the scale, it follows that the zero point of the vernier is 0.4 of a division to the left of 15°, and that the correct reading is 15.4°. It will be seen that by merely increasing the length of the vernier, as, e.g., making 20 divisions of it coincide with 21 on the scale, the latter may be read to twentieths; and a still greater increase in the length of the vernier would secure further accuracy. Verniers like the above in which the number of its divisions is less than the corresponding number on the scale are called retrograde or reverse verniers. But some instruments are provided with direct verniers, i.e., those in which the number of divisions exceeds the corresponding number on the scale. The principle of operation is the same as in the retrograde vernier, except that one must look forward along the vernier to find the coinciding line. Fig. 3 shows a direct vernier, and the principle of its construction is the same as for reverse

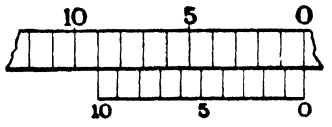

FIG. 3. DIRECT VERNIER.

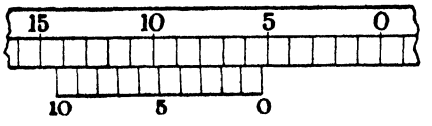

FIG. 4. DIRECT VERNIER SHOWING METHOD OF READING.

verniers, only the vernier division is greater by a tenth of a scale division instead of being smaller. Fig. 4 shows a direct vernier where the coincidence comes at 3, giving a reading of 5.3. In general, if v is the length of a vernier division, s the length of a scale part, and n the number of divisions on the vernier, then $nv = (n - 1)\ s$ for the direct vernier and $nv = (n + 1)\ s$ for the reverse vernier. Therefore $s - v = \frac{1}{n} \cdot s$, $v - s = \frac{1}{n} \cdot s$ respectively, which shows the comparative size of the divisions of the two scales and to what fraction of a division any vernier will read. For example, we wish a direct vernier, attached to a scale graduated to read half degrees, to read minutes; what must be the relation between a vernier and a scale division? Here $s = 30'$, and, since the vernier is to read mintues, $s - v = 1'$ and $v = 29'$. $s - v = \frac{1}{n} \cdot s = 1'$ and $n = 30$. Therefore, a space equal to 29 scale divisions is to be subdivided on the vernier into 30 equal parts.

Of the various methods for subdivision which were in use before the introduction of the vernier, the most important were the diagonal scale (q.v.) and the nonius. The latter is so called from its inventor, Petrus Nonius (Pedro Nunes), a Portuguese mathematician (1492–1577), who described it in a treatise *De Crepusculis Liber Unus* (Lisbon, 1542). It consists of 45 concentric circles described on the limb, and divided into quadrants by two diameters intersecting at right angles. The outermost of these quadrants was divided into 90, the next into 89, the third into 88, etc., and the last into 46 equal parts, giving, on the whole, a quadrantal division into 2532 separate and unequal parts (amounting on an average to about 2′ intervals). The edge of the bar which carried the sights passed, when produced, through the centre, and served as an index limb; and whichever of the 45 circles it crossed at a graduation, on that circle was the angle read; i.e., if it cut the seventh circle from the outside as its forty-third graduation, the angle was read as $\frac{43}{88}$ of 90°, or 46° 4′ 17$\frac{1}{11}$″. Consult Ludlow, "Subscales, Including Verniers," in Van Nostrand's *Engineering Magazine* (New York, 1882).

VERNIER, vâr'nyâ′, PIERRE (1580–1637). A French geometer, born at Ornans, in Burgundy. His father was a mathematician and director general of currency to the Count de Bourgogne. Vernier was commandant of the castle in his native town and director of the mint. His chief work was *La construction, l'usage et les propriétés du quadrant nouveau de mathématiques* (1631), which contains the description of the instrument bearing his name. See VERNIER.

VERNIS-MARTIN (Martin's varnish). The French name for the imitations of Chinese and Japanese lacquer, brought to perfection by the four brothers Martin in the reign of Louis XV, and quite as popular then as Boulé work had been in the reign of Louis XIV. See LACQUER.

VERNOIS, JULIUS VON VERDY DU. See VERDY DU VERNOIS.

VER'NON. A city and the capital of the Okanagan District, British Columbia, Canada, on the Canadian Pacific Railway, 5 miles from Lake Okanagan (Map: British Columbia, E 4). It is in a rich fruit-growing district, much of which is irrigated. Pop., 1901, 802; 1911, 2671.

VERNON. A town and the county seat of Wilbarger Co., Tex., 163 miles northwest of Fort Worth, on Pease River, and on the Fort Worth and Denver City and the St. Louis and San Francisco railroads. There are flour and oil mills, a cotton compress, and extensive grain and live-stock interests. Vernon has adopted the commission form of government. Pop., 1900, 1993; 1910, 3195.

VERNON, DIANA. A beautiful and talented girl in Scott's *Rob Roy*, trained to vie with men in their sports.

VERNON, EDWARD (1684–1757). An English admiral. He was born in Westminster; was educated at Westminster School, and in 1701 entered the navy, and saw much active service during the War of the Spanish Succession. In 1739, as commander of six ships, and with the rank of vice admiral, he captured Porto Bello, with a loss of only seven men. Owing to the inefficiency of the military support, he was repulsed from Cartagena in 1741, and lost heavily by sickness. This action has been described in *Roderick Random* by Smollett, who was serving in the expedition as assistant surgeon. Law-

rence, the eldest brother of George Washington, was also a member of the expedition, and his estate Mount Vernon was named in honor of the admiral. Vernon returned to England in 1742; was several times reëlected to Parliament; in 1745 was promoted to be admiral, and during the expected invasion by the Pretender commanded on the Kent and Sussex coasts. For criticizing the Admiralty in two pamphlets, he was removed from his command in 1746, but continued a member of Parliament until his death.

VERNON GALLERY. A collection of English paintings, formerly the property of Robert Vernon, now forming part of the National Gallery, London, to which it was given in 1847.

VERNON-HARCOURT. See HARCOURT, SIR WILLIAM G. G. V. VERNON; HARCOURT, WILLIAM VERNON.

VERON, FRANÇOIS, SIEUR DE FORBONNAIS. See FORBONNAIS.

VERONA, vā-rō'nā. A city of Italy, the capital of the Province of Verona, 71 miles by rail west of Venice (Map: Italy, C 2). The swift Adige traverses the city in a zigzag. It is crossed by seven bridges. Verona is a fortress of the first class and holds the key to Tirol. It is, with the exception of Venice, the most famous and attractive city of Venetia, and is both prosperous and progressive.

Its numerous weather-stained white marble palaces, richly sculptured, with evidences of having been painted, and often standing below the grade of the modern streets, give it an air of sumptuous decay, which effect is offset, however, by the abundant signs of its modern thrift. Its walls are pierced by several handsome gates. By far the larger part of the town is on the right bank of the Adige, where, in the centre, on the large and impressive Piazza Vittorio Emanuele, rises the celebrated Roman amphitheatre. This splendid ruin, dating from the reign of Diocletian, is 168 yards long and 106 feet high, and could accommodate over 20,000 persons. Almost all of the external arcades, with three tiers of arches, have disappeared, but the interior has often been restored, and the amphitheatre is still used. On the Piazza and in the immediate vicinity are to be seen the Municipio; fragments of the old Roman wall; an ancient Franciscan monastery, now closed, but containing the mediocre sarcophagus known to disillusioned sight-seers as the tomb of Juliet; and the Museo Lapidario, with classic inscriptions and antique marbles. From the Piazza extends southward the spacious and splendid Corso of the same name, and to the southeast stretches the likewise spacious Via Pallone—the latter reaching the river where, on the opposite side, lies the cemetery.

The Piazza is connected with the important Piazza del Erbe, on the northeast, by the busy Via Nuova Lastricata and Via Nuova, which together form the busiest thoroughfare of the city, especially at night. In the vicinity is the marble tablet marking the portal of an old and uninspiring house locally said to have been Juliet's home. A high tower affording a fine view of city and country, a very ancient fountain bearing the statue of Verona, a marble column surmounted by a copy of the Venetian Lion of St. Mark, and proud palaces with frescoed façades, here add interest to the scene. Adjacent on the northeast is the Piazza dei Signori, beautified by archways (with portraits) which span the entrances. It is surrounded by palaces dating from the time of the Scaligers, and contains the famous statue of Dante by Zannoni. Of these palaces the Palazzo del Consiglio is the most conspicuous. The superb structure (1476–92) in early Renaissance is probably a creation of Fra Giocondo, and is adorned with statues of the ancient Romans who were born in Verona—among them Catullus, Cornelius Nepos (probably), Pliny the Younger, and Vitruvius. Near by is the far-famed tomb of the Scaligers, rising in a small paved square. The grave Gothic outlines of the monument appear behind lofty railings in which are to be seen recurring ladders—the family emblem. Farther north, and in the extreme bend of the Adige, stands the uninteresting Gothic cathedral (consecrated 1187). It contains, however, a fine "Assumption" by Titian.

Northwest of the Roman Amphitheatre, and on the river bank, stands the battlemented Castel Vecchio (1355), from which a venerable pinnacled bridge stretches to the northern shore. Thence, to the northeast, extends the spacious and imposing Corso Cavour, bordered by fine palaces. It is a prominent thoroughfare. It leads northeast towards the Porta de' Borsari—a triumphal arch constructed 265 A.D. On the southwest it connects, near the Castel Vecchio, with the broad fine street leading southwest to the attractive Porta del Palio. In the extreme western corner of the city, and near the river, rises the church of San Zeno Maggiore, dating from 1139. It ranks among the finest Romanesque churches in Italy and is notable for its symmetries. It contains a valued painting by Mantegna, and the fine bronze tomb of the saint.

By the Ponte Navi, on the opposite side of the city, stands the mediæval church of San Fermo Maggiore, with a striking façade. The narrow, curving, and extended section of the city on the left bank, with the cemetery on the south, is called Veronetta. The municipal museum and the picture gallery are situated here by the Ponte Navi, in the majestic Palazzo Pompei, overlooking the river. The edifice was constructed by Sammicheli and now belongs to the city. The paintings are nearly all of the Veronese school. Farther north looms the commanding Castel San Pietro, where a fortress of Theodoric the Great stood. It is now used as barracks. The ancient church of Santo Stefano, restored by Theodoric, and the San Giorgio in Braida are near. Mention should be made of the Dominican church of Sant' Anastasia (1261–1422), remarkable for its decoration and early paintings and sculptures.

Verona has a royal seminary, an industrial school, and a deaf and dumb institution. The Biblioteca Capitolare contains valuable palimpsests, among them the *Institutes* of Gaius. The municipal library was established in 1860. The city is provided with numerous hospitals, including a military hospital, an asylum for the aged, and one for paupers and beggars, public dormitories, and three associations for the care of poor children. There are cotton, paper, and flour mills, an immense nail factory, and piano and organ factories. Silk, soap, sugar, and candles also are manufactured. There are, besides, the new arsenal and extensive artillery establishments. Verona is important in the Italian traffic with Switzerland, Austria, and Germany. It deals in wines, fruits, rice, and marble. At the head of the municipal government

is a syndic. Pop. (commune), 1901, 74,271; 1911, 81,909.

Verona was conspicuous in its architecture already in mediæval times, and with the Renaissance came Fra Giocondo and its military architect Sammicheli. Verona had an early and distinct school of painting, which, like that of Venice, excelled in coloring. The great master Paul Veronese came from here. Verona also contributed worthily to sculpture.

History. Verona was anciently a Gallic town. From the Celts it passed under Roman rule as a colony in 89 B.C., and was wealthy and important. Theodoric the Great made it a royal seat. It fell to the Lombards, whose King, Alboin, met his death at Verona. From the rule of the Lombards Verona passed under that of the Frankish King Pepin. It shared in the terrible struggles between Guelph and Ghibelline. It came under the power of the great Ghibelline Scala or Scaliger family in the middle of the thirteenth century, its rulers being called podestàs. This celebrated family made of it a sumptuous and famous city. Dante found a refuge with Can Grande della Scala after being driven from Florence. Early in the fourteenth century Verona extended its sway and brought Padua and Vicenza under its control, and also Brescia, Parma, and even the distant Lucca. It became subject to Milan in 1387 and to Venice in 1405. It was powerfully fortified by Sammicheli in 1527. It passed to Austria on the extinction of the Venetian Republic in 1797. The Austrians strongly fortified it after 1814, and made it a pivot of their famous Quadrilateral. In the winter of 1822 it was the meeting place of a congress of European monarchs and diplomats which under the guidance of Metternich (q.v.) determined upon the intervention of the Holy Alliance (q.v.) for the suppression of the Spanish Revolution. Verona became a part of the Kingdom of Italy in 1866. It was bombarded from the air by the Austrians in the war which began in 1914. See WAR IN EUROPE.

Consult: Allen and Williamson, "Verona," in *Cities of Northern Italy*, vol. ii (Boston, 1906); Wiel, *The Story of Verona*, in "Mediæval Towns Series" (London, 1902); R. R. Peyré, *Padua et Vérone* (Paris, 1907); A. M. Allen, *History of Verona* (New York, 1910).

VERONA. A borough in Allegheny Co., Pa., on the Allegheny River, and on the Pennsylvania Railroad. Among the industrial establishments are railroad shops, tool works, lumber yards, steel-casting works, structural iron works, and a chemical plant. Pop., 1900, 1904; 1910, 2849.

VERONA, GUARINO DA. See GUARINO DA VERONA.

VER'ONAL. A hypnotic, chemically diethyl-barbituric acid. It is a white, crystalline powder, soluble in boiling, practically insoluble in cold water. It acts on the central nervous system, especially on the cerebrum. Eruptions and poisoning have occurred in a few cases. A habit may be contracted. Veronal sodium, chemically sodium diethyl-barbiturate, is a similar drug, having practically identical sedative effects, but, being more soluble, it acts more quickly.

VERONESE, vā'rō-nā'zā, GIUSEPPE (1854–). An Italian mathematician, born at Chioggia, Venice. He was educated at Venice, Zürich, Rome, and Leipzig, was an assistant in mathematics at Rome in 1877–80, and served as professor of mathematics at the Royal University at Padua after 1881. Veronese was also a deputy from 1897 to 1900, and a Senator of the Kingdom after 1904. His publications include many treatises, especially on geometry. In English appeared *Notions of Intuitive Geometry* (1900–15); *Complements of Algebra and Geometry* (1915).

VERONESE, PAOLO (PAUL) (properly PAOLO CALIARI or CAGLIARI) (1528–88). A painter of the Veronese school, who became one of the chief masters of the Venetian Renaissance. He was born at Verona, the son of Gabriele Caliari, a stonemason, and studied painting first with Antonio Badile, but was more influenced by Domenico Brusacorsi. His earliest known work, dating from 1551, was a commission from the architect Sammicheli to fresco Villa Soranza, near Castelfranco, and soon afterward he decorated Villa Emo (now Fanzolo) in the same vicinity. Fragments of the former frescoes are preserved in the sacristy of the cathedral of Castelfranco and in England, but the latter remain in situ, though in a damaged condition. They represent scenes from ancient history, classic myths, and contemporary life. In both of these commissions he was associated with Battista Zelotti. In 1552 he and three other Veronese painters received a commission to paint an altarpiece each for the cathedral of Mantua; Paolo's panel, "The Temptation of St. Anthony," is now in the Museum of Caen.

Veronese's early works are in the silver-gray tone peculiar to Veronese art, and the decoration just mentioned already contained the characteristic qualities of his fully developed style. On Jan. 14, 1555, he was resident in Venice, where he had probably come sometime earlier. In 1555 he received from his countryman, the prior of San Sebastiano, the commissions which have made this little church a museum of his works. He began (1555) the decoration of the ceiling of the sacristy with the "Coronation of the Virgin," and in the pendentives the "Four Evangelists"; in 1556 he finished the three panels of the ceiling of the nave with subjects from the "Life of Esther"; and in 1558 the altarpiece, a "Madonna in Glory, with Four Saints," and the walls of the church with scenes from the "Life of St. Sebastian," etc. In 1560 he completed the paintings on the doors of the organ, the "Pool of Bethesda," the "Purification of Mary," and a "Nativity"; he also modeled the ornament of the organ. For several years following he was engaged in other work, and not until 1565 did he complete the splendid paintings of the choir walls, "The Martyrdom of St. Sebastian" and "Sts. Mark and Macellinus Going to their Execution." Besides these decorations, he painted some fine altarpieces in the church. In competition with the great Venetian masters he greatly improved his work, both as to color, which became richer and more harmonious, and as to form, which became nobler.

In 1556 Veronese visited his native city, where he portrayed Pace Guarienti in full armor (Pinacoteca, Verona), and painted the "Deposition from the Cross" in Santa Maria della Vittoria. A visit to Rome in the retinue of Cardinal Grimani was without influence on his art. A second visit to Verona in 1566 was the occasion of his marriage to the daughter of his former master, Badile. In 1560 he decorated the villa at Tiene, near Vicenza, a masterpiece by Palladio (q.v.), with a series of historical frescoes, which are among the most remarkable of his works. Among the best subjects represented are

PAUL VERONESE

"THE MARRIAGE AT CANA," FROM THE PAINTING IN THE DRESDEN MUSEUM

"Cleopatra's Banquet" and "Sophronisba Meeting Masinissa."

Veronese's frescoes in San Sebastiano met with the hearty approval of Titian, who in 1556 assigned to him an important part of the decoration of the Library (now the Royal Palace), which Sansovino had just completed. His subjects, the allegories of "Music," "Mathematics," and "Fame," treated in the form of episodes, were pronounced the best in the Library by the jury of his rivals, who awarded him a golden chain of honor. To this period (1561–62) are usually assigned the ceiling decorations, which he painted in association with Ponchino and Zelotti, but Von Hadeln, with strong reasons, places them as early as 1553–54. Of those surviving "Jupiter Destroying the Giants" is in the Louvre, and "Juno Showering Treasures upon Venice" at Brussels; only an "Old Man with a Young Woman" remain in situ. His principal decoration in the neighboring Sala della Bussola, "St. Mark and the Cardinal Virtues," is also in the Louvre; but his grand painting of the "Homage of Frederick I" in the Hall of the Great Council was destroyed in the fire of 1577.

About the same time Veronese began his celebrated series of banquet scenes for the refectories of Venetian monasteries, in which the scriptural subject is a mere pretext for the rendition of a luxurious Venetian feast, in all the splendor of contemporary costume. The "Marriage at Cana" (1562–63), intended for the refectory of San Giorgio Maggiore, but now in the Louvre, is a colossal picture containing 130 figures, painted almost entirely by his own hand. In it he represented the chief notables of Europe and Venice as the participants. The bridal couple are Francis I of France and Eleanor of Austria; and as a group of musicians in the foreground he portrayed the principal painters of Venice, Titian, Tintoretto, and himself among them; while on a balustrade in the background curious Venetians watch the spectacle. Another celebrated "Marriage at Cana" is at Dresden (see illustration); a third is at Madrid. The "Feast at the House of Simon" (or Levi) is in the Venice Academy, Paris, Turin, and Milan; the "Supper at Emmaus" at Paris and Dresden; and a "Feast of St. Gregory" (1572), at Vicenza. The first named of these paintings caused Veronese to be cited before the tribunal of the Inquisition; the third, a very fine example, contains portraits of the artist and his family.

Among his patrons and friends were the brothers Barbari—Daniele, Patriarch of Aquileja, and Marcantonio, procurator of San Marco. His portrait of the former is in the Pitti Palace; and for both he decorated the beautiful Villa Barbaro (now Giacomelli) at Maser. The frescoes, usually assigned to 1566, but which Hadeln, for stylistic reasons, assigns to 1560, cover three chambers, a gallery, and a salon, and rank with the best and most characteristic productions of the Renaissance. The subjects represented are mostly mythological and symbolical in character —the "Gods of Olympus" as the Planets, the "Muses" and "Virtues"; which, with the portraits of his hosts, himself and his beloved, and even religious subjects, form a strange medley. The architectural and landscape backgrounds are very remarkable.

Veronese was occupied with many decorative tasks which time has not spared; a better fate befell those at Magnadola, near Treviso, which are similar in subject to the Tiene frescoes, but in a free style. The grandest works of his last period are those executed in the Ducal Palace. His only fresco there, "Venice Enthroned," on the ceiling of the Anticollegio, has lost its color, but the "Rape of Europa" is undimmed in beauty, and one of his finest paintings. In the Sala del Collegio he painted (1575–77) a "Thanksgiving for Lepanto," in which the Doge kneels before Christ in Glory, to whom he is recommended by Sts. Mark and Justina. The figure of "Faith" is one of the most beautiful in Venetian painting. On the ceiling of this hall, the finest in the Ducal Palace, Venice, attended by "Justice" and "Peace," sits enthroned; the remaining panels contain various allegorical figures. After the great fire of 1577 he depicted in the Hall of the Great Council three battle pieces, including the "Defense of Scutari" and the "Capture of Smyrna." His most ambitious effort, painted before 1585, is the splendid "Apotheosis of Venice," surrounded by the gods and her heroes, and crowned by the goddess of fame. The pillars supporting her power are upheld by stalwart sailors; and her rule is acclaimed by noble lords and ladies on a balcony, and by the people and soldiers below.

Veronese's work in the Ducal Palace was interrupted by his death, April 19, 1588. The monks of St. Sebastian gave him a resting place in their church, which his work had rendered famous. His two sons and his brother, Benedetto (1538–98), continued his commissions under the signature "Herodes Paoli." The most gifted of his sons, Carlo (1570–96), died young. They were the most important assistants in his large atelier. In the paintings thus produced design and color scheme were Paolo's own, but the execution was carried out largely by assistants. He was essentially a decorative painter, and even in his easel paintings the decorative character predominates. Of these he executed an almost incredible number, considering the number of his frescoes. The subjects are mostly religious, but in all of them the "painter of pageants" is evident. Of his numerous Madonnas, one of the most remarkable is the "Madonna of the Cuccina Family," Dresden, a curious, oblong picture, representing the Virgin and saints adored by a family of a dozen members; a beautiful "Holy Family" in the Louvre; and the "Madonna Enthroned with Five Saints" in the Venetian Academy. Among his most celebrated religious subjects are "Jesus and the Captain of Capernaum" (Dresden), the "Burning of Sodom," and "Esther before Ahasuerus" (Louvre); an "Annunciation"; "Martyrdom of St. Justin"; and the "Raising of Lazarus" (Florence, Uffizi); "Christ Bearing the Cross" (Dresden and Louvre); "Susanna in the Bath" (Dresden and Madrid); "Adoration of the Kings" (Dresden, Vienna, Munich, Venice, and Milan); and a fine series of "Prophets" and "Evangelists" in the Venetian Academy. The National Gallery (London) possesses two very fine examples, the "Vision of St. Helena" and "Alexander and the Family of Darius" (1563), in which the varied feelings of the monarch's captive daughters are marvelously expressed. Celebrated among his mythological pictures are "Venus and Adonis" (Madrid); "Minerva and Mars" (Berlin); "Mars and Venus" (St. Petersburg); "Mars and Venus United by Love" (Metropolitan Museum, New York); two allegories, "Wisdom and Strength" and "Virtue Changes to Vice," in the Frick collection, New

York—the last three probably painted for Emperor Rudolf II. His few portraits, which are decorative and subjectively rendered, include the "Young Mother and Child," in the Louvre, "Unknown Women" at Florence and Munich, and "The Man in Green," in the Colonna Palace, Rome.

Veronese was the true heir of Giorgione and Titian in Venetian art. Although gifted with narrative talent of a high order, he never appealed to the intellect, but to the eye and the imagination. From Verona he brought a sound naturalism, the silvery tone and mild harmony of color. He was a decorative painter of the highest rank. The example of Titian enriched his color and ennobled his forms, but without depriving them of their individual quality. His color is transparent and brilliant in its lightness; he is one of the best all-round draftsmen of the Venetian school, a consummate master of composition, and in the sureness of his brushwork he stands almost the peer of Velazquez. In the eighteenth century he inspired Tiepolo, and he has been a very important influence in the modern decorative revival in Europe and America.

In subject Veronese was characteristically Venetian. He painted the Venetian aristocracy —the men preferably in the case of middle life, the women blond, fair-haired, and in richest costume. Especially did he delight in their fêtes, then the most pompous and luxurious in the world, and it is as the great "painter of pageants" that he is chiefly known.

Bibliography. Monographs on Veronese have been written by Pietro Caliari (Rome, 1888); Charles Yriarte (Paris, 1888); F. H. Meismer (Bielefeld, 1897); and Mrs. Arthur Bell (London, 1908). But the most critical account thus far is the article "Paolo Caliari," by Detlef von Hadeln in Thieme-Becker, *Künstler-Lexicon*, vol. v (Leipzig, 1911).

VERONICA, SAINT. The name Veronica was applied, demonstrably in the thirteenth century (from a mediæval corruption of the Latin *vera icon*, true image), to a supposed authentic likeness of the features of Christ, said to have been miraculously impressed upon a linen cloth which one of the women of Jerusalem (see Luke xxiii. 27) offered him to wipe his face as he was carrying his cross towards Calvary; later the name was applied to the woman herself. The miraculous picture is reported to have been preserved in Rome since the year 700, and its possession has been claimed also by Milan and Jaén. The face has been frequently reproduced, especially by the Spanish painter Morales. Consult E. von Dobschütz, *Christusbilder* (Leipzig, 1899); H. Thurston, *The Stations of the Cross* (London, 1906).

VERONICA. See LEPTANDRA; SPEEDWELL.

VERPLANCK, vĕr-plănk', GULIAN CROMMELIN (1786–1870). An American scholar and essayist, born in New York City. He graduated at Columbia in 1801, practiced law in New York, spent several years in European travel, was active in State politics, and from 1821 to 1825 was professor of the evidences of revealed religion in the General Theological Seminary, New York. Subsequently he was a member of Congress (1825–33), State Senator (1838–41), and vice chancellor of the State University (1855–70). He was also president of the Board of Emigration (1846–61). His chief books are: *Essays on the . . . Evidences of Revealed Religion* (1824); *Essay on the Doctrine of Contracts* (1825); *Discourses and Addresses on American History, Arts, and Literature* (1833); and an edition of *Shakespeare's Plays* (3 vols., 1844–46). With Bryant and R. C. Sands, he edited the *Talisman* (1827–30), an annual. As a critic and a Shakespearean scholar he exercised in his day in America a useful function.

VERRALL, vĕr'al, ARTHUR WOOLGAR (1851–1912). An English classical scholar, born at Brighton. He received his education at Wellington College, and at Trinity College, Cambridge, where he became fellow in 1874. In 1911 he was appointed to the chair of English literature at Cambridge. He was the author of *Euripides the Rationalist* (1895). He also edited Euripides' *Medea* (1881), Æschylus' *Seven against Thebes* (1887), *Agamemnon* (1889), *Choephori* (1893); and wrote *Essays on Four Plays of Euripides* (1905). His papers were collected, after his death, in two volumes, *Collected Studies in Greek and Latin Scholarship* (1913), and *Collected Literary Essays, Classical and Modern* (1913). The latter contains a memoir, by M. A. Bayfield.

VERRAZANO, vĕr'rät-tsä'nō, GIOVANNI DA (?1480–?1527). A Florentine navigator. Little is known with certainty of his career. The year of his birth is doubtful. He journeyed widely in the East, and in 1521 is reputed to have been sailing as a French corsair under the name of Juan Florentin or Florin, preying upon Spanish commerce. His first voyage of discovery, under commission from Francis I, was apparently in 1523, though it is much confused with the doings of Juan Florin in that year against the Spaniards. His notable voyage to America was made in 1524 and he seems to have touched the coast of North Carolina near Cape Fear. He apparently coasted south and then north, probably as far as Cape Breton. The chief evidence of this interesting voyage is a letter of Verrazano to Francis I, the authenticity of which is questioned. After his return he fought in the battle of Pavia, Feb. 24, 1525, and was temporarily a prisoner of the Spaniards. If Verrazano was Juan Florin he was captured again at sea in 1527 and hanged, but some later documents indicate that he was at a later time in the year in Paris, preparing another expedition for America. Consult: H. C. Murphy, *The Voyage of Verrazano* (Albany, 1875), the most complete presentation of the argument against the authenticity of the account of the voyage; also, on the other side, B. F. De Costa, *Verrazano the Explorer* (New York, 1880), with a full bibliography; Justin Winsor, *Narrative and Critical History of America*, vol. iv (Boston, 1886), for a critical discussion of authorities.

VERREIUS FLACCUS, MARCUS. See FLACCUS, M. V.

VERRES, vĕr'rēz, GAIUS. A Roman politician. He was elected prætor in 74 B.C., and by lot became prætor urbanus. At the expiration of his term of office he went as Governor (proprætor) to Sicily, the richest province of the Republic (74–71). Here he was guilty of oppression and extortion, and was accused by the Sicilians. Cicero agreed to manage the prosecution, and Hortensius (q.v.) the defense. The defense put forth a sham prosecutor, Quintus Cæcilius Niger (there was no official prosecuting attorney in ancient Rome), and it became necessary to hold a trial to determine whether Cicero or Cæcilius should prosecute the case. By his *Divinatio in Cæcilium*, still extant, Cicero won

the right to act as prosecutor. Cicero then gathered his evidence, and prepared five orations against Verres, but when the first had been delivered, so clear was the guilt of Verres that, without awaiting his sentence, he fled to Massilia (Marseilles), remaining in exile 27 years. He was proscribed by Antonius in 27. Consult the article "C. Verres," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

VERRILL, vĕr'îl, ADDISON EMORY (1839–). An American zoölogist, born at Greenwood, Me. He graduated at Harvard College in 1862, and held a chair of zoölogy at Yale from 1864 till his retirement in 1907. In 1868–70 he was professor of comparative anatomy and entomology in the University of Wisconsin. From 1860 Verrill investigated the invertebrate fauna of the Atlantic coast, with especial reference to the corals, annelids, echinoderms, and mollusks, and became the chief authority on the living cephalopods, especially the colossal squids of the North Atlantic. His *Report upon the Invertebrate Animals of Vineyard Sound* (1874), with S. I. Smith, is a standard manual of the marine zoölogy of southern New England. His collections were deposited in the Peabody Museum of Yale University. In later life he explored with his students the geology and marine animals of the Bermuda Islands. Besides many memoirs and articles on the subjects mentioned above, he published a work on *The Bermuda Islands* (1903; 2d ed., 1907).

VERROCCHIO, vĕr-rō'kē-ō, ANDREA DEL, properly ANDREA DI MICHELE CIONE (1435–88). A celebrated Florentine sculptor, painter, and goldsmith, one of the foremost of the early Renaissance. He was born in Florence, the son of Michele di Cione, a tiler, who died in 1452. That year Andrea accidentally killed a companion while throwing stones, but was acquitted of homicide. He was apprenticed to the goldsmith Giuliano Verrocchio, after whom he was called, but his master in sculpture was Donatello, whose pupil he probably was. The only surviving example of his goldsmith work, a relief of the "Beheading of John the Baptist," is part of the silver altar of San Giovanni in the Cathedral Museum at Florence, and shows a thorough mastery of this art. He studied painting with Alessio Baldovinetti, and was besides a bronze founder, an architect, and a mechanical engineer. In rivalry with the Pollaiuoli he conducted a large and important bottega, which became the principal training school in Florence for the young artists of the branches he practiced. Notwithstanding his many commissions he was often in financial difficulties, owing to his support of many impecunious relatives. One of his earliest works was the completion of Donatello's charming marble fountain in the sacristy of San Lorenzo.

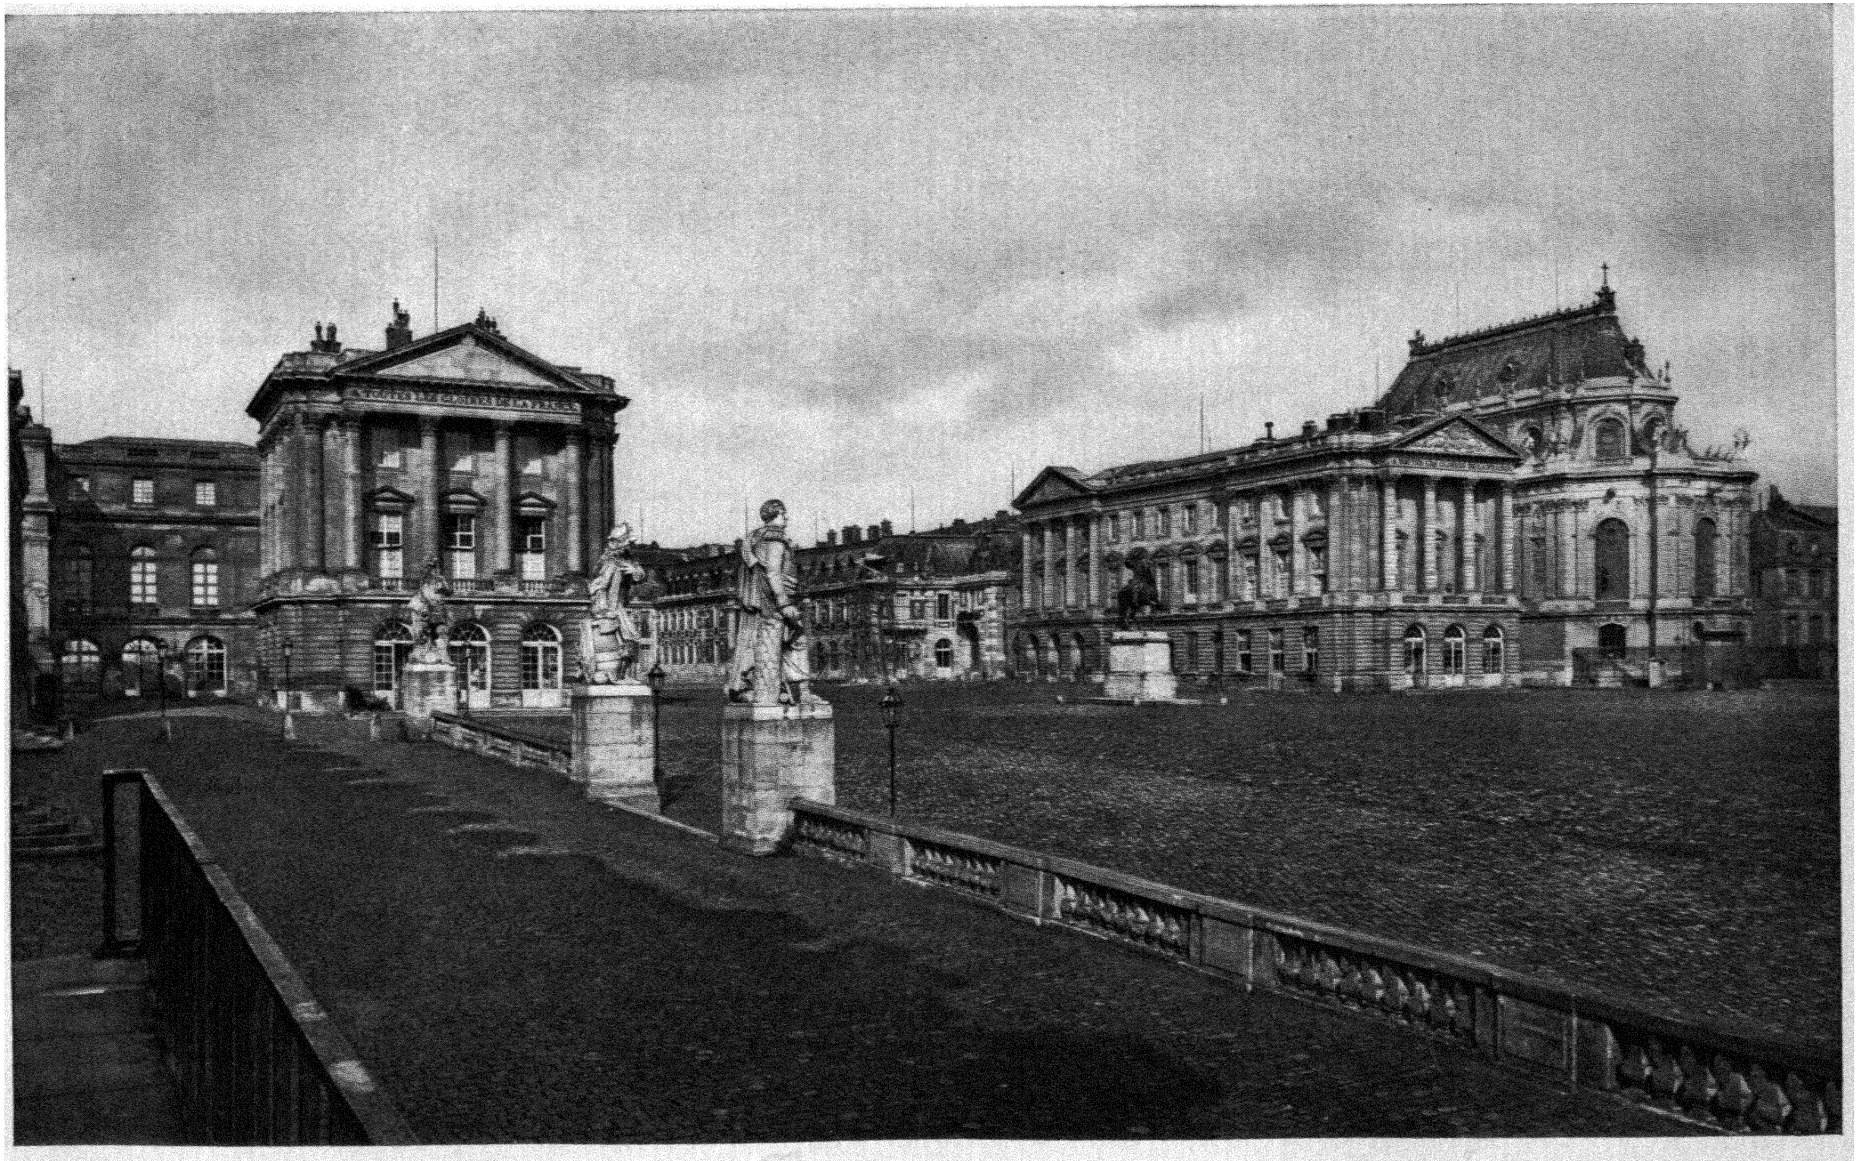
The most important of Verrocchio's commissions in Florence were for the Medici. In San Lorenzo he designed the simple sepulchral slab of Cosimo de' Medici (died 1464), restored in the sixteenth century, and the beautiful tomb of Giovanni and Piero, a decorative masterpiece of most original conception, finished in 1472. For Lorenzo the Magnificent he also executed a bronze statue of the "Youthful David" (1476, Museo Nazionale), an admirable rendering of the transition from youth to manhood, as naturalistic as it is graceful in position and form. His "Boy with a Fish," a charming fountain piece, still adorns the court of the Palazzo Vecchio. The marble group of the "Incredulity of Thomas," in Or San Michele, Florence, survives as one of the finest of the Renaissance, both in technical execution and in the beauty and majesty of the figures. His last work, the equestrian Bartolommeo Colleoni at Venice, is his most important. Admirable alike in the martial bearing of the rider and the anatomy and stride of the horse, it is probably the finest of equestrian statues. Upon his death in 1488, he had completed the model of horse and rider, which were cast somewhat later by Alessandro Leopardi, who also designed the pedestal. He executed also a number of works in terra cotta and marble. Among the latter are reliefs of the Madonna in the Museo Nazionale, Florence, the Shaw collection, Boston; the tomb of Francesca Tornabuone, of which parts survive in the Museo Nazionale, Florence; and the André collection, Paris; and the tomb of Cardinal Forteguerri in the Cathedral of Pistoia. His finest relief of the Madonna is the terra cotta of the Museo Nazionale. For his portrait busts, especially of young women, he is justly celebrated. The best of these are the "Unknown Florentine," called Ginevra dei Benci, in the Museo Nazionale, Florence, Verrocchio's masterpiece in marble sculpture; and the terra-cotta bust in the Foulc collection, Paris. Dr. Bode attributes also to him the terra-cotta bust of an unknown young man in the Museo Nazionale and those of Piero (Dreyfuss collection, Paris) and Lorenzo de' Medici (Shaw collection, Boston). He modeled also many attractive statuettes, of which there are terra cottas in the South Kensington and Berlin Museums, and bronzes in the Morgan collection (Metropolitan Museum, New York).

Verrocchio is the most important among the pupils and followers of Donatello, whom he, more than any other, approached in individuality and strength, even surpassing him in movement. The influence of his training as a goldsmith is evident in the thorough and conscientious finish of his work.

As a painter he is known chiefly as a teacher of great pupils, Leonardo, Lorenzo da Credi, Botticini, and Perugino, rather than as an independent artist. Most of the pictures attributed to him were executed after his designs by his pupils; but a few reflect his personal style. It was distinguished by exquisite workmanship, firm drawing and modeling, and enamel-like color. The landscapes in particular show him as a pioneer of atmospheric perspective, which forms his chief contribution to Florentine painting. Among his principal paintings are the "Baptism" (Florentine Academy), the well-known "Annunciation" of the Uffizi, after his design, and partly by him in execution; the "Unknown Young Woman" in the Liechtenstein Gallery, Vienna; a "Madonna and Child" in the Altman collection (Metropolitan Museum, New York); and a "Madonna and Two Angels," after his design (National Gallery, London). Of the numerous drawings attributed to him, the "Angel's Head" in the Uffizi, and the "Female Head" in the British Museum are the most celebrated.

Bibliography. The chief monographs on Verrocchio are by H. Mackowsky (Bielefeld, 1901) and Maud Crutwell (New York, 1906). For complete illustrations of his sculptures see Wilhelm Bode, *Denkmäler der Renaissance Skulptur Toscanas* (Munich, 1892–1905).

VERRUCA. See WARTS.



VERSAILLES, vĕr'sā'y'. The capital of the Department of Seine-et-Oise, France, situated about 12 miles by rail and by tram southwest of Paris (Map: France, N., H 4). The flat town, with its quiet avenues, has little of interest or charm save what is offered by the famous palace and park of Louis XIV, whose magnificence under the Bourbons made this unequaled in fame among all the royal residences of the world. In the town are a library of over 112,000 volumes, a hippodrome, and a shooting school. Pop., 1901, 54,982; 1911, 60,458.

The palace, chiefly dating from 1661, and restored and converted into an historical museum under Louis Philippe, is on the western side of the town, with the park beyond. Three spacious avenues—de Saint-Cloud, de Paris (the middle one), and de Sceaux—converge in the great Place d'Armes, which separates the palace from the town and through which the former is entered. South of this place is the room of the Jeu de Paume, where the famous Third Estate met in June, 1789. The room contains a Musée de la Révolution. The palace consists of a central block, surrounding three sides of the Cour d'Honneur and Cour Royale, which is open to the east, and of two immense wings, stretching north and south from the Cour Royale, and each inclosing two or more courts. The length of the palace is over a quarter of a mile, or, including its dependencies, nearly half a mile. The palace is entered from the Cour d'Honneur, between which and the Place des Armes intervenes the Cour Royale, containing an equestrian statue of Louis XIV and two columns of victory. The parts adjacent to the Cour d'Honneur or Cour de Marbre are the oldest extant portions. They belong to the hunting château erected in 1627 for Louis XIII by an architect LeRoy (as has recently been proved), to replace an earlier structure of 1624. This was later enlarged (1631) by Levan, and later again by J. H. Mausart, who was employed by Louis XIV to create the present vast palace. He built the garden façade of the central block and added the great north and south wings, including the magnificent chapel, his masterpiece, the ceiling of which was painted by Coypel. The theatre at the north end of the palace was remodeled by Gabriel for Louis XV. It was later used by the National Assembly after the Franco-Prussian War (1871), and then by the Senate until 1878. The central block contains the famous Galerie des Glaces, with paintings by Le Brun. William I was proclaimed Emperor of Germany in this hall in 1871. Adjoining it on the north side are the Grand Apartments of Louis XIV, with the splendid bedchamber in which he signed the revocation of the Edict of Nantes in 1685. In the Salle de l'Œil-de-Bœuf—so termed from its oval "bull's eye" window—the gentlemen of the court of Louis XV awaited the royal "lever." In the south range of this block are the Queen's apartments, with the smaller suite occupied by Marie Antoinette. The long north and south wings contain imposing corridors filled with statuary, the chapel and theatre, the gorgeous Galerie des Batailles 130 yards long, the Galerie de l'Empire, the Salles des Croisades with modern paintings of the Crusades, and innumerable rooms, corridors, and staircases. Some of these rooms are of great magnificence, adorned with paintings by great artists of the seventeenth century and of later times, and the whole palace is a vast museum of French history and art. Parts of it are worthy of high praise, but the planning is defective and the architecture generally—except the Chapel—monotonous and pretentious rather than noble and effective.

The park with its decorative ponds and vast fountains was first laid out by the celebrated Le Nôtre. It is imposing, but thoroughly stiff and artificial, and has served as a famous type of Renaissance garden. Terraces, large ornamental basins, huge vases overflowing with flowers, marble groups and busts, statues—especially reflecting the appropriate art of Coyzevox—quincunxes, bosquets, and geometrically trimmed trees, here mock nature and the natural. An immense pond stretches away in the shape of a cross in front of the palace. The playing of the grand fountains, enlivened by colored lights, is one of the great sights in and about Paris. The water is supplied by the famous machine of Marly. The largest fountain, the Bassin de Neptune, is a wonderful piece of hydraulic mechanism. Two immense flights of marble steps descend on the opposite side of the palace to the famous orangery, beyond which extends a vast pond, which was dug by the Swiss guard of Louis XIV. The gardens proper have a salle de Bal or des Rocailles, and contain the Bosquet de la Reine, where the notorious transaction of the diamond necklace took place. In the northern section of the park are the charming Grand and Petit Trianon. (See TRIANON.) Near by are the carriage houses, with many vehicles of state, including some of the magnificent equipages used by Napoleon.

History. When Louis XIV chose Versailles as the site of his new palace and park, it had little to commend it, being a low, swampy area, and distant from an adequate water supply. Louis XIII began the reclamation of the territory, which he bought from the Archbishop of Paris and others; but it was Louis XIV who converted the hunting-seat into a palace of imperial extent. The court came here permanently about 1682, and from this date for over 100 years Versailles figured prominently in history. Louis XV dwelt here and Mme. de Pompadour and Mme. Du Barry reigned over this vast pleasure establishment. Here, too, Louis XVI and Marie Antoinette resided. In the palace was signed the Treaty of 1783 between England, France, and Spain, on the same day (September 3) on which the definite treaty of peace in which England recognized the independence of the United States was signed in Paris. On October 6 the palace was ravaged in the presence of Louis by the market women and fish wives, with the result that the King and Queen were forced to go to Paris. The meeting of the States-General, the opening act of the French Revolution, took place here on May 4, 1789. Since then it has never been a residence. During the siege of Paris in 1870–71 King William I made his headquarters here. When the Germans departed, the French government established itself at Versailles, whence it carried on war against the Paris Commune. It remained here until 1879, when Paris was once more made the political capital. See the articles on COMMUNE; FRANCE; FRENCH REVOLUTION; WILLIAM I.

VERSCHAFFELT, vĕr-skäf'fĕlt, PIETER ANTONIS (known also as PIETRO FIAMMINGO) (1710–93). A Flemish sculptor and architect. He was born in Ghent, and studied there under de Sutter and in Paris under Bouchardon. In 1737 he went to Rome, where he modeled the bust (Capitol, Rome) and the marble statue (Monte Cassino) of Pope Benedict XIV, and the bronze figure of the archangel Michael (1740) surmounting the castle of Sant' Angelo. In 1752 he was appointed court sculptor and architect and director of the academy at Mannheim. There he was architect of the arsenal and the Bretzenheim Palace, and modeled decorations, reliefs, and statues for the library, the palace of Swetzingen, and the façade and high altar of the court church. His chief work in Belgium is the tomb of Bishop van der Noot in Ghent Cathedral. Verschaffelt possessed a good sense of the beautiful and of decoration, and much inventive talent. Consult the monograph by Beringer (Strassburg, 1902).

VERSECZ, vĕr'shĕts, or **WERSCHETZ**. A town in the County of Temes, Hungary, at the foot of the Versecz Mountain, 45 miles south of Temesvár (Map: Hungary, G 4). Steam saw mills, breweries, and machine shops are the chief industrial establishments. The town is famous for its brandy and red wine. Pop., 1900, 25,199; 1910, 28,759.

VERSIEGELT (Ger., Sealed). An opera by Blech (q.v.), first produced in Hamburg, Nov. 4, 1908; in the United States, Jan. 20, 1912 (New York).

VER'SIFICA'TION (Lat. *versificatio*, from *versificare*, to versify, from *versus*, turning, furrow, row, line, verse, from *vertere*, to turn). A term used to designate both the art of making verses and the principles on which that art is based. In the latter sense it includes rhythm and metre. By rhythm (q.v.) is meant the measured movement of language which is caused by the regular recurrence of metrical units known as feet. These units may be formed by a combination either of long and short syllables, i.e., be based on quantity, or of stressed and unstressed syllables, i.e., be based on accent. Metre deals with the measurement of poetry by means of the rhythmical feet. See METRE; METRICAL FOOT.

GREEK AND LATIN

According to the theory prevalent in England and America since the publication, in 1868, of the well-known works of Schmidt (see the bibliography below), the unit of measure for the foot is the short syllable, ∪, technically called mora, having the musical value of an eighth note, 𝅘𝅥𝅯; a long syllable is (approximately) equivalent to two moræ, _, 𝅗𝅥. In certain measures a long syllable may be protracted to the length of three or four moræ, ⌴, 𝅗𝅥.; ⌴, 𝅗𝅥 ; or a syllable may be shortened so as to occupy less than its normal time. These phenomena, however, are confined for the most part to logaœdic verse (q.v.). Each foot has an accented and an unaccented part. The portion on which the metrical accent, ictus, falls is called the thesis; the unaccented part is called the arsis. See BEAT.

The principal feet are the following:

Feet of three morœ (𝅗𝅥. *time*)

Trochee ´ ∪ εἶπε, prĭmus 𝅗𝅥 𝅘𝅥𝅯

Iambus ∪ ´ λέγω, amō 𝅘𝅥𝅯 𝅗𝅥

Tribrach ∪ ∪ ∪ λέγετε, hominis 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅘𝅥𝅯

Feet of four morœ (𝅗𝅥 *time*)

Dactyl _ ∪ ∪ εἴπομεν, dūcimus 𝅗𝅥 𝅘𝅥𝅯 𝅘𝅥𝅯

Anapæst ∪ ∪ ´ σέβομαι, facerent 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅗𝅥

Spondee ´ _ εἶπω, dūcō 𝅗𝅥 𝅗𝅥

Proceleusmatic ∪ ∪ ∪ ∪ λεγόμεθα, mulieris 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅘𝅥𝅯

Feet of five morœ (𝅝 *time*)

Cretic _ ∪ _ εἰπέτω, dūcerent 𝅗𝅥 𝅘𝅥𝅯 𝅗𝅥

First Pæon _ ∪ ∪ ∪ λειπόμεθα, duxerimus 𝅗𝅥 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅘𝅥𝅯

Fourth Pæon ∪ ∪ ∪ _ λεγομένη, celeritās 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅗𝅥

Bacchius ∪ _ _ λεγοίμην, amābant 𝅘𝅥𝅯 𝅗𝅥 𝅗𝅥

Antibacchius _ _ ∪ φαίνητε, dūcēbat 𝅗𝅥 𝅗𝅥 𝅘𝅥𝅯

Feet of six morœ (𝅜 *or* 𝅗𝅥. *time*)

Choriambus _ ∪ ∪ _ ἐρχομένη, difficilēs 𝅗𝅥 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅗𝅥

Ionic *a maiore* _ _ ∪ ∪ ἐκλείπομεν, dēdūcerem 𝅗𝅥 𝅗𝅥 𝅘𝅥𝅯 𝅘𝅥𝅯

Ionic *a minore* ∪ ∪ _ _ ἐλελοίπη, relegēbant 𝅘𝅥𝅯 𝅘𝅥𝅯 𝅗𝅥 𝅗𝅥

These feet are variously combined into the larger units of dipody (two feet), metrical sentence or colon, and verse, which are bound together by the fact that the chief ictus falls on one foot in each unit; the colon and the verse may be identical, as in some lyric measures, or the verse may contain two or more cola. Verses are named trochaic, iambic, dactylic, etc., according to the nature of the fundamental foot. The last syllable of most verses may be either long or short indifferently, without regard to the theoretical requirements of the metrical scheme; hence it is called syllaba anceps. If the last foot lacks a syllable, the verse is called catalectic; but if the verse is complete, it is called acatalectic. The missing syllable in a catalectic verse is indicated by a rest mark, ∧. Whenever a word ends within a foot, the resulting break is known as cæsura and is marked thus, ||; if the end of a word coincides with the end of a foot, the break is named diæresis and is noted thus, ‡.

Trochaic Rhythms. Trochaic verses are usually measured by dipodies (´ ∪ ‡ ∪). In the place of the second trochee, rarely of the first, a spondee pronounced in the time of a trochee (hence called an irrational spondee, _ >) may be admitted. The apparent (irrational) anapæst (∪ ∪ >) and the cyclic (irrational) dactyl (– ∪ ∪) are sometimes used; and the tribrach (∪ ∪ ∪) is freely substituted in any foot but the last. The most frequent trochaic line is the tetrameter catalectic, measuring seven feet and one syllable, divided into two cola by

a diæresis after the second dipody. The movement is rapid and well suited to express excitement. It was employed by Archilochus (q.v.) and Solon (q.v.); it was the favorite measure of Epicharmus, and is frequently employed in the old Attic comedy. In early tragedy it was also used, but in the later only after about 415 B.C. Example:

— ∪ ⏑ ∪ | — ∪ ⏑ > — ∪ ⏑ > | — ∪ ∪ ^
ὦ σοφώτα | τοι θεαταὶ ‡ δεῦρο τὸν νοῦν | πρόσχετε

Aristophanes, *Nubes*, 575.

The same form of verse, under the name trochaicus septenarius, was common in Latin comedy and was employed also by Varro, Seneca, and many later Latin poets. In the early period, however, the Romans admitted substitutions in any foot but the last; in later Latin verse the Greek models were adhered to more strictly.

Hipponax (q.v.) introduced a modification of the trochaic tetrameter catalectic in which the last syllable but one is always long; the substitutions allowed are few. This form is called Hipponactean or Scazon, the lame tetrameter, from its peculiar movement. This may be illustrated by the following:

— ∪ ⏑ ∪ | — ∪ ⏑ ∪ | — ∪ — ∪ | — > ⏑ ^
ἀμφιδέξι | ος γάρ εἰμι ‖ κοὐχ ἁμαρτά | νω κόπτων

Hippon. frg. 83.

— ∪ ⏑ ∪ | — ∪ ⏑ > | — ∪ ⏑
nec coruscus | imber alto ‖ nubilo

∪ | — > ⏑ ^
ca | dens multus

Varro, *Sat.* frg. 557.

The rare trochaic tetrameter acatalectic (trochaicus octonarius) is mostly confined in both Greek and Latin to lyric systems. Great freedom of substitution is allowed, especially in Latin comedy.

— ∪ ⏑ ∪ | — ∪ ⏑ ∪ — ∪ ⏑ ∪ | — ∪ — ∪ | — ∪ — >
κλῦθι μευ γέ | ροντος, εὐέ ‡ θειρα χρυσό | πεπλε κούρα

Anacreon, frg. 76.

— ∪ > — ∪ > | — ∪ ⏑ > |
adeon homin(em) es | s(e) invenust(um) aut ‡

— ∪ ⏑ > | — ∪ ⏑ ∪ |
infelicem | quemqu(am) ut ego sum

Terence, *Andria*, 245.

Of the other trochaic rhythms too great variety, ranging from the dipody to the hexapody, is employed in lyric passages to admit of illustration here.

Iambic Rhythms. Iambic, like trochaic rhythms, are usually measured by dipodies (∪ — ∪ —). The tribrach is here allowed in any foot but the last, and the irrational spondee (> —), the irrational dactyl (> ⏑ ∪), or the cyclic anapæst (∪ ∪ —) may be substituted in the first foot of any dipody. The most common iambic verse is the trimeter acatalectic, in which the dialogue of the drama, tragic and comic, is composed. In Greek tragedy resolutions are not frequent and substitutions are usually confined to the first foot of the dipody, e.g.:

> — ∪ ⏑ | > — ∪ ⏑ | ∪ — ∪ ⏑
ὦ τέκνα Κάδ | μου ‖ τοῦ πάλαι | νέα τροφή

∪ — ∪ ⏑ | > — ∪ ⏑ | ∪ — ∪ ∪
τίνας ποθ' ἕ | δρας ‖ τάσδε μοι | θοάξετε

Sophocles, *Œdipus Tyrannus*, 1–2.

In comedy, however, the greatest freedom is allowed, except in the sixth foot, which is always an iambus (or, through use of the syllaba anceps, a pyrrhic, ∪∪), e.g.:

∪ ∪ — ∪ ⏑ | > — ∪ ⏑ | > — ∪ ⏑
ὅσα δὴ δέδηγ | μαι ‖ τὴν ἐμαυ | τοῦ καρδίαν,

> — ∪ ⏑ | ∪ — ∪ ⏑ | ∪ ⏑ ∪ ∪
ἤσθην δὲ βαι | ά, ‖ πάνυ δὲ βαι | ά, τέτταρα

Aristophanes, *Achar.* 1–2.

With the early Latin poets this verse, called by the Roman grammarians the senarius, was even less restrained, the proceleusmatic (∪ ∪ ⏑ ∪) being a possible substitution in any foot but the last, e.g.:

∪ ∪ — ∪ ⏑ | > — ∪ ⏑ |
ubi vent(um) ad æ | dis ‖ est Dromo |

> — ⏑ ∪ ⏑
pultat fores;

∪ ∪ — > ⏑ | ∪ — ∪ ∪ | ∪ ∪ |
anus quædam prod | it; ‖ hæc ub(i) ape- |

∪ — ∪ ∪
rit ostium

> — ∪ ⏑ > ⏑ | > — ∪ ⏑ ⏑ |
continu(o) hic se | coniecit ‖ in- |

∪ ∪ — ∪ ∪
tr(o), ego consequor.

Terence, *Heaut.* 275–277.

The later Roman writers, like Horace, conformed more closely to their Greek models, but the degree of strictness varied with each writer.

The Choliambus or limping iambus is an iambic trimeter in which a trochee has been substituted for the last iambus of the normal line. As this verse, like the corresponding trochaic measure, was introduced by Hipponax for satiric and ludicrous effects, it is also known as the Hipponactean. In the Alexandrine period it became a favorite measure for narrative and didactic poetry, especially for fables; the mimes of Herondas, discovered in 1890, are in this verse. In Latin it was used by Catullus, Martial, and others, often in poems of tenderest feeling:

∪ — ∪ — | ∪ | — ∪ ⏑ | ∪ — > ∪
miser Catul | le, ‖ desinas | ineptire

Catullus, 8, 1.

The iambic tetrameter catalectic (in Latin called the septenarius) is frequent in comedy. Resolutions and substitutions are numerous in the first six feet, and in Latin are allowed even in the seventh.

> — ∪ ⏑ | ∪ — ∪ ⏑ ∪ — ∪ ⏑ |
καὶ μὴν πάλαι | γ' ἐπνιγόμην ‖ τὰ σπλάγχνα κά |

∪ — — ^
πεθύμουν

Aristophanes, *Nubes*, 1036.

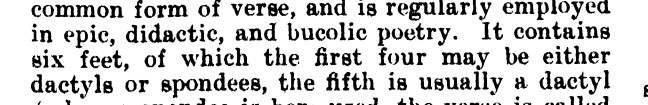
> — > ∪ ∪ | > — ∪ ⏑ > |
verb(um) unum cave | de nuptiis, ‖ n(e) ad

— > ∪ ∪ | > ∪ ∪ > ^
morb(um) hoc eti | am teneo

Terence, *Andria*, 300.

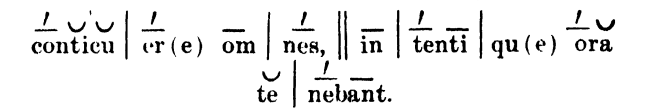
The iambic tetrameter acatalectic (Latin octonarius) is much less frequently used, but is found in the Greek lyric poets and in the cantica of Latin comedy.

> — ∪ ⏑ | > — ∪ — > — ∪ ⏑ | ∪ — ∪ ⏑ |
Κάστωρ τε πώ | λων ὠκέων ‖ δματῆρες, ἵπ | πόται σοφοί



Alcman, frg. 2.

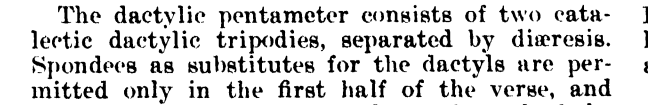
∪ ∪ — > ⏑ | ∪ — ∪ ⏑ | > ⏑ ∪ > |
enim vero, Da | ve, nil locist | segnitiæ



∪ ∪ | > — ∪ ⏑ |
neque | socordiæ

Terence, *Andria*, 206.

Dactylic Rhythms. In all dactylic rhythms the regular substitute for the dactyl (— ∪ ∪) is the spondee (— —). In Greek and Latin alike the dactylic or heroic hexameter is the most common form of verse, and is regularly employed in epic, didactic, and bucolic poetry. It contains six feet, of which the first four may be either dactyls or spondees, the fifth is usually a dactyl (when a spondee is here used, the verse is called spondaic), and the sixth is either a spondee or a trochee. The chief cæsura is usually after the thesis—occasionally in the arsis—of the third foot, less often after the thesis of the fourth. A diæresis after the fourth foot is called bucolic from its frequency in bucolic poetry.



Odyssey, 1, 1–2.

Vergil, *Æneid*, 2, 1–2.

The dactylic pentameter consists of two catalectic dactylic tripodies, separated by diæresis. Spondees as substitutes for the dactyls are permitted only in the first half of the verse, and syllaba anceps is allowed only at the end of the second tripody. This verse is never used by itself, but always follows a dactylic hexameter, the two making an elegiac distich. (See DISTICH.) This couplet is found in elegiac poetry (hence the name; see ELEGY), and was frequently employed for amatory verse and epigrams.

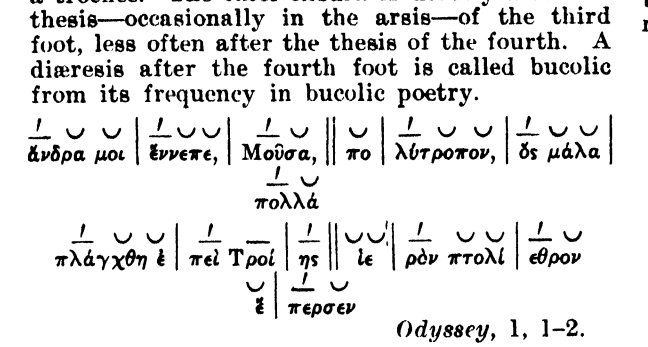
Ovid, *Amores*, 1, 15, 25–26.

The tetrameter acatalectic was used by Alcman and other Greek lyricists in dactylic strophes.

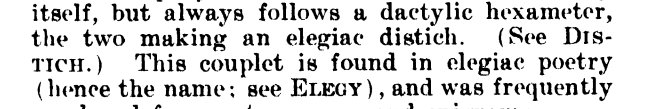
A tetrameter catalectic with an hexameter forms the Archilochian strophe, and the trimeter catalectic is known as the lesser Archilochian verse; both are employed by Horace.

Anapæstic Rhythms. Anapæstic verses are much more numerous in Greek than in Latin, as the latter language does not lend itself readily to this measure. The most common metrical equivalents for the anapæst (∪ ∪ —) are the spondee (— —), dactyl (— ∪ ∪), and rarely the proceleusmatic (∪ ∪ ∪ ∪). The verses are measured in dipodies. The common forms in Greek are: (*a*) the monometer; (*b*) the dimeter acatalectic; (*c*) the dimeter catalectic or parœmiac, e.g.:

Aristophanes, *Aves*, 221.

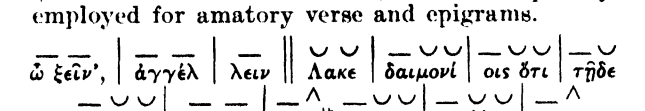


Æschylus, *Agamemnon*, 52.



Sophocles, *Ajax*, 136.

Both tragedy and comedy frequently employ a series of anapæstic dimeters, acatalectic, with an occasional monometer, closing always with a parœmiac, the whole forming an anapæstic system. Such systems are very common as march movements, e.g.:

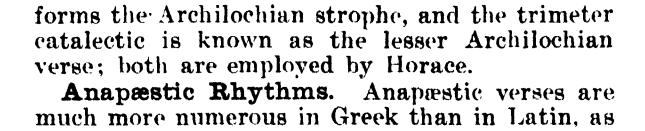


Æschylus, *Agamemnon*, 40–47.

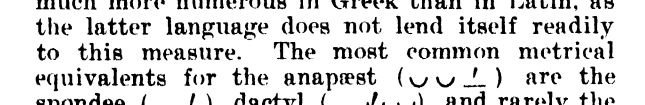
By the union of an acatalectic with a catalectic dimeter the anapæstic tetrameter catalectic is formed, which was employed by Tyrtæus and Epicharmus. In Attic comedy this is the regular measure for the entrance and departure of a chorus or an actor.

Tyrtaeus, frg. 16.

Aristophanes, *Equites*, 69.



In Latin, anapæstic measures are found in Plautus, where their measurement is often doubtful; Terence avoided them; but Varro, Seneca, Prudentius, and other late writers employed them, conforming, however, more strictly to their Greek models than Plautus did. Of the forms enumerated above, *b*, *c*, *d*, and *e* are found.



Plautus, *Trinummus*, 1115–16.

Plautus, *Pseudolus*, 916.

Plautus, *Trinummus*, 840–842.

Plautus, *Bacchides*, 640.

Further, in Latin two anapæstic dimeters acatalectic are combined to form a tetrameter acatalectic or octonarius. Diæresis regularly occurs after the second dipody, and both hiatus and syllaba anceps are allowed before the diæresis.

quid mihi meliust | quid magis in remst ‡ qu(am)a
corpore vi | tam secludam
Plautus, *Rudens*, 220.

Cretic and Bacchiac Rhythms. Rhythms of this class are all employed to express great emotion. For the cretic (⏑) may be substituted the following forms:

⏑ ⏑, ⏑ ⏑, > , ⏑ > , > ⏑ ⏑.

The bacchius (⏑) may have the forms ⏑ ⏑, ⏑ ⏑, > (for the antibacchius these are reversed). The tetrameter acatalectic is the most common measure.

τίς ἀχώ, | τίς δόμα | προσέπτα | μ' ἀφεγγής;
Æschylus, *Prometheus*, 115.

ut malis | gaudeant ‖ atqu(e) ex in | commodis
Terence, *Andria*, 627.

In the lyric portions of Greek tragedy, where great excitement is expressed, a peculiar foot, called the dochmius, is found, made up of an iambus and a cretic (⏑ , ⏑), or of a bacchius and an iambus (⏑ , ⏑). Since all possible substitutes for the constituent parts are allowed, the foot appears in a great variety of forms.

Choriambic and Ionic Rhythms. Many verses once called choriambic are now regarded as logaœdic; genuine choriambics are exceedingly rare, there being not over six cases in Latin.

δεινὰ μὲν οὖν, | δεινὰ ταράσ | σει σοφὸς οἰ | ωνοθέτας
Sophocles, *Œdipus Tyrannus*, 484.

ut neque quid | me faciam | nec quid agam ‖
certum sit
Terence, *Adelphœ*, 611.

Ionic rhythms appear chiefly in tripodies and tetrapodies.

πεπέρακεν | μὲν ὁ περσέ | πτολις ἤδη
βασίλειος | στρατὸς εἰς ἀν | τίπορον γεί | τονα χώραν
Æschylus, *Persæ*, 65–66.

molles, vete | res Delia | ci manu re | cisi
Petronius, 23.

The ionic a minore tetrameter catalectic or Galliambic verse admits of the greatest variety of resolutions and substitutions, which can be seen only by a study of Catullus, 63. See the editors of Catullus, in notes on that poem.

Dactylo-Epitritic Rhythms. About one-half the extant poems of Pindar are written in the dactylo-epitritic measure, which consists of dactyls, spondees, prolonged syllables ⏑, and epitrites. The epitrite is a dipody of the form ⏑ ⏑ , which may also be catalectic, ⏑ ⏑ .

Τυνδαρί | δαις τε φι | λοξεί | νοις ἀδεῖν καλ ‖ λιπλοκά | μῳ
θ' Ἑλέ | νᾳ
κλει | νὰν Ἀκρά | γαντα γε | ραίων | εὔχομαι
Pindar, *Ol.* 3, 1–2.

Dactylo-Trochaic Rhythms. These verses consist of two separate cola, one dactylic, the other trochaic. The following combinations are distinguished: (1) the greater Archilochian, consisting of a dactylic tetrameter acatalectic, and a trochaic tripody.

solvitur | acris hi | ems ‖ gra | ta vice ‖ veris | et
Favoni
Horace, *Carmina*, 1, 4, 1.

(2) The iambelegus, a trochaic dimeter catalectic with anacrusis followed by a dactylic tripody catalectic. No resolutions are allowed in the first colon, or substitutions in the second.

tu | vina | Torqua | to mo | ve ‖ consule |
pressa me | o
Horace, *Epodes*, 13, 6.

(3) The elegiambus, which is the same as the iambelegus with the cola reversed.

scribere | versicu | los ‖ a | more | percus | sum
gra | vi
Horace, *Epodes*, 11, 2.

Bibliography. Rossbach and Westphal, *Metrik der griechischen Dramatiker und Lyriker* (Leipzig, 1886); J. H. Schmidt, *Leitfaden in der Rhythmik der classischen Sprachen* (ib., 1896), translated by J. W. White, as *An Introduction to the Rhythmic and Metric of the Classical Languages* (Boston, 1878); id., *Die Kunstformen der griechischen Poesie* (ib., 1868–69); Christ, *Metrik der Griechen und Römer* (2d ed., ib., 1879); L. Mueller, *De Re Metrica Poetarum Latinorum* (2d ed., Leipzig, 1884); R. Klotz, *Grundzüge Altrömischer Metrik* (ib., 1890); W. W. Goodwin, *Greek Grammar* (Boston, 1893); G. M. Lane, *Latin Grammar* (2d ed., New York, 1913); Gleditsch, *Metrik der Griechen und Römer* (3d ed., Munich, 1901); the introduction to B. L. Gildersleeve's edition of *Pindar* (New York, 1885), that to M. W. Humphrey's edition of the *Antigone of Sophocles* (New York, 1891), and that to W. M. Lindsay's edition of the *Captivi of Plautus* (editio maior, London, 1900); T. D. Goodell, *Chapters on Greek Metric* (New York, 1902). (See also LOGAŒDIC VERSE.) The views set forth above rest primarily on the works of J. H. Schmidt (see above). Schmidt derived his views from a study of the extant remains of Greek and Roman poetry; he disregarded largely the statements contained in the writings of the extant ancient metricians. Early in the twentieth century there was a tendency in Germany, France, and the United States to give more heed to the statements of the ancient metricians. The New Metric, as it is called (in reality it is a return to ancient views), is too complicated to be presented here. For various presentations of it see "The New Metric," by O. Schroeder, translated by P. Shorey, in *Classical Philology*, vol. vii (Chicago, 1912); R. W. Husband, "The Old and the New in Metrics," in *The Classical Journal*, vol. ix (ib., 1914); and especially J. W. White, *The Verse of Greek Comedy* (London, 1912). Valuable reviews of

White's book are those by P. Shorey, in *Classical Philology*, vol. viii, and by M. W. Humphrey, in *Classical Weekly*, vol. ix.

ROMANCE VERSIFICATION

On the versification of the various Romance countries the influence of classic Latin, Celtic, Oriental, and German versification is very slight as compared with the influence in the Middle Ages of Provençal, and in the Renaissance of Italian, versification.

The long or short quantity of vowels plays no part in Romance versification, except in some scattered and fruitless attempts at imitations of antique verse, as in the *vers mesurés* of such poets as Baïf in the sixteenth century and a few more recent ones. There are, however, remodelings of the old measured verse which attempt to replace syllable length by word accent. Examples of this are to be found all the way from the Eulalia sequence down to the Odi barbare of Carducci in our own day.

The principle of syllable count is fundamental in all Romance verse. The rhythm is marked by one or more fixed accented syllables. These are the final syllables of the verse and of the syllabic series when there is more than one accented syllable in the verse. The counting of syllables in each syllabic series or verse includes this last accented syllable; the one or two optional additional syllables at the end of the syllabic series or verse cannot alter the rhythm, for these syllables are unaccented. In the earlier Romance verse we find verses with three or even four fixed accents, as in the trochaic eleven-syllable and fourteen-syllable verse; also the twelve-syllable verse with accented fourth, eighth, and twelfth, long used in the French folk songs.

A second principle of Romance versification is the vocalic or consonant-vocalic likeness in sound of the last accented syllable at the end of two or more verses. Assonance (likeness of vowels) and rhyme (likeness of vowels and consonants) emphasize the verse ending and make the rhythm of the verse fall more sharply on the ear, thus compensating in some measure for the decrease, as time went on, in the number of fixed accented syllables.

Very few popular Romance verses are found entirely without rhyme or assonance; yet even more seldom is rhyme found confined to the same sound of the consonant, or on an unaccented syllable, or binding accented with unaccented syllables. In the sixteenth century in Italian, under the influence of classic Latin, rhymeless verses (*versi sciolti*) appear, as in Trissino's *Sofonisba*, Ariosto's comedies, Rucellai's *Api*, and Allemanni's *Coltivazione*. The Spanish *versos sueltos*, the French *vers blancs*, and also English blank verse are learned productions and largely imitations of Italian models. Verses without assonance or rhyme are not present in the older French and Provençal poetry; unbound single lines like those at the ends of the tirades in *Aucassin et Nicolette* are very rare.

Accent, syllable count, and rhyme are thus the characteristic elements of Romance versification. Early attempts to explain the change from Latin foot measure to Romance accent, syllable count and rhyme, by foreign influence (Celtic, German, Arabic) as well as by the supposed character of ancient Roman (Fescenine, Saturnian) metres, have been thwarted by recent scholarship. Meanwhile no theory has enjoyed a documentation sufficient to establish itself beyond doubt. Certain basic facts have, however, gained general acceptance. In Latin the tonic accent was associated with long vowels. Poetic inscriptions of popular origin early show the growing uncertainty in the quantity of unaccented vowels, and hence an increasing importance of the accented syllable. The identity of accent, as now understood with the ictus, in other words the change from quantity to accent, was first recognized in criticism by Martianus Capella (*ictus* = *elevatio vocis*) of the fifth century. But the change probably occurred much earlier. For the earliest rhymed poem, that of St. Augustine against the Donatists was written c.393; while there are poems containing rhymes already in the first century A.D.; and the development of rhyme seems closely affiliated with the disappearance of quantity into accent, a change which disintegrated the classic metrical units, and necessitated the use of some other device to mark the close of the metrical period. Rhyme and assonance are but extensions of the principles of alliteration and of the repeated metrical movement already familiar in classic poetry itself, though probably much more common in ancient popular verse.

Similarly criticism has rejected various attempts to derive the particular Romance verses from any specific Latin measure (e.g., the Romance decasyllable from Latin hexameter), favoring generally the theory that side by side with the classic versification there existed from very ancient times a parallel popular versification, bearing much the same relation to it as vulgar Latin to the classic tongue. The first characteristically Romance verse to appear in writing is the decasyllable, perhaps unjustifiably identified by Stengel in the *Vita Sancti Faronis* (ninth century), but appearing fully developed in the Provençal *Boecis* (tenth century), and the French *Vie de Saint Alexis* and the *Chanson de Roland* (eleventh century). In these poems the decasyllable is a verse of ten counted syllables with a tonic accent on the fourth and tenth, and a cæsura after the fourth. An uncounted extra atonic syllable sometimes appears at the end of the cæsura (called thus the epic cæsura), sometimes at the end of the verse (called a feminine verse), sometimes in both places. There is almost without exception a conformity of cæsura and verse divisions to divisions of the sense, run-over verses being practically nonexistent. The exact syllable count is preserved by admitting hiatus, elision, and word contraction. The verses were grouped in assonanced strophes of varying length. Later in France appeared frequent decasyllables with the cæsura after the sixth syllable. Rhyme gradually replaced assonance after the twelfth century. While attempts to localize the origin of the decasyllable in north France have failed of conclusive proof, it is admitted that especially the epic cæsura was more in the genius of the *Langue d'oïl* (French). The later occurrences in Provençal epics (e.g., Girart de Roussillon) are almost certainly imitations of French. The Italian hendecasyllable, in view of the learned origins of written Italian verse, seems also to have been an adaptation of the French decasyllable, the extra syllable being due to the almost obligatory *verso piano* (_ ⏑) ending demanded by the Italian language. The cæsura never, however, became established in Italian verse with its French regularity. The hendecasyllable is the Italian verse par excellence, the lyric *set-*

tenario (seven-syllable) alone appearing as a poor competitor in point of frequency in all types of composition. The ten-syllable verse entered Spain with Provençal poetry, and was sparingly used and closely imitated. In the fifteenth century came a new introduction from Italy, and it was very popular for a time, yet it was built entirely on Italian models.

The eight-syllable verse is partly of popular origin, and can be followed nearly as far back as the ten-syllable. At first it shows two fixed accented syllables, and was among the most popular versifications of French and Provençal literature. Most narrative poetry of the Middle Ages in north and south France uses the eight-syllable verse, and the courtly epos and older drama are nearly exclusively eight-syllable. It is generally rhymed in pairs in this period. Since the middle of the sixteenth century it has lost ground and is now used only in lyrics. It is a stranger to Spain, Portugal, and Italy.

In France the twelve-syllable verse with accented sixth succeeded to the place of the ten- and eight-syllable verses. First called Alexandrine (after the French *Roman d'Alexandre*) in the fifteenth century, it was used also in *chansons de geste*, and in drama and didactic poetry of the Middle Ages. Out of style in the fourteenth and fifteenth centuries, it became the verse of classicism in the sixteenth century, and has been important ever since. The rhyming in pairs, so common in Renaissance poetry, first appears in an Anglo-Norman poem on the Old Testament (thirteenth century). In Provençal the twelve-syllable verse is used far less than in France, and is probably an imitation. In Italian are found some early examples, and also in folk song; in the eighteenth century G. Martelli adapted it in the fourteen-syllable *Martellian* verse (each hemistich being piano, i.e., $\underline{/}\ \smile$, with seven syllables for the masculine French hemistich of six) which has been much used in dramatic poetry down to the present time. The earliest twelve-syllable verses in Spain are in the thirteenth century. They are distinctly imitations of French Alexandrines and are bound in four-line strophes of one rhyme, exactly as in France. Moreover, they are always called *versos franceses*.

The twelve-syllable verse with accented fourth, eighth, and twelfth syllables is of popular origin, and is found somewhat in French and Provençal poetry. The six-syllable verse is a free creation of the Romance people, and is considerably found in Italian as the *settenario*, though seldom used as the exclusive verse of a complete poem. It is less used in Provençal, modern French, and old Portuguese lyrics. The four-syllable and two-syllable verses are found in lyrics, and are due to dissection of longer verses. The trochaic verses are native to Spain and Portugal, and are generally little used in France, Provence, and Italy.

The fourteen-syllable verse with accented seventh was very popular in Spain as verse of the romances, and later of the drama, and goes back to the catalectic trochaic tetrameter, which is very popular in older rhythmic Latin poetry. Also the lines of the *Poema del Cid*, a poem of the twelfth century, but preserved in a garbled manuscript of the fourteenth century, are mutilated fourteen-syllable lines, and not, as some have tried to prove, imitations of the French Alexandrine.

The ten-syllable verse with accented fifth is closely allied to the fourteen-syllable, and is called *verso de arte mayor*. It falls into two lines of five syllables each and is met in purely lyrical romances. The fourteen-syllable verse is again shortened into the eleven-syllable with accented seventh, the *verso de redondilla mayor con pie quebrado*. This is also found in Provençal, and sometimes bound in strophes with fourteen-syllable verses. The nine-syllable verse is a further shortening of the fourteen-syllable. Examples are found in Italian, Galician, Provençal, old and modern French.

Much more abundant is the seven-syllable verse, *verso de arte real*, or *de redondilla mayor*, which is the independent half of the fourteen-syllable, and is also related to the similarly cut trochaic tetrameter. As a result of this breaking up of the fourteen-syllable came the four-line strophes with cross rhyme—such as the later ballads offer. This seven-syllable verse is also seen in the lyric poetry of North and South France. *Aucassin et Nicolette* is written in this verse in single assonance tirades.

The five-syllable, or *redondilla de arte menor*, is often met in Spanish and Portuguese, and comes through division of the ten-syllable trochaic verse with accented fifth. Three-syllable and one-syllable verses, from the breaking up of longer verses, are little more than tests of metrical skill.

As time went on the number of syllabic series was generally reduced to two at most, and feeling for independent nature of the syllabic series was gradually lost. As, in the binding together of verses, assonance was replaced by rhyme, a great number of rhyme schemes grew up. For such schemes, see the particular name, e.g., SONNET, BALLAD, RONDEAU, ETC.

GERMANIC AND ENGLISH

There has been a steady stream of works on English versification ever since the appearance of Gascoigne's *Certayne notes of Instruction Concerning the making of verse or ryme in English* (1575), the first formal discussion of the subject. These treatises are mainly practical in character. In recent years, however, the historical and scientific study of language, especially through the experimental methods evolved in the study of phonetics, has reacted strongly upon investigations in metre and versification. The traditionally current system of nomenclature and classification, adapted from classical Greek and Latin practice to a metre of quite different kind, is generally acknowledged to be only remotely descriptive of the facts of English versification. Briefly stated, the purpose of the modern scientific student of versification is to

secure a basis in direct observation, usually with the aid of mechanical record of some kind, of the actual physical phenomena of the vocal rendition of verse for an independent system of terminology and organization. Physicists and psychological physicists have thus been enabled to secure results certainly more precise than those dependent entirely upon the variable testimony of the ear, and more exact than can be indicated by the conventional methods of scanning. Interesting and important as these results are, however, they remain at present incomplete, and certainly more significant for the psychologist and physicist than for the literary critic or historian. It is a fact in versification, as in many other forms of art, that a complete scientific or theoretical demonstration is not a necessary preliminary either for the enjoyment or production of works in the art. Until the scientific study of versification has something to add which can be shown to affect the practice of the art, its interest to the student of versification must be largely theoretical and its effect upon nomenclature must be slight. In the meantime, the traditional system, imperfect though it be, is the only one current, and as it has been followed from the earliest times down, it is the only one which has historical significance for the student of English literary criticism.

According to this traditional system the temporal unit of metrical measurement is the foot. The line is the next larger division, being composed of two feet, three feet, four feet (the common form being the octosyllabic line), five feet (pentameter), six feet (hexameter or Alexandrine), or seven feet (septenarius). Lines of two, three, or seven feet are relatively uncommon, the line of five feet in English poetry leading all the rest in popularity. The foot in turn is capable of division into stressed and unstressed syllables. The stressed syllables mark off the division of the line into approximately equal intervals constituting the feet. It is a prime condition of English verse that the metrical stress or accent (often called the ictus) shall coincide with the logical stress of words as they are used in natural speech, or, if the coincidence is not complete, it must be at least sufficiently complete to preserve the sense of the identity of the logical values of words in prose and verse. On the other hand, the metrically unstressed elements in the foot may not be words which ordinarily would take a heavy logical stress, since, if they were, they might obscure the value of the metrically stressed syllables in marking the division of the line into feet. Each foot ordinarily contains one stressed syllable, and one, two, or three unstressed syllables, though feet with three unstressed syllables are relatively uncommon. The question of quantity in connection with the stressed and unstressed syllables of English versification has been very much discussed, but with little agreement in theory, and no advantage to practice. It is mathematically demonstrable that the feet of an average line of English verse are approximately equal, but the temporal division of the elements of which the foot is composed is not constant. Usually a stressed syllable will be longer than an unstressed one, but this is not necessarily the case. And as any syllable may occupy the position of metrically stressed syllable, providing its logical significance is sufficiently great, it is evident that there is no absolute quantity in syllables which determines the part they play in the schematic foot of English verse. The same syllable may fall in one line in the metrically accented position, and in the unaccented in the next. The determining element in the constitution of syllables into feet is stress or accent, and for this reason English, like the other Germanic dialects, is rightly said to make use of an accentual rhythm in its system of versification. It is obvious, however, that the term "accent" is used as indicating not an absolute, but a relative value. In a five-foot line, e.g., each of the five accents does not necessarily receive an equal degree of force or energy in utterance, but each metrically stressed syllable is relatively energetic as compared with the metrically unstressed elements of its foot. And the unstressed syllables are of course not absolutely without stress, for if they were they would be without utterance. This stage of actual disappearance is sometimes reached when a pause is made to take the place of the unstressed element in a verse. On the other hand it is doubtful if a foot of two equally stressed elements (corresponding to the spondee of classical metre) falls within the spirit of English versification. Occasional examples of this type of foot may be found, but a succession of them would be impossible, since the elements of which they are composed being equivalents, there would be nothing in the structure of the line to indicate the division into feet. The main types of feet commonly used in English poetry are the trochaic ($/ \times$), the iambic ($\times /$), the dactylic ($/ \times\times$), and the anapestic ($\times\times /$). The macron, or dash, with the accent over it is customarily used to indicate the stressed syllables, but with no implications as to quantity; and the cross indicates merely unstressed syllables. Normally a line of English verse employs a succession of feet of the same type, but substitutions and transpositions occur not uncommonly. Mechanically regular verse is not regarded as good verse.

Accentual rhythm, accompanied by alliteration, is characteristic of the earliest known Germanic verse. In fact, the type may be still older, and may have been a common inheritance of the Indo-Germanic peoples. A great body of this alliterative verse is preserved in Anglo-Saxon, Old Saxon, and Old Norse, and a few lines from Anglo-Saxon will illustrate its structure:

Hwæt! wē Gār-Dena in gēardagum
þēodcyninga þrym gefrūnon
hū þā æþelingas ellen fremedon.

The long line consists regularly of two half lines bound together by carefully regulated alliteration. The number of accents in the half line is a matter of discussion. According to one theory there are four; and the whole line, with its eight stresses, is made to correspond to a primitive long line assumed for Indo-Germanic. According to another theory, which is the one most generally accepted, each half line (disregarding certain hypermetrical forms) has only two accents, and in the distribution of them it conforms to one of the following general types in which the grave accent (ˋ) represents secondary stress:

A. $/ \times \mid / \times$ stīdum wŏrdum.
B. $\times / \mid \times /$ ne wĭntersceūr.
C. $\times / \mid / \times$ and fŏrd gângan.
D. $/ \mid / \grave{} \times$ fŏrd fōldwège.
E. $/ \grave{} \times \mid /$ ândlângne dæg.

Each of the five types admits of several modifications, and except in a few situations there is great freedom as to the number of unaccented syllables. End rhyme is almost unknown; and stanza structure is very rare in Anglo-Saxon, though regular in Old Norse. This "five-type" verse was employed with marked regularity throughout the Anglo-Saxon period for poetry of all kinds. With the introduction of French models, the older alliterative verse of native origin lost literary caste, but in the fourteenth century occurred an interesting patriotic revival of it, and it was handled with masterly skill by two of the ablest poets of the age of Chaucer—Langland and the unknown author of the romance of *Gawayne and the Green Knight*. The *Pearl*, an elegy by the latter poet, exhibits a very difficult combination of alliteration with a complicated rhyme scheme.

The Middle English period, however, is marked in general by the adoption and gradual perfection of the more regular measures of which mediæval Latin and Old French verse afforded models. Three new characteristics, all due to foreign influence, made their appearance in this later verse: (1) end rhyme (see RHYME) became much more generally used, often in place of and often combined with the alliterative style; (2) stanza structure, a development closely associated with rhyme, became common; (3) the number of unaccented syllables in a line was more strictly regulated. The change to the new type of versification was gradual, and English poetry, especially in the matter of alliteration, has never ceased to show traces of the older usages. Yet the *Poema Morale*, a poem of the twelfth century, in rhymed septenaries, attained a pretty strict regularity in syllable counting; and the *Ormulum* (about 1200, in unrhymed septenaries) is mechanically monotonous. Layamon's *Brut*, on the other hand, a long poem of about the same time, is more various in structure. It employs both rhyme and alliteration, and retains the old freedom in the number of unstressed syllables. The free system persisted in many poems throughout the Middle English period, and later still in popular ballads and in the so-called tumbling verse of early modern English writers. In fact, the new principle of Coleridge's *Christabel* was really a revival of the old, native English method of counting accents and paying little attention to unstressed syllables.

In addition to the metres already mentioned, wide use was made in Middle English of the Alexandrine (often combined with the septenary), the octosyllabic couplet (extremely frequent), and a number of lyric forms. There was considerable imitation of French poetry in its more complicated, as well as its simpler stanza arrangements; and the so-called tail-rhyme stanza (used with humorous effect in Chaucer's *Sir Thopas*) was fairly common in narrative verse. To Chaucer, the first great master of the newer versification, is due the popularity of two important metres: the rhyme royal (seven-line pentameter stanzas rhyming ababbcc), and the decasyllabic couplet, or heroic couplet, as it is more commonly called. Of the former he has some 14,000 lines, and of the latter some 16,000; and both measures became in his hands admirable instruments for continuous narration. The rhyme royal was popular with Chaucer's immediate followers, Lydgate, Occleve, Dunbar, and James I of Scotland, and was used later by Skelton, Barclay, and Sackville. Shakespeare employed it in *The Rape of Lucrece*, but since then it has been rare. The pentameter couplet always remained a favorite English metre.

The beginning of the modern English period is marked by no such change in the fundamental principles of versification as that which took place between Anglo-Saxon and Middle English. Chaucer's system has been in all essentials the system of English poets ever since, though the modifications of the language through loss of inflections, and the like, have considerably altered the technical problems of English poetry. The nature of these changes can best be made to appear by comparing a few lines of Chaucer's *Knight's Tale* with Dryden's modernization of the same.

"The Firstë Moevere of the cause abovë,
When he first made the fairë cheyne of lovë,
Greet was theffect and heigh was his ententë;
Wel wiste he why and what ther of he mentë,
For with that fairë cheyne of love he bond
The fyr, the eyr, the water and the lond,
In certeyn boundës that they may nat flee."

Dryden renders the passage:

"The Cause and Spring of motion from above
Hung down on earth the golden chain of Love;
Great was the effect, and high was his entent,
When peace among the jarring seeds he sent;
Fire, flood, and earth and air by this were bound,
And love, the common link, the new creation crowned."

A complete survey of modern English verse forms lies far beyond the range of this article. It is not possible here to do more than name the commoner metres and give some brief indications of their history.

The long septenary, or seven-stress line, of which Chapman's *Iliad* is a famous example, is unusual in modern English. But in its resolved form, printed as quatrains of alternating four-stress and three-stress verse, it constitutes the common metre of the hymn-books; and one of the most frequent ballad stanzas has the same movement, though perhaps different in origin. The combination of septenaries with Alexandrines made the so-called "poulter's measure," which was rather popular with Elizabethan writers. Pure Alexandrine measure, like that of Drayton's *Polyolbion*, has not been common.

The octosyllabic couplet has been relatively less important in modern than in early English, particularly for narration. It was a good deal used for descriptive and reflective poetry by writers of the seventeenth and eighteenth centuries, partly because of the influence of Milton's *L'Allegro* and *Il Penseroso*. Butler's *Hudibras* gave it a new character as a typical metre of satire or burlesque, also well exemplified by Swift. In the nineteenth century it was again adopted for serious narration by Wordsworth, Byron, and Scott.

The various combinations of pentameter verse have undoubtedly been the favorite forms of English metre. The eight-line stanza, imitated from the Italian "ottava rima" (rhyming abababcc), was introduced by Wyatt and Surrey, and used by Spenser, Daniel, Drayton, Harrington, and Fairfax, chiefly in romantic poetry. In the nineteenth century Keats, Shelley, and

other poets wrote it in the romantic spirit, while Byron and Hookham Frere turned it to satirical uses. The Spenserian stanza (whatever the exact process of its formation) consists of eight pentameter lines with an added Alexandrine (rhyming ababbcbcc) invented by Spenser and used in the greater part of his poetry; it has been imitated by a number of later poets, among them Thomson, Shenstone, Beattie, and Keats. The pentameter couplet, Chaucer's favorite metre, was used by the Elizabethans for various purposes. But its greatest vogue was in the classic period of the seventeenth and eighteenth centuries, when it was steadily developed and perfected by Jonson, Sandys, Waller, Denham, Dryden, and Pope. Throughout the eighteenth century it was the prevailing measure and was written by many poets with strictness and technical skill. In the nineteenth century a freer form, approaching the effect of blank verse, was developed by Leigh Hunt, Keats, Shelley, and Browning. Alongside of the heroic couplet should be mentioned the less widely used heroic stanza (a pentameter quatrain rhyming abab), best known through Gray's *Elegy*. Blank verse, or iambic pentameter measure without rhyme, is probably the most distinctive of English metres, and has served the highest uses. Introduced in the sixteenth century, during the classical reaction against rhyme, it became in the hands of Marlowe and Shakespeare the accepted form for English dramatic poetry; and after Milton's use of it in *Paradise Lost* it was widely adopted for epic and reflective poetry as well. Among the nondramatic writers who used it in the eighteenth century were Blair, Akenside, Thomson, Young, and Cowper. In the nineteenth century it was very generally written —in highest perfection, perhaps, by Keats and Tennyson, and with great freedom and individuality by Browning. (For fuller treatment of the more important lyric forms, see ODE; SONNET.) It is impossible to take account here of the numerous minor metrical forms, chiefly lyric, of different periods. Some of them have arisen from the imitation of French metres which began in the Middle English period. There was a distinct revival of this in the nineteenth century, represented by the lighter verse of Henley, Dobson, and Andrew Lang. A number of metrical experiments have been made in the effort to reproduce in English the ancient classical verse forms, sometimes preserving even their quantitative scansion. One important metre which has been often tried, but, like all the rest, never completely naturalized, is the dactylic hexameter. This was first taken up in the time of the classical Renaissance, and among the poets who attempted it were Stanyhurst and Gabriel Harvey, and even Sidney and Spenser. The early hexameters were quantitative. In the eighteenth century the measure was revived, largely under German influence, by Coleridge and William Taylor. The modern hexameters have been for the most part accentual in rhythm, and in the hands of Southey, Clough, Longfellow, and Kingsley have attained some real popularity.

For general historical surveys, see Edwin Guest, *A History of English Rhythms*, edited by W. W. Skeat (London, 1882); J. Schipper, *Englische Metrik* (Bonn, 1881–88); George Saintsbury, *A History of English Prosody from the Twelfth Century to the Present Day* (3 vols., London, 1906–10). On the old Germanic verse forms, see Sievers, *Altgermanische Metrik* (Halle, 1892); also Ten Brink in Paul's *Grundriss der germanischen Philologie* (Strassburg, 1901 et seq.), and Kaluza, *Der altenglische Vers* (1894), both holding the four-accent theory. On German versification, which it has not been possible to discuss in detail in this article, see for the earlier periods Paul in the *Grundriss der germanischen Philologie*, and for the modern periods Westphal, *Theorie der neuhochdeutschen Metrik* (2d ed., Jena, 1877); Minor, *Neuhochdeutsche Metrik* (2d ed., Strassburg, 1902).

VERS LIBRE. 1. A term which has not yet acquired a precise and fixed meaning, but which is often used to describe various kinds of poetical composition, rhymed or unrhymed, where metrical regularity is disregarded. In this sense vers libre and free verse are used as practically synonymous, and describe kindred productions in French or English. Free verse is often applied, e.g., to the metrically irregular poetry of Walt Whitman, and vers libre is the term similarly applied to poems of the French Gustave Kahn and Paul Ford, in which the stringency of orthodox prosody is disregarded.

2. In the early years of the twentieth century vers libre—and perhaps also free verse—tended to assume a slightly different meaning. Practitioners of irregular forms who aimed to build upon the laws of cadence—whatever those laws may be—and sought to give their poems the rhythms of the speaking voice, with its breathing spaces, claimed the term for their own, and would not willingly have it applied to such irregular poems as those of Whitman, which were set down as rhythmic prose. This distinction was made by writers in both French and English. Early twentieth-century vers librists count as proper to their favorite form some notable poetry of the past, as, e.g., Dryden's "Absalom and Achitophel," Matthew Arnold's "Nightingale," and various poems of Henley.

Consult the essays in Amy Lowell's *Six French Poets* (New York, 1915); the preface to *Some Imagist Poets* (Boston, 1915), an anthology; and studies on this subject in the works (*passim*) of Rèmy de Gourmont, Gustave Kahn, André Spiré, and Robert de Souza.

VERSTEGEN, fĕr-stā'gan, RICHARD (fl.1565–1620). An Anglo-Dutch antiquarian author, born in London. In 1565 he was entered at Christ Church, Oxford, as Richard Rowlands. After 1576 he removed to Antwerp and resumed the Dutch name of his family. There he established a printing press, and was actively concerned in the printing and dissemination of Catholic literature. His zeal in this respect later caused his imprisonment in Paris (1587) at the instance of the English ambassador. He is known to have gone about 1595 to Spain, where he was received by Philip II and remained for some time at the Catholic college at Seville.

He wrote: *The Post of the World, wherein is contayned the antiquities and originall of the most famous cities in Europe* (1576); *Theatrum Crudelitatis Hæreticorum Nostri Temporis* (1587, 1588, and 1592; Fr. trans., 1588); *A Dialogue on Dying well* (1603; translated from the Italian of Pietro di Lucca), and *Restitution of Decayed Intelligence in Antiquities concerning the English Nation* (1605).

VERSTOVSKY, vĕr-stôf'skĭ, ALEXEI NIKOLAIEVITCH (1799–1862). A Russian composer, born near Tambov. He studied piano with John Field and Steibelt, violin with Böhm and Maurer, theory with Brandt and Zeiner, and singing with Tarquini. From 1823 to 1860 he was director of the Moscow Theatre, where numerous of his operatic vaudevilles won popular favor. His first serious work was the opera *Pan Tvardovsky*, composed under the influence of Méhul and Weber (qq.v.) and produced in 1828. This was followed by five other operas—*Vadim* (1832), *Askold's Tomb* (1835), *Home-Sickness* (1835), *The Boundary Hills* (1841), and *Gromoboy* (1845)—of which *Askold's Tomb*, full of Russian folk tunes and based on a mythical subject, proved the most successful. Verstovsky holds a prominent place in the history of Russian music, being generally considered the most gifted promoter of national Russian opera before Glinka (q.v.). He wrote also ten cantatas, three sacred concerts, a mass, choruses, and songs.

VERSUNKENE GLOCKE, fĕr-zụn'kĕ-ne glŏ'kĕ, DIE. See SUNKEN BELL, THE.

VERT, vâr (Fr., green). The name for green in heraldry (q.v.), represented in engraving by diagonal lines drawn from the dexter chief to the sinister base.

VERTEBRA, vĕr'tĕ-brȧ. See SKELETON; SPINAL COLUMN.

VER'TEBRA'TA (Neo-Lat. nom. pl. of Lat. *vertebratus*, jointed, articulated, from *vertebra*, joint, vertebra, from *vertere*, to turn). A subdivision of the phylum Chordata, which includes the largest and most differentiated or highly developed of animals. The group called vertebrates, or back-boned animals, may be defined as follows: Segmented Metazoa provided at some stage of development with a gelatinous supporting rod or chorda running through the long axis of the body, and with throat clefts or gill slits. They have a main nerve tube lying near the dorsal surface of the body which enlarges anteriorly to a brain. There is an internal, metameric, cartilaginous or bony skeleton, consisting typically of an axial series of parts replacing the chorda; of a box (cranium), inclosing the brain; of a series of arches (neural arches) protecting the nerve tube; and of supports to the body wall (ribs). The heart is ventral to the alimentary tract, which begins in a ventrally placed mouth and ends in a ventral anus, placed near the base of the tail. Vertebrates are the only group of animals in which the body may be divided into head, trunk, and tail, the tail being postanal. They alone are characterized by having typically, except as lost by degeneration, four limbs. They have an outer skin that consists of more than a single layer of cells. They have an internal skeleton that is essentially living, containing active cells within it. Each pair of limbs, when present, is supported by a bony girdle, which may in extreme cases be rudimentary. The skull, except in Cyclostomi, consists of cranium and lower jaw. The jaws are typically provided with teeth, but these are lost in turtles and birds. The central nervous system consists of a nerve tube (spinal cord) and brain, with which latter the main sense organs are connected. The brain is the special seat of sense perception, of voluntary motor impulses, and of the higher intellectual faculties. From brain and spinal cord a metamerically repeated series of nerves runs off to the skin, viscera, and muscles. The sense organs consist of an olfactory pit usually paired; paired camera eyes, with lens; a pair of auditory organs (pits or closed cavities) usually comprising three semicircular canals. In addition to the cerebrospinal system is a visceral system (the sympathetic). The digestive tract is a tube separated from the body wall by the peritoneum-lined body cavity. The digestive tube is divided into œsophagus and stomach, the small intestine with liver and pancreas, and the large intestine. (See ALIMENTARY SYSTEM.) Respiratory organs are typically present, either as gills in the aquatic vertebrates or as lungs. In some salamanders, however, respiration is by the throat and entire skin. The gills (q.v.) are thin plates typically placed in two rows on the gill arches between the slits. The lungs, which arise, apparently, as swimming bladders in fishes, come to lie ventral and to have a purely respiratory function in land vetebrates. The circulatory system (q.v.) consists of a set of vessels almost wholly cut off from the body cavity, and carries red blood, due to the red blood corpuscles. This fluid is propelled by a heart that consists essentially of two parts, a thin-walled auricle that receives blood entering from the trunk behind, and a thick-walled muscular ventricle that forces the blood out forward, to the respiratory organs, head, and trunk. In addition to the blood vessels are the lymph vessels, spaces incompletely cut off from the body cavity, and carrying chiefly white blood corpuscles and special nutriment to the blood. Special excretory organs (see EXCRETORY SYSTEM) are present, essentially consisting of paired, metamerically repeated tubules into which blood vessels pour their waste material. The tubules empty into a common paired duct, which also may serve, in the male, to convey the sexual products to the exterior. Reproduction is always sexual and the sexes are usually separate. See REPRODUCTIVE SYSTEM; MUSCULAR SYSTEM.

Development usually starts with a yolk-laden egg that cleaves incompletely. The embryo first appears as a disk or blastoderm lying on the yolk. At the hinder edge of the growing disk some cells are pushed in to form the alimentary tract. A pair of parallel folds rise up along the back to form the neural cerebral tube. From the upper right and left angles of the cavity of the alimentary tract metamerically repeated pairs of pouches are cut off to form the mesodermal pouches from whose walls the muscles and lining of the body cavity arise. The notochord develops first as a continuous groove, and finally as a rod, between the mesodermal masses. By the time the germ disk has surrounded the yolk the body wall is completely formed. The yolk lies at the bottom of the gut and forms a huge lump there, which gradually becomes absorbed and the animal assumes the typical cylindrical form. See EMBRYOLOGY.

The vertebrates form the section Craniata of the phylum Chordata, and embrace six classes, viz.: the cyclostomes, fishes, amphibians, reptiles, birds, and mammals. See CLASSIFICATION OF

ANIMALS; and the names of these various classes, and of their subordinate groups.

MODE OF EVOLUTION OF THE VERTEBRATA

At a very early period in the history of vertebrates, the internal rod or backbone, at first cartilaginous, became ossified and segmented into vertebræ, and four appendages developed which became fins, legs, or wings, for progression in water, on land, or in the air, respectively. Along the upper side of the backbone lay the spinal cord, holding the cells and nerves which coordinated the action of the different parts of the organism, and the anterior end of this cord early specialized into a brain. The sense organs and the mouth were grouped around the brain, and the bony structures which developed to protect them and facilitate their action constituted the skull, which became the most characteristic and highly differentiated part of the animal. Many vertebrates developed various protective bony structures over the surface of the body as well as the head.

The higher specialization of an animal, its more exact adaptation to a particular mode of existence, are an advantage to it so long as the conditions of its environment remain the same. But if the conditions change, the highly specialized type is at a disadvantage, as it cannot so well adapt itself to a new environment as its more generalized rivals. It is, therefore, likely to become extinct and be replaced by the less specialized forms, which in turn become highly specialized in adaptation to the new conditions. The many and great geological changes which have taken place involve many and complex changes in the conditions of life, both of marine and land animals, and changes in each group of organisms involve a widening circle of change in all the other groups dependent on it. But in the more complex modes of life a higher intelligence and a better mechanical adaptation to the more general conditions of the environment have been at all times of advantage. We observe, therefore, in the history of vertebrates through geological time, a general continuous progress in intelligence and in the broader lines of adaptation, together with a series of successive specializations in the details of their construction.

The greater size of an animal is of advantage to it in the struggle for life as against its rivals or enemies, but the larger animals require more food in proportion to their size in order to maintain the same relative activity. As long, therefore, as food is sufficiently abundant, a race of animals will tend to increase in size. But if changed conditions bring about a scarcity of food, the larger animals will become extinct and the smaller alone survive, and in their turn increase in size when a season of plenty recurs.

Accordingly we find that as a race of animals specializes in structure it likewise frequently increases in size during stable conditions, and that with changed environment the larger and more specialized animals become extinct. But the improvement in the general mechanical adaptation of its parts enables an animal to attain a greater size without corresponding loss in activity, and through geological time there has been a continual increase in the largest size attained by successive races of similar habits.

Besides structures which serve to protect the animal or aid it in obtaining food or attacking its enemies, the higher vertebrates develop many which are partly or wholly ornamental. The evolution of these is due to sexual selection and goes hand in hand with the development of extreme specializations and the increase in size which mark constant conditions of environment.

EARLY HISTORY OF THE VERTEBRATA

The vertebrates probably originated as aquatic or marine animals, partly amphibious. From this point they split into great sections, one, the fishes, becoming entirely marine, the other becoming amphibious and giving rise to the land vertebrates. These amphibious animals are most nearly represented among modern groups by the newts and salamanders, which with the frogs and toads constitute the order Amphibia. From the primitive Amphibia budded off three great groups or classes, the reptiles, predominantly amphibious, the mammals, predominantly terrestrial, and the birds, predominantly aërial. Each of those classes has since branched out into every available mode of life in its own province, and each has invaded more or less the especial province of the others, and also that of the fishes. The greater diversity and complexity of the conditions of life on the land have favored the evolution there of the highest types of vertebrates. The strictly terrestrial and the aërial life have brought out the highest degree of mechanical specialization of parts; the arboreal life has been among the conditions favoring the highest development of intelligence, and the races standing highest in this respect are arboreal or exhibit indications of descent from arboreal ancestors.

During the geological age of invertebrates, the vertebrates were probably being first evolved from lower animals, as soft eel-like creatures, not unlike the amphioxus which is still found living on the Brazilian coast, without limbs and without bony skeleton, and leaving no traces of their existence in the sediments. During the Silurian period, however, and perhaps as low down as the Ordovician, appeared certain marine vertebrates, somewhat allied to the fishes, but inferior to them in important points of organization, called Ostracodermi (q.v.). These had no internal bony skeleton, but were covered by bony plates over the head and sometimes over the body. Some had curious flipper-like appendages corresponding to the pectoral fins of fishes; there was no separate lower jaw. They are so unlike any living animal that it is difficult to get any complete knowledge of their anatomy from the external hard parts, which are all that is preserved, for the internal skeleton was not calcified.

In the succeeding or Devonian period the ostracoderms continue to exist, and true fishes appear and become the dominant forms of life. They are far more primitive than most modern fishes, less completely adapted for marine life, and in most of them the internal skeleton is not calcified and the fins are very imperfectly developed. The most remarkable among them is the *Dinichthys*, remotely allied to the modern lung fish, but of huge size and its head covered by massive bony plates. The ostracoderms die out at the end of this period. Fishes appear in all the succeeding marine formations and become more and more like those of the present day.

The next two periods, the Carboniferous and Permian, constitute the age of amphibians, when large and small Amphibia, mostly covered completely with bony plates, were the dominant forms of life. These animals were amphibious, some probably terrestrial, and had developed

limbs and feet for progression on land. They show various stages in the calcifying of the backbone, and in some it is complete. In the Permian the first reptiles appear, primitive types not easily distinguished from the Amphibia from which they had originated, but superior to them in their capacity for higher evolution.

Evolution of the Reptilia. During the Triassic, Jurassic, and Cretaceous periods the reptiles were the dominant types, and branched out into terrestrial, aërial, amphibious, and marine groups in great variety, and many of them, such as the dinosaurs (q.v.), were of gigantic size. With them lived ancestors of the modern crocodiles and turtles. The marine reptiles, ichthyosaurs, mosasaurs, and plesiosaurs, were dominant on the ocean, while the pterosaurs or flying reptiles ruled the air. At the end of the Cretaceous most of the reptile orders became extinct.

The first birds appear in the Jurassic, retaining many characters of their reptilian ancestors, especially reptile-like teeth and a long vertebrated tail, from which the tail feathers branch out on each side down to the tip. In the Cretaceous period the birds have lost the reptilian tail, but still retain the teeth. All later birds have horny beaks instead of teeth.

Evolution of the Mammalia. During the age of reptiles the mammals had been slowly evolving, but very little is known of them. The remains that have been found are exceedingly rare and very fragmentary, and indicate very primitive types, of minute size and apparently arboreal habit. But at the beginning of the Tertiary period they appear in force, and rapidly increase in size and variety, taking the place of the reptiles as the dominant type, and like them branching out into terrestrial, arboreal, aërial, marine, and some amphibious races. The ancestry of many modern animals has been traced back through successive stages nearly to the beginning of the Tertiary period, always converging towards a common ancestor. The most complete and instructive of these lines of descent is that of the horse (see HORSE, FOSSIL); that of the camel stands next in completeness; and less complete series represent the ancestry of many of the higher ruminants of the elephants, rhinoceroses, tapirs, dogs, and many other animals. Indeed, it may be said that there are comparatively few land mammals of which some ancestral types are not known; and these ancestral forms invariably present primitive characters linking the modern representative to the common ancestor of the mammals, although they often combine these primitive characters with peculiar specializations which show that they are not in the direct line of descent. And these primitive characters are more pronounced in the more ancient forms.

We have, however, very little positive knowledge of the ancestry of the marine mammals, the seals, cetaceans (whales, dolphins, and porpoises, etc.), and sirenians (dugongs and manatees). Setting aside these, with a few rare and peculiar land mammals whose history is unknown, and the Australian mammals (marsupials and multituberculates) which probably diverged from the common stock at an earlier date, we can infer with a high degree of probability from these known lines of descent a common ancestor to the modern mammals, which lived during the Cretaceous period and whose descendants at the beginning of the Tertiary period had diverged comparatively little in characters. This common ancestor was of small size, of a low order of intelligence for a mammal, the legs short, five toes on each foot and claws on the toes, and a long heavy tail. Its teeth were 44 in number, 11 on each side of each jaw, consisting of three incisors, a canine, four premolars, and three molars. The molars had each three sharp cusps arranged in the form of a triangle; the remaining teeth had but one cusp, but the canine was larger than the rest. The animal walked on the sole of the foot, and there are some reasons for thinking that it was at least partly arboreal. Its food was probably chiefly insects or other small animals. Only a few fragments of jaws and teeth of Cretaceous mammals have been found; but some of them correspond, as far as they go, to the characters of the hypothetical type, while others represent more ancient offshoots from the central stock.

The oldest Tertiary mammals preserve nearly all the above characters of their supposed ancestor, but show the early steps of the divergence which led into the various types of the present day. Some were becoming herbivorous, developing hoofs instead of claws, lengthening the limbs and losing one or more of the side toes on each foot to increase the speed, and changing the character of the teeth to fit them better for a vegetarian diet. Others were becoming more strictly carnivorous, adapting the teeth to cut and tear flesh; while others again were arboreal and frugivorous as judged from the characters of their limbs and teeth. In the succeeding stages of the Tertiary the characters of each line become more marked, some lines leading up into modern animals, others into side branches which have died out. Several of these side branches ended in clumsy monstrous races of huge size and peculiar form, occupying the same place in the various Tertiary faunas that the elephants, rhinoceroses, and hippopotami do in that of to-day. Such were the *Coryphodon* and *Uintatherium* of the Eocene, the *Titanotherium* and *Elotherium* of the Oligocene, the *Chalicotherium* of the Miocene, and various peculiar extinct rhinoceroses in America and Europe.

Evolution of Man. Of animals which can be considered as in or near the line of ancestry of man, the remains are very few and very fragmentary in the Tertiary, and are found only in the Old World. It must be supposed that the evolution of man during this period took place in a region which has not been thoroughly explored, or in which the Tertiary strata are not well exposed. But early in the Quaternary period remains and indications of man are found fossil in all parts of the world, along with animals identical or closely allied with those of modern time as well as others which have become extinct, such as the mammoth and the mastodon in the northern world, the *Megatherium* in South America, and the *Diprotodon* in Australia. For the extinction of these and for the rarity of most other large animals at the present time, man is, no doubt, largely responsible, directly as a hunter, or indirectly by depriving them of their food and range. He has become cosmopolitan and dominant in a sense that no animal ever was in previous ages, and it may almost be said that all other animals exist only by his sufferance or to be exploited for his benefit.

Museums and Collecting Grounds. The collections of fossil vertebrates are practically confined to the large museums of Europe and the

United States, the best being in New York, London, and Paris. With the Paris Museum is especially connected the name of Cuvier (q.v.). In the middle of the last century Owen and Huxley in England were the most prominent investigators, while in its latter years American students, especially Leidy, Cope, and Marsh, were in the front rank. In recent years American museums and collectors, under the masterful influence of Henry F. Osborn, have been in the lead, the arid Western States containing the richest fossil fields yet known. While in Europe the best collecting grounds have been quarries worked primarily for building stone, slate, or phosphate rock, or bone beds of limited area, the Western fossil fields are the extensive areas of Mesozoic or Tertiary rocks laid bare in the "bad lands," and while the fossils are widely scattered, they are remarkably well preserved.

CHART SHOWING DISTRIBUTION OF VERTEBRATES AND THE CHARACTERISTIC FORMS OF THE DIFFERENT PERIODS

PERIODS			Characteristic forms	Dominant type
Cenozoic	Quaternary	Recent		Man, estimated 50,000 years
		Pleistocene	Man (flint implements, skeletons of Spy and Neanderthal caverns). Mammoth, mastodon, woolly rhinoceros, *Elasmotherium*, Irish elk, *Megatherium*, *Glyptodon*, *Diprotodon*, one-toed horses, *Platygonus*, cave bear, sabre-tooth tiger	
	Tertiary	Pliocene	*Pithecanthropus*, *Sivatherium*, *Samotherium*, three-toed and one-toed horses, mastodon, horned rhinoceroses, *Chalicotherium*, camels, deer, oxen, *Dinocyon*, *Hyænarctos*	Mammals, estimated 3,000,000 years
		Miocene	Apes and baboons, three-toed horses, small-horned or hornless rhinoceroses, four-tusked mastodons, *Dinotherium*, *Merycochœrus*, *Procamelus*, deer, *Amphicyon*	
		Oligocene	Three-toed horses, *Titanotherium*, primitive rhinoceroses (*Cœnopus*, *Hyracodon*, *Metamynodon*), primitive ruminants (*Oreodon*, *Poebrotherium*, *Anoplotherium*, *Anthracotherium*), primitive dogs, and sabre-tooth tigers	
		Eocene	Four-toed horses, primitive types of hoofed and clawed mammals (*Uintatherium*, *Coryphodon*, *Phenacodus*, *Hyrachyus*, *Palæotherium*, *Patriofelis*, *Oxyæna*), monkeys, rodents, serpents	
Mesozoic		Cretaceous	Great land reptiles (dinosaurs), *Triceratops*, *Claosaurus*, marine reptiles (mosasaurs and plesiosaurs), flying reptiles (pterosaurs), toothed birds, crocodiles, turtles, sharks, rays, small insectivorous mammals	Reptiles, estimated 7,000,000 years
		Jurassic	Dinosaurs (*Brontosaurus*, *Diplodocus*, *Stegosaurus*, *Iguanodon*, *Megalosaurus*), plesiosaurs and ichthyosaurs, pterosaurs, reptile birds (*Archæopteryx*), crocodiles, turtles, true sharks and rays, true bony fishes	
		Triassic	Carnivorous dinosaurs (*Anchisaurus*, *Zanclodon*), primitive reptiles (*Pariasaurus*, *Cynognathus*, *Belodon*), large armored amphibians (*Labyrinthodon*, *Mastodonsaurus*), lungfish (*Ceratodus*)	
Paleozoic		Permian	Primitive reptiles (*Naosaurus*, *Diadectes*, *Pariotichus*), armored amphibians (*Eryops*, *Diplocaulus*, *Cricotus*, *Archegosaurus*), primitive sharks (*Pleuracanthus*)	Amphibians, estimated 5,000,000 years
		Carboniferous	Small amphibians (*Microsauria*), primitive bony fishes (*Palœoniscus*, *Platysomus*), primitive sharks (*Pleuracanthus*)	
		Devonian	Lungfish (*Dinichthys*, *Coccosteus*, *Dipterus*), primitive sharks, primitive bony fishes, ostracoderms (*Pteraspis*, *Cephalaspis*, *Pterichthys*, *Bothriolepis*), lampreys	Fishes, estimated 2,000,000 years
		Silurian Ordovician Cambrian	First vertebrates (ostracoderms), *Cyathaspis*, *Palæaspis*	Invertebrates, estimated 10,000,000 years
Eozoic		Algonkian Archean	No fossils	

The appended table shows the characteristic vertebrate animals found in the different geological periods as understood at the present time.

Bibliography. Lucas, *Animals of the Past* (New York, 1901), is a popular book on vertebrate fossils, most entertainingly written. A later book is *Animals Before Man in North America*, by the same author. Hutchinson, *Extinct Monsters* (London and New York, 1892), contains very good accounts of the more remarkable extinct types known up to the date of their publications, but does not include more recent American advances in the subject. A. Smith Woodward, *Outlines of Vertebrate Paleontology for Students of Zoölogy* (Cambridge, 1898), is one of the best English textbooks on the subject, and it contains a well-selected bibliographic list. Zittel, *Handbuch der Paläontologie*, vols. iii and iv (Munich, 1887–93), is an excellent reference book for advanced students, and his *Grundzüge der Paläontologie* (Munich, 1895), translated by Eastman under the title *Textbook of Paleontology*, vols. ii and iii (New York and London, 1900–03), gives a more condensed treatment. See also Lydekker, *Geographical History of Mammals* (Cambridge, 1896), and Gaudry, *Enchaînements du monde animal* (4 vols., Paris, 1878–96); O. Abel, *Grundzüge der Paläobiologie der Wirbeltiere* (Stuttgart, 1912); S. H. Reynolds, *The Vertebrate Skeleton* (Cambridge, 1913).

VER'TIGO (Lat., a turning or whirling round, giddiness), DIZZINESS. A condition characterized by an inability to maintain a due equilibrium. Vertigo may be caused by unusual and powerful visual sensations, such as those produced by water falling rapidly from a

great height, or by objects moving swiftly across the field of vision, or by looking down from an elevation. In some cases the subject feels as though all the visible objects were passing rapidly before him; in other cases as though he were falling in a certain direction. Vertigo may arise from changes taking place in the brain, and, while not a disease, is a symptom of many diseases and a result of several poisons. A severe form of dizziness is produced by rapidly rotating the body. A distressing form is produced by sending a galvanic current through the head from ear to ear. Vertigo caused by rotation of the body is due to false sensation in the vestibule and semicircular canals of the internal ear, and arises from excessive movements of the fluid contents passing over the delicate nerve filaments of the vestibular nerve. It is known that variations in the pressure of the endolymph within the canals give rise to two kinds of impulses: the auditory impulses and a series of afferent impulses which, although conducted to the brain through the auditory nerve, have nothing to do with hearing, but form the basis of our sense of equilibrium. Ménière's disease (q.v.) presents as its principal symptom a constantly recurring vertigo. Disease of the middle ear, and also rarely of the external ear, is accompanied by the same symptoms. Vertigo may be caused by an alteration of the intracranial blood pressure, and occurs in anæmia, hyperæmia, syncope, epilepsy, seasickness, hypertrophy of the left ventricle of the heart, hemorrhage, injuries of the brain, or after the use of alcoholics. Sometimes a sudden change of position causes it; as bending forward, stooping, rising, raising a weight above the head, or any sudden strain on the faculty of equilibration. Vertigo accompanying indigestion is due either to reflex circulatory disturbances in the brain, or to toxic influences, such as also accompany the use of alcohol, tobacco, belladonna, hyoscyamus, the inhalation of carbonic acid gas, etc. See EAR; LABYRINTH.

VER'TUE, GEORGE (1684–1756). An English engraver and antiquary. He was born in London and studied engraving with Michael van der Gucht for several years, and afterward was employed by Sir Godfrey Kneller to engrave some of his portraits. His plates of portraits, numbering over 500, are faithful transcripts of the originals. Vertue had always cherished antiquarian tastes, and during the latter part of his life, under the patronage of the Earl of Oxford and others, he traveled about England engraving objects of antiquarian interest. He became a member of the Society of Antiquaries in 1717, and until his death was its official engraver. Nearly all the plates of the *Vetusta Monumenta* till 1756 are by him, as are the headings of the Oxford Almanacs, 1723–51. He also collected materials for a proposed *History of the Arts in England*, which were purchased, after his death, by Horace Walpole, who compiled from them his *Anecdotes of English Painting*. See Plates of CHAUCER and MILTON.

VERTUM'NUS. In Roman mythology, the husband of the goddess Pomona (q.v.). See VOLTUMNA.

VER'ULAM, BARON. See BACON, FRANCIS.

VER'ULA'MIUM. See the first article SAINT ALBANS.

VERVAIN. See VERBENA.

VER'VET. One of the two South African representatives of that section of the cercopithecine monkeys called guenons. It is small, and its general color is a greenish grizzle; but the narrow face, the hands, feet, and end of the tail are black, while the cheeks, throat, and under parts are white, and the root of the tail is red—this last feature, with the black tail end, forming a distinctive specific mark. It inhabits the forests of Cape Colony and Natal, especially near the coast, and feeds mainly on the gum of the camel-thorn mimosa and similar trees. Its scientific name was *Cercopithecus lalaudi*, but it is more correctly known as *Lasiopyga pygerythra*. Its nearest relative is the grivet (q.v.). See GREEN MONKEY.

VERVIERS, vâr'vyâ'. The capital of an arrondissement in the Province of Liége, Belgium, on the Vesdre, 16 miles by rail east-southeast of Liége (Map: Belgium, D 4). It is an attractive modern industrial town separated into a lower and an upper quarter connected by handsome boulevards. The manufacture of glass, tools, and cloth, the preparation of wool, and the dyeing of yarn, for which the local water is particularly adapted, are large industries. It was at Verviers that the German troops entered Belgium at the beginning of the great war in 1914. See WAR IN EUROPE. Pop., 1900, 52,203; 1910, 48,084.

VERVINS, vâr'văN', TREATY OF. A treaty of peace concluded between Henry IV of France and Philip II of Spain, May 2, 1598. The Spanish restored their conquests, and, in general, the treaty marked a return to the conditions of the Treaty of Cateau-Cambrésis (q.v.), in 1559. The Peace of Vervins is noted as definitely closing the period of civil war in France, and was preceded by a few days only by the celebrated Edict of Nantes. See FRANCE; HENRY IV; NANTES, EDICT OF. Consult Ernest Lavisse, *Histoire de France*, vol. vi, part i (Paris, 1904).

VER'Y, FRANK WASHINGTON (1852–). An American astronomer, born at Salem, Mass. In 1873 he graduated from the Massachusetts Institute of Technology. He served as astronomer at Allegheny (Pa.) Observatory (1878–95) and adjunct professor of astronomy at the Western University of Pennsylvania (1890–95), as professor at Brown, and was later connected with the United States Weather Bureau and the Smithsonian Institution. After 1906 he was director of the Westwood (Mass.) Astrophysical Observatory. He made various important researches.

VERY, JONES (1813–80). An American poet, born in Salem, Mass. He graduated from Harvard College in 1836, and taught Greek there during the next two years. His first published work was *Essays and Poems* (1839), edited by Ralph Waldo Emerson, with whose Transcendental views Very was in sympathy. He was a friend of Emerson, Channing, and Clarke, the last of whom contributed a preface to the complete (posthumous) edition of his *Poems and Essays* (1886). Though few in number, his poems, chiefly in Shakespearean sonnet form, are marked by religious feeling, and are subtly introspective.

VERY HARD CASH. A story by Charles Reade which appeared serially in *All the Year Round*, as a sequel to *Love Me Little, Love Me Long*, and was published in 1863 under the abbreviated title *Hard Cash*.

VERY WOMAN, A. A comedy, possibly a final version of the lost plays *The Woman's Plot* (1621) and *The Spanish Viceroy* (1624), writ-

ten by Fletcher and revised by Massinger in 1634. It was printed as the latter's in 1655.

VESA'LIUS, ANDREAS (1514–64). A distinguished anatomist, born at Brussels. He studied classics at Louvain, and medicine at Cologne, Paris, Louvain, and Padua (M.D., 1537). He lectured on anatomy in Louvain, Venice, Padua (where he was professor in 1537–44), Basel, Pisa, and Bologna. In 1544 he was made physician in chief to Charles V and later to Philip II at Madrid, where he continued mainly to reside. In 1564 he made a pilgrimage to the Holy Land. The story is that he had begun to dissect a body before life was extinct and because of this was prosecuted not only for murder but for impiety and narrowly escaped death at the hands of the Inquisition. Philip II gained a pardon for him on condition that he make the pilgrimage. While in Jerusalem he was invited to Padua to occupy again the chair of anatomy, made vacant by the death of his pupil Fallopius (q.v.). He embarked for Europe; but was shipwrecked on the island of Zante, where he died from exhaustion.

Vesalius published: a translation of the ninth book of Rhazes (1537); an atlas of six plates, *Tabulæ Anatomicæ* (1538; reprinted in facsimile by Sir W. S. Maxwell, London, 1874); and his two best-known works, *De Humani Corporis Fabrica Libri Septem* (1542) and *De Humani Corporis Fabrica Librorum Epitome* (1543). Possibly these two, and certainly the *Tabulæ*, were illustrated by Jan Stephen van Calcar, a friend of Vesalius and a pupil of Titian. Vesalius proved that Galen (q.v.) described anatomy from dissections of lower animals and not of man, and he became the pioneer of comparative anatomy and of race craniology. Fallopius criticized his teacher in his *Observationes Anatomicæ* (1561), to which Vesalius replied in *Observationum Fallopii Examen* (1561). In 1547 he published *Radicis Chinæ Usus*, the result of his observations of the new remedy China root. The great edition of Vesalius' collected works, with fine plates cut in copper by Jan Wandelaar, was published at Leyden in 1725 under the supervision of Boerhaave and Albinus. It contains also the *Chirurgia Magna*, wrongly attributed to Vesalius. Consult the lives by Burggraeve (Ghent, 1841); Roth (Berlin, 1892); and J. M. Ball (St. Louis, 1910) with reproduction of cuts. See ANATOMY.

VES'ICANT. See BLISTERS.

VESIC'ULAR MURMUR. See RESPIRATORY SOUNDS.

VESON'TIO. See BESANÇON.

VESPA'SIAN (TITUS FLAVIUS VESPASIANUS) (9–79). A Roman Emperor. He was born at Reate, in the Sabine country. His father was a man of humble origin; his mother, Vespasia Polla, was daughter of a camp prefect and sister of a senator. Entering public life, Vespasian served as military tribune in Thrace, as quæstor in Crete and Cyrene, and as ædile and prætor at Rome. In the reign of Claudius he was made commander of a legion stationed in Germany, whence he was soon sent into Britain (43), where he conquered the Isle of Wight. He became consul suffectus in 51, and afterward passed a number of years in command of Roman legions. In 66 he was chosen to conduct the war against the Jews, and this proved the turning point of his life, for he was a fine disciplinarian, and endeared himself to his troops, who, on the news of the death of the Emperor Galba, proclaimed their general Emperor, in Alexandria, July 1, 69. The Roman Senate had meanwhile named Otho Emperor, and the troops in Germany had likewise declared in favor of their general Vitellius. A civil war was thus precipitated. (See OTHO; VITELLIUS.) The legions of all the eastern provinces soon declared in favor of Vespasian, and he had the advantage also of the control of Egypt, from which he could cut off the grain supply of Rome. Leaving his elder son, Titus (q.v.), to conduct the Jewish campaign, he intrusted his interests at Rome to the care of his loyal supporter, Mucianus, Governor of Syria, remaining himself in the East to strengthen and organize his support. Otho soon met a violent death, and the army of Vitellius in Italy was routed by Vespasian's supporters at Cremona. The murder of Vitellius in December, 69, left Vespasian in control of the Roman world. The chief events of his successful reign of ten years were the suppression of a formidable revolt of the Batavians under Civilis (q.v.) (69–70), the capture and destruction of Jerusalem by Titus (70), the grand triumph of Vespasian and Titus, the construction of the Colosseum, and the conquests in Britain by Agricola (q.v.) (78–79). Vespasian was succeeded by his son Titus, to whom he had already given a share in the government. Consult his *Life* by Suetonius (q.v.); B. W. Henderson, *Civil War and Rebellion in the Roman Empire*, 69–70 A.D. (London, 1908); the article "Flavius, 49," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. i (8th ed., Leipzig, 1914).

VESPASIAN, FORUM OF. See FORUM PACIS.

VESPER. See HESPERUS; LUCIFER.

VESPERS. See BREVIARY.

VESPER SPARROW, or GRASS FINCH. A common resident sparrow (*Powcetes gramineus gramineus*) of the eastern United States and Canada, distinguished by the bright chestnut color of the bend of the wings. See GRASS FINCH.

VESPUCIUS, vĕs-pū'shĭ-ŭs, AMERICUS (It. *Amerigo Vespucci*) (1451–1512). A Florentine navigator, from whom the Western continents received their name of America. He was born March 9, 1451; entered the offices of the commercial establishment of the Medici in Florence, and between 1483 and 1492 occupied a position of responsibility with that house. In 1492 he went to Spain and established himself as a merchant in Seville. In 1495 he took over the business of another Florentine merchant of Seville, who had been in the habit of furnishing supplies for the vessels engaged in the voyages to the West Indies. This brought Vespucius into direct touch with the affairs of the New World. Vespucius claims that in 1497 he placed his business in other hands, and set out to see something of the New World for himself. Sailing in May, 1497, he was absent 18 months, probably exploring the South American coast, on the lookout for opportunities for commercial profit. Instead of returning to Spain with the vessel on which he had sailed, Vespucius seems to have left it at some port at which he met a fleet commanded by Alonso de Ojeda. Despite Varnhagen's defense thereof, most scholars do not believe in this 1497 voyage. With Ojeda he started (May, 1499) on what he calls his second voyage, lasting 14 months. He returned to Spain in September, 1500. Shortly after this he must have gone to Portugal, for on May 10, 1501, he sailed on a Portuguese expedition which

reached the South American mainland on June 6, and returned in September, 1502. In May, 1503, he sailed again with the Portuguese, returning June 18, 1504. In February, 1505, he was back in Seville, where he met Columbus, who described him, in a letter to his son, Diego Columbus, as "a very worthy man who has always endeavored to be agreeable to me. . . . He is determined to do for me all he can." This letter of Columbus has been used to discount the assertion that the two explorers were rivals, or that Vespucius tried to secure the renown properly belonging to Columbus. After a visit to the court of Ferdinand, Vespucius became a citizen of Seville again and naturalized himself as a Spanish subject, in April, 1505. He spent the next 18 months in preparing an expedition for the Moluccas, in coöperation with Vicente Yáñez Pinzón (q.v.), which was eventually prevented from sailing by Portuguese intrigues. In November, 1507, Vespucius was summoned to the court at Burgos, where he was appointed pilot major on March 22, 1508. He then repaired to Seville, where he occupied himself with the duties of his office, examining pilots, collecting geographical and cartographical data, and supervising the dispatch of expeditions to the New World. He died on Feb. 22, 1512.

During his sojourn at Lisbon, in September, 1504, Vespucius completed and dispatched to his old patrons, the Medici, an account of his alleged four voyages. The original has unfortunately disappeared, and the abridged translations which were printed at the time are so confused, and in places so incoherent, that it is impossible to decide from them (the only source of information regarding those voyages) exactly where Vespucius went, or what he discovered. It is quite certain that he explored a large section of the coast of South America, and if his claims concerning the 1497 voyage could be authenticated, they would prove that he had landed on the American mainland a few days before Cabot reached the shores of North America. A literal reading of his narrative would give an exploration from somewhere on the Guiana coast northwestward for 1000 miles or more, reaching into the Pacific Ocean off the California coast. As there are physical difficulties against this, the champions of Vespucius have ascribed to him a voyage around the Gulf of Mexico and up the United States coast as far as the Chesapeake, but the country described by Vespucius is clearly that of northeastern South America, perhaps stretching south on his later voyages nearly to La Plata. Aside from all the other evidence, internal and external, against this voyage of 1497 with its alleged vast discoveries, we have the famous map of Juan de la Cosa made in 1500, after he had served on the 1499 voyage with Ojeda and Vespucius, and which indicates all the farthest known points, but marks none of the places that would have to be included if Vespucius' figures and claims were correct.

Vespucius' narrative was translated in 1507 by Martin Waldseemüller (q.v.), who printed it as an appendix to his *Cosmographiæ Introductio*. In this work he made a suggestion that inasmuch as Vespucius had been the first to make known this new southern continent, it might be proper to name the new continent America. The new name was given only to the newly discovered southern continent, with no thought of extending it over the islands of the West Indies. Waldseemüller's suggestion was embodied in printed and manuscript maps, a few of which have survived to the present day. The name gradually became fixed in popular usage. The actual facts regarding Vespucius are given in Henry Harrisse, *Discovery of North America* (London, 1892). Consult also John Fiske, *Discovery of America* (New York, 1892), and C. E. Lester, *Life of Americus Vespucius* (New York, 1905). The details of Waldseemüller's christening of America are given in Justin Winsor, *Narrative and Critical History of America*, vol. ii (New York, 1886), and in Thatcher, *Continent of America* (ib., 1896). One of the most scholarly books on the whole controversy is "The Letters of Amerigo Vespucci," etc., translated with Notes and an Introduction by C. R. Markham, in The Hakluyt Society, *Publications, No. 90* (London, 1894).

VEST, George Graham (1830–1904). An American political leader, born at Frankfort, Ky. He graduated at Centre College, Danville, Ky., in 1848, and in 1853 from the law department of Transylvania University at Lexington. He thereupon removed to Missouri, where he practiced his profession first at Georgetown and then at Booneville. He was a Democratic member of the Missouri House of Representatives in 1860–61; of the Confederate House for two years, and of the Confederate Senate for one year. After the war he renewed the practice of law at Sedalia, Mo., and later at Kansas City. Vest was a member of the United States Senate from 1879 to 1903.

VESTA (Lat., connected with Gk. Ἑστία, *Hestia*, goddess of the hearth and home). In classical mythology, the goddess of the hearth fire. In Greece, Hestia plays but a very small part in legend. The manifest connection of her name with the word for hearth made it difficult to conceive of her as fully a personal deity. However, she appears as the eldest daughter of Cronos and Rhea, and as wooed by Poseidon and Apollo, whose suit she escaped by vowing eternal virginity. If legend made little of Hestia, her cult was widespread in all Greek lands. To her, therefore, was given the honor of a place in all temples of the gods and all houses of men. Every community had its common hearth where the sacred fire burned (a survival from the time when the primitive community maintained constantly a fire for common use). From this sacred fire every colony took the sacred flame which was to kindle a new sacred centre in close connection with the old. Even confederacies recognized a central hearth, as the Arcadians at Tegea, the Cyclades at Delos, and the Amphictyonic Council at Delphi. In some places the sacred fire was in charge of maidens, in others of old women, and we hear of priestesses of Hestia in Athens and Sparta. At Rome this cult reached a far more prominent place than it seems to have assumed in Greece. *Vesta mater* is the only female in the original series of great Roman gods, and as Janus occupied the first place in the ritual invocations, so Vesta closed the series. The worship of the goddess was spread throughout Latium also, though the evidence for its early existence elsewhere in Italy is unsatisfactory. Her festival, the Vestalia, fell on June 9, while on March 1 the sacred fire was solemnly renewed, by a method belonging to primitive times (i.e., by the friction of dry sticks or by bringing the rays of the sun to a focus with a concave

mirror). The state worship was, however, the most important. Near the Forum, at the foot of the Palatine, close to the fountain of Juturna and the temple of Castor, was the little circular temple of Vesta (Ædes Vestæ), containing no image, but only the sacred hearth with the ever-burning fire, and a shrine in which were kept the implements and provisions for the sacrifices, and, according to popular belief, the Trojan palladium and other sacred objects on which the safety of the city was believed to depend. Near the temple was the Atrium Vestæ, where the vestal virgins lived. From the time of Numa Pompilius there were four vestals; some later King added two others. At first the King, later the Pontifex Maximus, controlled the selection of vestals. To be eligible a girl must be over six and under ten years of age; her father and mother both must be living; she must be without mental or physical defects; and, finally, she must be a daughter of a free-born citizen resident in Italy. Consult Aulus Gellius, *Noctes Atticæ*, i, 12. They served for 30 years, bound by a vow of virginity, and busy with exacting duties, chief among which were the guarding and annual renewing of the sacred fire. In return they enjoyed many privileges.

Farnell, *The Cults of the Greek States*, vol. v (Oxford, 1909); W. W. Fowler, *The Religious Experience of the Roman People* (London, 1911); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912); and the articles "Vesta" and "Vestalin" in Friedrich Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

VESTALE, La. An opera by Spontini (q.v.), first produced in Paris, Dec. 15, 1807.

VESTED RIGHT. A technical legal phrase denoting a present fixed interest resting in a definite person or corporation in or to a property right or franchise. It is the opposite of a prospective or contingent interest of any nature. For the security of property interests and the general welfare, the law very jealously protects such rights, and will not permit their destruction or allow their holders to be hindered in the full enjoyment of them, except for the public good, and then only upon just compensation being made therefor. The Fifth Amendment of the United States Constitution provides that no person shall be deprived of property without due process of law, but as this has been construed to be a restraint upon the Federal government only, it became necessary to incorporate in the Fourteenth Amendment a prohibition against any State taking such action. These constitutional provisions make vested rights secure and leave only the difficulty of determining what may be included under that head. A right in or to real or personal property not subject to a condition or contingency is considered as vested in the person who enjoys it. An expectant interest is, however, sometimes confused with one which has become fixed and unconditional. For example, the right of a husband to curtesy in his wife's property is, during her lifetime, inchoate or contingent in its nature, depending upon his survivorship. Therefore, it amounts only to an expectancy during that period, and may be regulated or even taken away by statute.

No one has a vested interest or property right in the rules of the common law as such, or the law as contained in statutes, and, therefore, the law may be changed by statute, even though the amendment may cause damage and hardship to persons who may have taken action relying upon the continuance of the existing law. For example, a great business may be established and built up under a high tariff act, which would be rendered very unprofitable if the tariff were reduced, but the owners of such an enterprise have no constitutional right to object to an amendment of the tariff act. Thus, also, the rules of descent may be changed, as the living have no heirs, but such a change would not affect the rights of persons who inherited property upon the death of ancestors before the amendment. Furthermore, such changes in the rules of law may be made retroactive, except in criminal cases. See Constitutional Law; Due Process of Law; Police Power; Property, and consult authorities there referred to.

VESTERÅS, vĕs'tēr-ȯs. The capital of the Province of Vestmanland, Sweden, on a northern bay of Lake Mälar, 69 miles by rail northwest of Stockholm (Map: Sweden, F 7). The handsome Gothic cathedral, built by Birger Jarl before 1271 and since then twice restored, has a tower 309 feet high, the loftiest in Sweden. The episcopal library of more than 12,000 volumes contains the books taken by the Swedes from Mainz in the Thirty Years' War. The Gymnasium dates from 1620, and the castle from about 1390. There are iron and copper mines in the vicinity of the town. Vitriol is manufactured. Pop., 1900, 11,999; 1910, 19,145. At a diet held here in 1527 Gustavus Vasa secured the establishment of Protestantism in Sweden.

VESTIBULE (Lat. *vestibulum*, forecourt, entrance, probably connected with *Vesta*, goddess of the hearth and home, Gk. ἄστυ, *asty*, city, Skt. *vas*, to dwell; less plausibly associated with Lat. *ve-*, apart + *stabulum*, abode). (1) An entrance lobby preceding a more important interior space for general circulation and communication; or (2), a lobby or small antechamber in the interior of a building. In dwellings and small buildings it is the space between the outer or storm door and the inner entrance door. Its function is, first, to provide an intermediate space between the outdoor air and the interior of the building, so that the wind, rain, heat, or cold from out of doors may not penetrate the building with every entrance or exit of one or more persons; secondly, to form an approach or gradual transition from the exterior architecture to that of the interior; thirdly (this especially in ancient Roman buildings), to provide a waiting place sheltered and inclosed for persons awaiting admission to the house or hall. In this sense the term is also often applied to an anteroom between a public hall and an important office or suite, and to the lobby between the public hall of an apartment house and the private hall or corridor of any of the apartments. The narthex of a church or basilica is also called the vestibule.

VESTIGIAL (from Lat. *vestigium*, footprint), or **RUDIMENTARY STRUCTURES.**

Organs which in some animals appear not to function, but which resemble functional organs in others. They are believed to be phylogenetic and formerly useful. There are reasons for believing that vestigial structures are rarely, if ever, present in plants. See DEGENERATION AS A FACTOR IN EVOLUTION; EVOLUTION; ORGAN, *Undeveloped and Vestigial Organs*.

VESTMENTS, SACRED. See COSTUME, ECCLESIASTICAL; EMBROIDERY.

VES'TRIS, MADAME (LUCIA ELIZABETH MATHEWS, née BARTOLOZZI) (1797–1856). An English actress, born in London. She was married at 16 to Armand Vestris, a celebrated dancer and ballet master at the King's Theatre. She then studied singing under Corri and made her début in Winter's *Il Ratto di Proserpina* in 1815 at the King's Theatre, London. She became a favorite with the public and appeared at different places in England and France. A large part of her success was undoubtedly due to her good fortune in securing great artists to appear with her. In Paris she played Camille in *Les Horaces* with the celebrated Talma as *Horace*. Her greatest English success was as Tilla in the *Siege of Belgrade* (London, 1820), which permanently established her in London as a popular favorite. Here she had the advantage of introducing popular ballads such as *Cherry Ripe* and *Meet Me by Moonlight Alone*. She accumulated a fortune and became manager in turn of the Olympic, Covent Garden, and Lyceum theatres. Her husband deserted her in 1817. She married in 1838 Charles Mathews the younger, and with him produced at Drury Lane important operas and musical productions of the period.

VESTRY (OF., Fr. *vestiaire*, from Lat. *vestiarium*, wardrobe, neut. sing. of *vestiarius*, relating to clothing, from *vestis*, clothing). (1) The room in which church vestments were kept, and where the clergy robed. Since meetings for parish business were sometimes held there, it came to mean (2) the representative and administrative body in parishes of the Church of England and of the Episcopal church in the United States. In England vestries are either general or common, i.e., composed of all the parishioners who are ratepayers, or select, i.e., composed of representative parishioners. Anciently all the affairs of a parish, as such, whether ecclesiastical or civil, were regulated in vestry. At the present time, however, the only duties of an ecclesiastical nature which a vestry has to perform are the election of a church warden (q.v.), the levying of church rates, and the reception of the accounts of church trustees. A vestry cannot interfere (except by observation and complaint) with the manner in which the services in the church are conducted. Although the minister is the proper head of the vestry, and, if present, is entitled to preside at all meetings, he is not an essential part of it.

The vestry in American parishes is a much more highly developed body with wider powers. They, together with two wardens, are elected by the members of the congregation at the annual parish meeting to serve for one year. The rector is ex officio a member of the vestry, and is entitled to preside, if present, at all its meetings. The function of the vestry is to represent the congregation in law, to have charge and care of its property, and to collect and disburse its revenues. The vestry choose and call a rector and make provision for his support. If the rector prove unworthy or incompetent, they may make complaint to the bishop of the diocese, but they may not themselves remove him. In some dioceses the vestry, instead of the body of parishioners, elect the lay deputies to represent the parish in the convention or council of the diocese. Consult H. M. Baum, *Rights and Duties of . . . Vestrymen in the American Church* (Philadelphia, 1879).

VESU'VIANITE, or IDOCRASE. A mineral basic calcium-aluminum silicate crystallized in the tetragonal system. It has a vitreous lustre and is brown to green, sometimes light-blue, in color. It was originally found among the masses ejected from Vesuvius (whence its name) and Monte Somma, Italy. It also occurs with frequency in limestone, serpentine, gneiss, and other rocks. The crystallized varieties are sometimes cut as gems, especially in the form of the letters V and I.

VESU'VIUS. A volcano near the eastern shore of the Bay of Naples, about 10 miles from the city of that name (Map: Italy, E 4). It is a solitary mountain rising from the plain of Campania, with a base of about 30 miles in circumference, and surmounted by two summits. The higher of these is a nearly perfect cone known as Vesuvius proper. The other, of ridgelike outline, partially inclosing the central cone, is called Somma. Up to the year 79 A.D. Vesuvius was looked upon as a truncated mountain, its volcanic origin being unsuspected. The crater formed a deep depression in the summit, and its sides were forest clad. Suddenly on August 24 of that year an eruption began with the appearance of a huge black cloud which rose from the mountain, accompanied by an explosion that blew off the top and rained a mass of ashes, lapilli, and mud on the towns and cities in that region. No lava was ejected in this eruption, nor in fact during any other eruption within historic times until the year 1066. In the first historic eruption Pompeii was buried under a thickness of 20 feet of loose ashes, and Herculaneum was covered by a torrent of mud. The elder Pliny, who commanded the Roman fleet at Misenum, sailed to help the distracted inhabitants. He landed near the base of the mountain and was himself suffocated by the vapors emanating from the volcano. The younger Pliny gives a graphic account of the eruption in two letters to Tacitus (written long after the event), which are well known.

Since the year 79 there have been a number of eruptions. One occurred in the year 203, and another in the year 472, during which the ashes were carried as far as Constantinople. Other outbursts were noted in the years 512, 685, 983, and 1066. In 1631 the villages at the base of Vesuvius were covered with lava and torrents of boiling water. During an eruption of 1779 showers of ashes, scoriæ, and stones were thrown to a great height, and streams of lava poured down the side of the cone. In 1794 another violent outburst took place which destroyed much of the town of Torre del Greco, and in the eruption of 1822 the mountain is said to have lost 800 feet of its height, but most of this loss has been made up by subsequent eruptions. Previous to this eruption of 1822 the summit is said to have been a rough and rocky plain, covered with blocks of lava and scoriæ, and rent by numerous fissures, from which issued clouds of smoke; it was then altered to a vast elliptical chasm, 3 miles in circumference,

and about 1000 feet deep. Another remarkable eruption took place in May, 1855, and a series of outbursts began in 1865. More recent eruptions have occurred in 1872, 1878, 1880, 1895, and 1906. In the last there was a considerable destruction of life and property. The present height of Vesuvius is a little over 4000 feet, and that of Somma 3730. The lavas of Vesuvius belong to the acid types, and among the gases hydrochloric acid has been detected. Ferric chloride often forms a yellow crust on the lava, especially in the vicinity of fumaroles. A railroad has been built from the base of the cinder cone to the summit near the edge of the crater.

Bonney, *Volcanoes: Their Structure and Significance* (3d ed., New York, 1912); Shaler, *Aspects of the Earth* (ib., 1890); Alfred Lacroix, *Eruption of Vesuvius in . . . 1906*. See VOLCANO; POMPEII.

VESZPRÉM, vĕs'prām (Ger. *Veszprim*). The capital of the County of Veszprém, Hungary, on the Séd, 60 miles southwest of Budapest (Map: Hungary, E 3). It has a fine cathedral, a Piarist college, a Gymnasium, and an institution for disabled priests. The vine, fruits, and tobacco are cultivated; there are coal mines, iron works, and large cattle markets. Pop., 1900, 14,114; 1910, 14,677, mostly Magyars.

VETĀLAPAÑCAVIṂŚATI, vā-tä'lä-pän'-chä-vĭm'shä-tē (Skt., 25 stories of a demon). A collection of Sanskrit novelettes. According to the framework of the tales, King Vikrama (q.v.) is bidden by an ascetic to carry a corpse which hangs on a certain tree to a graveyard where certain magic rites are to be performed which will give the monarch supernatural powers. While bearing this corpse, complete silence is enjoined on the King. As Vikrama carries the body, a Vetāla, or demon, which enters corpses, tells him a story, which ends in a problem that he asks the King to solve. Vikrama inadvertently answers, and the corpse returns immediately to the tree. This continues until the Vetāla has told 25 stories. The tales are of much interest, and the entire work bears a marked resemblance to the two other principal Sanskrit collections of like genre, the *Siṁhāsana-dvātriṁśikā*, or *Thirty-two Stories of the Lion-Throne* (also called *Vikramacarita*, or *Adventures of Vikrama*), and the *Sukasaptati* (q.v.), or *Seventy Stories of a Parrot*. The Vetālapañcaviṁśati has been edited by Uhle (Leipzig, 1881) and translated by Burton, *Vikram and the Vampire* (new ed., London, 1893).

VETANCURT, vā'tän-kōōrt (or **VETANCOUR**), AUGUSTÍN DE (1620–1700). A Mexican historian, born in the city of Mexico. He joined the Franciscan Order at Puebla, became a member of the provincial chapter, and when he died was commissary-general of the Indies. He was a profound Aztec scholar, and published *Arte de lengua mexicana* (1673) and *Teatro mexicano, descripción breve de los sucesos ejemplares, históricos, políticos, militares y religiosos* (2 vols., 1697–98). Much of the work is based upon that of Torquemada, but it is nevertheless of great value. A reprint of the *Teatro*, etc., was issued at Mexico in 1870–71 as vols. vii–x of the *Biblioteca Iberia*. Consult H. H. Bancroft, *History of Mexico*, vol. iii (San Francisco, 1883).

VETCH (OF. *veche*, Fr. *vesce*, from Lat. *vicia*, vetch; connected with Gk. *βικον, bikion*, vetch, Lat. *vincire*, to bind). A name properly applied to the genus *Vicia*, but loosely related to other genera of the family Leguminosæ. There are numerous species, mostly climbing annual, biennial, and perennial herbs, natives of Europe, northern Africa, western Asia, and America. Their cultivation dates back to the Romans. The crop can be grown on a variety of soils, but heavy well-tilled soils yield best. They are generally grown with a cereal crop for a support and to keep them off the ground. The annual species most commonly cultivated in Europe is the common or spring vetch or tare (*Vicia sativa*). In the United States this species, which is susceptible to dry and hot weather, has not given general satisfaction. One of the best species introduced into the United States is the hairy vetch (*Vicia villosa*), an annual which is successfully grown in various

HAIRY VETCH (*Vicia villosa*).

sections of the country. Hairy vetch is sown in August and September when intended for winter forage, and in regions of mild winters it will produce a second crop early in the spring. In the United States it is generally treated as a winter annual, being sown in the fall and harvested the following spring or early summer. For summer forage it is sown in April and May. The yield of hay varies from 2 to 4 tons per acre. See Plate of USEFUL LEGUMES with article LEGUMINOSÆ.

Some of the most important species not belonging to the genus *Vicia* are kidney vetch, or horned pod clover (*Anthyllis vulneraria*), winter vetch (*Lathyrus hirsutus*), and Dakota vetch (*Hosackia purshiana*). Kidney vetch is a perennial found wild in Europe on dry, thin soils with calcareous subsoil. Its cultivation originated in Germany about 1860. The yield of hay is usually small. Winter vetch is valuable in southern latitudes, where it furnishes forage late in autumn and early in spring. In the United States it is not hardy north of the latitude of 40°. Dakota vetch is a common bushy annual, native to the Rocky Mountain region of the Northwest, affording pasturage and hay in its wild state. Both green and cured vetches are fed to farm animals. Uncured spring vetch cut in bloom has the following composition: water, 83.9; protein, 4.0; fat, 0.6; nitrogen-free extract, 6.3; crude fibre, 3.2; and ash, 2.0. Hairy vetch: water, 68.7; protein, 5.2; fat, 1.3; nitrogen-free extract, 14.7; crude fibre, 7.7; and ash, 2.4. Vetch hay contains: water, 11.3; protein, 17.0; fat, 2.3; nitrogen-free extract, 36.1; crude fibre, 25.4; and ash, 7.9 per cent.

Like other leguminous crops, vetch is fairly rich in protein.

Consult United States Department of Agriculture, *Farmers' Bulletins Nos. 515 and 529* (Washington, 1913), and C. V. Piper, *Forage Plants and their Culture* (New York, 1914). See TARE.

VETCH, CHICKLING. See LATHYRUS.

VETCH, SAMUEL (1668–1732). The first British Governor of Nova Scotia, born near Edinburgh, Scotland. He was educated at Utrecht, and returned to England in 1688 with Prince William of Orange. In 1705 he was sent by Governor Dudley of Massachusetts to Canada to negotiate a treaty of neutrality and arrange for an exchange of prisoners. A plan for the capture of Canada proposed by him in 1708 was accepted by the British Government, but was never carried out. Subsequently, as the representative of the colonists, he induced the Government to undertake an expedition against Port Royal (now Annapolis, N. S.). Vetch was one of the commanders of this expedition, and after the capture of Port Royal in October, 1710, he became Governor of the conquered territory, part of which was now renamed Nova Scotia. In 1711 he was besieged in Port Royal by the French, but was relieved by the approach of a British squadron. In 1712 he was superseded as Governor by Sir Francis Nicholson, but was again Governor in 1715-17. He died in London.

VETCHLING, MEADOW. See LATHYRUS.

VETERAN LEGION, UNION. A patriotic organization, organized in Pittsburgh, Pa., in March, 1884. The simple requirements for admission to the Grand Army of the Republic (q.v.) had led to criticism, and in consequence the Union Veteran Legion requires for admission to membership that the applicant must have volunteered prior to July 1, 1863, for a term of three years and have served two years continuously in the same command unless discharged by reason of wounds. There are organizations in nearly all the States and the District of Columbia, and about 150 local bodies known as encampments, with a total membership of over 20,000. It has as an auxiliary an organization of women known as Ladies of the Union Veteran Legion.

VETERAN NAVY, THE UNITED STATES. See UNITED STATES VETERAN NAVY.

VETERAN UNION, UNION. A patriotic society founded in Washington, D. C., in 1886. Membership is extended to veterans who served honorably in the army, navy, or marine corps of the United States between April 12, 1861, and April 30, 1865, who participated in one or more engagements or battles, and received an honorable discharge. There are about 50,000 members.

VETERINARY MEDICINE (Lat. *veterinarius*, relating to beasts of burden, from *veterina, veterinum*, beast of burden). In early times men depended on domesticated animals for food and transportation. Attention was therefore devoted to a study of the means of combating animal plagues. The causes of animal diseases were grossly misunderstood, on account of superstitions, but certain men acquired reputation from their skill in the treatment of diseases by the application of empirical therapeutics. Some of the earliest veterinary literature is found in the ancient writings of India. Among the Greeks much was written on the anatomy and diseases of animals. Hippocrates found hydatids in the lungs of animals, and described articular dislocations, dropsy, epilepsy, and gid. Xenophon mentions a number of diseases of the horse. Aristotle described the chief symptoms of angina, tetanus, glanders, and other diseases. Among the Romans there were many writers on veterinary topics—Varro, Celsus, Columella, Pliny, Galenus.

The anatomical knowledge of the Greeks and Romans was largely based on the dissection of domesticated animals. This was practiced by physicians and veterinarians alike. The organs and parts of the animal body were well understood and accurately described by Aristotle, Herophylus, Erasistratus, and Galen. Concerning the nature and occurrence of animal plagues we have many records. Mention of destructive epizoötics is made in Deuteronomy and by Ovid, Homer, Thucydides, Vergil, Columella, and other Greek and Roman writers.

There were veterinarians attached to the Roman armies, but Vegetius Renatus states that their work was not skillful and that the profession was not held in high esteem. During the Middle Ages the Arabs made some progress in the treatment of diseases of the horse. In general, however, little real advance was made in veterinary medicine from 500 to 1500 A.D. Empiric "horse doctors" were found among the Germanic and Celtic peoples. Elaborate treatises on horseshoeing were published. The extensive movements of the nomadic races during the Middle Ages were responsible for the enormous distribution and destructiveness of animal plagues at this period. Not less than 32 epizoötics spread over the greater part of Europe during the Middle Ages and affected not only all domestic animals, but also man. During the first part of the Middle Ages the study of human anatomy was greatly neglected. With the revival of this study in the thirteenth to the fifteenth centuries, veterinary science was neglected. The *Anatomia del Cavallo*, by Carlo Ruini, however, marked a distinct advance in the study of animal anatomy.

While much information regarding animal diseases was accumulated anciently and during the Middle Ages, this knowledge was mere empiricism—experiences without formulation of underlying principles. Modern veterinary medicine, however, has been placed upon the same basis as human medicine and by similar methods of investigation. The veterinary investigator has found a most fruitful field in the pathology of organic, constitutional, functional, and infectious diseases of animals, as well as in bacteriology, methods of vaccination and immunization, and animal hygiene and methods of disinfection. Systematic investigations have been made in veterinary pharmacology and toxicology (including mineral and plant poisons). The field now includes meat and milk inspection, the establishment of quarantine, regulating traffic in live stock, and stamping out animal plagues, as well as general practice. While in the past there was most demand for the practitioner's services in connection with the horse, the raising of more improved stock and the increased value of live stock in general have caused greater attention to be given to their ailments and to providing proper conditions of hygiene for them. In large cities there are specialists in the diseases of dogs, cats, and other pets. The establishment of veterinary schools has done much to promote the science. The first veterinary

school was established at Lyons, France, in 1762. Later schools have been at: Alfort (1766), Copenhagen (1773), Vienna (1777), Marburg (1789), Berlin (1790), London (1792), Madrid (1793), St. Petersburg (1808), Stockholm (1820), Edinburgh (1825), and New York 1857). In the United States the best veterinary schools are connected with State universities or other institutions of learning. Among the more important of these are the universities of Pennsylvania, Cornell, and Ohio. In connection with a number of the agricultural colleges courses in veterinary science are given and veterinary degrees are granted.

Until recently the entrance requirements and standard of instruction in veterinary schools have not been as high as they should be. The veterinary profession was accordingly considered distinctly lower than that of human medicine. Persistent efforts of more progressive veterinarians have brought about the gradual elevation of entrance requirements in the better class of veterinary schools, the extension of the course so as to include three or four years of regular academic length, and a decided improvement in the social and scientific standard of the veterinary profession. The American Veterinary Medical Association wields a strong influence in the same direction, since graduation from an approved school is required for eligibility to membership.

As a good example of a four years' veterinary course that at the Iowa Agricultural College may be cited. The entrance requirement is a certificate of graduation from an accredited high school, or examination in subjects covering an equivalent course. The subjects taught during the veterinary course include the following: Comparative anatomy, histology, physiology, pharmacy, materia medica, therapeutics, structural botany, chemistry, poisonous plants, entomology, pathology, bacteriology, physical diagnosis, vertebrate zoölogy, animal parasites, animal husbandry, theory and practice of veterinary medicine, ophthalmology, surgery, embryology, horseshoeing, milk inspection, meat inspection, sanitary science, obstetrics, jurisprudence, etc. It will readily be seen that such a course offers instruction not only in the subjects immediately concerned in veterinary practice, but also in related fields, so that the student receives a rounded, comprehensive training.

Great changes have taken place in veterinary practice. In place of the indiscriminate use of firing iron, purgation, and bloodletting, we have a more rational system of treatment on a humane basis. Moreover, the excessive use of drugs has been abandoned and more attention given to the proper care and diet of animals and to preventive medicine. The course and severity of most diseases may be greatly modified by the use of pure water and wholesome food in reasonable quantities. Careful attention to the temperature and ventilation of stables is also important, especially in the treatment of diseases of the respiratory organs. It is along the line of preventive medicine, however, that the greatest progress has been made. Successful methods of vaccination and immunization have been devised for the prevention of anthrax, blackleg, hydrophobia, Texas fever, rinderpest, hog cholera, tetanus, etc., and much use is made of serodiagnosis—especially complement fixation, which is employed in glanders, dourine, contagious abortion, Malta fever, hemorrhagic septicæmia, etc. (See these articles.) The period of incubation of various diseases has been definitely determined and upon the data thus obtained quarantine regulations for dealing with infectious diseases have been formulated. The importance of isolating diseased animals and thoroughly disinfecting the premises after the occurrence of animal plagues is well understood. The adoption of such measures tends to restrict the spread of any epizoötic. Sometimes great losses to the animal industry of a country have been avoided apparently by the application of very drastic methods of eradication, including the destruction and innocuous disposal of all affected animals. Such measures are usually accompanied with the payment of an indemnity by the government. Great advances have been made in methods of disinfection by means of corrosive sublimate, formalin, live steam, lime, copper sulphate, lysol, carbolic acid, and other antiseptics. The development of antisepsis has yielded as important results in veterinary practice as in human surgery. In ordinary veterinary practice, however, the observance of strict antiseptic precautions is an exceedingly difficult matter.

In veterinary surgery a much larger proportion of operations are made without anæsthesia than in human surgery. It is generally believed that minor operations cause less pain and inconvenience to the animal than the struggles during administration of anæsthetics. Ether or chloroform is used for the larger animals, and ether alone for cats and dogs. In minor operations and in determining the location of lameness cocaine is satisfactory. In veterinary practice drugs are ordinarily administered in the allopathic form. Medicines are administered by way of the mouth in the form of balls, boluses, pills, capsules, and drenches; by hypodermic, intratracheal, intravenous, intra-abdominal, or intragastric injections; or in the form of an enema. Drug doses are usually larger than for man and vary according to the size of the animal.

As a rule veterinary dentistry is merely one branch of the ordinary practitioner's work, and is confined almost entirely to equine practice. There are but few locations where there is demand for specialists to devote their whole time to this work. Some horses require frequent attention to their teeth on account of the tendency to develop sharp points and other irregularities.

The importance of veterinary science to animal industry can scarcely be overestimated. The veterinary inspection and quarantine service make it possible to import high-bred stock into the United States without danger of introducing infectious diseases among the home herds. The improvement of the dairy and beef industries in the Southern States was not possible until a method was discovered for immunizing northern cattle against Texas fever. Before this was accomplished high-bred dairy and beef cattle were not imported into the South, for the reason that from 70 to 90 per cent of them died after exposure to infection. In South Africa the method of inoculation devised by Koch, the use of serum, etc., greatly reduced the losses from rinderpest, and put the business of cattle raising on a stable basis. As long as animals affected with tuberculosis had to be destroyed the improvement of dairy and beef herds was a difficult and expensive matter. The Bang method for controlling tuberculosis, however, makes it pos-

sible to utilize full-blooded tuberculous animals for breeding purposes without danger to the future of the herd.

The relation of this service to human health is best shown in the inspection of milk and meat. Since many diseases are transmissible between man and animals, it is deemed necessary to exercise some control of the milk and meat supply. The importance of sanitary regulation of the traffic in milk and meat is rapidly gaining the recognition of legislators, and inspection of these products is quite generally required. In Germany there is a federal inspection of all meat and meat products, and in the United States export meat is inspected by the federal authorities. Inspection is merely one of the functions of the veterinary service.

The organization of the veterinary service differs somewhat in different countries, according to local conditions. In Germany, England, and other European countries there is an army veterinary corps, the personnel of which bear titles corresponding to the regular army grades. In the United States veterinarians attached to the army are civil and not military officers. Nearly all European and other foreign countries maintain some form of official veterinary service, charged with investigation of outbreaks of contagious or otherwise serious diseases among domesticated animals, and of inspecting animals and animal products which may be imported into the country. Germany has developed an elaborate organization, with department and district veterinarians in various parts of the Empire. Appeal may be taken from the decisions of these officials to the Federal Veterinary Commission or to the Imperial Health Office. From time to time special commissions are appointed for the investigation of urgent problems. In most of the English colonies there is a government veterinarian or chief inspector, with numerous deputies and assistants.

In the United States these duties devolve upon the Bureau of Animal Industry of the United States Department of Agriculture, and upon the various State veterinarians and State boards of agriculture. The Bureau of Animal Industry maintains inspectors and special agents in various parts of the country, and has charge of quarantine regulations. The State veterinarians have full authority to investigate animal diseases and to enforce all State laws concerning such matters. Many of the larger cities maintain municipal veterinarians in connection with the boards of health. The majority of animals kept in captivity in zoölogical gardens are subject to the diseases which affect farm animals. Tuberculosis is the most important of these, and affects nearly all captive animals. It is especially fatal to apes and monkeys. On account of this it has been found necessary to fulfill the conditions of ventilation and other sanitary requirements in the construction of animal houses. Official veterinarians are maintained in connection with the larger zoölogical gardens and administer treatment in cases of curable disease. The administration of medicines to most wild animals in captivity is not an easy matter, but may usually be accomplished in connection with food and drink. Surgery on such animals is largely confined to the reduction of dislocations and the setting of broken bones. Veterinary medicine compares favorably in its achievements with human medicine. The etiology, pathology, treatment, and prevention of a number of animal plagues have been carefully and satisfactorily worked out. Blackleg and Texas fever, for example, are controlled as easily as smallpox and diphtheria in man and rather more effectively. The discoveries regarding the etiology of malaria and yellow fever in man have been paralleled by equally brilliant and important results obtained in studying the protozoön diseases of animals—e.g., surra, dourine, mal de caderas, nagana, etc. Many problems, however, remain to be solved, and investigators have, in the study of animal diseases, a very tempting field which already boasts of such distinguished names as Koch, Ostertag, Bang, Von Behring, Kitt, Chauveau, Nocard, Arloing, Perroncito, Hutyra, Marek, McFadyean, T. Smith, Salmon, Pearson, Law, Moore, Melvin, Mohler, Eichhorn, etc.

Hemenway, *The Essentials of Veterinary Law* (Evanston, Ill., 1916).

A large and increasing number of veterinary journals are published, among which may be mentioned the *Journal of the American Veterinary Medical Association*, formerly *The American Veterinary Review* (Ithaca); and the *American Journal of Veterinary Medicine* (Chicago). The bulletins and reports of the Bureau of Animal Industry and of the State Experiment Stations and State Boards of Agriculture are also important sources of veterinary information.

VETIVER, VITIVERT (from East Indian *vitivayr*), or CUSCUS. The dried roots of an East Indian grass (*Andropogon squarrosus* or

Vetiveria zizanioides) which has an agreeable and persistent odor, resembling sandalwood. It is much prized in India and elsewhere for perfuming linen, etc., making baskets, fans, and mats. It grows in low, moist, rich soils, and has been introduced in the West Indies, Brazil, and Louisiana to some extent. It has been grown in Tennessee, but the plants do not bloom. In Florida and along the Gulf it is considered a weed pest.

VETO (Lat., I forbid). In its most general application, the power of the chief executive of a government to negative the acts and resolutions of the Legislature. There are several forms and degrees of veto power, the suspensive, qualified, and absolute vetoes, and the so-called "pocket" veto. The suspensive veto is the form employed in France, where the President may suspend the operation of any law passed by the Legislature and demand its reconsideration. If the bill is repassed by the ordinary majority it becomes a valid law, notwithstanding the disapproval of the President. The qualified veto is the form most generally employed in constitutional States. It allows the executive a negative on all bills passed by the Legislature, subject to the power of the Legislature to override the effect of the veto by an extraordinary majority. The absolute veto is one which cannot be overridden by the Legislature by any majority. The "pocket" veto is defined below.

The veto is the remnant of the more extensive legislative power formerly possessed by the crown. In Great Britain this right was unquestioned from the time of the Tudors until the revolution of 1688. From then it was used more sparingly until 1707, when the refusal of Queen Anne to give her assent to a militia bill was the last instance of its exercise by an English sovereign.

In the American Colonies the royal governors were given the authority to veto any measure passed by the Colonial Legislatures, while in all except Rhode Island and Connecticut and possibly Maryland the King or the proprietaries had an absolute veto on all measures, even though approved by the Governor. In the United States Constitutional Convention of 1787 Gerry introduced the principle of the Massachusetts veto, and after discussion it was adopted. The clause provides that every bill which shall have passed the two Houses shall be presented to the President for his signature; if he approve he shall sign it; if not, he shall return it with his objections to the House in which it originated. The two Houses are then required to enter the objections upon their respective journals and proceed to reconsider it. If after such reconsideration two-thirds of each House shall approve the measure it shall become law, notwithstanding the executive veto. If any bill is not returned by the President within 10 days (Sundays not included) after presentation to him it shall become law without his signature unless Congress by adjournment prevent its return. This is the so-called "pocket" veto. Notable instances of the exercise of the veto power by the Presidents have been the vetoes of the bills for the recharter of the United States Bank by Jackson and Tyler; the veto of the Civil Rights, Freedmen's Bureau, and Reconstruction bills by Johnson; and the veto of the currency-inflation bill by Grant. The veto power was used sparingly by the first six Presidents. President Cleveland during his first term vetoed 301 bills, nearly twice as many as had all his predecessors combined. The majority of Cleveland's vetoes were private pension bills which had passed with little opposition; only two of these were passed over his veto. The principle of the veto has been incorporated in all the State constitutions except that of North Carolina, where the legislative authority is vested in the Legislature alone. Consult Mason, *The Veto Power* (Boston, 1891); Wyman and Sherwood, *Veto Power in the Several States* (Providence, R. I., 1907).

VETTER, Lake. See Vätter, Lake.

VETURIUS, TITUS. See Caudine Forks.

VEUILLOT, vēl'yō', Louis (1813–83). A French ultramontane publicist and author, born at Boynes (Loiret). Self-educated, he began to contribute to journals supporting the government, edited from 1831 the *Echo de Rouen* and from 1837 in Paris the *Charte de 1830* and afterward *La Paix*. After a visit to Rome in 1836 he had become the most uncompromising representative of ultramontanism in France and as contributor to (since 1843) and editor of (since 1848) its chief organ, the *Univers Religieux*, upheld with great talent the claims of the papacy to unrestricted dominion over church and state. His polemics against the Italian policy of Napoleon III in 1860 led to the suppression of the *Univers*, which did not appear again until 1867. During the Council of the Vatican (1869–70), by threats and denunciations he held at bay the remotest Gallican manifestations on the part of the French episcopate. His political influence reached its height under the government of the so-called moral order in 1877, whereafter, secluded by illness he seldom imparted his opinions through the medium of the *Univers*. Of his publications, including romances and saintly stories, political, historical, and literary essays, and poems, may be mentioned: *Pélerinages de Suisse* (1838); *Pierre Saintive* (1840); *Rome et Lorette* (1841); *Les Français en Algérie* (1845); *Les libres penseurs* (1848); *L'Esclave Vindex* (1849); *Le parfum de Rome* (1861); *Historiettes et fantaisies* (1862); *Les odeurs de Paris* (1866); *Les couleuvres* (1869), a collection of poems; *Paris pendant les deux sièges* (1871); *Rome pendant le Concile* (1872); *Molière et Bourdaloue* (1877); *Etudes sur Victor Hugo* (1885). Some of these went through many editions. A collection of his writings he published under the title *Mélanges religieux, historiques, politiques et littéraires* (1857–76). Consult the biographies by his brother Eugène Veuillot (Paris, 1883), and by Cornut (ib., 1891).

VEUSTER, Joseph Damien de. See Damien de Veuster, Joseph.

VEVEY, vĕ-vā' (Ger. *Vivis*). A town of the Canton of Vaud, Switzerland, on the left bank of the Veveyse, near its influx into Lake Geneva, 11 miles east-southeast of Lausanne (Map: Switzerland, A 2). Vevey, the scene of Rousseau's *Nouvelle Héloïse*, is a charming tourist resort, with a magnificent view of the Valais Alps. It has an extensive system of quays. The Tour de Peliz (thirteenth century) is now used as a prison. There is a modern museum, containing a natural-history collection, paintings, and a public library. Chocolate, children's food, and condensed milk are extensively manufactured. Pop., 1900, 11,781; 1910, 16,330.

VEYGOUX, Louis Charles Antoine Desaix de. See Desaix de Veygoux, L. C. A.

VEZIN, vē'zĭn, HERMANN (1829–1910). An actor, born in Philadelphia and educated at the University of Pennsylvania. He went to England and obtained an engagement at the Theatre Royal at York in 1850. His London début was made at the Princess's Theatre under Charles Kean's management in 1852. Two years later he "starred" through the English provinces. In 1857 he appeared in the United States, returning to England in 1858. The next year he appeared at the Surrey Theatre in an important series of Shakespearean rôles, including Macbeth, Hamlet, Shylock, and Othello. Then for a time he played at the Sadler's Wells Theatre. He married in 1863 Mrs. Charles Young, with whom he successfully brought out Marston's *Donna Diana* at the Princess's Theatre in 1864. Among his subsequent impersonations may be mentioned *Dr. Davey* (1866), James Harebell in Wills's *Man o' Airlie* (1867), Martel in Merwale's *Son of the Soil* (1872), Jacques in *As You Like It* (1875), *Daniel Druce* (1876), which ran for one hundred and six times at the Haymarket, and Dr. Primrose in Wills's *Olivia* (1878). Later he also became known as a teacher of elocution and as a writer.

VIADANA, vyä-dä'nä (properly GROSSI), LODOVICO (1564–1645). An Italian composer, credited with being the inventor (1602) of the *basso continuo*. Little is known of his life, save that he was born at Viadana, near Mantua, became a monk, and held successive posts as organist and choirmaster at Mantua, Venice, and elsewhere. Among his numerous works may be mentioned the famous *Cento concerti ecclesiastici a una, a due, tre e quattro voci, con il basso continuo per sonar nell' organo* (1602, 1603, 1609, 1611, and 1612); *Sinfonie musicali a otto voci* (1617). Consult A. Parazzi, *Della vita e delle opere musicali di Lodovico Grossi-Viadana* (Milan, 1876).

VI'A DO'LORO'SA (Lat., dolorous way). The name, probably given during the Middle Ages, applied to a narrow street in Jerusalem, indicated by a doubtful tradition as the street through which Jesus carried his cross from the Hall of Judgment to Mount Calvary. The fourteen stations are marked by tablets. The location of these has varied at different times.

VI'ADUCT (ML. *viaductus*, from Lat. *via*, way, road + *ductus*, a leading). A structure for conveying a roadway or waterway across a valley or low level. They are of every kind of construction—of wood, iron, or steel, stone, brickwork, and in recent practice reënforced concrete. In recent years, and more particularly in America, the term "viaduct" has come to mean more specifically a structure composed of a number of comparatively short spans carried by tower-like piers of steel framework. These piers usually consist of four column-like legs spread wide apart at the base, converging towards the top, and braced together in all directions.

This construction was best typified for a great many years by a viaduct crossing Kinzua Creek in northwestern Pennsylvania, on the Erie Railroad, which is familiarly known as the Kinzua Viaduct. The Lethbridge Viaduct, on the Crow's Nest branch of the Canadian Pacific Railway in southern Alberta, a steel structure of this type, is the largest and highest bridge in the world, being 1 mile, 47 feet in length, and 307 feet above water level. It consists of 44 plate-girder spans 67 feet long, 22 plate-girder spans 99 feet long, and one deck lattice span 167 feet long. This whole structure is carried on 33 rigidly braced steel towers rising from concrete pedestals supported on concrete piles.

Two notable viaducts of quite a different type were completed (1914–15) west of Scranton, Pa., on the Lackawanna Railroad, to cross the valleys of Tunkhannock Creek and Martins Creek. The former, or Nicholson Viaduct, is the largest concrete bridge in the world, 2375 feet in length, comprised of 10 spans of 180 feet each and two spans of 100 feet each. It is 242 feet in height. The Martins Creek Viaduct consists of 11 spans, seven of 150 feet, two of 100 feet, and two of 50 feet, with a total length of 1600 feet. It is 150 feet in height. Both viaducts are of reinforced concrete and have considerable architectural merit. See BRIDGE.

VIA LATINA. See LATIN WAY.

VIA MALA, vē'ä mä'lä (Lat., Bad Road). A famous road, made in 1470, through a deep gorge of the Rhine in the Grisons, Switzerland. The present road, 7 yards wide, was built in 1818–24. It passes between limestone cliffs 1600 feet high and crosses the river three times by high bridges spanning the ravine. It forms the first part of the Splügen Road.

VIA OSTIENSIS. See OSTIENSIS, VIA.

VIARDOT, vyär'dō', LOUIS (1800–83). A French art critic. He was born in Dijon, studied law in Paris, took up journalism, managed the Grand Opera (1838–41), and married the opera singer Pauline Garcia (1840). He traveled widely and made many translations from Spanish and Russian, writing also *Etudes sur l'histoire des institutions et de la littérature en Espagne* (1835); *Histoire des Arabes et des Maures d'Espagne* (1851); and *Les merveilles de la peinture* (1868), translated in part as *The Wonders of Italian Art*.

VIARDOT-GARCIA, -gär-thē'ä, PAULINE (1821–1910). A celebrated French vocalist, born in Paris. She was the daughter of the tenor Manuel Garcia, and sister of Madame Malibran (qq.v.). She was taken with her family first to England, then to the United States, and in 1828 returned to Europe. She was one of Liszt's most accomplished pupils. Her concert début was at Brussels in 1837, and her first London appearance was at the Opera House, in 1839, as Desdemona in Rossini's *Otello*. She then appeared in Italian opera at the Paris Odéon with equal success. In 1840 she married the director of the Paris Italian Opera, Louis Viardot. After her marriage she made numerous European tours, until her retirement in 1863. Her name is associated with the first performances of Myerbeer's *Les Huguenots* and *Le Prophète*, and Gounod's *Sapho*. She sang the title rôles in the revivals at Paris of Gluck's *Orphée* (1859) and *Alceste* (1861). In 1871 she settled in Paris as a teacher of singing. Her compositions include several operas, 60 popular vocal melodies, instrumental pieces, and an *Ecole classique de chant*. Consult La Mara, *Pauline Viardot-Garcia*, in Waldersee's "Sammlung musikalischer Vorträge" (Leipzig, 1882).

VIAREGGIO, vē'ä-rĕd'jō. A sea-bathing resort in the Province of Lucca, Italy, situated on the shore of the Mediterranean, 33 miles by rail southeast of Spezia (Map: Italy, C 3). The famous pine woods to the north extend for 6 miles and the town has lately become a winter resort. There is a monument erected to Shelley, who was drowned near Viareggio. Pop. (town), in 1911, 14,906.

VIA SA'CRA. See SACRED WAY.

VIAT'ICUM (Lat., journey money, provision for a journey). The word applied in ecclesiastical terminology to the communion administered to dying persons. The Roman Catholic church, which in all other cases requires an absolute fast from the midnight before communion, dispenses dying persons from this obligation. The viaticum may be given frequently during the same sickness, at intervals anciently of ten or seven days, but by the modern practice even daily, should it be earnestly desired by the sick person. It is administered by parish priests or their assistants, or, in case of necessity, by deacons.

VIAUD, vē'ō', JULIEN. A French writer. See LOTI, PIERRE.

VIAZMA, vyäz'mȧ. A district town in the Government of Smolensk, Russia, situated on the river Viazma, 151 miles west of Moscow (Map: Russia, D 3). Flax and oil are the chief products. Pop., 1911, 29,568. The town was founded in the eleventh century and was an important place in the Principality of Smolensk. In 1812 it was the scene of an engagement between the Russians and the French, in which the former were victorious.

VIBERT, vē'bâr', JEAN GEORGES (1840–1902). A French genre painter. He was born in Paris and studied at the Ecole des Beaux-Arts, under Barrias and Picot. He first exhibited in 1863, his early productions being in the grand style, such as "Repentance," "Narcissus Transformed into a Flower" (Bordeaux Museum), and "Christian Martyrs in the Lion's Den." His material success began when he turned his attention to genre, for which the popular demand was large, producing "Roll Call After the Pillage," and following it with a long succession of subjects mainly drawn from clerical life. In the satirical vein are "The Cardinal's Menu"; "The Missionary's Story" (Mrs. Collis P. Huntington); "The Convent Under Arms"; "The Wonderful Sauce"; "The Antechamber of Monseigneur"; "The Startled Confessor," and three others in the Metropolitan Museum, New York. In 1867 he was one of the five who originated the Society of French Aquarellists, which, under his presidency, had an influence in raising the technical standard of the Salon.

VIBORG, vē'bôrg. A government occupying the southeastern part of Finland, Russia (Map: Russia, C 2). Area, 16,624 square miles, exclusive of its portion of Lake Ladoga (q.v.). The coast region along the Gulf of Finland and Lake Ladoga is low and exceedingly indented. The interior is rocky and mountainous and interspersed with marshes and lakes. The chief rivers are Kymenne and the Wuoxen. Viborg has extensive deposits of building stone, copper, lead, and iron. Agriculture is less developed than in most regions of Finland, owing to the scarcity of suitable land and the severity of the climate. Rye, oats, and barley are grown. Its forests occupy a large part of the area and are an important source of income. The manufacturing industries are highly developed, and consist chiefly of lumber and other products of wood, also paper, leather, metal products, and articles of rubber and bone. Its commerce is mainly domestic. Pop., 1897, 394,412; 1912, 515,000, chiefly Finns.

VIBORG (Finnish *Wäpuri*). The capital of the Government of Viborg, in Finland, Russia, and a third-class fortress, situated at the northern end of a deep inlet of the Gulf of Finland, at the mouth of the Saima Canal and about 75 miles northwest of St. Petersburg (Map: Russia, C 2). It is a clean, well-built town, with an ancient castle (1293) now used as a prison, and a notable museum. It has a school of navigation and a museum. The harbor is not sufficiently deep for large vessels, which anchor at Transund, about 8 miles distant. Viborg has extensive sawmills and carries on a large trade in lumber and dairy products, paper, and products of iron. Pop., 1900, 31,388; 1913, 35,000.

VIBORG, vē'bôrg. The capital of the Government of Viborg, in Jutland, Denmark, about 140 miles northwest of Copenhagen (Map: Denmark C 2). The foundation dates back into antiquity, when it was the main sacrificial place for North Jutland. Most of the great historical events of the country up to modern times were connected with Viborg. It has a cathedral school, diocesan library, museum, insane asylum, and garrison. The cathedral, built in romanesque style in 1130–69, rebuilt in 1864–76, is the most important granite church in the country. Pop., 1901, 8623; 1911, 10,885.

VIBRATION. See ACOUSTICS; HARMONICS; MUSIC.

VIBRATO, vē-brä'tō (It., vibrated). A term denoting an effect somewhat similar to tremolo (q.v.). On stringed instruments it is produced by the quick oscillation of the finger on the string which it is stopping. The result is a pulsating, wavering tone. In vocal music it is a partial suppression and reënforcement of a note, producing an apparent reiteration.

VIBUR'NUM (Neo-Lat., from Lat. *viburnum*, the wayfaring tree). A genus of shrubs and a few trees of the family Caprifoliaceæ. The numerous species are characterized by their opposite, dentate or lobed leaves, showy cymes of white flowers and red or blackish fruits. Many are popular as ornamentals in gardens, perhaps the best known being the snowball (*Viburnum opulus*), which is a horticultural derivative closely related to the "high-bush cranberry" (*Viburnum opulus americanum*). Other well known species are *Viburnum tinus*, the laurustinus or laurestinus, which blooms from May to August; *Viburnum cassinoides*, the withe-rod or Appalachian tea, well known from Newfoundland to North Carolina and westward to Manitoba; *Viburnum lentago*, the nanny berry or sheep berry, also well known in the above territory and as far south as Mississippi and Georgia, and whose black berries are often eaten; *Viburnum prunifolium*, the stagbush or blackhaw, frequent from Connecticut and Michigan to the Gulf States; *Viburnum alnifolium*, the American wayfaring tree, a companion of the withe-rod, except in its more northerly quarters; *Viburnum dentatum*, arrow-wood, and *Viburnum acerifolium*, dockmackie, of similar range to the previous species. There are several evergreen species, of which *Viburnum japonicum* is the most hardy. The hardy species are easily propagated by seeds, cuttings, or layers, and easily cultivated in almost any soil. See Plate of TANSY, ETC.

VICAIRE, vē-kâr', GABRIEL (1848–1900). A French poet, born at Belfort. He belonged to the Parnassians (q.v.), but wrote popular and spirited verse of the folksong type, much of it being written in assonance (q.v.). He wrote *Emaux bressans* (1884); *Les déliquescences d'Adoré Floupette, poète décadent* (1885), in collaboration with Henri Beauclair, a satire of the

so-called "decadents"; *Le miracle de Saint Nicholas* (1888); *L'heure enchantée* (1890); *Cinq ballades* (1891); *Au bois joli* (1893); *Le clos des fées* (1897); *Au pays des ajoncs* and *Avant le soir* were published posthumously. He was twice crowned by the French Academy and was made Chevalier of the Legion of Honor in 1892.

VIC'AR (OF., Fr. *vicaire*, from Lat. *vicarius*, substitute, from *vice*, in place of; connected with Gk. *εἴκειν*, *eikein*, AS. *wīcan*, OHG. *wīhhan*, Ger. *weichen*, to yield). A person deputed or authorized to perform the functions of another. In this sense the Pope is called in the Catholic church the Vicar of Christ.

A vicar in the Church of England is an incumbent of an appropriated benefice, who receives only a part of the emoluments; generally speaking, a share of the glebe and the small tithes. (See TITHES.) He is supposed to act as the deputy of the rector, who receives the great tithes. The title is used in a few of the larger city parishes of the Episcopal church of the United States which support two or more places of public worship, where the ministers of chapels belonging to the parish church are termed vicars.

VICAR APOSTOLIC. The title of certain prelates in the Roman Catholic church. The vicars apostolic of the Middle Ages corresponded to the *legati nati* of later times (see LEGATE); those of the present time are delegated by the Pope to exercise pastoral care in certain churches or districts, not in their own name, but in that of the Pope. Vicars apostolic are appointed (1) for missionary countries where as yet dioceses are merely in the course of formation, as in some parts of the United States; (2) for the Roman Catholic portion of the population in some countries that have been lost to the Roman obedience; (3) in urgent cases, where the administration of a diocese fully organized becomes temporarily disordered, i.e., by the absence, captivity, sickness, and the like of its bishop. Consult Smith, *Elements of Ecclesiastical Law* (New York, 1895); E. L. Taunton, *The Law of the Church* (London, 1906).

VICAR-GENERAL. The title of an ecclesiastical functionary in the Roman Catholic church and in the Church of England. In the former a vicar-general is an ecclesiastic who is appointed to exercise, in a general way, episcopal jurisdiction in the bishop's stead, and in such manner that his acts are considered the acts of the bishop himself. In the United States a vicar-general can (unless the bishop disposes otherwise) give priests faculties, together with the cure of souls, and revoke them for just reasons. He cannot, however, erect, unite, or divide benefices or parishes, nor can he give another bishop permission to exercise pontifical functions in the diocese.

In the Church of England a vicar-general is a lay legal officer of some dioceses, whose duties are practically the same as those of a chancellor (q.v.). Consult E. L. Taunton, *The Law of the Church* (London, 1906).

VICAR OF BRAY, THE. A popular ballad of the first half of the eighteenth century. The subject is a clergyman, called Simon Alleyn, Pendleton, or Symonds, notorious for the changes of faith he made during the Henry VIII to Elizabeth period in order to retain office. The name has become proverbial for political hedging.

VICAR OF WAKEFIELD, THE. A novel by Oliver Goldsmith (1766). It narrates the misfortunes of a worthy but simple-minded country clergyman, Dr. Primrose.

VICE ADMIRAL. The permanent rank of vice admiral does not exist in the United States navy, but by an act of Congress in 1915 the second in command of the Atlantic, Pacific, and Asiatic fleets may be so commissioned while acting in that capacity. See ADMIRAL; also FLAG OFFICER.

VICE CHANCELLOR. In England, a judge of the court of equity who is appointed by the crown under letters patent as an associate to the Lord Chancellor. The office was created in the reign of Henry II and later fell into disuse, but was revived by the Statute of 53 Geo. III, c. 24, appointing one vice chancellor, and the Act of 5 Vict., c. 5, § 19, by which two vice chancellors were appointed, because of the increase of business on the abolition of the equitable jurisdiction of the court of exchequer. The vice chancellor presides over a branch of the court of equity, and is authorized to perform the duties of the Lord Chancellor in the latter's absence or illness. The term is employed in a few of the United States, as New Jersey, to designate an associate of a chancellor of a court of equity.

The vice chancellor of a university is an officer with authority to discharge certain duties of a chancellor, generally those connected with granting degrees in the absence of the latter.

VICEN'NIAL PRESCRIPTION. In Scottish law, a limitation of 20 years within which certain actions relating to real property may be commenced.

VICENTE, vē-sĕn'tā, GIL (1470–1540). The founder of the Portuguese drama, born probably in Lisbon. He studied jurisprudence at the University of Lisbon, but soon gave himself up to literature. His first production was a pastoral monologue in Spanish, which celebrated in 1502 the birth of the prince who became John III. Other pieces followed, a number of them being the religious mysteries called *autos*, and also various comedies. His farce *Inez Pereira* was composed impromptu. He wrote both in Spanish and in Portuguese, and sometimes used both languages in a single play. Vicente was an actor as well as a poet; and his children often appeared with him. A collected edition of his works was published by his son (Lisbon, 1561), and 25 years later a new edition appeared after expurgation by the Inquisition. Eight of his Spanish pieces are included in Böhl von Faber's *Teatro español anterior á Lope de Vega* (Hamburg, 1832). His collected works were published by Barcto Feio and Monteiro in 1834 (Hamburg). Consult Braga, *Historia do theatro portuguez no seculo XVI* (Oporto, 1870); De Ouguella, *Gil Vicente* (Lisbon, 1890).

VICENZA, vē-chĕn'tsȧ. The capital of the Province of Vicenza, Italy, situated at the confluence of the Retrone and the navigable Bacchiglione, 41 miles by rail west-northwest of Venice (Map: Italy, C 2). Seven bridges span the rivers. The city is compact and is surrounded by a moat and by walls half in ruins. Many of the magnificent palaces for which the city is justly famed are by Palladio. The Piazza de' Signori, the remarkably fine square in the centre of the town, contains the Palazzo della Ragione, or town hall, surrounded by the splendid Basilica Palladiana, a beautiful colonnade having two stories and with a slender campanile 265 feet high. In the handsome Palazzo Chierecati is

the valuable municipal museum with some good paintings and archæological and natural history collections. Near by, in the northeastern part of the city, is the fine wooden Teatro Olimpico by Palladio, finished in 1584. The curious permanent scenery in its stage represents a kind of piazza with diverging streets. On Monte Berico, looming picturesquely on the south of the city, stands the pilgrimage church of Madonna del Monte, containing a number of paintings by Bartolommeo Montagna. East of it is situated the ruined villa Rotonda Palladiana, a square structure with a Greek colonnade, and a round domed room in the centre.

Vicenza has an academy of science, literature, and art, and a library of 179,520 volumes, some 80,000 pamphlets, 1000 incunabula, and 6000 manuscripts. The Corpus Christi festival is of great interest. The principal industry is the production of silk and silk goods. Straw hats, woolen goods, leather, machinery, and musical instruments are also manufactured. The trade is active in wine, grain, and vegetables. Pop. (commune), 1901, 44,777; 1911, 54,555.

Vicenza, the Roman Vicetia, rose into prominence in the early part of the Middle Ages as the capital of a Lombard duchy. It was one of the cities which, banded together in the Lombard League, opposed Frederick Barbarossa in the twelfth century. It was stormed and pillaged in 1236 by the Emperor Frederick II. Having freed itself from Padua in 1311, it was successively in the hands of the Scala and Visconti families. It became subject to Venice in 1404.

VICENZA, vē-chĕn'tsȧ, DUKE OF. See CAULAINCOURT, A. A. L. DE.

VICE PRESIDENT. The second officer of the government of the United States in rank and chosen for the same term and in the same manner as the President, except that in case no candidate for the vice presidency receives a majority of the electoral votes, the election is thrown into the Senate, which then chooses by a majority vote one of the two leading candidates. Previous to the election of 1804 the electors were not required to specify which candidate was voted for as President and which as Vice President. Although described as an executive officer, he performs no executive functions whatever, his only duty being to preside over the deliberations of the Senate, except when it is sitting as a court of impeachment for the trial of the President, when the Chief Justice presides. He has a casting vote in the Senate in case of a tie, and he presides at the joint meeting of the two Houses when the electoral votes are counted. The chief importance of the office consists in the fact that the Vice President is made by the Constitution the successor of the President in case of the latter's removal from office or of his death, resignation, or inability to discharge the powers and duties of the office. Of all these contingencies only one has so far occurred, viz., the death of the President. The deaths of Presidents Harrison in 1841, Taylor in 1850, Lincoln in 1865, Garfield in 1881, and McKinley in 1901 caused the succession to devolve upon the Vice President. The qualifications required of the Vice President are the same as those of the President. His salary is $12,000 per year.

VICEROY, vīs'roi. An American butterfly (*Basilarchia disippus*) which so closely resembles or mimics in color and markings the monarch (*Anosia plexippus*) that it is not infrequently mistaken for the latter. The monarch is protected by a nauseous taste and smell from the attack of birds; the viceroy has no such protection. (See MIMICRY.) The viceroy ranges over nearly all of the United States. Its larvæ feed on the willow poplar, cottonwood, aspen, and balm of Gilead. The eggs are laid on the tip of a leaf, and the young larva, feeding at the tip, attaches bits of leaf to the midrib, thus stiffening its perch and preventing it from curling as it dries. Towards winter a tubelike case is formed along the midrib, and in this the larva passes the winter. The pupa is suspended to a twig by a silken attachment at its posterior end, and is characterized by a projection like a Roman nose which issues from the middle of the body.

VICETIA. See VICENZA.

VICH, vĕk, or **VIQUE.** A city of the Province of Barcelona, Spain, on a hill-girt plain, 38 miles north of Barcelona (Map: Spain, G 2). Its cathedral, built about 1040, was repaired and modernized in 1803. Interesting pictures and sculptures are found in the Museum of Art and Archæology. Corn, fruit, and a poor wine are products of the vicinity; the inhabitants are employed in weaving, and in the manufacture of hats, paper, and cotton goods. Pop., 1900, 11,146; 1910, 12,171. Vich, the Roman Ausa, was afterward called Ausona and Vicus Ausonensis.

VICHY, vē'shē'. A town of the Department of Allier, France, on the right bank of the Allier, 69 miles by rail south-southeast of Paris (Map: France, S., H 2). It is one of the most famous of watering places, its numerous springs being annually visited by 60,000 persons. Vichy consists of the mediæval and the new towns and is almost surrounded by parks and gardens. In the old town are the Romanesque church of St. Louis and Pavillon de Sévigné, now a hotel. Here Madame de Sévigné, who first brought Vichy into prominence, passed the year 1676. The attractive new town, on the north, contains a fine promenade flanked by the Casino and large bazars on one side, by the main establishment of the baths on the other. The splendid Renaissance Casino is modern. The elegant thermal establishment is an immense edifice surrounded by a massive arcade, with a large annex on the west. There are yearly exported 11,000,000 bottles of Vichy water, the total daily supply being over 65,000 gallons. Salts, pastilles, and barley sugar are manufactured. The Vichy linen is made here. Pop., 1901, 14,254; 1911, 16,502. The waters were known to the Romans.

VICHY-CHAMROND, MARIE ANNE DE. See DEFFAND, MARQUISE DU.

VICIA, vĭsh'ĭ-ȧ *or* vĭs'ĭ-ȧ. A genus of the Leguminosæ (pea family), whose species are known as vetches (see VETCH). It comprises about 130 species of wide distribution, about 25 of which occur in North America. The common vetch or tare (*Vicia sativa*) is a European species, often cultivated as a forage plant.

VICIOUS INTROMISSION. See INTROMISSION.

VICKSBURG. The largest city of Mississippi and the county seat of Warren County, 234 miles by rail north by west of New Orleans, on the Mississippi and the Yazoo rivers, and on the Yazoo and Mississippi Valley, the Alabama and Vicksburg, and the Vicksburg, Shreveport, and Pacific railroads (Map: Mississippi, D 6). It is attractively situated among the

Walnut Hills. The Federal building, the county courthouse, the Carnegie Library, the city hall, the banks, and the clubhouses are noteworthy structures; and among the prominent institutions are the Mississippi State Charity Hospital, All Saints College (Episcopal), St. Francis Xavier Academy, St. Aloysius College, the Vicksburg Infirmary, and the Vicksburg Sanitarium. The National Cemetery has 16,727 graves, 12,723 of unknown dead. The Vicksburg National Military Park, with over 1300 acres, 30 miles of driveways, and more than 1000 markers and monuments, restores the Vicksburg battleground as it was in 1863. As a commercial centre Vicksburg is noted for its cotton trade, and in manufacturing it ranks second among the cities of the State. The industrial establishments include railroad shops, saw and lumber mills, cottonseed-oil mills, furniture, box, ice, wagon, and boat-oar factories, canning establishments, boiler and iron works, a molasses refinery, foundries, machine shops, etc. Pop., 1900, 14,834; 1910, 20,814; 1915 (U. S. est.), 22,453.

Vicksburg was laid out on the plantations of William Vick and John Lane, and was incorporated in 1840. It was strongly fortified in 1861 and was provided with a large garrison, which, after a long siege, surrendered to General Grant on July 4, 1863. See VICKSBURG, CAMPAIGN AGAINST.

VICKSBURG, CAMPAIGN AGAINST. The campaign or series of operations in 1862 and 1863, during the Civil War, which had for its object the capture by the Union troops under Generals Grant and Sherman of Vicksburg, Miss. It was pronounced by Sherman "one of the greatest campaigns in history." The year 1862 had been fruitful in reverses to the Union cause, and the Washington authorities realized that, both for political and military reasons, redoubled efforts must be made to turn the tide. In the West the great territorial object was the possession of the Mississippi River, which in the autumn of 1862 remained in the hands of the Confederates, who maintained strong garrisons at several points below Memphis—the largest force, under General Pemberton, being stationed at Vicksburg. In October, 1862, the Union forces near the Corinth and Memphis line comprised about 48,000 men under General Grant. He decided to assume the offensive, and having concentrated (November 4) a part of his command on the Mississippi Central Railroad (which in that vicinity runs parallel to the great river) at Grand Junction, prepared to move upon Vicksburg with an expedition down the Mississippi River under Sherman, and a force under his personal direction advancing by the way of the railroad. Sherman started December 20 with 32,000 men and 60 guns, reached Milliken's Bend, 20 miles from Vicksburg, attacked the Confederate position at Chickasaw Bluffs (q.v.), and was repulsed with a loss of 2000 men. In the meanwhile Grant's communications had been cut by cavalry under Forrest and Van Dorn, the latter having destroyed the Union depot of supplies at Holly Springs, while the former tore up the railroads in Grant's rear, compelling him to retire and recall Sherman. The project of a combined land and water movement upon Vicksburg had failed through the cowardice or incapacity of the commanding officer at Holly Springs, who surrendered the post without striking a blow, and from the unforeseen strength of the Confederate position at Chickasaw Bluffs. McClernand, who had been assigned to command the river expedition from Washington simultaneously with Sherman's advance, but whose order miscarried, now assumed command. Escorted by gunboats under Admiral Porter, he ascended the Arkansas River to Arkansas Post. Here was a strong work known as Fort Hindman, defended by 5000 men and 17 guns under General Churchill. A combined attack of land and naval forces resulted in the capture of the entire garrison on Jan. 11, 1863, of which 200 were killed, the Union loss aggregating 977 killed, wounded and missing. A new campaign was now planned by Grant to get below Vicksburg and operate from the south. At first he intended to pass around the city through a canal to be cut across the peninsula opposite Vicksburg, but after much labor on the work it was abandoned. An attempt was then made to get in rear of the city by land from the north. Finally it was determined to move the Union land force by a series of bayous running from Milliken's Bend past Richmond to New Carthage, on the west bank of the Mississippi, 30 miles below Vicksburg, while the gunboats ran the batteries protecting the city. This was successfully done on the night of April 18, 1863, by the naval force under Porter. The ensuing operations, which brought Grant's army in rear of Vicksburg and to its final investment, must be referred to very briefly. Within a period of three weeks the battles of Grand Gulf (April 29), Port Gibson (May 1), Raymond (May 12), Jackson (May 14), Champion's Hill (May 16), and Big Black Bridge (May 17), and two assaults upon Vicksburg (May 19 and 22), occurred.

Reckoning upon the apparently demoralized condition of his enemy, who had given way precipitately in the affair of Big Black Bridge, Grant on May 19 promptly assaulted the works in his front with a part of his force, but after some hours was obliged to desist and prepare to invest the city completely. After establishing a depot of supplies and strengthening his communications with the Yazoo, Grant determined upon one more effort to dislodge the Confederate garrison. On the 22d he attacked with his entire force. The defenses were armed on the east and north sides with 128 guns, of which 36 were siege pieces; in addition water batteries comprising 44 guns protected the western front. The result again proved the superiority of the defense under such advantages of position. Although Grant's troops got inside the advanced line of works, they could not penetrate farther, and after eight hours' exposure to a severe and continuous fire from the Confederate works the Union troops withdrew with the loss of 4075 men. The siege was now commenced in earnest; 12 miles of trenches and 89 batteries were constructed, armed with 220 guns—most of which were field pieces; in addition at several points, where the hostile lines were separated by a few yards, small mortars were improvised by boring out tough logs and strengthening them with iron bands. After 12 days of incessant bombardment from the gunboats and the land forces, during which the Confederate garrison, cut off from relief and reduced to "one biscuit and a mouthful of bacon a day," showed signs of mutiny, General Pemberton surrendered on July 4, 1863. The number actually paroled was 29,391 officers and men; 790 refused paroles.

The artillery found comprised 172 pieces. The capture of Vicksburg and the simultaneous defeat of Lee at Gettysburg marked the turning point of the war.

Grant* (ib., 1895; new ed., 1909); Sherman, *Memoirs* (ib., 1892); Greene, *The Mississippi* (ib., 1882), in the "Campaigns of the Civil War Series"; Swinton, *Twelve Decisive Battles of the War* (ib., 1867); and Nicolay and Hay, *Abraham Lincoln: A History* (ib., 1890); Steele, *American Campaigns* (Washington, 1907).

VICKSBURG NATIONAL MILITARY PARK. See PARK, NATIONAL MILITARY.

VICO, vē'kō, GIOVANNI BATTISTA (1668–1744). An Italian philosopher and jurist. He was born at Naples, spent most of his life in that city, and died there. He studied law, history, and philosophy, and in 1697 obtained the chair of rhetoric in the University of Naples. In 1734 he was appointed historiographer to Charles III, King of Naples. The great work which has made his name illustrious, the *Principj di una scienza nuova d' intorno alla comune natura delle nazioni,* first appeared at Naples in 1725; but it was completely recast in a subsequent edition, published in 1730. A third edition, in which the work was considerably enlarged, was published in 1744, shortly after the author's death. On account partly of its obscure and enigmatical style, the work was long in arriving at its proper place in European literature. The *Scienza nuova* was virtually unknown out of Italy until 1822, when a German translation of it appeared at Leipzig. It was five years later translated into French by Michelet; and the author has since that time found his proper rank among the most profound of modern thinkers. His other writings include *De Ratione Studiorum* (1708); *De Antiquissima Italorum Sapientia* (1710); *De Universi Juris Uno Principio et Fine Uno* (1720); *De Constantia Jurisprudentis* (1721).

Vico proposed to himself the task of distinguishing amid social phenomena the regular from the accidental; of finding out the laws which govern the formation, the growth, and the decay of all societies; in fine, of tracing the outlines of the history of peoples—the idea of which he himself believed to have existed from eternity in the mind of God. In 1818 the Marquis de Villa Rosa published Vico's complete works. Another edition of his works, including an autobiography, was published at Naples (1858–69) in seven volumes, the Latin works in Italian translation. Consult: Ferrari, *Vico et l'Italie* (Paris, 1839); Cantoni, *G. B. Vico* (Turin, 1867); Diendorfer, *Gianbattista Vico und seine Ideen* (1877); Flint, *Vico* (Edinburgh and London, 1884); Klemm, *G. B. Vico als Geschichtsphilosoph und Völkerpsycholog* (1906).

VICOL, vē-kōl', or **BICOL.** A Christianized Malay people living in southern Luzon, and in Catanduanes and Masbate Islands. Their dialect stands midway between Tagalog and Visayan, while in general appearance and culture they differ little from the people of the latter group. See PHILIPPINE ISLANDS.

VICOMTE DE BRAGELONNE, vē'kôNt' de brȧ'zhe-lôn', LE. A romance by the elder Dumas (1848), a sequel to *Vingt ans après.* A charming criticism of it is in Stevenson's *Memories and Portraits.*

VICTOORS, JAN. See VICTORS, JAN.

VIC'TOR. A city in Teller Co., Colo., 45 miles southwest of Colorado Springs; on the Florence and Cripple Creek and the Midland Terminal railroads (Map: Colorado, D 3). Victor is of considerable importance as the centre of a region noted for its extensive mineral deposits, and has gold mines, lumber mills, reduction works, ore-sampling mills, novelty works, bottling works, etc. Pop., 1900, 4986; 1910, 3162.

VICTOR. The name of three popes.—VICTOR I, Saint, Pope 189–198, an African by birth. His best-known activity was in connection with the time for the celebration of Easter (q.v.). He was only prevented from excommunicating the Quartodecimans of Asia Minor by the representations of St. Irenæus. St. Jerome designates him the first Latin ecclesiastical author.—VICTOR II (c.1018–57), Pope 1055–57, Gebhard by name, son of the Count of Tollenstein and Hirschberg, and a relation of Leo IX, whom he succeeded. He was nominated for the bishopric of Eichstätt by the Emperor Henry III, who opposed his elevation to the papacy through unwillingness to lose so faithful a counselor. His reign was distinguished by its purity, its zeal against the prevalent vices, and its constant alliance with the Imperial house. Henry III died in his arms, and he secured the succession of the youthful Henry IV under the regency of his mother, Agnes.—VICTOR III (c.1027–87), called BLESSED. Pope 1086–87, Dauferius by name, of the family of the princes of Benevento. Under the name of Desiderius he became a Benedictine monk at an early age, despite strenuous objections by his family, and ultimately became abbot of Monte Cassino (1058). In the following year he was named Cardinal and Vicar of the Holy See in southern Italy, and conducted the negotiations between the Pope and the Normans. He was chosen to succeed Gregory VII, but his excessive modesty induced him to refuse the honor, and he was crowned almost by force. Soon afterward the pressure of the Imperial party forced him to leave Rome, and he laid aside the papal insignia and retired to Monte Cassino. In the following year, however, he was enthroned in St. Peter's, which had previously been occupied by the Antipope Guibert, though the latter still contested the possession of the city with him. Though he had been an intimate friend of Gregory VII, and maintained the refusal to concede the Emperor's claims in the investiture question, his attitude towards Henry IV was somewhat more conciliatory than his predecessor's. The name of VICTOR IV was assumed by two antipopes: Cardinal Gregorio Conti, who opposed Innocent II in 1138, and Cardinal Octavian, whom Frederick Barbarossa supported against Alexander III in 1159–64. Consult Duchesne, *Histoire ancienne de l'église* (Paris, 1906), and H. K. Mann, *Lives of the Popes in the Early Middle Ages,* vols. vi–vii (London, 1910).

VICTOR, vēk'tôr', CLAUDE PERRIN, DUKE OF BELLUNO (1764–1841). A French marshal born at La Marche in the Vosges. He enlisted in the army in 1781, gained the attention of Napoleon by his conduct at the siege of Toulon (1793), and was promoted at the close of that year to the rank of brigadier general. He became general of division in 1797. In the Italian campaigns of 1796–97 and 1799–1800 Victor commanded the vanguard. He did bril-

liant service at Marengo. In 1806 he fought against Prussia, was captured in 1807, was exchanged for Blücher, and at Friedland won the baton of a marshal of France and the title of Duke of Belluno. He was Governor of Berlin after Tilsit. In 1808 he commanded a corps in Spain, and gained several victories, but was defeated by Wellington at Talavera (July 27–28). In 1812 he commanded the Ninth Corps in the Russian campaign, and shared in the defense of the passage of the Beresina. He then went over to the Bourbons, from whom he received a peerage; was president of the military commission appointed to try those officers who deserted to Napoleon after the Emperor's return from Elba. He was Minister of War in 1821–23, and second in command in the Spanish Peninsula in 1823, but was recalled on suspicion of complicity in fraudulent contracts. There is a brief life, Boullée, *Biographie contemporaine*, vol. ii (Paris, 1862).

VICTOR, JAN. See VICTORS, JAN.

VIC'TOR AM'ADE'US. The name of three sovereigns of the house of Savoy. See SAVOY, HOUSE OF.

VICTOR EMMAN'UEL I (1759–1824). King of Sardinia from 1802 to 1821. He was born at Turin, July 24, 1759, the second son of Victor Amadeus III, and bore the title of Duke of Aosta. He commanded the Sardinian forces against the French in 1792–96, and after the conclusion of peace lived in southern Italy and Sardinia. Upon the abdication of his brother, Charles Emmanuel IV, in 1802, he became King, all the dominions of his house at this time, except the island of Sardinia, being in the possession of the French. With the aid of an English subsidy he organized a fleet and army. The first Peace of Paris (1814) restored to him Piedmont, Savoy, and Nice, the second (1815) added the former dominions of Genoa. It was only then, when the fall of Napoleon had freed northern Italy from the French, that Victor Emmanuel really came into his Kingdom. He abdicated March 13 in favor of his brother, Charles Felix. See ITALY, *History*.

VICTOR EMMANUEL II (1820–78). King of Sardinia from 1849 to 1861 and of Italy from 1861 to 1878. He was the son of Charles Albert (q.v.), King of Sardinia, and was born March 14, 1820. He was educated under his father's guidance, commanded the brigade of Savoy in the campaign of 1848–49, and displayed gallantry at Goito and Novara. Believing that his son could make better terms with Austria, Charles Albert, on the evening following the fatal day of Novara (March 23, 1849), abdicated in favor of his son. The new King chose for ministers such men as D'Azeglio and Cavour (q.v.), who sought to increase the strength and importance of the country by improved administration, rigid economy, care of the army, and encouragement of trade. Church property was sold, and reforms intended to diminish the privileges of the clergy were adopted—changes which brought displeasure from the Vatican; but Victor Emmanuel asserted and maintained his independence of the papacy. Under the guidance of Cavour Sardinia joined England and France on the outbreak of the Crimean War, sending an army of 17,000 men under La Marmora. After the Peace of Paris (1856) the King entered into a closer alliance with France, gave his elder daughter, Clotilde, in marriage (Jan. 30, 1859) to Prince Napoleon, and, backed by French arms, provoked a war with Austria. The campaign of 1859 was brief but decisive, the Austrians were defeated at Magneta and Solferino, but the preliminary treaty between France and Austria at Villafranca, while securing the liberation of Lombardy, left Venetia in Austrian hands. Victor Emmanuel was compelled by the agreement with Napoleon III to yield Nice and Savoy to France.

In the meanwhile Tuscany, Parma, and Modena had emancipated themselves, and the Romagna had thrown off the papal authority, and in 1860 these regions were annexed to the dominions of Victor Emmanuel. Another step in the building up of his Italian kingdom was taken in the liberation of the Two Sicilies by Garibaldi (q.v.), who turned them over to the King. At the same time the Sardinian forces advanced into the marches of Umbria, which were seeking to free themselves from the rule of Pius IX, and these regions were also annexed. On Feb. 26, 1861, Victor Emmanuel II was declared King of Italy by the National Italian Parliament assembled at Turin, and on March 17 he formally assumed the title. When, in 1862, Garibaldi attacked the Papal States, the King was compelled to interfere, and the patriot leader was taken prisoner by the royal troops at Aspromonte. Italy joined Prussia against Austria in 1866, and, although defeated on land (Custozza) and on the sea (Lissa), she achieved her aim in the acquisition of Venetia. In 1870, after the outbreak of the war between France and Germany, the French garrison was withdrawn from Rome, and the Italian troops entered the Imperial city, which, finally united to the Kingdom, became the capital of Italy. Consult: Ruffer, *König Victor Emmanuel* (Vienna, 1878); Godkin, *Life of Victor Emmanuel II* (London, 1879); Massari, *La vita ed il regno di Vittorio Emanuele II* (Milan, 1880); Cappelletti, *Storia di Vittorio Emanuele II e del suo regno* (Rome, 1894); R. S. Holland, *Builders of United Italy* (New York, 1908). See ITALY, *History*.

VICTOR EMMANUEL III (1869–). King of Italy, the only son of King Humbert I and Queen Margherita (qq.v.). He was born at Naples, Nov. 11, 1869, and until he succeeded to the throne bore the title Prince of Naples. He was educated under the direction of his mother and of Colonel Osio, and, outgrowing the ill-boding weakness of his early years, he entered the army in 1887 as a second lieutenant. In 1890 he became colonel of the First Infantry Regiment at Naples, in 1892 major general, in 1894 lieutenant general, and in 1897 commanding general at Naples. Meanwhile the Prince had given much attention to horsemanship and to the study of warfare, extending his military knowledge by frequent visits to the German army. He represented King Humbert at the coronation of Czar Nicholas II in 1896, at the Victorian Jubilee in 1897, and at the celebration of the coming of age of the German heir apparent in 1900. On Oct. 24, 1896, he married Princess Helena, daughter of Prince (later King) Nicholas of Montenegro. King Humbert was assassinated at Monza July 29, 1900, and on the 11th of the following August Victor Emmanuel formally ascended the throne. The new King, although a man of quiet disposition, showed Liberal tendencies together with the desire and ability to exercise a forceful and just rule. To the King and Queen were born several

children, the heir, Prince Humbert, being born Sept. 16, 1904. Upon the entrance of Italy into the European War the King assumed active command of the Italian armies on the Austrian front. See WAR IN EUROPE. Consult Helen Vacaresco, *Kings and Queens I Have Known* (New York, 1904), and A. G. Gardiner, *The War Lords* (ib., 1915).

VICTO'RIA. A state of Australia, occupying the southeast portion of the continent (Map: Australia, G 6). It is triangular in shape, with the apex pointing eastward. It is the smallest of the continental states, having an area of 87,884 square miles, only 210 square miles less than that of Great Britain.

Victoria is traversed from west to east by an irregular range of mountains, an extension of the Great Dividing Range. It sends out numerous branching spurs, which make the whole surface very diversified, except the northwestern portion, which belongs to the Great Plains. The mountains are low in the west, but rise towards the east into the rugged and romantic Australian Alps, whose highest peak in Victoria, Mount Bogong, has an altitude of 6508 feet. The coast is lined with broken ranges of hills, and is irregular, with granitic headlands and land-locked bays, such as Port Phillip, the harbor of Melbourne. There are several navigable rivers. Those on the northern watershed are tributaries of the Murray, which forms most of the boundary on the side of New South Wales.

The climate is cool and more agreeable than elsewhere in Australia, though the maximum temperature in summer may be above 100°. In the lowlands the temperature is seldom below 32°, and the annual mean at Melbourne is 58°. The rainfall at Melbourne averages 25.61 inches, but may vary in different years between 15 and 44.14 inches, and droughts are liable to occur. The northwest plains are dry and treeless, covered with a scanty scrub vegetation. In other sections there are grassy slopes or open, parklike forests, becoming dense on the mountains. The trees of the genus *Eucalyptus* reach an extraordinary height. In general the flora and fauna of the state are not distinctive. See *Flora* and *Fauna* under AUSTRALIA.

The mountain system consists of greatly denuded Silurian and Carboniferous rocks with numerous extensive intrusions of granite overlain in area by Tertiary sandstones. Over 80 extinct volcanic peaks occur just west of Port Phillip and basaltic flows mark some of the plains. The mountains and drift deposits are rich in minerals, of which gold is the most important.

About two-thirds of the enormous gold production of Australia has been obtained in Victoria. From 1851 to 1913 the value of the gold produced in the state aggregated £293,550,928, from 73,515,268 ounces. The value of the output in 1913 was £1,847,475, from 467,052 ounces fine. The richest gold field is Bendigo. Coal, silver, tin, lead, and copper are also found. The total mineral production in 1913 was valued at £2,344,744.

General farming is more extensively followed in Victoria than in any other Australian state, the rainfall there being more propitious for crop growing. There were 6,129,893 acres under cultivation in 1914. Over one-third of this area (2,565,860 acres) was in wheat. The production for that year was 32,936,000 bushels. With the exception of 1896 and 1903 the breadstuffs produced in the 38 years ending 1914 have been more than sufficient for home consumption. The principal other cereals raised in 1914 were oats, 442,060 acres, producing 8,890,000 bushels, and barley, 83,351 acres, producing 1,813,000 bushels. Hay crops, consisting chiefly of wheat and oats, cut green, covered an area of 977,684 acres, producing 1,350,000 tons; and 74,754 acres, producing 177,000 tons, were devoted to potatoes. Much attention is given to fruits, particularly grapes, 22,435 acres in 1913–14 producing 926,191 gallons of wine. Stock raising is more extensively carried on in connection with cropping than in any other Australian state. In 1914 there were 12,113,682 sheep, 1,528,553 head of cattle, and 221,277 swine. The quality of the sheep has improved greatly since 1860. The wool produced in 1913–14 amounted to 106,833,690 pounds, valued at £4,032,954. The number of dairy cows in 1914 was 656,080, and in 1911 over 51,000,000 pounds of Victorian butter were exported. In 1914 there were 562,331 horses.

In 1913 there were 5613 manufactories, employing 118,744 persons, of whom 38,690 were females. The manufactures were almost entirely for home consumption.

In 1913 the tonnage of vessels entering Melbourne, which has nearly all the tonnage for Victoria, amounted to 6,128,266. About half of this was British. Victoria ranks next to New South Wales in the amount of its foreign trade. In 1914 its total oversea imports amounted to £23,109,678, and the total oversea exports to £14,791,121. Nearly all the total trade is with Britain, the other Australian states, and New Zealand. Of the imports from foreign countries in 1913 £2,580,362 came from the United States of America, £1,738,678 from Germany, £683,083 from Belgium, and £215,475 from France. The exports to foreign countries were £2,563,201 to France, £767,749 to Belgium, £1,029,433 to Germany, and £632,996 to the United States of America. The principal articles of Victorian produce exported in 1913 and their values were: butter, £1,681,987; wheat, £2,053,454; flour, £710,416; beef and mutton, £1,442,847; hares and rabbits, £107,818; skins and hides, £1,688,409; wool, £6,282,291; gold (bullion and specie), £624,264.

All the railroads belong to the state. The management of the system is in charge of three commissioners. A special committee from both Houses of Parliament considers all proposals for new lines and reports to Parliament. There were 3747 miles open in 1914. The system connects with both the New South Wales and the South Australia lines. The gross receipts for 1914 were £5,560,958 and the working expenses £3,835,964.

The Governor receives his appointment from the British crown. The Parliament consists of a Legislative Council of 34 members, elected for six years, and a Legislative Assembly of 65 members, elected for three years. A voter for members of the Council must satisfy a property qualification, but this does not apply to certain classes, chiefly professional. No property qualification is required of those voting for members of the Assembly, who are elected by universal male and (since 1908) female suffrage. Clergymen are not allowed to hold seats in either branch of Parliament. Victoria sends 21 members to the Federal House of Representatives. Melbourne is the temporary capital of the Fed-

eral Parliament. For a discussion of the state's activities, see AUSTRALIA.

The total general revenue in 1912–13 was £10,287,285, and the expenditure £10,258,081. The revenue from taxation amounted to £1,317,079, and the surplus returned from the commonwealth (includes customs and excise revenue), £1,691,833. The revenue from the productive public works, principally railways and tramways, was £5,654,615. The largest items of expenditure were the working expenses of railways, which in 1912–13 were £3,627,510, and the interest on the public debt. The state's construction of railways and participation in other revenue-yielding schemes have led to a heavy debt, which amounted in 1912–13 to £62,776,724.

Victoria is the second most populous of the Australian states, and ranked first prior to 1891. The most rapid growth of population occurred between 1850 and 1860. In 1891 the population was 1,140,405, in 1901 it was 1,201,070, and in 1911, 1,315,551. The population of Victoria was estimated to be 1,431,000 in 1914. In 1911 there were only 643 aborigines. There is a large urban population. Melbourne, the second city of Australia, had with its suburbs in 1911 a population of 591,830. The principal other towns with their populations at the end of 1913 are: Ballarat, 42,093; Bendigo, 38,706; Geelong, 33,847.

There is no state church nor state assistance to any religion. The Church of England, the largest denomination, had 475,203 adherents in 1911. The adherents of the other denominations in the same year numbered as follows: Roman Catholics, 286,433; Presbyterians, 234,553; Methodists, 176,662; Baptists, 31,244; Independent or Congregational, 16,484; Lutheran, 11,682; Church of Christ, 16,511.

In 1891 nearly 96 per cent of the population over 15 years of age could read and write. School attendance is compulsory between the ages of 6 and 13. The public system is secular and the primary grades are free. In 1913 there were 241,042 pupils enrolled in 2127 state schools. The average attendance was 152,600. Secondary education is in the hands of private and denominational interests. In 1912 there were 48,391 scholars in attendance at private schools. The Roman Catholic schools contained over half of the total private school enrollment. The state encourages attendance at the grammar schools and universities by the awarding of scholarships. The higher educational institutions include the University of Melbourne, with its affiliated colleges of Trinity (Anglican), Ormond (Presbyterian), and Queen's (Methodist); also the School of Mines at Ballarat. There are also 19 technical schools, a college of domestic economy, a workingmen's college, two agricultural colleges, and a horticultural college. There are also several schools of art. For a comparison with other Australian states, see AUSTRALIA.

History. The coast of Victoria was sighted by Captain Cook in 1770, and the first explorations were made in 1798 by George Bass, who discovered Bass Strait. In 1802 Lieutenant Murray took formal possession of Port Phillip Bay, and in 1803 an unsuccessful attempt was made by the English government to establish a settlement. Exploring parties traversed the country from time to time, but the first permanent settlement was not made until 1834, and was then accomplished by the individual enterprise of one Henty. The settlement of the Henty family is usually regarded as the founding of Victoria. Henty and his seven sons were squatters on the shore of Portland Bay, where they set up a whale-fishing establishment, and also carried on sheep farming. That type of settlement had been a source of much vexation to the home government, and Henty was unable for some time to obtain any legal recognition. His settlement never grew, but was absorbed in the Port Phillip Association, led by John Batman, from Tasmania, in 1835, and reënforced during the year by colonists under a trader named Fawkner, who is jointly with Batman entitled to the credit of founding the colony. The settlers bought land of the natives. Such titles were not favored by Great Britain, but the colony at Port Phillip obtained such accessions of number that its recognition could not be avoided. It was incorporated within the territory of New South Wales in 1835, and formally opened for settlement in 1836. In 1837 the town of Melbourne was laid out, and in 1842 it received a city charter. The colony grew rapidly. In 1842 agitation began for separation from New South Wales. This was accomplished in 1850, although the new colony of Victoria was not formally organized until 1851. By this time the population had reached 77,000. Upon the discovery of gold Victoria had an extraordinary rush of immigration, the population increasing from 77,455 in 1851 to 540,322 in 1861. Discontent with the severe mining regulations imposed by the Legislature led to serious miners' riots at Ballarat in 1854 and to the enactment of more liberal laws. The period after 1855 witnessed the rise of a powerful democratic party, which entered into bitter conflict with the squatter or land-owning class on the question of a protective tariff for the purpose of encouraging home industries. The conservative attitude of the squatters, who were in control of the Upper House of the Legislature, kept back until after 1860 the full development of the agricultural resources of the colony. Like its sister colonies, Victoria during the last 10 years of the nineteenth century enacted many legislative measures of a decidedly democratic and even socialistic character. Among other things these acts provided for old-age pensions, and for every trade established mixed tribunals of employers and employees for the determination of a minimum wage. The people of Victoria were from the beginning overwhelmingly in favor of Australian federation (q.v.), and in 1898 ratified the first draft of the Federal constitution by a vote of five to one. See AUSTRALIA.

nual Statistical Abstract, Quarterly Statistical Abstract, Official Year Book of Australia, Victorian Year Book, and other periodical government publications issued at Melbourne.

VICTORIA (Brazilian, *Nossa Senhora da Victoria*). A seaport, the capital of the State of Espirito Santo, Brazil, on the island of Espirito Santo, 275 miles northeast of Rio de Janeiro (Map: Brazil, K 8). The former Jesuit College, now used as the government palace, is the chief edifice. The harbor is good, with a lighthouse and batteries. It is the principal commercial centre of the state and exports sugar, coffee, rice, and manioc. The town was founded in 1535. Pop. (est.), 15,000.

VICTORIA. The capital of Hongkong (q.v.).

VICTORIA. A town of Luzon, Philippines, in the Province of Tárlac, situated 6 miles northeast of Tárlac, near the confines of Nueva Ecija (Map: Luzon, D 4). Pop., 1903, 14,945.

VICTORIA. A town of Venezuela, the capital of the state of Aragua, situated on the Aragua River, 45 miles southwest of Carácas, near Lake Valencia. Its favorable position gives it an extensive trade in coffee, sugar, cacao, and cereals. Pop., municipal (est.), 14,000.

VICTORIA. The capital of the Province of British Columbia, Canada, and of the Victoria district, at the southeast extremity of Vancouver Island, on the Strait of San Juan de Fuca, and the Esquimalt and Nanaimo, and the Victoria and Sidney railroads, 84 miles southwest of Vancouver (Map: British Columbia, D 5). It has extensive commercial interests, excellent harbor accommodation, which is (1916) being extensively improved, and regular steamship communication with all points on the northwest coast, Seattle, Alaska, San Francisco, the Sandwich Islands, China, Japan, India, New Zealand, and Australia. The imports in 1915 were valued at $4,879,880 and the exports at $1,532,782. Victoria's delightful climate, its beautiful surrounding scenery and many fine private residences, gardens, and public parks make it an attractive residential place. Victoria's public buildings include the fine government building, opened in 1897, comprising the Parliamentary chamber, a provincial museum, a library, and administrative offices. Other important edifices are the Anglican and the Roman Catholic cathedrals, the Metropolitan Methodist Church, the St. Andrews Presbyterian Church, the Provincial Royal Jubilee Hospital, St. Joseph's Hospital, the Provincial Library, and the Meteorological Office and Observatory. Among Victoria's many industries, its sawmills, brickyards, shipbuilding yards, ironworks, and furniture factories are the most important. Pop., 1891, 16,841; 1901, 20,919; 1911, 31,660.

VICTORIA. A city and the county seat of Victoria Co., Tex., 128 miles by rail southwest of Houston, on the Guadalupe River and on the Galveston, Harrisburg, and San Antonio, and the St. Louis, Brownsville, and Mexico railroads (Map: Texas, D 5). It is the seat of St. Joseph's College (Roman Catholic), and has the Nazareth Academy, the Bronte Library, an attractive courthouse, and a handsome city hall. Victoria is of considerable importance as a shipping point. The industrial establishments include a large planing mill, cotton gins, an oil mill, and manufactories of safes and locks, cigars, brooms, sugar, canned goods, and creamery products. Pop., 1900, 4010; 1910, 3673.

VICTORIA. A kind of carriage. See CARRIAGE.

VICTORIA (Neo-Lat., named in honor of Victoria, Queen of England). A genus of plants of the family Nymphæaceæ, resembling the common water lily. The best-known species is *Victoria regia*. This is said to have been first observed by Hänke, about 1801, but was not described until 1832, when Pöppig found it in the river Amazon. Its floating leaves are circular and attain a diameter of 5 to 6 feet; have the margin turned up about 2 inches, are purplish beneath, and exhibit prominent veins, furnished with prickles. The flowers rise among

BLOSSOM OF VICTORIA REGIA.

the leaves upon prickly stalks. They are more than a foot in diameter, white, internally rose-colored, and are very fragrant. The fruit is a capsule, almost globose, with a depression on the top, about half the size of a man's head, fleshy within, and divided into numerous cells, full of round farinaceous seeds, which are an agreeable article of food. The plant is called *maïs del agua*, or water maize, in some parts of South America. To the cultivation of the plant special hothouses have been devoted in some places in the United States and in Europe.

VICTORIA (1819–1901). Queen of the United Kingdom of Great Britain and Ireland, Empress of India. She was the daughter and only child of Edward, Duke of Kent, fourth son of George III. Her mother, Victoria Mary Louisa, fourth daughter of Francis, Duke of Saxe-Coburg-Saalfeld, and sister of Leopold, King of the Belgians, was married to the Duke of Kent in 1818, four years after the death of her former husband, the Prince of Leiningen. Victoria (baptized as Alexandrina Victoria) was born May 24, 1819, at Kensington Palace, whence her parents had temporarily removed from their home in Germany, in order that the child, a possible claimant for the British throne, might be born on English soil. The princess, left fatherless when eight months of age, was taught by her mother and the Duchess of Northumberland. She ascended the throne on the death of her uncle, William IV (q.v.), June 20, 1837. Her uncle, the Duke of Cumberland, became King of Hanover in virtue of the Salic Law, and thus terminated the connection which had lasted 123 years between the crowns of England and Hanover. Victoria was proclaimed June 21, 1837, and crowned at Westminster, June 28, 1838.

On her accession she found at the head of the Whig government Viscount Melbourne, by whom her early political course was largely influenced. Her long, prosperous, and comparatively peace-

ful reign included the administrations of Melbourne (till 1841), Peel (1841–46), Russell (1846–52 and 1865–66), Derby (1852, 1858–59, and 1866–68), Aberdeen (1852–55), Palmerston (1855–58 and 1859–65), Disraeli (1868, and as Earl of Beaconsfield, 1874–80), Gladstone (1868–74, 1880–85, 1886, and 1892–94), Salisbury (1885–86, 1886–92, and 1895 to the end of the reign), Rosebery (1894–95). Of the legislative record of her reign the most important events are the establishment of penny postage (1840), amendment of the poor laws of Scotland (1845) and Ireland (1847), repeal of the corn laws (1846), the Irish encumbered estates act (1848), repeal of the navigation laws (1849), the removal of the disabilities of the Jews (1858), the reform act of 1867, the disestablishment of the Irish church (1869), elementary education act (1870) and abolition of religious tests in the universities (1871), Irish land acts (1870, 1881), abolition of purchase in the army (1871), Scotch educational act (1872), and the franchise bill of 1884. Events of national and international importance were numerous in her long reign, among them being the rebellion in Canada (1837–38), Afghan War (1838–42), Opium War in China (1840–42), culmination of the repeal agitation in Ireland under O'Connell (1843), First Sikh War (1845–46), Irish famine (1846–47), chartist agitation (1848), Second Sikh War (1849), the establishment of a Catholic hierarchy in England (1850), Crimean War (1854–56), war with China (1856–58), Indian Mutiny (1857–58), transfer of India from the East India Company to the crown (1858), expedition to China (1860), complicated relations with the United States during the Civil War (1861–65), Canadian confederation (1867), Abyssinian War (1867–68), Ashanti War (1873–74), the assumption by Victoria of the title of Empress of India (1876), Afghan War (1878–80), Zulu War (1879), Transvaal War (1880), and the virtual establishment of British domination in Egypt (1882), the struggle for the reconquest of Nubia for Egypt (1884–98), the conquest of Burma (1885), Ashanti War (1896), South African War (1899–1902), Australian federation (1900–01). The reign of Victoria, the longest in English history, witnessed an extraordinary development of Imperial Britain as shown in the growth and political organization of the Canadian, Australian, and African colonies. For many years the agitation for home rule in Ireland was the main feature of internal politics. Victoria was preëminent among sovereigns by her personal character. She "for many years . . . exerted an almost unbounded moral control over the larger policies of the British Empire. She was industrious and methodical, patient and tactful, with a memory that was a great storehouse of knowledge of things past and present." The leading feature of the Victorian epoch was "the new conception of the British monarchy which sprang from the development of the colonies and dependencies of Great Britain, and the sudden strengthening of the sense of unity between them and the mother country. The crown after 1880 became the living symbol of Imperial unity, and every year events deepened the impression that the Queen in her own person typified the common interest and the common sympathy which spread a feeling of brotherhood through the continents that formed the British Empire." Her Diamond Jubilee in 1896 was marked by empire-wide rejoicing and a celebration such as London had never before seen.

Queen Victoria was married, Feb. 10, 1840, to her cousin, Albert, Prince of Saxe-Coburg-Gotha, second son of the then reigning Duke. Although the union was not at the time greatly approved of by the Queen's advisers and subjects, it proved a most felicitous one, marked by a degree of mutual affection rarely found in marriages of state. The Prince Consort died Dec. 14, 1861; Victoria never ceased to mourn him. To them were born four sons and five daughters: The Princess Royal, Victoria, born Nov. 21, 1840, married Jan. 25, 1858, to Frederick William, who in 1888 became Frederick III, Emperor of Germany of brief reign (died 1901); Albert Edward, King of Great Britain, 1901–1910, born Nov. 9, 1841, married March 10, 1863, Princess Alexandra Caroline, eldest daughter of Christian IX, King of Denmark; Princess Alice, born April 25, 1843, married July 1, 1862, Prince Frederick William of Hesse (died 1878); Prince Alfred, born Aug. 6, 1844, created Duke of Edinburgh, 1866, married Jan. 23, 1874, Marie, only daughter of the Emperor of Russia (died 1901); Princess Helena, born May 25, 1846, married in 1866 to Prince Christian of Denmark; Princess Louise, born March 18, 1848, married in 1871 to the Marquis of Lorne; Prince Arthur, born May 1, 1850, created Duke of Connaught, 1874, married in 1879 Princess Louise Marguerite of Prussia; Prince Leopold, born April 7, 1853, was created Duke of Albany, 1881, and married to Princess Helena of Waldeck in 1882 (died 1884); Princess Beatrice, born April 14, 1857, married, 1885, Prince Henry of Battenberg.

In her seclusion from public life after the death of the Prince Consort, and as later testimonials of her affection for him, Victoria supervised the publication in 1867 of *The Early Days of His Royal Highness, the Prince Consort;* published in 1868 *Leaves from the Journal of our Life in the Highlands;* supervised a second *Life of the Prince Consort* in 1874; adding in 1884 *More Leaves from the Journal*, etc. She died Jan. 22, 1901, at Windsor. See UNITED KINGDOM and articles on the statesmen mentioned in this article.

Bibliography. *The Letters of Queen Victoria . . . between 1837 and 1861*, edited by A. C. Benson (3 vols., London, 1907); Sidney Lee, *Queen Victoria* (ib., 1902); Walter Walsh, *The Religious Life and Influence of Queen Victoria* (ib., 1902); Fitzgerald Molloy, *Victoria Regina, her Court and her Subjects* (2 vols., New York, 1908); Frank Hird, *Victoria, the Woman* (ib., 1908); Theodore Martin, *Queen Victoria as I Knew her* (London, 1908); *The Girlhood of Queen Victoria, a Selection from her Majesty's Diaries between the Years 1832 and 1840*, ed. by Viscount Esher (2 vols., New York, 1912); Clare Jerrold, *The Married Life of Queen Victoria* (London, 1913); id., *The Widowhood of Queen Victoria* (ib., 1916).

VICTORIA, ADELAIDE MARY LOUISA (1840–1901), Princess Royal of England, and later known as the Empress Frederick. She was the oldest daughter of Prince Albert and Queen Victoria, and in 1858 was married to Crown Prince Frederick William of Prussia, subsequently the German Emperor, Frederick III (q.v.). She was of remarkable force of character, and strove to introduce English manners

QUEEN VICTORIA
FROM A PHOTOGRAPH

and ideas at her court, but was opposed by the dislike of Bismarck. She devotedly attended Emperor Frederick in his illness. After the Emperor's death she remained at her country place, Friedrichshof, near Cronberg, until her death.

VICTORIA, Ciudad. See Ciudad Victoria.

VICTORIA, Ciudad de. See Durango (first article).

VICTORIA, Guadalupe (1789–1843). The first Mexican President, born at Durango. His name was Juan Felix Fernández, but he changed it to Guadalupe Victoria in 1822. He joined the revolutionary movement in 1810, was promoted to be general, and figured conspicuously in the revolt which deposed the Emperor Itúrbide in 1823. He was the successful candidate of the Federalist party in the presidential election of 1824. During his administration he secured the recognition of the Republic by England and the practical abolition of slavery. Although the last year of his administration was disturbed by the civil war between the Yorkino and Escoces parties, he held the office till the end of the term (1829). Afterward he was Governor of Puebla and senator. Consult H. H. Bancroft, *History of Mexico*, vol. v (San Francisco, 1885).

VICTORIA, Tomás Luiz de (c.1540–c.1613). One of the greatest of the older Spanish composers, born at Avila in Castile. He is perhaps even better known by the Italianized form of his name, Tommaso Ludovico da Vittoria. While still very young he went to Rome, where his countrymen Escobedo and Morales, both singers in the Papal Chapel, were his teachers. In 1573 he became maestro di cappella at the Collegium Germanicum, and two years later at Sant' Apollinare. From 1589 till his death he lived in Madrid. As a composer he is classed with the masters of the Roman school, because his style resembles that of Palestrina, with whom he was an intimate friend. His greatest work, the *Requiem*, written in 1605 on the death of the Empress Mary, is ranked with the masterpieces of Palestrina. He wrote, besides, numerous masses, motets, psalms, and antiphonies. His complete works, edited by Felipe Pedrell, were published in eight volumes by Breitkopf and Härtel (1903–13). Consult H. Collet, *Le Mysticisme musical espagnol au XVIme siècle* (Paris, 1913).

VICTORIA AND ALBERT MUSEUM. See South Kensington Museum.

VICTORIA CROSS. The most highly prized decoration of the British military and naval services. It was instituted by royal warrant, dated Jan. 29, 1856, and promulgated in the official *Gazette* on February 5. It is a Maltese cross in shape, and is made from cannon captured in the Crimean War, principally at Sebastopol, the design on the obverse side consisting of the royal crest, a crowned lion, beneath which is the inscription "For Valour." Noncommissioned officers and men, and such commissioned officers as may have risen from the ranks, who have been awarded the Victoria Cross receive an annuity of £10, which, under special circumstances, may be increased to £50. The ribbon is blue for the naval service and red for the military. In 1911 native officers and men of the Indian army were made eligible for this decoration. Civilians acting in a volunteer capacity are eligible for the medal. Up to 1913, 522 crosses were awarded, and this number was considerably increased in the great war. Consult D. H. Parry, *The V. C., its Heroes and their Valour* (London, 1913). See Plate of Orders.

VICTORIA EMBANKMENT. See Thames Embankment.

VICTORIA FALLS (native name *Mosi-wa-Tunya*, Thundering Smoke). A magnificent cataract on the middle Zambezi in Rhodesia, a few miles below the Kwando confluence (Map: Africa, G 6). The river, here nearly a mile wide, suddenly plunges to a depth of 400 feet and within 200 feet of the falls the river suddenly narrows to a width of 100 to 400 feet. A dense cloud of vapor rises far above the falls, and as it condenses it darkens to the appearance of smoke, whence the native name. Below the falls, spanning the gorge, a railroad bridge, a marvel of engineering skill, was completed in 1905. The name Victoria was given to the falls by Livingstone, who discovered them in 1855.

VICTORIA GREEN AND ORANGE. See Coal-Tar Colors.

VICTORIA INSTITUTE, The. A society founded in London in 1870 with the object of bringing together men of scientific attainments as well as those interested in the investigation of philosophy and science in the inquiry how far these may be found to harmonize with the great truths taught in the Holy Scripture; also by the discussion of these truths to test the faith of the members in "one eternal God." The results of such discussions are printed in the *Transactions* of the Institute. The membership is about 1000.

VICTORIA LAND. See South Victoria Land.

VICTO'RIAN GOTHIC. The general name commonly applied to those phases of the Gothic Revival in England which developed during the reign of Queen Victoria (1837–1902). It was characterized at first by the effort to attain archæological correctness of detail, to which the extensive restorations of mediæval buildings, especially by Sir G. Gilbert Scott (q.v.), greatly contributed. Later, in its adaptations to secular architecture, its leaders developed an increasingly free eclecticism. The most noted of these leaders were Sir G. Gilbert Scott, George Edmund Street, Alfred Waterhouse, and William Burges. Among its most noted productions are the Houses of Parliament (by Barry), the Manchester Town Hall and Courts, Exeter College Chapel at Oxford, and the New Law Courts, London. Consult Eastlake, *The Gothic Revival* (London, 1872).

VICTORIA NYANZA, nē-ăn'zȧ, or Ukerewe. The largest lake in Africa, and, next to Lake Superior, the largest sheet of fresh water in the world. It is 450 miles from the Indian Ocean and 175 miles northeast of Lake Tanganyika (Map: Africa, H 5). Its length from north to south is over 200 miles, its average breadth 150 miles, and its estimated area about 26,000 square miles. The lake occupies a broad depression, probably due to a series of faults in the ancient crystalline rocks of the East African plateau. Its surface lies at an elevation of 3775 feet. The shores, especially on the south and east, are very irregular, with numerous headlands and deep bays, and the lake contains several large and numerous smaller islands with an aggregate area of about 2300 square miles. The largest islands are Ukerewe, in the southeast,

and Sesse, in the northwest. Some of the islands are densely wooded, some of them show fresh, green meadows with a number of villages, while others, even some of considerable size, are uninhabited and rocky. The west shore of the lake is high, steep, and rocky in the south, becoming lower and densely forested northward. The south shore is low and marshy, while the country bordering the lake on the east is mostly an open steppe region. There are many fish in the lake and it abounds in mollusks. Crocodiles are numerous, and on the uninhabited islands there are many hippopotamuses. It receives the drainage of 92,000 square miles through many small streams, the largest of which is the Kagera, and discharges through the Victoria Nile to the Nile. The lake is comparatively shallow. Deeper soundings have been made inshore than near its centre. It was discovered by Speke in 1858, circumnavigated by Stanley in 1875, and subsequently explored at various times by him and others.

VICTORIA UNIVERSITY. An English university founded in 1880 by the union of Owens College, Manchester, University College, Liverpool, and Yorkshire College, Leeds. In 1903 the University of Liverpool (q.v.) became a separate institution, and in 1904 a charter was given to the University of Leeds (q.v.), and Owens College became the Victoria University of Manchester. See MANCHESTER, UNIVERSITY OF.

VICTORIAVILLE. A town in Arthabaska County, Quebec, Canada, on the Grand Trunk Railway (Map: Quebec, J 5). It possesses a Roman Catholic college, convent, and academy. Pop., 1901, 1693; 1911, 3028.

VIC'TORI'NUS, GAIUS MARIUS. A Latin grammarian, rhetorician, and philosopher of the fourth century. He was an African by birth, went to Rome about 300 A.D. to teach rhetoric, and in his old age became a Christian. St. Jerome was one of his pupils. His translations from the Greek of Plotinus (q.v.) and other Neo-Platonists were the indirect means of Augustine's introduction to that philosophical system. His commentaries on the Pauline Epistles and polemics against the Arians and the Manichæans are edited in Migne's *Patrologia Latina* (vol. viii); but his greater fame is as a grammarian. A commentary on Cicero's *De Inventione* (in Halm, *Rhetores Latini*, 1863), an *Ars Grammatica*, dealing almost entirely with prosody (edited with other grammatical fragments in Keil, *Grammatici Latini*, vol. vi, Leipzig, 1874), and a treatise *De Definitionibus* (edited by Stangl, 1888) are his chief works. Consult: R. Schmid, *Marius Victorinus Rhetor und seine Beziehungen zu Augustin* (Kiel, 1895); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. iii (6th ed., Leipzig, 1913); Martin Schanz, *Geschichte der römischen Litteratur*, vol. iv (2d ed., Munich, 1914).

VIC'TORS, JAN (also called FICTOOR, VICTOORS, and VICTOR) (c.1620–c.1682). A Dutch genre and biblical painter, pupil, and follower of Rembrandt. He lived in Amsterdam, and his work is represented there and at Brunswick, Copenhagen, Prague, and St. Petersburg.

VICTOR VITEN'SIS (c.430–c.490). A Latin historian, of whose life little is known. As early as 455 he was a cleric in the Carthaginian church, and in 483 he was employed by Eugenius, Metropolitan of Carthage, to help the clergy made destitute by the persecution of the Arian Vandals. The *Historia Persecutionis Vandalicæ seu Africanæ sub Genserico et Hunnerico, Vandalorum Regibus* (edited in Migne's *Patrologia Latina*, vol. lviii, and by Petschenig in the Vienna *Corpus*, vol. vii, 1881) is valuable for the information it gives of churches in Africa and of pagan superstitions.

VICTORY, THE. Lord Nelson's flagship in the battle of Trafalgar, Oct. 21, 1805.

VICUDA, vē-kōō'dȧ. One of the barracudas (*Sphyræna ensis*), about two feet long, and a food fish of some importance on the Pacific coast of Mexico and Central America.

VICUÑA, or **VICUGNA,** vē-kōō'nyȧ (Sp., from Peruv. *vicuña*, Mex. *vicugne*). One of the Andean llamas (*Lama vicunia* or *vicugna*). In size it is intermediate between the llama and the alpaca. Its neck is longer and more slender; its wool finer, short, and curled. It is of a rich-brown color, with patches of white across the shoulders and on the inner side of the legs. The vicuña inhabits the most desolate parts of the Cordillera, at great elevations, and delights in a kind of grass, the ychu (*Stipa ychu*), which abounds there in moist places; but it seldom ventures to the rocky summits, for which its tender feet are ill adapted. It is commonly found in small herds of from 6 to 15 females with one male. The vicuña is a very active and alert animal, like the wild goat or the antelope. The Indians seldom kill it with firearms, but set up a circle of stakes, about a mile in circumference, and so entrap it. It has never been domesticated. Compare ALPACA; GUANACO; LLAMA. See Plate of CAMELS AND LLAMAS.

VICUÑA-MACKENNA, vē-kōō'nyȧ mȧ-kĕn'nȧ, BENJAMIN (1831–86). A Chilean historian and politician, born at Santiago. He was educated in the National Institute and the University. For taking part in the revolution of 1851–52, he was imprisoned and condemned to death. He escaped to the United States and traveled there and in Europe. Returning to Chile in 1856, he was elected to Congress, but was exiled in 1859 for his opposition to the government. While in Europe he made extensive historical investigations in the archives of Spain and France. Upon his return to Chile, he was elected to Congress (1867), chosen Senator (1871), and named intendant of the Province of Santiago (1872). He was editor of numerous periodicals and wrote many works upon the history of Chile. His writings include: *El ostracismo de los Carreras* (1857); *El ostracismo del General O'Higgins* (1862); *Historia de la administración Montt* (1862–63); *Historia de Santiago* (1868); *Historia de Valparaiso* (1868); *Francisco Moyen* (1868); *Historia de Chile* (1868); *Historia de las compañas de Arica y Tacna* (1881).

VIDA, vē'dȧ, MARCO GIROLAMO (c.1485–1566). An Italian Latinist poet, born in Cremona, Italy. He was educated at Padua and Bologna, and became a canon of St. John Lateran at Rome. In 1532 he was made Bishop of Alba. Vida has left three monuments of his Latinity and scholarship, the *Poeticorum Libri Tres*, the *Bombices* (on silkworms), the *Scacchiæ Ludus* (on chess), and an epic, the *Christias*, published in 1535 at the instance of Pope Leo X.

Consult: *Vidæ Poemata Omnia* (Padua, 1721, and London, 1732); Cichitelli, *Sulle opere poetiche di Gir. Vida* (Naples, 1904), bibliog-

raphy and biography; V. Osmo, in *Giornale storico della litteratura italiana* (Turin, 1911).

VIDA ES SUEÑO, vē'dȧ ȧs swā'nyō, LA (Sp., Life is a Dream). The best known of Calderón's romantic productions, written about 1630.

VIDAL, vē'dȧl', PEIRE. A Provençal poet. He was the son of a furrier of Toulouse and became a favorite in the courts of southern France and of Spain, being on terms of special intimacy with Barral, Viscount of Marseilles, whose wife he celebrated under the name of Vierna. He lived for a time in the East, in later life visited the Marquis of Montferrat and the King of Hungary, and probably went on a crusade with the former. His death occurred early in the thirteenth century. Among his poems are to be found some of the best specimens of Provençal literature. An edition of Peire Vidal's songs was published by Bartsch (Berlin, 1857), but it is now out of print. Consult Schopf, *Beiträge zur Biographie und zur Chronologie der Lieder des Troubadours Peire Vidal* (Breslau, 1887).

VIDAURRI, vē-dou'rē, SANTIAGO (1803–67). A Mexican general and statesman, born in the State of Nuevo León. He began life as a lawyer, took part in the civil wars, attained the rank of general, and became Governor of Nuevo León in 1853. He assisted in the operations against Santa Anna, 1854–55. In 1856 he united Coahuila to Nuevo León by force and refused to recognize the government of President Comonfort. Thereupon a treaty was signed which left Vidaurri in a practically independent position. He was suspected of designing to establish an independent republic in northern Mexico. He supported Juárez in the "war of reform," 1857–60, and at first opposed the French domination, but after 1864 submitted and was made lieutenant of the Empire by Maximilian in 1867. Taken prisoner in the same year by the Liberal forces, he was shot as a traitor.

VIDOCQ, vē'dȯk', FRANÇOIS-JULES (1775–1857). A celebrated French criminal and detective. He was the son of a baker of Arras, where he was born July 23, 1775. When a boy he stole from his father and was imprisoned, but on release appropriated a sum of money. He was later an acrobat, and then entered the army. Returning home, he lived a disreputable life, and in 1796 went to the galleys for forgery. Escaping, he joined a band of highwaymen, afterward turned them over to the police, and soon acquired some note as a spy upon criminals. In 1812 he was made chief of a small detective force, the brigade de sûreté, which developed great efficiency in detecting crime and in creating crime to detect. His *Mémoires* (1829) are of doubtful authenticity and, if authentic, are unreliable.

VIEBIG, fē'bĭk, CLARA (1860–). A German writer of short stories and novels. She was born at Treves on the Moselle, and removed early to Düsseldorf. At the death of her father she went to Posen, and thence, to study singing, to Berlin. Here she began to write in 1894. In 1896 she married the bookseller and publisher Cohn. She published *Kinder der Eifel* (1897), *Vor Tau und Tag* (1898), collections of short stories of the Eifel region and the following novels: *Rheinlandtöchter* (1897); *Es lebe die Kunst* (1899); *Das Weiberdorf* (1900), widely read; *Vom Müller Hannes* (1903), tragically pessimistic; *Das Schlafende Heer* (1904), depicting a national struggle to the death between the Germans and the Slavs; *Absolvo te* (1907); *Das Kreuz im Venn* (1908); and *Die vor den Toren* (1910). *Die Rosenkranzjungfer* (1901) and *Naturgewalten* (1905) are late collections of excellent tales. Clara Viebig's best work lies in her short stories, depicting the life of her native Eifel, and in her earlier novels. The rest of her work has not reached the grade of her *Kinder der Eifel*. Some of her books passed through many editions. Her dramas have not been successful. See autobiography in *Als unsere grossen Dichterinnen kleine Mädchen waren* (Leipzig, 1911).

VIE DE POÈTE, vē de pō'ȧt', LA (Fr., Poet's Life). An opera by Charpentier (q.v.), first produced in Paris, June 17, 1892.

VIEIL EVREUX. See EVREUX.

VIEILLE, vē'ȧ'y', PAUL (1854–). A French engineer and inventor, born in Paris. He graduated from the Ecole Polytechnique of that city in 1875, and went into the government service as engineer in the department of explosives. In 1879 he was nominated assistant chief of the central laboratory of powders and saltpetre at Paris. There he conducted a series of investigations on projectiles which led to his invention in 1884 of a smokeless powder, which was adopted by the French army. (See EXPLOSIVES.) For his scientific discoveries he was admitted to the Legion of Honor and was awarded (1889) by the Academy of Sciences the Lecomte prize of 50,000 francs.

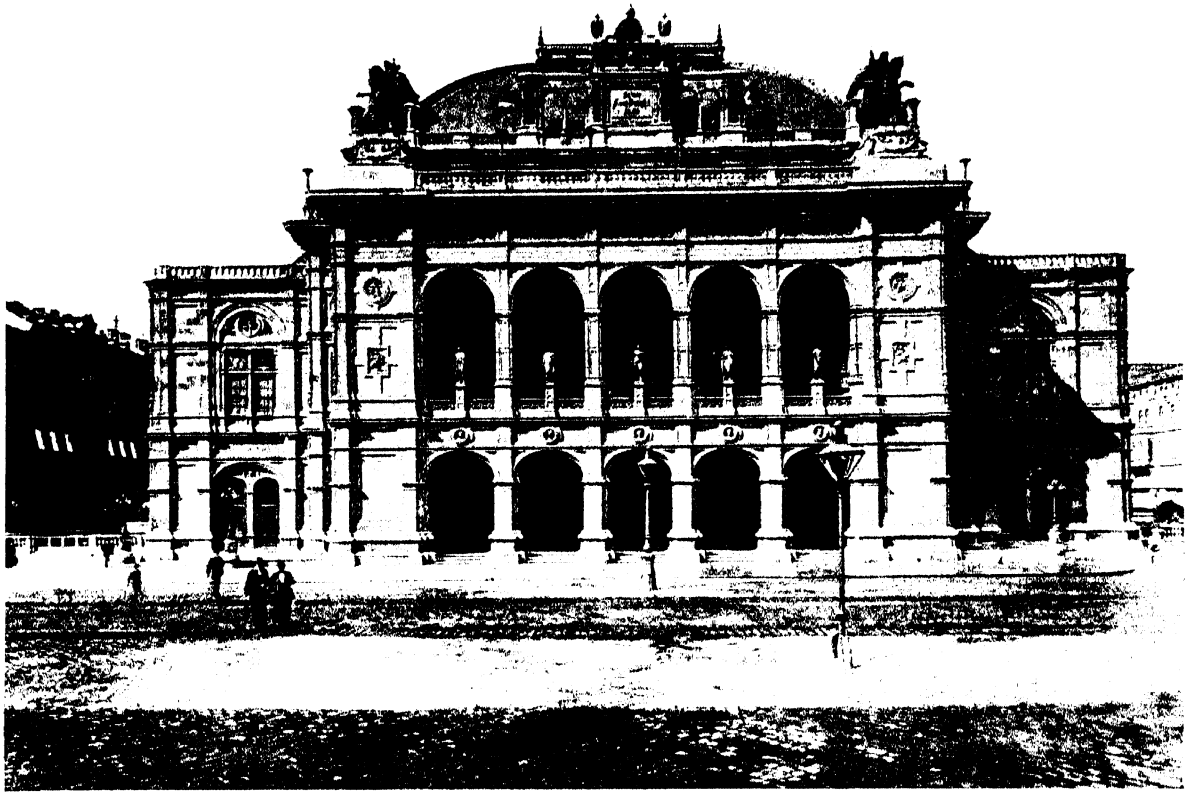
VIEIRA, vē-ā'rȧ, ANTONIO (1608–97). A Portuguese preacher and missionary, born at Lisbon. He was taken to Brazil in 1615, was educated in the Jesuit schools of Bahía, and was ordained in 1635. He returned to Lisbon in 1641, and rose to be court preacher, in which post he exercised a great influence upon the economic and political conditions of the country and upon Portuguese diplomacy. He was sent by his order to Brazil in 1652 as director of the northern missions. There he was imprisoned by the colonists in 1661 and sent back to Portugal. On the charge of teaching doctrines condemned by the Church in 1665, he suffered imprisonment by the Inquisition for two years more, but was released finally without any demand upon him to retract. In 1681 he returned to Brazil, and died there as provincial of his order. His sermons (15 vols., 1679–1748) are considered examples of the best Portuguese prose. Among his other writings may be named the *Noticias reconditas do modo de proceder a Inquisição de Portugal com os seus presos* (1821). Consult Luiz Cabral, *Vieira, biographie, caractère, éloquence* (Paris, 1900); id., *Vieira pregador* (2 vols., Oporto, 1901).

VIELE, vē'lē, EGBERT LUDOVICKUS (1825–1902). An American soldier and civil engineer, born at Waterford, N. Y. He graduated at West Point in 1847; served under General Scott in Mexico; and became a first lieutenant in 1850, but resigned in 1853. He reëntered the army on the outbreak of the Civil War; became a brigadier general of volunteers in August, 1861; commanded the land forces in the capture of Fort Pulaski; was engaged in the advance on Norfolk, Va., and was military governor of that place from August, 1862, until October, 1863, when he resigned from active service. In 1883 he became commissioner of parks for New York City, and in the following year was made president of the department. In the same year he was

elected to Congress as a Democrat, but two years later was defeated in a contest for reëlection. He published: *Handbook for Active Service* (1861); *Topographical Atlas of the City of New York* (1865); *Report of the Board of Visitors to the United States Military Academy at West Point* (1886). For his sons, see VIELÉ, HERMAN K., and VIELÉ-GRIFFIN, FRANCIS.

VIELÉ, vē'lā', HERMAN KNICKERBOCKER (1856–1908). An American author, painter, and engineer, born in New York City, where he studied civil engineering in the office of his father, Egbert L. Viele (q.v.). Painting and writing, which were at first his avocation, occupied more and more of his time, and by 1900 they had become vocations. Though his paintings found some favor, he was more widely known as a novelist, His writings include: *The Inn of the Silver Moon* (1900); *The Last of the Knickerbockers* (1901); *Myra of the Pines* (1902); *Random Verse* (1903); *Heartbreak Hill* (1908); *On the Lightship* (1909); and a play, *The House of Silence* (produced 1906).

VIELÉ-GRIFFIN, vē'lā' grē'făn', FRANCIS (1864–). A French poet, whose name was originally Egbert Ludovicus Vielé. He was born at Norfolk, Va., but was educated for the most part in France. He there allied himself with the group of literary men who were known, first among themselves and later to a wider circle, as Symbolists (q.v.). His publications include: *Cueille d'Avril* (1886), made up of verses which appeared in *Lutèce; Les cygnes* (1887); *Ancœus* (1888); *Joies* (1889); *Entretiens politiques et littéraires* (1890–92); with Paul Adam and Bernard Lazare, *Swanhilde* (1893); *Poèmes et poésies* (1895); *Phocas la jardinière* (1898); *La légende ailée de Wieland* (1900); *Sainte Agnès* (1901); *L'Amour sacré* (1900–03); *Plus loin* (1906); *Poèmes et poésies* (1907); *Sapho* (1911); *La lumière de la Grèce* (1912). Consult Thompson, *French Portraits* (Boston, 1900), and Van Bever and Léautaud, *Poètes d'aujourd'hui* (Paris, 1900). For his father see VIELE, EGBERT L.



VIEN, vē'ăn', JOSEPH MARIE, COUNT (1716–1809). A French historical painter. He was born in Montpellier, and studied under Natoire, in Paris. In 1743 he won the Prix de Rome, and after his return to Paris he became the head of an influential school, in which were trained David and the principal leaders of classicism in France. He became a member of the Academy des Beaux-Arts in 1754, in 1775 was made director of the French Academy at Rome, and in 1789 court painter to the King. His art represents the period of transition from the rococo to classicism. His masterpiece, "St. Denis Preaching to the Gauls," is in the church of St. Roch; "A Sleeping Hermit" and "St. Germain and St. Vincent" are in the Louvre, and he is represented in many French provincial museums.

VIENNA, vē-ĕn'nà. The capital of Austria-Hungary, situated on the right bank of the Danube and intersected by an arm of the river called the Danube Canal, into which the small river Wien here empties (Map: Austria, E 2). It has a temperate climate, the mean annual temperature being 48.8° F. The annual rainfall is 23.42 inches; the altitude, from 560 to 655 feet. The last northeastern outliers of the Alps (Wiener Wald) here reach the Danube plain. Vienna is distinguished by an unusually large acreage of forests and meadows within its confines, the extent of the total area being much greater than that of Berlin.

Description. Vienna is notable for the magnificent Ringstrasse lined with imposing Renaissance structures and beautiful public parks and squares, and for its general air of gayety, due to its genial, music-loving population. In modern architectural development, both in extent and in artistic value, perhaps no city is its equal. The traditional Vienna baroque style, with its open-air embellishments in relief and in color, give everywhere a lively and varied aspect. The modern improvements of every kind, especially in fine new streets, are remarkable. This modernization of the city has been continuous since 1857. The old inner city, which still has many Durchhaüser, or short-cut passages through the courts of houses, is encircled by the Ringstrasse, marking the site of the interior fortifications finally demolished in 1857. The southwest section of the inner city is occupied by the Imperial Hofburg, and by the Volksgarten and the Hofgarten, with the extensive square lying between. The Burg, or Imperial residence, has been the official home of the Hapsburgs since they obtained possession of the city in 1276. Built, renovated, and added to from the thirteenth century until the beginning of the twentieth, it is a vast, confused, and generally somewhat uninteresting group of buildings, containing many reminiscences of former rulers. Splendid in architectural decoration is the Knights' Hall in the Residenz. In the spacious inner court, the Franzenplatz, stands an elaborate monument to Francis I (by Marchesi, 1846). Through a portal on the east may be entered the Josefsplatz with the equestrian bronze statue of Joseph II (by Zauner, 1806). Here rises the splendid Imperial library, dating from 1722, crowned by a great frescoed dome, and a long, handsomely embellished gallery, with statues. The library contains over 600,000 volumes. There is also an immense and invaluable collection of engravings (over 350,000). In the Outer Burgplatz, which separates the Burg from the Ringstrasse, are two fine equestrian statues by Fernkorn—one to Archduke Charles (1860), the other to Prince Eugene of Savoy (1865). Here on the Ringstrasse is the Burgthor, with five passages, formed by Doric columns. Two immense wings by Semper connect this gate with the old palace. The attractive and popular Volksgarten dates from 1824 and contains the notable modern Grillparzer monument (1889), of elaborate design.

Passing from the Hofgarten northward farther into the former inner city, the Augustiner Kirche (1339) is noted, in the vicinity of various government palaces and offices. It is a mediæval Gothic building and contains besides other well-known monuments Canova's famous monument to the Archduchess Maria Christina. Near by, on the Augustiner Bastei, one of the few remnants of the old bastions, stands the palace of the Archduke Friedrich, containing the Albertina Library with its famous collections of drawings and engravings. Of the latter there are more than 220,000.

The Imperial Opera, in the style of the Renaissance, situated on the Opern-Ring, is one of the superb modern art temples of Europe. It was completed in 1869. The luxurious interior is adorned with frescoes, statues, busts, etc., of

VIENNA

THE OPERA HOUSE (UPPER)

THE CITY HALL (LOWER)

great excellence. The vicinity is the fashionable centre of the capital, and hence the spacious Kärntnerstrasse, one of the busiest thoroughfares of the city, leads northeast past the Neuer Markt, to the cathedral. The spacious Neuer Markt contains a fine fountain, by Raphael Donner. In the Capuchin Church (1622) here is the Imperial vault. In this section palaces and governmental establishments abound.

A little distance to the north, near the centre of the inner city, towers the cathedral of St. Stephen. It is the most famous structure in Austria. Founded in 1144, the present edifice dates mainly from 1300 to 1510. Its shape is that of a Latin cross. It is 355 feet long, and has been partially restored in recent times. Great catacombs are beneath it, also the old Imperial burial vault. From its impressive steeple, whose cross is 453 feet high, a magnificent view of the city and the surrounding country may be had. Between the cathedral and the Burg extends the wide modernized Graben northwest and southeast, a fashionable business street. In the northeast section of the inner city is found the baroque university, or Jesuit church (1631), with the Academy of Sciences (1846) near by in the old university. In the extreme northeast corner of the old city are the post office and the Imperial Ministry of Commerce. The Greek Church is seen to the west, and to the south are the Horticultural Society building and the splendid Renaissance palace of Archduke Eugene.

Entering the northwest section of the inner city from the Graben, the Austrian Kunstverein is noticed. It holds a permanent exhibition. To the northeast is the square called Hoher Markt, said to be the site of the forum of the ancient Vindobona. This is the most ancient part of the town. In the centre of the square rises a votive monument by Fischer von Erlach. West is the spacious square Am Hof, where dwelt the ancient rulers of the Babenberg family. Farther northwest, on the Freiung, is the Harrach Palace, containing a fine picture collection of some 400 canvases. Near by is the far less valuable Schönborn collection. In the vicinity are the Schotten cloister and church (1638–62). Southward in the general direction of the Volksgarten are the fine Hofburg Theatre (1889), containing a valuable collection of actors' portraits; the imposing Landhaus of the Lower Austrian Diet (1838, housing the Museum of the Imperial Agricultural Society); the Minorite Church, finished 1330, with Raffaeli's splendid mosaic of Da Vinci's "Last Supper" done at the command of Napoleon I; and the notable Kultus Ministerium. Near the northwest corner of the inner city is the splendid modern Renaissance stock exchange (1877). It holds the valuable Museum of Trade, collections of industrial products, etc.

Beginning here at the northwestern end of the Ringstrasse, by the river Wien, there may be mentioned conveniently in succession the objects of interest lining the street. The Stiftungshaus, a benevolent establishment, has an expiatory chapel built by Francis Joseph on the spot where the Ring Theatre was destroyed by fire in 1881 with great loss of life. To the west is the striking Gothic Votivkirche, one of the chief modern ornaments of the city, completed in 1879 with a beautiful façade, towers, and a resplendent interior. In this region is the excellent Liechtenstein picture gallery, with over 800 good canvases. Rubens's "History of Decius" and "Two Sons" and Van Dyck's famous portrait of Maria Louisa de Tassis are here. A park and a fine new palace of Prince Liechtenstein are near by. On the south of the Votivkirche extends the wide Universitätsstrasse, entering the Ringstrasse, and having the university on the south. This is the most superb part of the Ringstrasse. The immense quadrangular university building, exhibiting the Tuscan Renaissance, was completed in 1884, and contains the famous college collections, library, etc. See VIENNA, UNIVERSITY OF.

South of the university extends the Rathaus Park, opposite the Hofburg Theatre, and with the sumptuous Rathaus on the west. This unsurpassed Gothic town hall was completed in 1883, at a cost of $6,000,000. It abounds in statuary and frescoes. Its majestic tower rises 320 feet. It holds the valuable historical museum of Vienna, the municipal library (over 78,000 volumes), and the municipal collections of weapons. The first is rich in antiquities, costumes, and objects of personal interest. On the south of the Rathaus Park and opposite the Volksgarten rise the imposing Houses of Parliament, designed in the Greek style, by Hansen. They are approached by a columned portico. About a hundred yards farther south is the fine Palace of Justice, in German Renaissance, finished in 1881. South of it stands the attractive Deutsches Volktheater (1889) in Italian Renaissance. To the east are the celebrated natural-history and art-history museums in two spacious and imposing edifices flanking the Maria-Theresiaplatz opposite the Burgthor. Here is to be seen the colossal bronze Maria Theresa monument, erected in 1888 by Zumbusch.

The museum buildings are twin, domed edifices in the Italian Renaissance, and were completed in 1889. They are abundantly decorated with symbolic and portrait statuary, and in the interior with frescoes and marbles by great artists. The natural-history collections, among the most famous in the world, date from 1748. The equally celebrated art museum includes the art treasures of the Imperial House. In this section is one of the principal military institutions, known as the Military Geographical Institute.

Southeast of the art museum, near the Ring, is the Schillerplatz, with Schilling's fine bronze Schiller monument (1876). The square is flanked on two sides by the Palace of Justice (1881) and the Academy of Art (1877). The Goethe monument, by Hellmer (1904), is to the north, in the Hofgarten. In this vicinity, facing south on the river Wien, which from this point to the Stadtpark has been covered and runs underground, are the Commercial Academy (1862), the Künstlerhaus (1881) with a permanent exhibition of modern pictures, and the Renaissance building of the Musikverein. In the last are the Vienna Conservatory of Music (1870), with a musical library of over 20,000 works, and a museum.

In the district of Wieden is the Polytechnic Institution (1815), with collections and a laboratory. Turning northeast from the Wieden district, along the exterior side of the Ring, we pass the Schwartzenberg monument (by Hähnel, 1867), the Academic Gymnasium, and the bronze statue of Beethoven, by Zumbusch, erected in 1880. The charming little Stadt-Park farther on has an attractive Kursalon. Here are

the fine monuments to Schubert, by Kundmann (1872), to the painter Hans Makart (1898), by Tilgner, and to the painter Schindler (1895), by Hellmer. Beyond are the Austrian Museum of Art and Industry (1871) and the Art Industrial School (1877)—both in sightly brick Renaissance edifices, embellished with attractive features, and connected by a passageway. These institutions are models of their kind. Extensive quays along the Donaukanal, which is spanned in this section by the Aspern, Ferdinand, Marien, Stephanie, and Maria Theresa bridges, connect the extremities of the Ring.

East of the Wien, just above its mouth, into the Donaukanal, stretches the Landstrasse district, with the customhouse, the central markets, the mint, the geological institution, the botanic garden, and the Metternich Palace. South from this section extends the Belvedere Garden, with a palace at either end. Immediately to the west are the Schwarzenberg Palace and Gardens. The district northeast of the Danube Canal, opposite the old city, is the Leopoldstadt. Adjoining this section on the north is the Augarten Park. The main artery of the Leopoldstadt is the fine and broad Praterstrasse, stretching northeast to Prater. The International Exhibition of 1873 was held here.

Among ecclesiastical buildings not hitherto mentioned are the Karlskirche, erected 1736–37 by Fischer von Erlach, in the district of Wieden, and the church of Maria Stiegen (Maria am Gestade) in the inner city, dating from 1340. The inner city also contains the church of St. Michael, originally erected early in the thirteenth century. The Altlerchenfeld Church, in the district of Neubau, is a fine modern brick edifice, in the Italian mediæval style (1861). In the Leopoldstadt is the handsome modern Jewish synagogue, in the Moorish style (1858), and in the Seitenstettengasse the older synagogue (1826). One of the most striking of secular buildings is the Artillery Arsenal (1854), in the southeastern section, with its fine army museum. Near it are the stations of the Southern and State railways. The finest railroad station is the Nordbahnhof, near the entrance to the Prater. Among places of burial, the large Central Cemetery, with its fine monuments, claims attention.

A new quarter of the city, called the Donaustadt, has sprung up on both sides of the Danube, northeast of the Leopoldstadt, as a result of the Danube improvement works, which have provided a broad new channel for the river and done away with the inundations formerly so destructive. An even more remarkable triumph of engineering skill was the regulation of the Wien, which in the centre of the city flows partly underground.

The environs of Vienna have much of interest and charm. On the northwest rise the Kahlenberg and the Leopoldsberg, whose summits, about 1400 feet above the sea, present an impressive view of mountains, city, and the Danube plain. A mountain railway leads to the top of the Kahlenberg. The historical Schönbrunn Palace (q.v.) is on the southwest of the city, and the battlefields of Aspern and Wagram lie on the Marchfeld plain to the east, with the island of Lobau. South of the city is the picturesque Brühl—a ravine converted into beautiful pleasure grounds.

Industries and Commerce. Vienna is a great and growing centre of manufactures which are characterized by their taste and artistic ingenuity; the city is noted for its elegant shops and its objects of art. It produces also machinery, metal wares, fine furniture, textiles, chemicals, pottery, clothing, millinery, musical instruments, etc. The product of the great Vienna breweries is celebrated. Among the chief articles of commerce are grain, cattle, wine, textiles, coal, iron, flour, wood, furniture, chemicals, clothing, shoes, leather goods, books, and art publications.

Administration. Administratively the city is subject to the Diet and Governor of Lower Austria, and its burgomaster must be approved by the Emperor. It is, however, virtually autonomous. The modern sanitary reforms have greatly diminished the annual death rate. It was not until 1874 that the city was first supplied with good drinking water by an aqueduct, and this supply has been greatly increased and improved. Vienna is surpassed by many cities with respect to lighting and facilities of intercommunication. It can, however, now boast of an admirably constructed metropolitan railway. The finances are on the whole on a good footing. In 1903 the total municipal revenue and expenditure amounted to about $64,978,000. The expenditure on account of education was nearly $4,352,000. The great increase in these figures in late years has been due naturally to the extensive improvements of every nature. The city owns the gas and electricity works, and the tramway system.

Population, Education, and Charities. The population in 1910 was 2,031,498, Vienna being the largest city in Austria-Hungary and the fourth largest in Europe. About three-quarters of the population are Germans and Roman Catholics. Great advance has been made in the educational facilities. The Grand Opera is second to none in the world, and the acting at the Hofburg Theatre is scarcely surpassed anywhere. In addition to the educational institutions already mentioned, and including the famous conservatory of music, the Oriental Academy (a school for training in diplomatic service, dating from 1754) claims particular attention. The government printing establishment is one of the most complete of its kind. Among the charity institutions not already mentioned are the soldiers' asylum, famous institutions for the blind and the deaf and dumb, the general hospital, the largest in Europe, with 2000 beds, and several other large hospitals, asylums for the insane, night asylums, etc.

History. Vienna is the Vindobona of the Romans, under whom it was strategically important. It was made a municipium, but declined in importance in the later Empire and during the migrations was occupied by Huns and Avars. At the close of the eighth century it passed from the possession of the latter to that of the Franks. In the twelfth century it became the residence of the Babenberg dukes of Austria. The traffic which arose in connection with the Crusades caused Vienna to prosper. Ottokar of Bohemia, in the middle of the thirteenth century, enlarged the bounds of the city. Soon afterward it became the capital of the Hapsburg rulers of Austria. In 1365 the university was founded. From the fifteenth century the Hapsburgs permanently occupied the Imperial throne of Germany, which added greatly to the importance of Vienna. In 1477 it resisted a siege by the Hungarians, but was taken by Matthias

Corvinus in 1485. The Turks twice besieged it without success, in 1529 and 1683. The second time, when it was heroically defended by Starhemberg, it was on the point of falling into the hands of the Mussulmans, when it was rescued by the splendid victory of the Polish King, John Sobieski, and the German princes, achieved before its walls (Sept. 12, 1683). In 1735 and 1738 treaties were concluded here in connection with the War of the Polish Succession. (See SUCCESSION WARS.) Vienna was greatly embellished by Maria Theresa and her sons. The city was for a brief period occupied by Napoleon in 1805 and 1809, and the battles of Aspern and Wagram were fought in its environs, the latter followed by the Treaty of Schönbrunn (1809). The famous Congress of Vienna was held in 1814–15. The city was the scene of a revolutionary movement in 1848, which ended in bloodshed. (See AUSTRIA-HUNGARY.) Under Francis Joseph Vienna has undergone an unparalleled transformation, and has become architecturally one of the most imposing capitals of the world.

VIENNA, CONGRESS OF. A convention of the representatives of the European nations, held for the purpose of settling the affairs of Europe after the Napoleonic wars (September, 1814–June, 1815). The work of readjusting the map of Europe after Napoleon's downfall presented many difficult and complicated problems. The boundaries of European states had been altered with bewildering rapidity. Old states had been destroyed and new ones created. Historic dynasties had been overthrown and the social and legal systems in most of the states of western Europe had undergone a radical transformation.

The Congress was one of the most brilliant assemblages of crowned heads and prominent diplomats and statesmen that had ever gathered in the history of Europe. Of the sovereigns of Europe there were in attendance the Czar of Russia, the Emperor of Austria, and the kings of Prussia, Denmark, Bavaria, and Württemberg, besides a large number of the princes of the smaller German states. Among these royal visitors the Czar Alexander I was the most conspicuous. He was one of the few liberal-minded men at the Congress. He had interested himself in the democratic development of Swiss institutions. He sympathized with Stein's schemes for unifying the German states and set his heart on the restoration of the Polish nation under a liberal constitutional government.

Of the diplomats, Prince Metternich, the Austrian Minister of State, who acted as President of the Congress, played perhaps the most prominent part in the work of the Congress. Undoubtedly the most astute of the representatives was the French diplomat, Prince Talleyrand. When he arrived at the Congress he found that the representatives of the four Powers—Great Britain, Russia, Prussia, and Austria—had agreed that neither France nor Spain, nor any of the smaller Powers should take part in the deliberations, but that all decisions should be made by the four Great Powers. Talleyrand soon showed that this arrangement was contrary to the agreement for calling the Congress and succeeded in securing for France a share in the deliberations on an equal footing with the other Powers. Among the other prominent diplomats and statesmen in attendance were Castlereagh and Wellington from Great Britain, Hardenberg and Humboldt from Prussia, and Nesselrode from Russia.

Certain questions had been decided in principle in the first Treaty of Paris, immediately after the overthrow of Napoleon, and the Congress of Vienna simply arranged the details of this settlement. France was deprived of all of the territory conquered by Napoleon. Holland and Belgium were united into a single kingdom under the house of Orange in order to provide a stronger buffer state to the north of France. Norway and Sweden were joined under a single ruler, one of Napoleon's generals, Bernadotte. The independence and neutrality of Switzerland were guaranteed, and the union of the cantons was reconstituted as a loose confederation.

As a result of Napoleon's work the 300 states which had constituted the old Holy Roman Empire had been consolidated into 38 sovereign states, and the Congress made no effort to restore the former petty sovereignties. In regard to the organization of the surviving states there were two views in the Congress. The national party, headed by the Prussian statesman Stein, demanded a close federal union, while Metternich, who feared that a strong united Germany would not be in the interest of Austria, advocated a loose confederation. With the aid of the other German states, Metternich was able to carry through his plan. The confederation which was provided by the Congress was not a union of the countries but of "The Sovereign Princes and Free Towns of Germany." Moreover, there were included in the confederation two non-German sovereigns, the King of Denmark for Holstein and the King of the Netherlands for Luxemburg, while a considerable part of the possessions of Prussia and Austria were not included.

In dealing with Italy the Congress did not see fit to recognize the consolidations which had been made by Napoleon, as it had done in the case of Germany. All of the old governments were restored with the exception of the Republic of Genoa, which was given to Sardinia to strengthen that state against France, and the Republic of Venice, which was given to Austria to compensate her for the loss of the Austrian Netherlands.

Serious trouble developed in the Congress over the distribution of the territories of Poland and Saxony. As has been noted, the Czar was determined to restore the old Polish Kingdom as an autonomous monarchy under the control of Russia. Prussia was willing to relinquish her Polish territory, but demanded in return the whole of the Kingdom of Saxony, whose King was to be deprived of his dominions for remaining faithful to Napoleon to the end of his career. Both Austria and England opposed this arrangement, and Talleyrand, taking advantage of the split between the four Great Powers to improve the position of France, offered to come to the aid of Austria and England with a French army, if necessary, to oppose the claims of Russia and Prussia. A compromise was finally reached by which Prussia received about half of Saxony and some territory on the left bank of the Rhine, while Russia received the

larger part of the Duchy of Warsaw, which was erected into the Kingdom of Poland. In addition Russia received Finland from Sweden.

Great Britain found her compensation in the extension of her colonial possessions. During the Napoleonic wars she had seized a number of the colonial possessions of France, and of the allies and dependencies of France, particularly Holland. Most of these she retained, including the island of Helgoland in the North Sea; Malta and the Ionian Islands in the Mediterranean; Cape Colony in South Africa; Ceylon, Mauritius, Demerara, St. Lucia, Tobago, and Trinidad.

Such were the chief territorial readjustments made by the Congress of Vienna. In making these arrangements no consistent principle was followed. The principle of "legitimacy" so strongly urged by Talleyrand was adopted only so far as it suited the convenience of the Great Powers which dominated the Congress. Even more ruthlessly did the Congress disregard the principle of nationality. Belgium was joined with Holland despite the fact that the people of the two countries differed in race and religion. Norway was turned over unwillingly to Sweden. The hopes of the German Nationalists were not realized, while Italy became in the words of Metternich "a geographical expression." Such flagrant violations of the growing spirit of nationality could not be considered a permanent settlement, and during the nineteenth century many of the ill adjustments made by the Congress were corrected.

While the Congress is chargeable with many shortcomings, and some of its decisions were certain not to remain permanent, it did achieve much important work. It reëstablished a real balance of power among the states of Europe, and it paved the way for a concert of the Great Powers which succeeded in maintaining the peace of Europe practically undisturbed for 40 years. The Congress, moreover, took a noteworthy step forward in condemning the slave trade and in providing for the freedom of navigation of rivers traversing several states or which formed the boundaries between states. VIENNA, UNIVERSITY OF. One of the oldest and most famous universities of Europe, founded by Duke Rudolph IV in 1365. Under its first rector it maintained but a precarious existence. Duke Albert III obtained in 1384 from Pope Urban VI the right to add a theological faculty to the three secular ones. At the same time the university was divided into four nations, modeled after those of Paris. In 1623 Ferdinand II transferred the university to the Jesuits, who erected a number of buildings, some of which still exist. By the beginning of the reign of Maria Theresa it had lost what prestige it acquired during the humanistic awakening. Gerard van Swieten, however, succeeded in rescuing the medical faculty from the general ruin, and it has since maintained an almost unrivaled position in the European medical world. Joseph II reorganized the university as a practical state institution and deprived it of academic freedom. Reforms in 1848–50 introduced again the era of free academic life, and henceforth it regained its former renown. The magnificent new university building designed by the famous architect Ferstel was dedicated in 1884.

The university consists of the following faculties: (1) law and political science; (2) theology; (3) medicine; (4) philosophy. The attendance in 1913 was 8784, including 655 women. The university departments include, besides a large number of seminaries, museums, and laboratories in art and sciences, three medical clinics, two surgical clinics, two lying-in clinics, two for psychiatry, one each for diseases of women, skin diseases, children's diseases, etc. These clinics have attained a world-wide reputation, due to the eminent specialists conducting them. The university library, founded in 1775 by Maria Theresa, has received since 1808 a copy of every work printed in Lower Austria. It includes over 857,000 volumes and 900 manuscripts. Notable also are the observatory, botanical garden, and Central Institute for experimenting in meteorology and terrestrial magnetism. Consult K. Schrauf, *Geschichte der Wiener Universität in ihren Grundzügen* (Vienna, 1901), and C. F. Thwing, *Universities of the World* (New York, 1911).

VIENNA WHITE. A name applied to white pigments exported from Austria, which are mixtures of lead carbonate and barium sulphate.

VIENNE, vē'ĕn'. An interior department of west France, forming the eastern part of the former Province of Poitou, and situated south of the Loire (Map: France, N., F 6). Area, 2711 square miles. The surface is mostly level, watered by the Vienne, a tributary of the Loire. Five-sixths of its area is cultivated, producing crops of wheat, oats, barley, potatoes, and beets. Large numbers of sheep are raised. Vineyards occupy about 72,000 acres, with an annual productive value of about $3,500,000. The chief manufactures are cutlery, paper, and alcohol. Pop., 1901, 336,343; 1911, 332,276. Capital, Poitiers.

VIENNE. The capital of an arrondissement in the Department of Isère, France, on the left bank of the Rhone, 20 miles by rail south of Lyons (Map: France, S., J 3). The Rhone, spanned here by a suspension bridge, is joined by the Gère, which flows through the town. Vienne is picturesquely situated among low hills, but poorly built and ill kept. The ancient ruins and antiquities are numerous. The Roman aqueducts, restored in 1822, supply the town with water. The remarkable Corinthian temple of Augustus and Livia, rebuilt in the second century, resembles the Maison-Carrée at Nîmes. It is 88 feet long and adorned with columns. The town has also some immense arches, now thought to belong to a Roman edifice. The Plan d'Aiguille, a pyramidal structure resting on arches, was formerly pointed out as Pilate's tomb, but is now recognized as a probable goal of an ancient circus. The Gothic cathedral of St. Maurice (twelfth to sixteenth century), with its two towers, façade, and balustrade, produces an attractive effect. The ruins of the Château de la Bâtie are picturesque. There are a library and a museum (rich in Roman remains), a Musée Lapidaire, and a handsome modern Hôtel de Ville. The value of the annual production of textiles is about $4,000,000. Gloves, cutlery, glass, paper, woolen caps, bricks, and leather are

manufactured and there are foundries and brass works. The trade by rail and river is important, especially in wine, and there are iron and silver mines near. Pop., 1901, 24,619; 1911, 25,711.

Vienne, the capital of the Allobroges, became a Roman colony in 47 B.C., and was the earliest centre of Christianity in Gaul. It was the capital of the first and second Burgundian kingdoms. In 1349, when the rest of Dauphiné passed to France the city was left under the rule of its archbishops who did not cede their rights to France till 1449. The ecumenical council which abolished the order of the Knights Templars was held here in 1311–12.

VIENNE, HAUTE-. A department of France. See HAUTE-VIENNE.

VIEQUES, vyâ'kâs, ISLA DE, or CRAB ISLAND. A small island belonging to Porto Rico, geographically one of the Virgin Islands. It lies 7 miles from the east extremity of Porto Rico, and is 19 miles long, with a breadth of three miles (Map: Porto Rico, G 5). The surface is low, but hilly. On the south coast there are several spacious and landlocked harbors accessible for large ships. The soil is fertile, and sugar is cultivated, while many cattle are also raised. With the neighboring island of Culebra, Vieques forms a district of the Department of Humacao, and has a population of about 6800.

VIERECK, fēr'ĕk, GEORGE SYLVESTER (1884–). A German-American editor and poet, born in Munich, Germany. He went to America in 1895, graduated from the College of the City of New York in 1906, and then became editor of *The International* (magazine), and associate editor of *Current Opinion*. After the outbreak of the European War in 1914 he assumed the editorship of the *Fatherland*, a paper devoted to pro-German propaganda in the United States. Viereck lectured at the University of Berlin on American poetry in 1911. His publications include: *A Game at Love, and Other Plays* (1906); *America—A Litany of Nations* (1906); *Nineveh, and Other Poems* (1907; Ger. ed., 1906); *The House of the Vampire* (1907; Ger. ed., 1909), which was dramatized and produced as *The Vampire* in 1909; *Confessions of a Barbarian* (1910; Ger. ed., 1911); *The Candle and the Flame* (1912).

VIERGE, vyâr'hâ, DANIEL (1851–1904). A Spanish illustrator. He was born in Madrid, the son of Urrabieta Ortiz, a well-known draftsman, but adopted his mother's name. He studied under his father, and at the Madrid Academy under Madrazo and others. In 1867 he went to Paris, where he first made a name by his drawings of events of the Commune. He worked principally for the *Monde Illustrée* and *La Vie Moderne*, supplying both these and other journals with a great number of sketches. He also illustrated works of Victor Hugo, Zola, Poe, Michelet's *Histoire de France*, and Quevedo's *Pablo de Segovia* (1882). The two latter are masterpieces of illustration and remarkable, as all his work is, for the drawing of scenery and architecture. His last and perhaps most noteworthy achievement is the 260 illustrations for *Don Quixote*, published in London in 1907. After his right side became completely paralyzed, when he was 30 years old, he learned to draw equally well with his left hand. The art of illustration owes much to Vierge, his influence being particularly strong on American draftsmen. He worked chiefly in pen and ink, of which he may be said to have made a new art, but he also essayed pastel, water color, and etching. Consult the monograph by Marthold (Paris, 1905).

VIERORDT, fēr'ôrt, KARL VON (1818–84). A German physiologist, born at Lahr (Baden). He studied at Heidelberg, Göttingen, Berlin, and Vienna (M.D., 1841), and after holding several less important posts in the University of Tübingen became, in 1855, professor of physiology. Through his *Lehre vom Arterienpuls* (1855) he became the founder of sphygmography (see SPHYGMOGRAPH). Among his works is also *Grundriss der Physiologie* (1860; 5th ed., 1877).

VIERSEN, fēr'zen. A town in the Rhine Province, Prussia, 18 miles west of Düsseldorf (Map: Prussia, B 3). It has a mediæval, late Gothic church and a charming park. Viersen manufactures silks, umbrella covers, cottons, damask, linens, ribbons, and plush on a large scale, and has machine works and tanneries. Pop., 1900, 24,797; 1910, 30,172.

VIERZON-VILLE, vyĕr'zôn'-vēl. A town of the Department of Cher, France, 20 miles by rail northwest of Bourges, on the Cher and the Canal du Berry (Map: France, N., H 5). The manufacture of porcelain and the furnaces and steel refineries are of importance. Pop., 1901, 11,796; 1911, 11,856.

VIETA, vē-ā'tà. See VIÈTE, FRANÇOIS.

VIÈTE, vē'ĕt' (Latin form, VIETA), FRANÇOIS (1540–1603). A French mathematician, born in Fontenay-le-Comte. He was educated for the law, and practiced this profession until the opening of his political career. In 1580 he was appointed as maître des requêtes under the Parliament at Paris. Viète was attached to the court of Henry IV during the war with Spain, and rendered his government valuable service by deciphering the secret messages dispatched by the Spanish court to the Governor of the Netherlands. Viète was the foremost French algebraist of the sixteenth century. His chief works are: *In Artem Analyticam Isagoge* (1591), to which were subsequently added the supplements *Logistice Speciosa* and *Zeticorum, Supplementum Geometriæ* (1593); *De Numerosa Potestatum* (1600). A collection of Viète's works was published by Van Schooten (Leyden, 1646).

VIEUSSENS, vyē'sän', RAYMOND (1641–1716). A French anatomist, born in Rouergue, and educated at Montpellier, where he became professor of neurology in 1671. He was well known for his anatomical studies of the brain, practical anatomy being then in its infancy, and it was stated that he had made over 500 dissections. His *Neurographia Universalis* (1685), with an account of his important researches on the anatomy of the brain and of the spinal column, won him membership in the French Academy of Sciences and in the Royal Society of London. The "valve of Vieussens" is a name still applied to the superior medullary velum, which he discovered.

VIEUXTEMPS, vyē'tän', HENRI (1820–81). A Belgian violinist and composer, born in Verviers. Before five years of age he began to study the violin under a local teacher named Lecloux. Two years later, accompanied by his master, he made a tour of the principal towns of Belgium, and in Brussels met De Bériot, who gave him instruction for several months. In 1833 he made a tour of Germany, and in Vienna became a pupil of Simon Sechter, the court organist. Later he was received with great enthusiasm at Moscow

and St. Petersburg. Other successful tours followed, notably those of America (1844–45, 1856, and 1870). In 1846 he was appointed solo violinist to the Emperor of Russia, and in 1871 was made first professor of the violin, in the place of De Bériot, at the Brussels Conservatory. In 1873, after he sustained a stroke of paralysis, he devoted himself to composition entirely. He died in Algeria. Vieuxtemps ranks with the greatest violin virtuosi of the world. As a composer for the violin he holds a high place. His compositions include six violin concertos, solos, duets, études, variations, fantaisies, transcriptions, and caprices. Consult Th. Radoux, *Henri Vieuxtemps, sa vie et ses œuvres* (Paris, 1891).

VIGAN, vē'gän. The capital of the Province of Ilocos Sur, in Luzon, Philippine Islands, 210 miles northwest of Manila, near the right bank of the Abra River and not far from the coast (Map: Philippine Islands, C 2). It has a number of fine public buildings. The surrounding country produces rice, indigo, cotton, sugar cane, and live stock. In the town there are fisheries, brick and tile kilns, and yards for the construction of small coasting vessels. There is an extensive traffic up the Abra River. The town, formerly called Villa Fernadina, has been the seat of the bishopric of Nueva Segovia since 1755, and has a fine cathedral. It has a monument erected to the memory of Juan de Salcedo, the conqueror of the province. Pop., 1903, 14,945.

VIGÉE-LEBRUN. vē'zhā'-le-brŭn', MARIE ANNE LOUISE ELISABETH (1755–1842). A French portrait painter. She was born in Paris, and received her first instruction from her father. She was more influenced by Greuze, however, and at an early age had established herself as a portrait painter of note. In 1775 she was elected member of the Academy of St. Luke, at Rome. In 1776 she contracted an unfortunate marriage with the painter and art critic Jean B. P. Lebrun, a spendthrift and a man much older than herself. In 1783 she was elected to the Académie des Beaux-Arts. She became a great favorite of society, and was appointed painter in ordinary to Marie Antoinette, of whom she painted about 30 portraits. At the time of the Revolution (1789) she fled to Italy, where she remained three years, then visited Vienna, Prague, Dresden, and St. Petersburg. She was everywhere received with high honor, admitted to membership in the principal academies, and abundantly employed. In 1802–05 she lived in England. Later she visited Holland, Belgium, and Switzerland, making her home alternately in Paris and Louveciennes. She died in Paris, at the age of 87.

Madame Lebrun's figures are well posed, and although the composition is sometimes conventional her presentation is always charming. Her technique is careful in finish, her drawing good, and the color pleasing. Among the best of her portraits are two of the artist and her daughter (Louvre); self-portraits in the Uffizi, Florence, the National Academy, London, and St. Luke's Academy, Rome; Jean Paesiello; the painter Hubert Robert; Joseph Vernet (Louvre); Madame Molé-Raymond; Lord Byron; Marie Antoinette and her three children (Versailles Museum); Marquise de Laborde, Morgan collection, Metropolitan Museum, New York. Consult Madame Lebrun's *Souvenirs de ma vie* (Paris, 1869; Eng. trans., New York, 1903); J. J. Foster, in *French Art from Watteau to Prud'hon* (London, 1906); the biography by Pierre de Nolhac (Paris, 1908); W. H. Helm, *Vigée Lebrun* (Boston, 1915).

VIGER, vē'zhā', DENIS BENJAMIN (1774–1861). A Canadian statesman. He was born and educated in Montreal, and for some years practiced law in that city. In 1808 he was elected a member of the Lower Canada (Quebec) Legislative Assembly. Viger became a leader of the French Canadians in the province, and twice (1828, 1831) went as a delegate to London to state their views and grievances to the British government. During the rebellion of 1837 he was arrested for sedition, but was shortly afterward set free. After the union of Upper and Lower Canada in 1841 he sat in the Canada Legislative Assembly. In the earlier part of his career he sympathized with the cause of popular rights, but in 1843 he supported Sir Charles (afterward Baron) Metcalfe (q.v.), a reactionary Governor of Canada, and became premier of an administration opposed to responsible government. In 1846 he resigned, and in 1848 was appointed a member of the Legislative Council. Consult J. C. Dent, *The Last Forty Years* (Toronto, 1881).

VIGFÚSSON, vĭg'fŭs-son, GUDBRANDUR (1827–89). An Icelandic philologist and author. He was born at Litli Galtardalur, Iceland, studied at the University of Copenhagen, and in 1864 was called to England to complete and publish the Icelandic-English dictionary, left unfinished by Richard Cleasby at his death. This was published in 1869–74, and is Vigfússon's most important work in English. It is still the only dictionary of its kind which approximates completeness. Its etymologies, however, are fantastic and untrustworthy. Vigfússon became in 1884 professor of the Old Norse-Icelandic language and literature at Oxford. He was a skilled reader of the saga manuscripts. Among his principal works, in addition to his *Dictionary,* are *Um Tímatal í Islendinga Sögum* (1855); *Icelandic Sagas* (2 vols., 1887); and, in coöperation with F. York Powell, an edition of the *Sturlunga Saga* with *Prolegomena* (2 vols., 1878); *An Icelandic Reader* (1879); *Corpus Poeticum Boreale* (2 vols., 1883); and *Origines Islandicæ* (2 vols., 1905). He likewise published editions of the *Biskupa Sögur* (1856–62); *Bárdar Saga Snæfellsás* (1860); *Viglundar Saga; Fornsögur* (1860); *Eyrbyggja Saga* (1864); and the *Flateyjarbók* (3 vols., 1860–68), with C. R. Unger.

VIGIER, COUNTESS. See CRUVELLI, SOPHIE.

VIGIL (OF. *vigile,* Fr. *vigile,* from Lat. *vigilia,* watch, from *vigere,* to be lively). In the early church, the watch kept in a church or cemetery on the night before a feast, the time being occupied in prayer. In the eleventh and twelfth centuries the vigil took the form of a preparatory time of devotion which went before the more solemn festivals of the church year, and especially Christmas, Easter, Pentecost, and the principal martyrs' days. The observance of vigils is still retained in the Roman Catholic church, by the use of a special office and in the case of some great festivals by a strict fast. In the *English Book of Common Prayer* the vigils or evens of the chief festivals are retained in the calendar as days of fasting, but they have no special observance appointed for them.

VIGILANCE COMMITTEE. In the United States an unauthorized organization of citizens for the purpose of administering summary justice in the absence of a regular judiciary or when

the courts are prevented from exercising their accustomed functions. In times of civil strife or other public emergency, vigilance committees are frequently formed for the purpose of ascertaining the loyalty of suspected persons and for enforcing against disloyal ones the punishment fixed by public opinion. Thus, during and immediately preceding the American Revolution, vigilance committees were formed in many communities to enforce the nonimportation agreements and to ferret out Tories. These bodies were not very different from the Colonial Committees of Safety and of Correspondence, except that their methods were less open and they were usually self-constituted. In the Southern States prior to the Civil War vigilance committees were sometimes formed to enforce the will of the community against abolitionists or other persons suspected of disloyalty to the South, or to prevent the circulation of abolition literature. During the disorder and confusion of the Reconstruction period similar committees were often formed to warn Carpetbaggers, Scalawags, and obnoxious negro politicians. (See KU-KLUX KLAN.) The most notable instance of the employment of the vigilance committee as a governmental improvisation occurred in California during the years 1848 and 1849. Thousands of adventurous characters had immigrated to this region on account of the discovery of gold, and, as no legal government had yet been organized, the law-abiding citizens supplied the deficiency by the organization of vigilance committees, which undertook the task of administering justice and punishing criminals.

VIGILANTIUS, vĭj'ĭ-lăn'shĭ-ŭs. A Gallic writer and presbyter of the last years of the fourth century. Born in Calgurris (modern Cazères), in western Gaul, he became an inn keeper, but about 395 he made the acquaintance of Sulpicius Severus, who recommended him to Paulinus of Nola. After Vigilantius's ordination, probably in 395, he went to visit St. Jerome in Bethlehem, but immediately quarreled with him, attacking his personal beliefs and especially his study of Origen, and in turn being sharply assailed by Jerome's *Contra Vigilantium*, a pamphlet from which we gather that the Gallic presbyter, who probably returned to Gaul or to a charge in Barcelona, objected to the worship of relics, to invocation of saints, to celibacy of the clergy, and to monasticism. He resembled Jovinian (q.v.), but was little of a theologian and showed a lack of any grasp of fundamental principles. Consult Lindner, *De Joviniano et Vigilantio* (Leipzig, 1840), and Gilly, *Vigilantius and his Times* (London, 1844).

VIGIL'IUS, POPE c.537–555. He was a Roman by birth, of an old senatorial family. He appears first as a deacon in 531 and represented the papacy at Constantinople during the pontificate of Silverius, to procure whose imprisonment and exile he was sent to Rome by Theodora, wife of the Emperor Justinian. Vigilius was elected to succeed him by the Roman clergy under the orders of Belisarius, but was not acknowledged as lawful Pope until after the death of Silverius. In 545 he was summoned by Justinian to Constantinople, that he might there condemn the Three Chapters. (See CHAPTERS, THE THREE.) At first, considering the document orthodox, he refused to condemn it; but subsequently, under pressure, yielded to the Emperor's wishes, and then was allowed to return to Rome. On the way, however, he fell ill and died at Syracuse. Consult Savio, *Il papa Vigilio* (Rome, 1904).

VIGNALI, vē-nyä'lē, JACOPO (1592–1664). An Italian painter, born at Prato. He was a pupil of Matteo Roselli in Florence and belonged to the Florentine Mannerists. A large number of his works, both oil and fresco, survive, principally in Florentine churches. Vignali appears to greatest advantage in the frescoes of the Capella Buonarotti, Florence.

VIGNAUD, vē'nyō' (JEAN) HENRY (1830–). An American diplomat and writer, born of Creole stock in New Orleans. He was early a teacher, journalist, and Confederate captain in the Civil War, and in 1863 became connected with the Confederate agency in Paris. He was translator to the Alabama Claims Commission, which met at Geneva in 1872, and was Second Secretary (1875–82) and First Secretary (1882–1909) of the American Legation (later Embassy) at Paris. His publications include: *Toscanelli and Columbus* (1902; Fr. ed., 1901); *Letters to Sir Clements R. Markham and C. Raymond Beazley* (1903); *La maison d'Albe et les archives Colombiennes* (1904); *Etudes critiques sur la vie de Colomb* (1905); *Histoire critique de la grande entreprise de Christophe Colomb* (2 vols., 1911); *Henry Harrisse: étude biographique et morale, avec la bibliographie de ses écrits* (1912).

VIGNOLA, vē'nyō-lä, GIACOMO BAROZZIO DA (1507–73). An Italian architect, born at Vignola, near Modena. He studied painting at Bologna and architecture at Rome, and was charged by Primaticcio with some commissions for Francis I which led to a visit to France. He returned to Bologna, and was chosen as the architect of the Portico dei Banchi, several palaces, and public buildings. In 1550 he was made papal architect by Pope Julius III, and the latter part of his life was spent in Rome, where he designed the casino of the villa of Papa Giulio and the church of the Jesuits (il Gesù, 1558–68). His masterpiece is probably the famous Caprarola palace and villa near Viterbo. He became the architect of St. Peter's after the death of Michelangelo, and designed the two lateral cupolas. He was the author of *Regole delle cinque ordini d'architettura* (Rome, 1563) and *Le due regole della prospettiva prattica* (ib., 1583). The treatise on the orders has been translated into nearly all modern languages and is still considered a classical standard. Like other works of the same class and time, it was based on Vitruvius (q.v.), and represented not, as is so often assumed, an arbitrary cast-iron rule of proportions for the five orders, but the author's ideal form for each of them—an ideal which Vignola himself never followed textually. (See ORDERS OF ARCHITECTURE.) This ideal system he based upon the module (q.v.) or half diameter of the shaft as the unit of proportion.

VIGNOLES, vē-nyōl', CHARLES BLACKER (1793–1875). A British engineer, born at Woodbrook County, Wexford, Ireland. He served under Wellington in the Peninsula and retired from the army in 1833. The Vignoles or flat-based rail was introduced by him into Europe from the United States. He built the Dublin and Kingstown (1832–34), the Sheffield and Manchester (1835–40), and the London, Chatham, and Dover (1855–64) railways, and carried out important works in Russia, including the great suspension bridge across the Dnieper at Kiev. He was professor in University College,

London (1841–43), and published *Observations on the Floridas* (1823, with valuable map).

VIGNY, vē'nyē', ALFRED, COUNT DE (1799–1863). A French poet and novelist, born at Loches, Indre-et-Loire. He was educated in Paris and served in the army 12 years. His *Poèmes* (1822) and *Poèmes antiques et modernes* (1824–26) contained grandiose poetic evocations of the Middle Ages and were among the first attempts (*Le cor* and *Moïse*) to treat philosophic subjects in epic form. The epic *Eloa* (1824) served Lamartine as a model for his *Chute d'un ange* and marks the influence of Hugo, whom it influenced in turn, as *Le cor*, inspired by the bloodless Spanish campaign of 1823, did Musset's *Contes d'Espagne et d'Italie*. In 1826 Vigny published a long historic novel, *Cinq-Mars*. Though a falsification of history, the novel attained immediate and great success; it has the merit of having been first in a field where Hugo and Dumas were to gather brighter laurels. In 1832 Vigny applied his unique historic method in *Stello* to André Chénier and Gilbert and to the English poet Chatterton. *Servitude et grandeur militaires* (1835), three military stories, contains his best work in fiction. Meanwhile he had borne his part in the romantic rejuvenation of the drama by translating Shakespeare's *Othello* (1829), and writing an insignificant comedy, *Quitte pour la peur*, an historic drama, *La maréchale d'Ancre* (1830), and *Chatterton* (1835), his strongest drama, in spite of its pessimistic gloom. But Vigny saw the limitations of romanticism in drama and never pursued his success. Indeed, he published no more, though the posthumously gathered *Destinées* (1864) and the *Journal d'un poète* (1867) show him at the height of his lyric power.

Vigny's *Works* were collected in 1863–66, in 1868–70, and in 1883–85. There are *Lives* by A. France (Paris, 1868), Paléologue (1891), and Lauvrière (1909). Consult: Montégut, *Nos morts contemporains*, vol. i (Paris, 1882); Caro, *Poètes et romanciers* (ib., 1888); Emile Faguet, *Dix-neuvième siècle* (ib., 1890); Sainte-Beuve, *Portraits littéraires*, vol. iii (ib., 1893); E. Lauvrière, *Alfred de Vigny* (ib., 1910); L. Séché, *La vie littéraire politique et religeuse; la vie amoureuse d'Alfred de Vigny* (ib., 1913).

VIGO, vē'gō. A town of the Province of Pontevedra, Spain, 72 miles north of Oporto, on Vigo Bay (Map: Spain, A 1). It has a good harbor and has had a comparatively rapid growth. The tunny and sardine fisheries give employment to a large element of its population. There are iron foundries, machine shops, paper, flour, and saw mills, petroleum and sugar refineries, chocolate, soap, leather, and pasta factories, and cognac and alcohol distilleries. The building of small steamers and the manufacture of cordage are also important industries. The chief exports are wines, cattle, sardines, dried fish, pastas, and agricultural products. Pop., 1900, 23,144; 1910, 41,500. The town of Vigo was attacked by Drake in 1585 and 1589; by a combined Anglo-Dutch fleet in 1702; and by Lord Cobham in 1719.

VIGORITE. See EXPLOSIVES.

VIGOUROUX, vē'gōō'rōō', FULCRAN GRÉGOIRE (1837–1915). A French biblical scholar, born at Nant. He began teaching at Autun, but for many years was stationed at the Paris seminary. Vigouroux, after he was made secretary of the commission created by Pope Leo XIII in 1902 to settle moot biblical questions, lived in Rome. His works, showing great erudition combined with power of logical presentation, include: *La bible et les découvertes modernes en Palestine, Egypte et Assyrie* (1877); *Manuel biblique* (1879; 13th ed., 1913; It. and Span. trans.); *Les livres saints et la critique rationaliste* (1886); *Nouveau testament et les découvertes archéologiques modernes* (1890); *La sainte bible polyglotte* (8 vols., 1900–08); *Dictionnaire de la bible* (5 vols., 1890–1912), probably his most important publication.

VIHĀRA, vē-hä'rà (Skt., recreation, walking for diversion). A designation for a pleasure garden in early India, more especially of the temple precincts and monastic grounds of the Buddhist and Jain religions. Originally the word designated the hall or halls where Buddha and the priests by whom he was accompanied used to meet. Adjoining the sanctum there is usually a narrow room, in which are images and paintings; and opposite the entrance there is another door, protected by a screen; and when this is withdrawn, a very large image of Buddha is seen with a table or altar before it, upon which flowers are placed. In front of the temple stands a sacred bo-tree, regarded as the descendant of the original bo-tree (q.v.). The best examples of the old Vihara are still to be seen in Ceylon, but the finest specimens in India itself are those at Ajunta, Ellora, Salsette, and Junir. Consult Fergusson, *History of Indian and Eastern Architecture* (London, 1876; new ed., 2 vols., 1910); A. Foucher, *L'Art gréco-bouddhique du Gandhâra* (2 vols., Paris, 1905–08).

VIJANAGARA, vē'jà-nà-gä'rà, or **BIJAYANAGAR** (Skt., city of victory). A city of southeastern India, famous for its architectural remains. It was the capital of a dynasty of Hindu rulers that formed a bulwark against Mohammedan invasion and flourished c.1336–1565. The most noted of its architectural remains is the temple built in the style of southern India (c.1529–42) and dedicated to Vitoba, a manifestation of the god Vishnu. The structure is in ruins, but its sculptures, wholly in granite, are carved with great boldness and expression. The finest architectural remains of the Vijanagara dynasty, however, are 100 miles to the south, at Tarputry, where two temples are situated. Near by are two gopuras (ornamental gateways) belonging to a deserted temple, more exquisitely carved than any others in the Dravidian style. Vijanagara is also interesting because of its importance in connection with Sanskrit literature. Here, in the fourteenth century, Sayana (q.v.), the great Vedic commentator, flourished at the court of King Bukka, whose prime minister Madhava (q.v.) was the learned scholar's brother. See INDIAN ART. Consult B. S. Row, *History of Vijayanagar* (Madras, 1906).

VIKINGS, vī'kĭngz *or* vē'kĭngz. See NORMANS.

VIKOVÁ-KUNĚTICKÁ, vē'kō-vä-kōō'nyĕ-tĕts-kä, BOŽENA (1863–). A Czech novelist and advocate of woman's rights, the first woman to be elected a deputy to the Bohemian Diet. Her first novels and short stories, chiefly published in the periodicals *Lumír*, *Svetozar*, and *Květy*, were followed by a series of novels in which the plot was subordinated to the expression of her ideas of sex equality. The best known include: *Medřická* (1895), *Revolt* (1900–

01), and *The Lord* (1906). She also wrote several dramas and, under the pseudonym "Ignota," *Má Lásko* ("My Love," 1909).

VIKRAMA, vĭk'rȧ-mȧ, or VIKRAMĀDITYA. The name of a famous king or kings of India, after whom the Vikrama, or Samvat (q.v.) era is called. This was the golden age of Sanskrit literature. Much uncertainty prevails with regard to his precise date. Tradition ascribes it to 57 B.C., but later scholarship sought to prove that the Samvat era was established by Vikrama in 544 A.D. and its commencement dated back 600 years to 57 B.C. Additional support for this was sought in the accepted date of the Hindu astronomer Varahamihira (q.v.), together with Kalidasa (q.v.), Amarasinha (q.v.), and others. But recent researches have shown that the Vikrama era was previously called the Malava era, and the coins and inscriptions of Chandragupta II, named Vikramaditya, belong to a period of about 400 A.D. The present tendency, therefore, is to date the reign of Vikrama in the beginning of the fifth instead of in the middle of the sixth century. Consult: Macdonell, *Sanskrit Literature* (London, 1913); Duff, *Chronology of Ancient India* (Westminster, 1899); Sewell and Dikshit, *The Indian Calendar* (London, 1896); and Sewell, *Indian Chronography* (ib., 1912).

VILÁGOS, vĭl'ä-gŏsh. A commune of Hungary, in the County of Arad, about 16 miles northeast of the city of Arad. Pop., 1900, 6694; 1910, 6378. It is noted as the scene of the surrender of the Hungarian army under Görgey to the Russians, Aug. 13, 1849, marking the collapse of the national Hungarian movement. See AUSTRIA-HUNGARY.

VILAN, vē-län', or **BULNAN.** See BILA-AN.

VI'LAS, WILLIAM FREEMAN (1840–1908). An American lawyer, soldier, and political leader, born at Chelsea, Vt. In 1851 he removed with his family to Madison, Wis., and in 1858 he graduated at the State University there. He graduated at the Albany Law School in 1860 and practiced for a time, but in 1862 entered the Federal military service, in which he rose to the rank of lieutenant colonel. He served during the siege of Vicksburg, but in 1863 resigned his commission and returned to Madison. From 1868 to 1885 he was a professor in the law school of the University of Wisconsin, and became interested in politics, being a member of the Democratic National Committee (1876–86). He was a member of the Wisconsin Legislature in 1885, was permanent chairman of the National Democratic Convention in 1884, was United States Postmaster-General from 1885 to 1888, was Secretary of the Interior from January, 1888, to March, 1889, and United States Senator from 1891 to 1897. When W. J. Bryan was nominated for the presidency, on a free-silver platform, by the Democratic party in 1896, Vilas was one of those who helped to organize the National (gold) Democrats.

VILAYET, vē'lä-yĕt' (Ar. *vilāyat*, province, government, from *valiya*, to rule, govern), or EYLAYET. The largest and most important of the administrative divisions of the Turkish Empire. Each vilayet is administered by a pasha, who is governor, and the general name for whom is *vali*, or viceroy. He is assisted by a provincial council. The vilayets are subdivided into *livas* or *sanjaks*.

VILJOEN, vĭl'yo͞on, BEN (JAMIN) J (OHANNIS) (1868–). A South African soldier, of French Huguenot descent. As a general of the Transvaal he fought at Elandslaage, took part in the operations against Ladysmith, and was taken prisoner and sent to St. Helena. He served as a member for the Witwatersrand Gold Fields in the Second Volksraad of the South African Republic. Viljoen was author of *Under the Vierkur* (1904); *My Reminiscences of the Anglo-Boer War* (1905); *An Exiled General* (1906).

VILKITSKY, vĕl-kĭts'kĭ, BORIS ANDREEVITCH (c.1870–). A Russian naval officer and Arctic explorer. Occasionally he has been confounded with his father, Maj. Gen. A. I. Vilkitsky (died 1913), himself a distinguished explorer who served as the chief hydrographer of the Imperial Russian navy. The son was unusually successful, while commanding a squadron of ice breakers, in surveys of the ice-clad waters of the Siberian ocean. (See POLAR RESEARCH.) His original discoveries not only added two islands to the New Siberian Archipelago (see NEW SIBERIA ISLANDS), but also Nicholas II Land, an arctic archipelago which extends from 30 miles north of Cape Chelyuskin to 81° N. lat., 96° E. long. Between July, 1914, and September, 1915, he made the Northeast Passage from Bering Strait to the White Sea, wintering en route in Taimyr Bay. It is the first such voyage in history made from east to west. Vilkitsky became a captain in the Imperial Russian navy, and an aid-de-camp to the Czar.

VILKOMIR, vĕl-y'-kô-mēr' (Polish *Wilkomierz*). A district town in the Government of Kovno, west Russia, 43 miles northeast of Kovno (Map: Russia, B 3). Its fourteenth-century church is one of the first Roman Catholic churches founded in Lithuania. Its chief manufactures are leather, brick, and pottery. Pop., 1911, 14,780, of whom the Jews constitute over one-half. The town was founded in the tenth century.

VILLA (Lat., country house, farm). A somewhat extensive country estate, occupied for rest and pleasure for a part of the year; the house and grounds together are generally indicated. It is not used of farms, nor of rural or suburban estates occupied the whole year. The villa originated with the ancient Romans, and received its highest development in Italy in the sixteenth and seventeenth centuries. The villas of the Romans were extensive estates; residence buildings covered a large area and provided apartments for eating, sleeping, recreation, study, exercise, and bathing, set in and combined with grounds laid out with the highest art. Pliny had five villas; Cicero at least as many; and that of Hadrian at Tivoli covered nearly a square mile of territory. The Italian villas of the Renaissance were due in large measure to the splendor of the papal court. They were intended as places for brief sojourn and recreation. They are generally smaller, and the buildings less important than dwellings of the ancients. The grounds reproduce in little, and with consummate skill, characteristic features of the antique gardens. Some, like that at Castel Gandolfo, are built on the ruins of ancient villa terraces. The villas Pamfili, Borghese, Albani, Medici, Madama, and Papa Giulio, at Rome, those at Frascati, the Villa d'Este at Tivoli, the Palmieri and Castello at Florence, the Imperiale (Rovere) at Pesaro, and the Villa Lante at Bagnaia, near Viterbo, are among the best known. They represent a type of formal landscape gardening and architecture seen in the same per-

fection nowhere else. Villas of more modern date in Europe and America borrow from the Italian many suggestions as to landscape architecture and detail, but, being intended for a season's residence, the dwelling presents a more permanent character than the casino of the Italian villas, and is accompanied by dependencies, as stables, lodges, tennis courts, and kitchen gardens, which are foreign to the purposes of the Italian villa. See CASINO. Consult: Percier and Fontaine, *Maisons de plaisance de Rome* (Paris, 1824); Letarouilly, *Edifices de Rome moderne* (Paris, 1860); Reynolds, "Italian Villas," in *Architectural Record*, vol. vi (New York, 1906-07); Pliny, *Letters;* Patzak, *Die Renaissance und Barockvilla in Italien* (3 vols., Leipzig, 1908-13).

VILLA, vēl'yȧ, FRANCISCO (PANCHO) (1877–). A Mexican revolutionary general, born at Las Nieves. His name was Doroteo Arango and he took the name of Villa after joining the Madero revolt. He received no education and at an early age became an outlaw and bandit, after killing an official who had outraged his sister. Many deeds of cruelty and daring were ascribed to him and a price was put on his head by the Díaz administration. Upon the outbreak of the revolution in 1910 Villa offered his services to Madero (q.v.) in return for pardon. During Madero's administration he served under Huerta (q.v.) against Orozco (q.v.), in 1914 joined Carranza in the revolution against Huerta, and later in the same year himself headed a revolt against Carranza. For his career from 1910 to June, 1915, see MEXICO, *History*. In response to President Wilson's note of June 2, 1915, Villa agreed to treat with Carranza to settle the difficulties of the country, but the latter refused. Upon receipt of the identic note of the Pan-American states (Aug. 11) he again accepted the peace overtures; but this was of no avail, since Obregon was now gradually forcing him towards the border. In October, 1915, Villa controlled only portions of the states of Sonora, Chihuahua, and Sinaloa, and on November 2 he suffered a severe defeat at Agua Prieta. In December, representatives of Carranza and Villa met in El Paso and endeavored to arrange a surrender of the Villistas. Carranza insisted on giving no guarantees to Villa and declared him an outlaw. This resulted in the failure of the peace movement and Villa continued the struggle. He was considered responsible for the Santa Isabella massacre (January, 1916) and was reported to be hostile towards the United States. On March 9 he crossed the border and attacked the town of Columbus, New Mexico, killing a number of citizens and destroying a portion of the town. The purpose of this invasion was supposed to be to embroil the United States and Carranza. The United States immediately dispatched a punitive expedition to Mexico to capture Villa and disperse his forces. Villa escaped into the mountains and the United States was soon brought into conflict with the Carranza administration. American soldiers were fired on in the town of Parral by a mob and by Carranza troops, who wished to see Villa captured by their chief and not by the Americans.

VILLA ALBANI, vēl'lȧ, ȧl-bä'nē. See ALBANI, VILLA.

VILLA ALDOBRANDINI, ȧl'dō-brän-dē'nē. A handsome villa with extensive grounds, at Frascati, 15 miles from Rome. It was built by Giacomo della Porta for Cardinal Pietro Aldobrandini, whose uncle was Clement VIII, towards the end of the sixteenth century. It contains a fine collection of the works of Cavaliere d'Arpino.

VILLA BOA DE GOYAZ. See GOYAZ.

VILLA BORGHESE, bōr-gā'zȧ. See BORGHESE, VILLA.

VILLACH, fil'läk. A town in Carinthia, Austria, 24 miles west of Klagenfurt, situated, at an altitude of 1665 feet, on the right bank of the Drave (Map: Austria, C 3). The manufactures include colors and other chemical products, cement, wood products, and articles of lead and other metals from the mines at Bleiberg, 9 miles distant. There are a Gothic church (fifteenth century), Gymnasium, and theatre. Just to the southwest are the Villacher Alps (Dobratsch, 7110 feet). Pop., 1900, 9360; 1910, 10,265. From 1007 to 1759 Villach was under the rule of the bishops of Bamberg. It was the commercial centre of Carinthia and had especial prominence in the trade between Germany and Venice. Here in 1492 the Germans under Khevenhüller defeated the Turks under Ali Pasha. In 1759 Villach went by purchase to Austria. A conflict took place here in 1813 between Frimont and the Viceroy of Italy.

VILLA CLARA. See SANTA CLARA.

VILLA CONCEPCIÓN. See CONCEPCIÓN (Paraguay).

VILLA D'ESTE, vēl'lȧ dĕs'tȧ. One of the most important of Italian villas, situated on a steep slope at the edge of the town of Tivoli, 18 miles from Rome. It was laid out in 1549 by Pirro Ligorio for the Cardinal Ippolito d'Este, and is remarkable for the skill with which the steep slope and the more level lower portion were treated, and for the extent and variety of its water works, cascades, grottoes, and fountains. These were in part the work of later architects, Carlo Fontana perhaps among them. The casino, really a vast palace with paintings by Zuccheri, was never completed externally. It became the property of the Austrian Crown Prince, but was requisitioned (1915) by the Italian government for use as a barracks. Consult Patzak, "Die Villa d'Este in Tivoli," in *Zeitschrift für bildende Kunst;* new series, vol. xvii (Leipzig, 1905–06).

VILLAFRANCA DI VERONA, vēl'lȧ-frȧŋ'kȧ dē vȧ-rō'nȧ. A town in the Province of Verona, Italy, on the Tione, 14 miles by rail north of Mantua (Map: Italy, C 2). The preliminary treaty of peace between France and Austria, which ended the War of 1859, was signed here July 11, 1859. Pop. (commune), 1901, 9461; 1911, 11,756.

VILLAGE COMMUNITY (OF., Fr. *village*, from Lat. *villaticus*, relating to a country house or farm, from *villa*, country house). The name given to the organized agricultural community of primitive times. About the middle of the nineteenth century historians held that the political unit among the early Germans, if we except the family, was a form of village community known as the mark (q.v.). It was also believed that the organization of early Anglo-Saxon society was similar to that existing in Germany. These views were promulgated by men like Waitz, Von Maurer, Nasse, and Kemble; and Maine sought analogies in the village communities of modern India to support this theory. All these views were attacked by Fustel de Coulanges and Seebohm, who held that the

village communities of Germany and England were not free communistic organizations, as the mark theory would have them, but that the villages were inhabited by serfs. In recent years many writers, especially Maitland and Vinogradov, have put forth a modified form of the old view. A primitive form of village community, which is known as the mir (q.v.), still exists in Russia. For a complete bibliography, see SERF.

VILLAGE INDIANS. See PUEBLO.

VILLA GIULIA, jōō'lī-ȧ. A palace near Rome, built by Pope Julius III (1550–55). It forms part of a complex of buildings, the *Vigna di Papa Giulio,* just to the north of Rome, near the Via Flaminia, and is one of the best examples of the High Renaissance at Rome. The villa is probably due in the main to Vignola, who may have worked out ideas suggested by Michelangelo and Vasari, so that Vasari's claim to its authorship is probably not warranted. The gardens have long ago disappeared. The building comprises a main court surrounded by a semicircular Ionic colonnade, and a lower court built about a fountain. The façade, showing Vignola's characteristic details, is an excellent example of the restrained simplicity of the Roman High Renaissance. In the interior are fine frescoes by the brothers Zuccheri. After the death of Julius III the building sank into decay, but it has been restored, and is now a museum of Etruscan antiquities found outside of Rome, chiefly at Falerii.

VILLAGRAN, vēl'yȧ-grän' (or VILLAGRA), FRANCISCO DE (?1507–63). A Spanish colonial administrator, born at Astorga, León. He served conspicuously with Valdivia in Peru during the conquest of Chile (1540–45), and succeeded him as Governor when Valdivia was killed in the Araucanian revolt (1553–54). In 1557 he was superseded by the new Governor, Mendoza, but replaced him in turn in 1561. Although a second Araucanian uprising took place before Villagran's death in 1563, he succeeded in carrying the Spanish flag beyond the Andes.

VILLA LANTE. See LANTE, VILLA.

VILLALOBOS, vēl'yȧ-lō'bŏs, FRANCISCO LÓPEZ DE (c.1473–c.1549). A Spanish physician and author, born in Toledo, of a Jewish family. He studied medicine, became a convert to Christianity, and became physician to Ferdinand the Catholic and to Charles V. His works include a translation of Plautus's *Amphitruo;* the volume (1543) containing the didactic works *Problemas* and *Tratado de los tres grandes vicios;* and the poem *El sumario de medicina* (1538).

VILLA MEDICI, mā'dē-chē. A villa near the southern gate of the Pincio, Rome. It was built in 1540 by Annibale Lippi, and Cardinal Alessandro de' Medici became its owner about 1600; it then came into possession of the grand dukes of Tuscany, and in 1801 was the headquarters of the French Academy of Art. The walls of the garden façade are adorned with antique reliefs. Galileo was imprisoned here between 1630 and 1633 by the Inquisition.

VILLA NAZIONALE, nä'tsē-ō-nä'lȧ (It., national villa). An extensive park, formerly the Villa Reale, bordering the Chiaja in Naples and forming a fashionable promenade. It was laid out in 1780 and has since been considerably enlarged. It contains the Naples Aquarium and Marine Biological Station.

VIL'LANEL'LA (It., rustic). A rustic Italian part song without accompaniment. It was originally a country dance accompanied by singing, but the singing gradually displaced the dance and became a separate art form. As a part song, the villanella was like the canzonetta and the ballata. It was of loose construction, although the villanelle of the Neapolitan school of the seventeenth century are charming compositions. Kapsperger, Nenna, and Stefano Felis wrote admirable villanelle. The villanella and the villotte, a rustic composition in counterpoint, were the precursors of the madrigal (q.v.).

VILLANI, vēl-lä'nē, GIOVANNI (c.1275–1348). An Italian historian, born in Florence. He held many offices in Florence and wrote a history of that city, in the vernacular, consisting of 12 books, extending to 1348. His work included the history of other countries, and is sometimes called *Chronicon Universale.* For the history of Villani's own time in Italy it is of great value. A continuation to 1363 in 11 books was written by his brother, Matteo. The eleventh book was continued by Matteo's son, Filippo, to 1364. Giovanni's work is noteworthy for its excellent style. Parts of it have been translated into English by R. E. Selfe (2d ed., London, 1896). Consult Ugo Balzani, *Early Chronicles of Europe: Italy* (London, 1883); August Potthast, *Bibliotheca Historica Medii Ævi,* vol. ii (Berlin, 1896), which gives a list of editions and a bibliography.

VILLA-NOVA, or **VILLANOVA,** vēl'lȧ-nō'vȧ. The name given by archæologists to a cemetery discovered near Bologna (q.v.), in which were found, in great quantity, important remains of the earliest Iron age of Italy. These remains, and similar relics discovered widely elsewhere over northern Italy in cemeteries at Este, Golasecca, Rivoli, Trezzo, and Oppiano, show a marked advance, in the power to work metals, over the civilization represented by the Terramare (q.v.). In one view, the Terramare civilization was Ligurian (see LIGURIA; LIGURIAN), the Villa-nova, Umbrian. The Villa-nova remains include cist graves, whose four sides are often of flat, unhewn stones; in each grave was an urn, containing the ashes of the dead. The urns show incised linear ornament. Articles of many kinds, in bronze and iron, especially many varieties of brooches, appear. So do figures of animals, which may have been votive offerings; these bear repoussé work in geometric designs. Consult T. E. Peet, *Stone and Bronze Ages in Italy and Sicily* (Oxford, 1909); A. Grenier, *Bologne villanovienne et étrusque viii–iv siècle avant notre ère* (Rome, 1913).

VIL'LANOVA'NUS, ARNOLDUS (1235–1313). A Spanish-Italian alchemist, whose real name was Arnoldo Bachuone. He was born at Villanova, Aragon, and was educated at Barcelona. Afterward he lived successively in Spain, France, and Italy, and was subjected to ceaseless persecution by the clergy because of his astrological pretensions. In his numerous writings, as the *Tractatus Chemicus,* for example, he calls attention for the first time to the potency of the philosopher's stone and the potion known as *Aurum Potabile.* His chief work is the *Rosarius Philosophorum.*

VILLANUEVA, vēl'yȧ-nwā'vȧ, JOAQUÍN LORENZO (1757–1837). A Spanish author and patriot, born at Játiva, near Valencia. He went into the Church and rose to be court preacher and royal confessor. He was elected to the Cortes in 1813, and was imprisoned for six years

after the restoration of 1814. In 1820 he reentered the Cortes, was sent in 1822 by the Constitutional Party on a mission to the Pope, and upon the second return of Ferdinand VII in 1823 fled to Ireland, where he died. His works include: *El año cristiano de España* (19 vols., 1791–1803); *Las angélicas fuentes, ó el tomista en las Cortes* (1811–13); *Viaje literario á las iglesias de España* (22 vols., 1803–52; vols. i–iii reprinted 1902), with his brother Jaime; his autobiography: *Vida literaria* (London, 1825); *Ibernia Phœnicœ, seu Phœnicum in Ibernia Incolatus* (1831; Eng. trans., *Phœnician Ireland*, 1832).

VILLA NUEVA DE LA SERENA, dâ lâ sâ-râ′nâ. A town of the Province of Badajoz, Spain, 150 miles southwest of Madrid, near the southern bank of the Guadiana River (Map: Spain, C 3). The town is clean and well built, with well-paved streets. The surrounding country is a fertile plain with extensive productions of cereals, fruit, wine, hemp, and live stock. The town is noted as the birthplace of De Soto the explorer. Pop., 1900, 13,500; 1910, 14,573.

VILLARD′, HENRY (1835–1900). An American journalist and financier, born in Speyer, Rhenish Bavaria, and educated at the universities of Munich and Würzburg. His father was judge of the district court of Munich. Henry Villard's name was originally Hilgard (for his cousin, see HILGARD, EUGENE W.), but he changed it to Villard upon coming to the United States in 1853. During the Civil War he won distinction as a war correspondent with the Federal armies, and during the brief Austro-Prussian War of 1866 was correspondent for the New York *Tribune*. After the financial panic of 1873 he was made the representative of several committees of German bondholders in connection with the Pacific Coast railroads. He at once went to the Pacific Northwest, where he eventually bought the interests of various European investors and organized the Oregon Railway and Navigation Company. He formed a syndicate which obtained control of the Northern Pacific Railroad, of which he became president in 1881. Under his direction the main line to the Pacific was completed, but at such an expense that the company became embarrassed, and Villard sacrificed his private fortune and retired from the presidency. A few years later he again obtained control of the Northern Pacific, and from 1889 to 1893 was chairman of its board of directors. In 1881 he bought a controlling interest in the New York *Evening Post* and the *Nation*. He was also interested in promoting Thomas A. Edison's inventions, and in 1890 organized the Edison General Electric Company, of which he became president. In 1866 he married a daughter of William Lloyd Garrison. Consult *Memoirs of Henry Villard*, 1835–1900 (3 vols., Boston, 1904).

VILLARD, OSWALD GARRISON (1872–). An American journalist, son of Henry Villard and grandson of William Lloyd Garrison (qq.v.). He was born at Wiesbaden, Germany, and in 1893 graduated from Harvard (A.M., 1896), where he was an assistant in United States history (1894–96). After working as a reporter on the Philadelphia *Press* (1896–97), he became an editorial writer for the New York *Evening Post* and its publisher. In 1916 he was elected president of the Symphony Society of New York. He wrote *John Brown—A Biography Fifty Years After* (1910); *Germany Embattled* (1915); and monographs on the early history of Wall Street and on the German Imperial court.

VILLARD DE HONNECOURT. See WILARS DE HONNECOURT.

VILLA REALE, vēl′lâ râ-ä′lâ. See VILLA NAZIONALE.

VILLARI, vēl′lâ-rē, PASQUALE (1827–1914). An Italian scholar, born in Naples. Exiled in 1848, he long resided in Florence. He was elected to the Chamber in 1867; was appointed Senator in 1884, and was Minister of Education in 1891–92. Villari wrote: standard biographies of Savonarola (1888) and Machiavelli (1895); *The First Two Centuries of Florentine History* (1894); and *The Barbaric Invasions in Italy* (1902), all available in English. Among numerous minor works *Lettere meridionali* (1878) is to be noted.

VILLA RICA, vē′lâ rē′kâ. A town of Brazil, known also as Ouro Preto (q.v.).

VILLA RICA, vēl′yâ rē′kâ. A town of the Department of Guaira, Paraguay, 70 miles southeast of Asunción, with which it has railway connection (Map: Paraguay, H 3). It has a thriving tobacco trade, and is the centre for the collection of maté. Pop. (est.), 8000.

VILLARREAL, vēl′yâ-râ-äl′. A town in the Province of Castellón, Spain, 33 miles north of Valencia, near the coast, at a short distance from the mouth of the Mijares River (Map: Spain, E 3). Near the town is the famous Canal de Castellón, a magnificent piece of Moorish irrigation engineering, still in good condition after seven centuries of continuous use. The town has distilleries and woolen and paper manufactories. Its decadence dates from the expulsion of the Moriscoes (1609). Pop., 1900, 16,493; 1910, 17,554.

VILLARS, vē′lär′, CLAUDE LOUIS HECTOR, DUKE DE (1653–1734). A French marshal. He was born in Moulins, Department of Allier, May 8, 1653; became a court page, and entered the army in Holland as a volunteer in 1672. He served in many important campaigns under Turenne, Condé, and Luxembourg, and in 1686, and again from 1698 to 1701, represented France at the court of Vienna. In 1702 he was given an independent command and sent to aid the Elector of Bavaria, who had taken up arms on the side of France. He defeated the Imperialists at Friedlingen and in the following year gained the victory of Höchstädt (Sept. 20, 1703). In 1704 he suppressed the insurrection of the Camisards (q.v.). He opposed Marlborough, and, entering Germany, outgeneraled the Imperialists under the Margrave of Baden. In 1708 with a comparatively small force he foiled the attempts of Prince Eugène to penetrate France from Italy. In 1709 he commanded in Flanders and was defeated by Marlborough and Prince Eugène at Malplaquet (q.v.). He was severely wounded at the beginning of the battle, and the reopening of his wound in the autumn of 1710 forced him again to resign the command. But in 1711 he returned to his post, defeated the English and Dutch at Denain, July 24, 1712, and gained a success over Prince Eugène near Landrecy. These victories hastened the conclusion of the Peace of Rastadt, which Villars signed as Plenipotentiary, in 1714. He then became chief adviser of the court on military and foreign affairs. In 1733 as marshal general he took command of the French forces in Italy, but later resigned. He died at Turin, June 17, 1734. Vil-

lars was the last of the great military leaders of the French monarchy. His *Mémoires* were edited by Vogüé and published by the Société de l'Histoire de France (Paris, 1884–91). Consult Anquetil, *Vie du Maréchal de Villars* (Paris, 1784); Vogüé, *Villars d'après sa correspondance* (ib., 1888).

VILLAR'SIA (Neo-Lat., named in honor of Domenique Villars, a French botanist), or FLOATING HEART. A genus of plants of the family Gentianaceæ. *Villarsia*, or *Limnanthemum*, *peltatum*, or *Nymphoides peltatum* as it is now called, is a native of Europe, from Denmark to the Mediterranean, and is very abundant in Holland, often covering large tracts of the canals with its beautiful yellow flowers and leaves. It abounds in the south of Siberia. It is easily cultivated. This species has become established in ponds in the District of Columbia. There are two indigenous species in the United States, *Nymphoides lacunosum* and *Nymphoides aquaticum*. The name *Villaresia congonha* is given to a plant belonging to the family Staphyleaceæ which produces a kind of maté (q.v.).

VILLASIS, vēl-yä'sēs. A town of Luzon, Philippines, in the Province of Pangasinán, situated on the right bank of the Agno River, 24 miles southeast of Lingayén. It is an important junction of highways. Pop., 1903, 12,660.

VILLA-URRUTIA, vēl'yà-o͝or-ro͝o'tyà, WENCESLAO RAMÍREZ, MARQUÉS DE (1850–). A Spanish diplomat, statesman, and scholar. Born in Havana, Cuba, he studied law at the University of Madrid and entered the diplomatic service at 18. After serving as attaché and secretary of various legations and embassies, he was minister resident at Carácas and then at The Hague, and Minister Plenipotentiary at Constantinople and at Brussels. At the time of negotiating the Peace Treaty at Paris between Spain and the United States (1898) he was Spain's Plenipotentiary. He was also a delegate for Spain at The Hague Peace Conferences of 1899 and 1907. Afterward he served as Ambassador in Vienna, as Minister of Foreign Affairs, and as Ambassador in London (1906-13) and in Paris (1913–14). He received many honors, including the British G. C. V. O. His publications are concerned mostly with problems of diplomacy and international relations.

VILLAVICENCIO, PEDRO NÚÑEZ DE. See NÚÑEZ DE VILLAVICENCIO.

VILLEFRANCHE-DE-ROUERGUE, vēl'-frănsh'-de-ro͝o'ârg'. The capital of an arrondissement in the Department of Aveyron, France, 27 miles west of Rodez, on the Aveyron (Map: France, S., F 4). Among its interesting features are the thirteenth-century bridge across the Aveyron, the mediæval Church of Notre Dame, and the old Carthusian convent, at present used as a hospital. The industrial establishments include foundries, oil mills, and tanneries, and a trade is carried on in flour, linen, truffles, wine, and liquors. Lead and phosphates are found in the vicinity. Pop. (commune), 1901, 9730; 1911, 8434. Villefranche was founded about the middle of the thirteenth century and soon attained considerable commercial prominence. It played an important part in the struggle between the English and French over the disposition of Aquitaine.

VILLEFRANCHE-SUR-SAÔNE, sụr sōn. The capital of an arrondissement in the Department of Rhône, France, on the left bank of the Saône, 21 miles by rail north-northwest of Lyons (Map: France, S., J 3). The Church of Notre Dame des Marais (fourteenth to sixteenth century) and the Renaissance Hôtel de Ville are worthy of notice. The value of the cotton fabric manufactures exceeds $5,000,000 annually. There is a large trade in the famous Beaujolais wine. Pop., 1901, 14,793; 1911, 16,388.

VILLEGAIGNON, vēl'gā'nyôn', or **VILLEGAGNON**, NICOLAS DURAND DE (1510–71). A French naval officer, born in Provence. He became a member of the Order of St. John, fought in the disastrous expedition of Charles V to Algiers in 1541, transported to Scotland the French force destined to assist the Regency, and carried Mary Stuart from Dumbarton to France. He then fought against the Turks, and was afterward vice admiral of Brittany. With the approbation of Coligny he attempted to found in South America a colony for French Protestants. In 1555 he sailed with two ships, and established a colony at Rio de Janeiro. Other colonists arrived, but religious disputes broke out, and after the return of Villegaignon to France in 1559 the weakened colony was conquered by the Portuguese. For having sided with the Catholics in the disputes, Villegaignon was given the name of the "Cain of America." Among his published works are *Caroli V. Imperatoris Expeditio in Africam ad Arginam* (1542; republished in 1874) and the controversial work, *Ad Articulos Calvinianæ de Sacramento Eucharistæ Traditionis Responsiones* (1560)

VILLEGAS, vēl-yā'gȧs, ESTEBÁN MANUEL DE (1589–1669). A Spanish poet, born at Matute or Nájera in the Province of Logroño, and educated at Madrid and at Salamanca. In 1617 he published his clever *Eróticas ó amatorias*. He published in 1665 an excellent translation of Boëthius' *De Consolatione Philosophiæ*. Villegas is known not only for the amazing imitations of Anacreon and Catullus contained in his early volume of poems, but also for the good prose and excellent verse of his Boëthius. Consult George Ticknor, *History of Spanish Literature* (6th ed., 3 vols., Boston, 1888). His poems are accessible in Rivadeneyra's *Biblioteca de autores españoles*, vol. xlii.

VILLEGAS, JOSÉ (1848–). A Spanish genre painter. He was born in Seville and studied there at the Academy, and at Madrid, and in 1869 at Rome. His paintings, which display great versatility and dexterity, include: "Columbus at La Rábida"; "Palm Sunday in Venice"; "A Spanish Christening," "Examining Arms," and "A Dream of the Arabian Nights" (all three in the Metropolitan Museum, New York); and "A Cairo Slipper Market" (1872; W. T. Walters collection, Baltimore, Md.). Villegas took the grand gold medal at the Berlin Exhibition of 1875, and in 1895 was elected to the Academy of that city. He also became a member of the Academy of St. Luke, Rome, and director of the Prado Museum, Madrid.

VILLEHARDOUIN, vēl'ȧr'dwăN', GEOFFROY DE (c.1150–c.1213). A French chronicler of noble birth, born near Troyes. In 1199, while marshal at the court of Thibaut of Champagne, he enlisted in the Fourth Crusade. He was sent as leader of an embassy to Dandolo, Doge of Venice, asking for transports for the Crusaders. Upon going to Constantinople, he was sent to Emperor Alexis to aid in settling difficulties. He played a brilliant part in the conquest of Constantinople, and received from Baldwin I (q.v.) lands in Macedonia and the title of Mar-

shal of Rumania. After Baldwin's defeat by the Bulgarians, he served Baldwin's brother Henry faithfully. His history of the conquest of Constantinople is one of the earliest known historical works in the vernacular French. It is a somewhat prejudiced account of the Fourth Crusade, and apologizes for the misdeeds of the Christian leaders. The Venetian Senate began to print an edition in 1573, but the first complete edition was printed at Paris in 1585. The best modern editions are by De Wailly (Paris, 1872), which gives the original text of the thirteenth century and a translation into modern French, and by Bonchet (2 vols., Paris, 1891). For other editions of his writings and for secondary works, consult Potthast, *Bibliotheca Historica Medii Ævi*, vol. ii (Berlin, 1896); Molinier, *Les sources de l'histoire de France*, vol. iii (Paris, 1903).

VILLEIN, vĭl'ĭn (OF. *villein, vilain*, Fr. *vilain*, from ML. *villanus*, farm servant, serf). Another name for a serf (q.v.). Sometimes historians call all the peasants of the Middle Ages, whether free or unfree, villeins. At times villeins means the free peasants as distinguished from the unfree.

VIL'LEINAGE. The status of villeins, which was between slavery and freedom. Each villein was allowed to hold and cultivate some land for himself on condition of assisting his lord—the lord of the manor—in his farming operations. The villein was bound to the soil: he could not be sold, he could not be turned out so long as he discharged his obligations to his lord, and he was obliged to remain on the manor unless his lord consented to his removal. His lord was bound to afford him protection to life and limb, but as there was otherwise no law of the realm governing the relations of lord and villein they varied greatly, according to the "custom of the manor," which was determined and interpreted by the manorial courts. By the middle of the fifteenth century villeins were for the most part no longer doing work on their lords' lands but were paying their rent in money, and with this change they became copyholders. (See COPYHOLD.) Consult Paul Vinogradov, *Villainage in England* (Oxford, 1892), and T. W. Page, *The End of Villainage in England* (New York, 1900).

VILLÈLE, vē'lĕl', JOSEPH, COUNT DE (1773–1854). A French statesman, born at Toulouse. In 1791 he entered the navy, went to the West Indies, remained there until 1803, and accumulated a fortune. Returning to Toulouse, he lived quietly until the Restoration. In 1814 he wrote a pamphlet, *Observations sur le projet de Constitution*, in which he opposed the *Charte* issued by Louis XVIII. He became mayor of Toulouse, was elected to the Chamber of Deputies in 1815, and soon became the most influential among the leaders of the Royalist party. He entered the Richelieu ministry in 1820, and a year later became Minister of Finance. In 1822 he was given the title of Count and made President of the Council and Minister of Foreign Affairs. During his administration an expedition was sent into Spain to restore Ferdinand VII (1823) in accordance with the policy of the Holy Alliance. Villèle's extreme Royalist policy was satisfactory to Charles X, but it tended to bring on the revolution which finally overthrew the Bourbons. His reactionary measures (restrictions on the press, and partiality for the Jesuits) led to his retirement in January, 1828. Consult Neuville, *Notice historique sur M. le Comte de Villèle* (Paris, 1855), and *Mémoires et correspondance du Comte de Villèle* (ib., 1888–90).

VILLEMAIN, vēl'măN', ABEL FRANÇOIS (1790–1870), born in Paris. A French historian and critic. He was professor of rhetoric at the Lycée Charlemagne (1810), the Ecole Normale, and the Sorbonne (1816–26). He won three academic prizes (1812–16), published a *Histoire de Cromwell* (1819), was elected to the Academy (1821), and in 1829 became a deputy. Under Louis Philippe he was made a peer (1832). From 1840 to 1844 he was Minister of Public Instruction. After the revolution of 1848 he gave himself entirely to literature. His chief works, revised in later editions, are: *Discours et mélanges* (1823); *Cours de littérature française* (1828–30; 2d ed., 1864); *Etudes de littérature ancienne et étrangère* (1846); *Souvenirs contemporains de l'histoire et de la littérature* (1856); and a *Histoire de Grégoire VII*, published posthumously. Villemain, though a writer of wide culture, is often shallow, but he is always interesting and sometimes eloquent.

VILLEMAIN, SIEUR DE. See NICOT, JEAN.

VILLEMARQUÉ, THÉODORE CLAUDE HENRI HERSART, VICOMTE DE LA. See LA VILLEMARQUÉ, VICOMTE DE.

VILLEMESSANT, vēl'me-sĂN', JEAN HIPPOLYTE CARTIER (1812–79). A French journalist, born at Rouen. He went to Paris in 1840, and revived, in 1854, *Le Figaro* (q.v.) as a weekly, semiweekly, and, after 1866, a daily newspaper. His methods were original and successful. Consult his *Mémoires d'un journaliste* (Paris, 1867).

VILLENA, vēl-yā'nà. A town of the Province of Alicante, Spain, on the right bank of the Vinalapó, 63 miles south of Valencia (Map: Spain, E 3). The town, above which towers an imposing fortress, is irregularly built, with winding streets and buildings of mediæval Moorish architecture. East of the town is a great salt lagoon. Silks, brandies, linen, flour, and soap are the chief industrial products. Pop., 1900, 14,028; 1910, 15,692.

VILLENA, DON ENRIQUE DE (also called DON ENRIQUE DE ARAGÓN) (1384–1434). A Spanish author and scholar. He was connected by blood with the royal houses of Castile and Aragon. By Henry III of Castile he was made Grand Master of the Order of Calatrava in 1404, but the appointment was annulled by the General Session of the order 10 years afterward. Villena was an enthusiastic student of the sciences, and because of his knowledge was suspected of sorcery. Among his works were *Arte de Trovar, Tractado del arte del cortar del cuchillo* (usually called *Arte cisoria*, a treatise on carving); *Libro del aojamiento ó fascinología* (a treatise on the "evil eye"); and *Doce trabajos de Hércules* (original in Catalan). He made the first translation of Vergil's *Æneid* (finished, 1428). Consult Emilio Cotarelo y Mori, *Don Enrique de Villena* (Madrid, 1896).

VILLENEUVE, JÉRÔME PÉTION DE. See PÉTION DE VILLENEUVE, JÉRÔME.

VILLENEUVE, vēl'nēv', PIERRE CHARLES JEAN BAPTISTE SYLVESTRE DE (1763–1806). A vice admiral of France, born at Valensoles, in Provence. He entered the navy in his 15th year. He became a rear admiral (1796) and commanded the rear division at the battle of the Nile (1798). In 1804 he was made vice admiral, and in the following year received com-

mand of the Toulon squadron. At the Azores he encountered a British squadron, under Sir Robert Calder, and an indecisive battle ensued (July 22, 1805). The failure of Villeneuve's movement broke up Napoleon's plan for invading England, and the Admiral, blamed unjustly and about to be superseded, sailed out and engaged Nelson in the great sea fight of Trafalgar. (See TRAFALGAR; NELSON.) Villeneuve's vessel, the *Buocntaure*, was dismasted; he struck his flag, was made prisoner, and conveyed to England. He returned to France in April, 1806, but, learning at Rennes of the Emperor's disfavor, he committed suicide.

VILLENEUVE-SUR-LOT, sŭr-lō′. The capital of an arrondissement, Department of Lot-et-Garonne, France, in a charming valley, 22 miles by rail north-northeast of Agen (Map: France, S., F 4). The river Lot is spanned by a remarkably bold thirteenth-century bridge with a single arch. There are manufactures of paper, cloth, table linen, and copper wares. Pop., 1901, 13,594; 1911, 13,181.

VILLEROI, vēl′rwä′, FRANÇOIS DE NEUFVILLE, DUKE DE (1644–1730). A French soldier. He was born at Lyons, was educated with young Louis XIV, and always had the favor of that monarch. Created a marshal in 1693, he commanded the French army in the Low Countries, where he vainly attempted to relieve Namur. In the War of the Spanish Succession he was put in command of the Army of Italy in 1701, but was repulsed by Prince Eugène at Chiari, and in the following year was surprised at Cremona and was taken prisoner. In 1706 he had command of the army opposing Marlborough; but he was defeated at Ramillies.

VILLERS, vē′lâr′, CHARLES DE (1765–1815). A French soldier and author, born in Boulay (Lorraine). In 1782 he entered the army as an artillery officer, but was compelled to emigrate in 1793. After a few months in the army of Condé he lived in various cities of Germany until 1797, when he settled in Lübeck. There he took up German literature and philosophy, with which he subsequently endeavored to familiarize his countrymen, and published *La philosophie de Kant ou principes fondamentaux de la philosophie transcendentale* (1802)—the first introduction of Frenchmen to the works of the German philosopher. It was followed by *Essai sur l'esprit et l'influence de la Réformation de Luther* (1804; 5th ed., 1851; Ger. trans., 1805; abridged ed., 1836) and *Coup d'œil sur les universités de l'Allemagne protestante* (1808). His sympathy for Germany was not, however, confined to her literature. In 1806 he wrote *Lettre à Madame la comtesse Fanny de Beauharnais sur Lubeck*, in which he related the outrages committed by the French when they took that city. As a result, when the Hanseatic towns were incorporated in the French Empire, De Villers was exiled from Lübeck. He then secured a professorship at Göttingen, but was deprived of his post after the restoration of the Hanoverian dynasty by the French.

VILLETTE, vē-lĕt′. The last completed novel of Charlotte Brontë (1853).

VILLEURBANNE, vēl′ŭr′băn′. A French town in the Department of Rhône, 3 miles east of Lyons, on the Lyons-Saint-Genix Railway. Its manufactures include silks, hats, wax candles, chemical products, church bronzes, and liqueurs. Pop., 1901, 27,746; 1911, 32,526.

VILLI, vēl′lē, LE. An opera by Puccini (q.v.), first produced in Milan, May 31, 1884; in the United States, Dec. 17, 1908 (New York).

VILLIERS, vĭl′ērz, CHARLES PELHAM (1802–98). An English statesman, born in London. He graduated at St. John's College, Cambridge, in 1824, and in 1827 was called to the bar. In 1834 he was returned to the House of Commons for Wolverhampton, and he continued to represent that constituency down to its division in 1885, after which he sat for South Wolverhampton. Throughout his parliamentary career he was an ardent free trader. In 1838 he introduced in Parliament the first of his famous annual motions for the repeal of the Corn Laws. This was before the formation of the Anti-Corn Law Association (afterward transformed into the Anti-Corn Law League) and before either Cobden or Bright had become interested in the subject, hence to Villiers belongs the honor of being the pioneer in the movement. He continued to be one of the leaders in the agitation until the repeal was effected in 1846. With the accomplishment of that end his chief work was done. Some of his speeches, edited by a member of the Cobden Club, were published as *Free-Trade Speeches of the Right Hon. Charles Pelham Villiers, M.P.* (1883).

VILLIERS, FREDERIC (1852–). An English war artist and correspondent, born in London. He was educated at Guines, Pas-de-Calais, France, and studied in the South Kensington School of Art and at the Royal Academy. In 1876 he was war artist for the *Graphic* in Servia, and two years later was with the Russians in the war with Turkey. Subsequent assignments took him to all parts of the world, and he lectured widely. He was correspondent for the *Illustrated London News* during the Boer War (1899), and with the Japanese forces in 1905, and was present at the siege of Port Arthur. In 1912–13 he accompanied the Bulgarian army during the Balkan wars. He published: *Pictures of Many Wars* (1902); *Port Arthur* (1905); *Peaceful Personalities and Warriors Bold* (1907)—all illustrated by himself.

VILLIERS, GEORGE, first DUKE OF BUCKINGHAM (1592–1628). The favorite of James I and Charles I of England. He was born in August, 1592, and in 1614 entered the service of the court, where at first his advance was retarded by the enmity of the powerful Earl of Somerset. After Somerset's fall Villiers rapidly rose in favor. In 1616 he received the Garter, and was created Viscount Villiers and Baron Waddon. In the January following he was created Earl of Buckingham, and was sworn Privy Councilor. Thereafter he became in succession Marquis, Lord Admiral of England, Master of the King's Bench, High Steward of Westminster, and Constable of Windsor Castle. In 1620 Buckingham married Lady Katherine Manners, daughter of the Catholic Earl of Rutland. In 1623, while negotiations were in progress for a marriage of the Spanish Infanta with the Prince of Wales, later Charles I, Buckingham persuaded the latter to go to Madrid and press his suit in person. While on this mission he was created Duke of Buckingham, and on his return was nominated Lord Warden of the Cinque Ports. The negotiations proved an absolute failure, partly no doubt on account of Buckingham's arrogance, and as a result James declared war against Spain and allied himself with France. Buckingham maintained his ascendency after Charles I came to the throne, and the treaty for

the marriage of Charles with the Princess Henrietta of France was concluded by him, but he was never after permitted to return to Paris, in consequence of his audacity in making love to the French Queen, Anne of Austria. For a short time Buckingham enjoyed a passing popularity, but the ill-fated expedition to Cadiz made him odious to the nation, and he was barely saved from impeachment by the King, who dissolved Parliament. The alliance with France proving unsatisfactory, Buckingham prepared to aid the Huguenots. In 1627, with an armament of 100 sail and 7000 soldiers, Buckingham appeared before La Rochelle, then in possession of the Huguenots, but they refused him admission to the harbor. His troops then made a descent on the Isle of Rhé, only to return to England, defeated and disgraced. Buckingham was not discouraged and soon after prepared a second expedition to La Rochelle. He proceeded to Portsmouth for embarkation, and there was assassinated on Aug. 23, 1628, by a discontented subaltern named Felton. Buckingham was an agreeable personality, but he lacked all the qualities that go to make a statesman, and he regulated his policy in accordance with personal pique. Consult: A. T. Thompson, *Life and Times of George Villiers, Duke of Buckingham* (3 vols., London, 1860); S. R. Gardiner, *History of England*, vols. ii–iv (London and New York, 1889); Philip Gibbs, *The Romance of George Villiers* (ib., 1908).

VILLIERS, GEORGE, second DUKE OF BUCKINGHAM (1628–87). An English politician. He was the second son of the first Duke of Buckingham, and, his elder brother dying while his father was still living, he succeeded to the title on the death of his father. He was brought up with the royal princes and educated at Trinity College, Cambridge. In the Civil War he served in the royal army, and as a result his immense estates were confiscated. In 1650 Buckingham was given an important command in the projected invasion of Scotland, and fought with Charles II at Worcester. Later, however, he sought to make his peace with the Protector by returning secretly to England and marrying the daughter of Fairfax, the Parliamentary general. But he was arrested, and only released on the abdication of Richard Cromwell. When Charles II was placed on the throne Buckingham received various minor offices about the court, but did not possess much influence until the downfall in 1667 of Clarendon, who had been his enemy. Buckingham now became one of the chief advisers of Charles, and belonged to the so-called Cabal, though he held no official position. He favored the Declaration of Indulgence of 1672, and was an opponent of the Duke of York. Buckingham favored an alliance with France, but was not in the secret of the Treaty of Dover of 1670. His influence rapidly declined, and in 1673 he came to an open rupture with Arlington, who had the support of the King. The result was that he lost the remainder of his influence, and that he soon retired to private life. Buckingham was a patron of authors, and also wrote himself. His drama, *The Rehearsal* (1871), enjoyed some popularity. Consult: Leopold Ranke, *History of England* (Oxford, 1875); Winifred Burghclere, *George Villiers, Second Duke of Buckingham, 1628–1687* (London, 1903).

VILLIERS, GEORGE WILLIAM FREDERICK, EARL OF CLARENDON. See CLARENDON.

VILLIERS DE L'ISLE ADAM, vē'lyâr' de lēl à'dăN', PHILIPPE AUGUSTE MATHIAS, COMTE DE (1838–89). A French author, born at Saint-Brieuc, in Brittany. He is perhaps to be considered the originator of the symbolistic movement in French literature. He was a writer of vivid imagination and remarkable power, and he exercised considerable influence upon the younger school of authors; but his work was never popular with the general public, and he died in poverty in the care of the Frères Saint-Jean-de-Dieu. His first publication was a volume entitled *Premières poésies* (1856–58), and it was followed in 1862 by a romance of the supernatural called *Isis*. Among his other works are: the plays *Elen* (1864), *Morgane* (1865), *La révolte* (1870), *Nouveau monde* (1880), and the remarkable *Axel* (posthumous, 1890); the fine volume of short stories, *Contes cruels* (1883); the satirical romance of modern science, *L'Eve future* (1886); and the romances *L'amour suprême* (1886), *Tribulat bonhomet* (1887), and *Secret de l'Echafaud* (1888). A biography was written by Lady Mary Lloyd (London, 1904).

VILLOISON, vē'lwä'zôN', JEAN BAPTISTE GASPARD D'ANSSE DE (1750–1805). A French classical scholar, born at Corbeil-sur-Seine. He early displayed great ability, and at the age of 23 became a member of the Académie des Inscriptions. In 1778 he was commissioned by the French government to examine the manuscripts of the library of St. Mark at Venice. The results of his study there were published in his *Anecdota Græca* (1781). The most important of these results was the discovery of the famous *Codex Venetus* of Homer with the scholia. From 1785 to 1788 Villoison traveled in Greece. Shortly after his return to Paris the French Revolution broke out, and he retired to Orléans; but in 1800 he was appointed professor at the Collège de France. His other most important publications are: the *Homeric Lexicon* of Apollonius (1773); *Longi Pastoralium Libri IV* (1788); and his most famous work, the *Iliad*, edited on the basis of the *Codex Venetus* (1788). Consult: J. Dacier, *Notice historique sur la vie et les ouvrages de Villoison* (1806); E. Quatremère, in *Nouvelle biographie générale*, vol. xiii; J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

VILLON, vē'yôN' *or* vē'lôN', FRANÇOIS (1431–?). The first and one of the greatest of the French lyric poets of the modern school. His real name was François de Montcorbier, and the name Villon, by which he is generally known, he adopted out of gratitude to Maître Guillaume de Villon, who was to him a sort of second father. The details of his life are little edifying. His immediate family was poor and ignorant. Young François showed vivacity of mind and facility of study, which caused Guillaume de Villon to take an interest in him and to give him an education and make him an ecclesiastic. Maître-Guillaume took him to live with him in the Convent of Saint-Benoît-le-Bétourné, near the Sorbonne. Villon became bachelor of arts in 1449, and master of arts in 1452. But master's degree was inferior, and many long years of study were needed to reach in the other faculties the higher positions. Villon was well liked by his fellow students, and led the roistering life characteristic of the time.

On June 5, 1455, Villon, apparently in self-defense, fatally stabbed a priest, named Philippe Sermaise, and took refuge in the convent. He

then absented himself from Paris, while awaiting a pardon, which was granted in January, 1456, and probably at this time had a disgraceful intrigue with the Abbess of Pourras. In December, 1456, he took part in the robbery of a large sum of money in the Collège de Navarre at Paris. He fled to Angers, and in 1457 we find him at Blois at the poetic and gallant court of Charles of Orléans. Then he began a nomadic life, that led him into nearly every corner of France. In 1641 he was arrested by order of the Bishop of Orléans and imprisoned at Meung-sur-Loire, but after several months of durance was set free on the strength of an amnesty proclaimed by King Louis XI in honor of his recent accession. Before the end of 1462 Villon returned to Paris, determined to settle down and become a man. But his good intentions were not fulfilled. In November, 1462, we find him imprisoned in the Châtelet on a charge of theft, which was not proved. In this same month he was in a serious brawl, and, although he seems to have taken no active part in it, he was arrested and condemned to death. After more than a year's imprisonment the sentence was commuted to banishment from Paris. From this time on Villon disappears from view. He must be judged, not by our standards, but by those of his times, in which, from a moral and social point of view, those who represented the law, and those who held their heads highest, were hardly better in many respects than he. His good points were his piety, intermittent but real, his sincerity, the humility with which he acknowledged his faults and planned to do better, only to fall again at the first temptation, his affection for his mother, his gratitude toward Maître Guillaume, his sympathy for those who were suffering the misery about which he knew so much, and his patriotism. He had seen life in all its phases, and knew everything, as he naïvely puts it, except himself.

Villon's great merit lies in the intense subjectivity of his verse. There is no sham, no hiding of anything he feels, whether it be good or bad. His frankness about himself made him feel that he had a right to be just as frank about others, and every one with whom he comes in contact is put upon the grill. The result is that his writings form a highly colored and generally trustworthy picture of the times in which he lived. They comprise *Le petit testament* (1456), a poem in 40 stanzas; *Le grand testament* (1461), a poem in 173 stanzas, in which about a score of ballads or rondeaux are inserted; a *Codicile*, composed mainly of ballads; *Le jargon*, a collection of ballads in argot; an admirable *Dialogue* between the Seigneurs de Mallepaye and Baillavent; and a *Monologue*, even more excellent, entitled *Le franc archier de Bagnolet*. *Les repues franches*, a curious production, describing the swindling tricks of Villon and his companions, has been wrongly attributed to him.

Bibliography. The first edition of his works was published in 1489. In 1533 they enjoyed the honor of having Marot for their editor. The best of recent editions is that by Longnon (Paris, 1892). For his biography, consult Longnon (ib., 1877), Schwob, in the *Revue des Deux Mondes* (Paris, July, 1892), and Gaston Paris (ib., 1901). Consult also: Byvanck, *Spécimen d'un essai critique sur les œuvres de François Villon* (Leyden, 1882); Schwob, *Le jargon des coquillards en 1455* (Paris, 1890); Payne, *François Villon, Poems; rendered into English verse, in the original forms, with a biographical and critical introduction* (London, 1892); Paris and Schwob, "Villoniana," in *Romania* (Paris, 1901); the *Poems*, translated by H. DeVere Stacpoole (ib., 1913); P. Champion, *Villon, sa vie et son temps* (1913); R. L. Stevenson, *Familiar Studies* (biographical ed., New York, 1910).

VILMAR, fil'mär, AUGUSTUS FRIEDRICH CHRISTIAN (1800–68). A German theologian and literary historian, born at Solz, Hesse-Cassel. He studied theology and philosophy at the University of Marburg. In 1851 he was elected by the synod superintendent in chief of the Church of the Electorate, but as this election was not approved he shortly afterward accepted the post of professor of theology at the University of Marburg. His theological writings include *Theologische Moral* (1871; ed. by Israel) and *Die Theologie der Thatsachen wider die Theologie der Rhetorik* (1856-76), but he is better known as a literary historian, in which field his chief works are *Geschichte der deutschen Nationallitteratur* (1845; 26th ed., 1905), which was continued by Adolf Stern, and *Deutsche Verskunst* (1870; new ed., rev. by Kauffmann under the title *Deutsche Metrik*, 2d ed., 1907). Consult biography by Leimbach (Hanover, 1875).

VILNA, vêl'nà. A government of west Russia, lying between the Dvina and the Niemen. Area, 16,420 square miles (Map: Russia, C 4). The larger part of the surface is low, and its highest point is only a little above 1000 feet. Marshes and lakes occupy a considerable proportion of the area. The chief rivers are the Niemen, the Vilia, and the Dvina—all of them navigable and important for the commerce of the government. The climate is moderate and steady, the precipitation ample. Agriculture is the principal occupation. The population was 1,989,900 in 1912, of whom the Lithuanians formed about one-half and the rest was composed of Russians, Poles, and Jews. The Roman Catholics numbered about 1,000,000.

VILNA (Polish, *Wilno*). The capital of the Government and Governor-Generalship of Vilna, in west Russia, situated at the confluence of the Vileika with the Vilia, 436 miles south-southwest of St. Petersburg (Map: Russia, C 4). It is an old city irregularly built and unsatisfactory in its sanitary arrangements. Its most interesting ecclesiastical edifices are the Roman Catholic cathedral of St. Stanislaus with the silver coffin of St. Casimir, the Greek Catholic cathedral of St. Nicholas and the Greek Orthodox cathedral of the Holy Virgin. Vilna is well provided with educational institutions which include a Greek Orthodox and a Roman Catholic seminary, three classical Gymnasia, an archæological museum with a public library (containing some 220,000 volumes and over 10,000 manuscripts), and a municipal theatre. In the suburbs are a number of ancient monasteries and churches and the ruins of the castle of the Jagellons. Vilna manufactures tobacco, knit goods, articles of apparel, artificial flowers, gloves, etc. The extensive commerce in grain and timber is favored by the position of Vilna at the intersection of three important railway lines and on a navigable river. Pop., 1900, 162,633; 1911, 192,746, composed of Jews, Lithuanians, and Poles.

Vilna was probably founded in the tenth cen-

tury, but it became prominent only as the capital of Lithuania under Gedimin (about 1323). It obtained Magdeburg rights from Jagellon, and had a printing press as early as 1519. During the seventeenth century it was nearly ruined in the struggle between Russia and Poland. It was annexed to Russia in 1795. The inhabitants of the city welcomed Napoleon in 1812 and took a prominent part in the Polish uprisings of 1830–31 and 1863. Since the sixteenth century Vilna has been an important cultural, religious, and commercial centre of the Jews inhabiting eastern Europe. The city was occupied by the Germans in 1915. See WAR IN EUROPE.

VILNA, ELIJAH OF. See WILNA, RABBI ELIAS.

VILVORDE, vĕl'vôrd'. A town of the Province of Brabant, Belgium, on the river Senne, 9 miles north of Brussels (Map: Belgium, C 4). It has manufactures of horsehair goods and passementerie. Pop., 1900, 12,992; 1909, 15,403.

VIMEUR, JEAN BAPTISTE DONATIEN DE. See ROCHAMBEAU, COUNT DE.

VINA, vē'nȧ (Skt. *vīṇȧ*, lute). The principal musical instrument of the ancient Hindus. It consists of a cylindrical pipe of bamboo 3½ feet long with a finger board about 2 feet long. At the ends of the pipe are two hollow gourds for resonators, each 15 inches in diameter. Behind one of these resonators are four pegs on which metal strings are fastened, tuned as follows: dominant, leading tone, tonic, subdominant. On the bamboo pipe are 18 movable bridges, somewhat lower than the principal bridge. These bridges can be adjusted so that the instrument can be tuned in any of the Hindu scales. Along the finger board run three sympathetic strings acting as bourdons (q.v.). The vina has a range of two octaves with all chromatic intervals. The player knelt, so that one resonator rested upon the left shoulder, the other upon the right knee. The strings were struck by means of the first and second fingers of the right hand, each having a kind of thimble with a flexible point.

VINCENNES, văn'sĕn'. A town of the Department of Seine, France, 5 miles by tramway east-southeast from the Louvre, Paris, on the north edge of the Bois de Vincennes (Map: Paris and Vicinity). The town is almost entirely given over to military purposes. There are immense barracks, a great fortress famous for its arsenal and its school of marksmanship, and depots of military supplies. The château to which the town owes its historical importance is built in the form of a parallelogram. It originally possessed nine towers, of which only one, known as the Donjon de Vincennes, with walls 17 feet thick and 170 feet high, remains. The building was begun by Louis VII in 1164, and was used as a royal residence until 1740. In 1832 Louis Philippe fortified it and turned it into a military depot. Among its famous prisoners were Henry IV, the great Condé, Cardinal de Retz, Mirabeau, and the unfortunate Duc d'Enghien, who was executed here in 1804. Chemicals, rubber goods, and hardware are manufactured. Pop., 1901, 31,405; 1911, 38,568.

VINCENNES, vĭn-sĕnz'. A city and the county seat of Knox Co., Ind., 117 miles by rail southwest of Indianapolis; on the Wabash River, and on the Cleveland, Cincinnati, Chicago, and St. Louis, the Baltimore and Ohio Southwestern, the Chicago and Eastern Illinois, and the Vandalia railroads (Map: Indiana, C 7). It has Vincennes University (nonsectarian), St. Rose Female Academy, a public library, and the Cathedral Library. Other points of interest are the house occupied by William Henry Harrison, while Territorial Governor, the old legislative hall, the Roman Catholic Cathedral, the courthouse, city hall, government building, Vincennes Sanatorium, and Harrison Park. In the vicinity are several Indian mounds. Vincennes manufactures novelties, jewelry, sewer pipe, stoves, glass, paper products, flour, furniture, tools, bridge work, spokes, handles, etc. Pop., 1900, 10,249; 1910, 14,895; 1915 (U. S. est.), 17,202.

Vincennes is built on the site of the principal village, Chip-kaw-kay, of the Piankashaw Indians. A fort was erected here by the French about 1702, and a regular settlement was established soon afterward, which was called Au-Post or The Post until about 1736. Subsequently the name Vinsenne, given in honor of François Morgan de Vinsenne, an early commandant, gradually came into use. This name was finally changed to Vincennes. The British occupied the place in 1763; Col. George Rogers Clark captured it for Virginia early in 1779, and Virginia ceded it to the United States in 1783. It was the capital of Indiana Territory from 1801 to 1816, and was chartered as a city in 1856. It is the oldest permanent settlement in the State. Consult: Law, *The Colonial History of Vincennes* (Vincennes, 1858); "The Founding of Post Vincennes," in *Magazine of American History*, vol. xxii; and Powell, *Historic Towns of the Western States* (New York, 1901).

VINCENNES, văN'sĕn', JEAN BAPTISTE BISSOT, SIEUR DE (1688–1736). A Canadian explorer. He became an ensign in 1701 and in 1704 he saw service in the Miami country. There he rescued a number of Iroquois who had been taken prisoners by the Ottawas contrary to treaty stipulations, and thus prevented a general war. In 1712 he defended Detroit against the Fox Indians and subsequently, as the lieutenant of La Mothe Cadillac, was active in the exploration of the country between the Ohio and the Great Lakes. About 1725 he built a fort and trading post on the site of the city in Indiana that now bears his name. In 1736 he participated in an expedition against the Chickasaws, but was taken prisoner and burned at the stake.

VIN'CENT, BOYD (1845–). An American Protestant Episcopal bishop. He was born at Erie, Pa., and was educated at Yale (A.B., 1867). Ordained a priest, he held rectorships in Pennsylvania, at Erie (1872–74), and at Pittsburgh (1874–89), was consecrated Coadjutor Bishop of Southern Ohio in 1889, and became Bishop of that district in 1904. Bishop Vincent served as President of the Court of Review (1904) and of the Missionary Council (1907) of the Fifth Department of the Protestant Episcopal church, and as chairman of the House of Bishops (1910). He published *Can God Hear Prayer?* (1897).

VINCENT, SIR CHARLES EDWARD HOWARD (1849–1908). An English author and soldier, born at Slinfold, Sussex. He was educated at Westminster School and at Sandhurst. After serving with other regiments he became colonel commandant of the Queen's Westminster Volunteers (1884–1904), and served with that body during the South African War. He entered

Parliament as a Conservative in 1885 from central Sheffield, which constituency he represented until his death; founded the United Empire Trade League in 1891; and was chairman of the National Union Conservative Associations in 1895. His publications include: a translation from the German of Hugo Sturman's *Russia's Advance Eastward* (1873); *Military Geography, Reconnoitring, and Sketching* (1873); *Law of Extradition* (1880); *Police Code and Manual of Criminal Law* (1882; 12th ed., 1904).

VINCENT, EDGAR, first BARON D'ABERNON (1857–). A British financier, born in Sussex. In 1883 he was president of the council of the Ottoman public debt, held at Constantinople, and then until 1889 was financial adviser to the Egyptian government. While in that post he reformed the Egyptian currency, and later, as governor of the Imperial Ottoman Bank (1889–97), freed Turkey from financial embarrassment. From 1899 to 1906 he was a Conservative member of Parliament for Exeter. He had received the K.C.M.G. when 30 years old, and in 1914 he was raised to the peerage. In 1915 he was appointed chairman of the Central Control Board, which had control of the liquor traffic in Great Britain during the European War. He published *A Grammar of Modern Greek* (1881).

VINCENT, FRANK (1848–1916). An American traveler and author, born in Brooklyn, N. Y., and educated at Yale. He spent many years in traveling in almost all parts of the world, and in 1884 he presented to the New York Metropolitan Museum of Art a valuable collection of Indo-Chinese antiquities and art and industrial objects. Among his works are: *The Land of the White Elephant* (1874; 4th ed., 1884); *Through and Through the Tropics* (1876); *Two Months in Burmah* (1877); *Norsk, Lapp, and Finn* (1881); *Around and About South America* (1890; 5th ed., 1895); *In and Out of Central America* (1891; 4th ed., 1896); *Actual Africa* (1895).

VINCENT, GEORGE EDGAR (1864–). An American university president, born at Rockford, Ill., the son of Bishop John H. Vincent (q.v.). After graduating at Yale in 1885 he engaged in journalistic and literary work. In 1888 he became associated with the Chautauqua system as vice principal, and after 1907 was president of the Chautauqua Institution. From 1892 to 1894 he was fellow at Chicago University, to the faculty of which he was appointed in 1894, becoming professor of sociology in 1904. From 1900 to 1907 he was dean of the junior colleges, and from 1907 to 1911 dean of the faculties of arts, literature, and science. In 1911 he became president of the University of Minnesota. In 1914 he was elected president of the Religious Education Association. His writings include *Social Mind and Education* (1896); *An Introduction to the Study of Society* (1895), with Prof. Albion W. Small.

VINCENT, JOHN HEYL (1832–). An American Methodist Episcopal bishop. He was born at Tuscaloosa, Ala., and was educated at Lewisburg (Pa.) Academy and at Wesleyan Institute, Newark, N. J. He entered the New Jersey Conference (1853), and was transferred to the Rock River Conference (1857). He was pastor of churches in Chicago and established the *Northwest Sunday-School Quarterly* (1865) and the *Sunday-School Teacher* (1866). He was corresponding secretary of the Sunday-school Union of his denomination and editor of its publications (1868–84). In 1888 he was elected Bishop and was appointed Resident Bishop in Europe in 1900, stationed at Zurich, Switzerland; in 1904 he retired from the active episcopate. He was the chief founder of the Chautauqua Assembly (1874), and chancellor of Chautauqua University from its organization (1878). He published *The Chautauqua Movement* (1886); *The Church School and Its Officers* (1886); *Studies in Young Life* (1890); *A Study in Pedagogy* (1890); *Family Worship for Every Day in the Year* (1905). For his son see VINCENT, GEORGE EDGAR.

VINCENT, JOHN MARTIN (1857–). An American historical scholar, born at Elyria, Ohio. He studied at Berlin and Leipzig in 1881–83, and in 1890 took his Ph.D. at Johns Hopkins, where he taught history after 1889, from 1905 as professor of European history. In 1909 the University of Geneva gave him the degree Docteur en Droit. He became editor of the "Johns Hopkins University Studies in Historical and Political Science." Besides editing W. D. Ball's *Evolution in Science and Revolution in Religion* (1893) and Borgeaud's *Adoption and Amendment of Constitutions in Europe and America* (1895), he published: *State and Federal Government in Switzerland* (1891); *Government in Switzerland* (1900); *Historical Research* (1911).

VINCENT, MARVIN RICHARDSON (1834–). An American Presbyterian scholar, born at Poughkeepsie, N. Y. He was educated at Columbia, graduating in 1854, and becoming the first classical instructor in the grammar school connected with the college. He was professor of Latin in Troy University in 1858–60; held two Presbyterian pastorates, in Troy and New York, from 1863 to 1888, in which year he became professor of New Testament exegesis and criticism in Union Theological Seminary. Among his published works are: *Faith and Character* (1880); *Word-Studies in the New Testament* (4 vols., 1887, 1900); *The Age of Hildebrand* (1896); *History of the Textual Criticism of the New Testament* (1899); and translations of Bengel's *Gnomon of the New Testament* (1862) and Dante's *Inferno* (1904).

VINCENT, MARY ANNE, *née* FARLIN (1818–87). An American actress, born at Portsmouth, England. She first appeared on the stage at Cowes in 1835, and in the same year was married to James R. Vincent (died 1850), a comedian, with whom she toured in England, Ireland, and Scotland until 1846, when they went to the United States. Mrs. Vincent played at the National Theatre, Boston, until it was burned in 1852, and thenceforth, until her death, was connected with the company at the Boston Museum, where she was a great favorite.

VINCENT DE PAUL, văn'săn' de pōl, SAINT (1580 or 1576–1660). A distinguished French priest, founder of the missionary Order of the Lazarists. He was born at Ranquines, near Pouy, in Gascony, and was sent to school at Toulouse. He became an ecclesiastical student, and was admitted to priest's orders in 1600. On a voyage which he was making from Marseilles to Narbonne his ship was captured by corsairs, and he with his companions sold into slavery at Tunis, where he passed through the hands of three different masters. The last of these, who was a renegade Savoyard, yielded to the exhortations of Vincent, resolved to return to the

Christian faith, and, with Vincent, made his escape from Barbary. They landed in France in 1607. Having gone thence to Rome, he was intrusted with an important mission to the French court in 1608, and continued for some time to reside in Paris as the almoner of Marguerite de Valois. The accident of his becoming preceptor of the children of M. de Gondy, the commandant of the galleys at Marseilles, led to his being appointed almoner general of the galleys in 1619. For the foundation of the Congregation of Priests of the Mission, which occupied a large part of his time from 1624, see LAZARISTS. His life was devoted to the organization of works of charity and benevolence. To him Paris owes the establishment of the foundling hospital. The Sisters of Charity (see BROTHERS AND SISTERS OF CHARITY) were founded under his direction, and he was intrusted by St. Francis of Sales with the direction of the newly founded Order of Sisters of the Visitation. He left nothing behind him but the *Constitutions of the Congregation of the Mission*, *Conferences* on these constitutions, and a considerable number of letters, chiefly on spiritual subjects. He died at St. Lazare, Sept. 27, 1660, and was canonized by Clement XII in 1737. His festival is July 19, the day of his canonization. Consult his *Life* by Adderley (London, 1901), Jones (ib., 1873), P. Boyle (New York, 1909), and in French by Lorti (Paris, 1880), Morel (1884), De Broglie (Eng. trans., New York, 1899), and L. Bougaud (Eng. trans., ib., 1908).

VINCENT OF BEAUVAIS, bō'vā' (c.1190–c.1264). A French encyclopædist. He belonged to the Dominican monastery of Beauvais, and was in high favor with Louis IX of France, who invited him to his court. Here he composed his famous encyclopædia called the *Speculum Majus*. This vast summary of the knowledge of the times is in all printed editions divided into four parts: *Speculum Naturale*, *Doctrinale*, *Historiale*, and *Morale*. This last, however, is considered by most scholars to be an addition by a different hand. The *Speculum Naturale* contains all that was known at that time of natural history. The *Speculum Doctrinale* is a compendium of the scholastic learning of the day. The *Speculum Historiale* begins with the creation and gives the history of the world down to 1244; this book has little intrinsic value. In addition he wrote several other works, all marked by great industry but little originality. Consult August Potthast, *Bibliotheca Historica Medii Ævi*, vol. ii (Berlin, 1896), for editions and secondary works relating to Vincent.

VINCENT'S ANGINA. A variety of pharyngitis characterized by the formation of a false membrane, covering a sloughing, ulcerated base, being first described by a French physician, H. Vincent. The disease is caused by two organisms dwelling in symbiosis, viz., a fusiform bacillus and a spirillum. Numerous transitional forms have been noted by late investigators, pointing to the possibility that the bacillus and spirillum are merely developmental stages of the same organism. These organisms do not confine their activities to the throat, but are found in the larynx, trachea, ear, in brain abscess, and in necrotic lesions about the anal orifice and vulva. Devitalized tissues are especially susceptible to attack, and children exhausted by long illnesses and possessing diseased teeth and tonsils are not infrequent victims. Mulholland, of New York, who studied the incidence of the malady among foundlings, concludes that it is an institutional disease, and that it is mildly contagious. Several epidemics have been reported among institutional children. Localized lesions, if treated promptly, can be cured by the application of iodine, trichloracetic acid, or other active antiseptics. The most efficacious remedy seems to be salvarsan (q.v.), applied locally or given by intravenous injection. See CANCRUM ORIS.

VINCI, vĭn'chē, LEONARDO DA (1452–1519). A Florentine painter, one of the greatest masters of the High Renaissance, also celebrated as a sculptor, architect, engineer, and scientist. He was born at Vinci, a Tuscan mountain town near Empoli, the illegitimate son of Ser Piero d' Antonio, a Florentine notary, and Catarina, a peasant woman. His boyhood was spent in the paternal home at Vinci. In 1649 the family removed to Florence, where his father's wealth enabled him to enjoy the very best education which Florence, at that time the intellectual and artistic centre of Italy, could afford, and he speedily became the embodiment of every social and intellectual charm. He was singularly handsome in person, powerful in physique, persuasive in conversation, a fine musician and improvisatore; and his mind was possessed of a profound and insatiable love of knowledge and research, which proved the controlling factor of his life. Before taking up painting he began the studies in mechanics and in the natural sciences which went hand in hand with his artistic activity throughout life.

About 1466–69 he became the pupil of his father's friend Andrea del Verrocchio (q.v.). In 1472 he was entered into the painters' guild of Florence, and in 1476 he is still mentioned as Verrocchio's assistant, but in 1478 he was working as an independent master. From Verrocchio Leonardo learned modeling as well as painting; but nothing of his work during apprenticeship has survived. According to Vasari he painted an angel in Verrocchio's "Baptism of Christ" (c.1470, Academy, Florence) with such skill that his master resolved to cease painting. The statement concerning Verrocchio is wrong, but it is quite possible that the angel in question is by Leonardo. The account of the terrifying shield upon which the artist painted all manner of monstrosities acquired from his studies of lizards, serpents, worms, etc., may have some basis of fact; but the "Head of Medusa" in the Uffizi is certainly a forgery based on Vasari's description. The "Annunciation," too, in the same gallery is by a member of the school of Verrocchio; but a genuine painting of this subject by Leonardo is in the Louvre.

In 1478 he was commissioned by the Signoria of Florence to paint a picture for the Chapel of St. Bernard in the Palazzo Pubblico. His first masterpiece, the "Adoration of the Kings," which in an unfinished state survives in the Uffizi, was ordered in 1481 for San Donato a Scopello, Florence. The figures have not, for the most part, advanced further than the grounding; but they reveal a fine scheme of composition and dramatic action. The Madonna sits in the midst of a great classic ruin; and in the intense, dramatic action of the worshipers and the crowds endeavoring to approach, the artist has surpassed the highest achievements of the Early Renaissance. Of the other works ascribed to this youthful period none seem genuine, except his unfinished "St. Jerome" (Vatican), a fine

anatomical study. The small "Madonna del Fiore" in the Hermitage, St. Petersburg, is after Leonardo's design, but Berenson attributes to him an unfinished profile of a girl, in possession of Donna Laura Minghetti at Rome.

Leonardo first visited Milan about 1482–83 as the bearer of a present from Lorenzo de' Medici to Lodovico il Moro, the reigning duke. This present was a strange musical instrument sounding like a lute, and invented by Leonardo himself, who thus sang his way into the Duke's favor. Among the artist's papers is the brief of a curious letter which he wrote to the Duke after his return to Florence, stating his various accomplishments. Nine of the 10 divisions of the letter are devoted to his abilities as a military and naval engineer; in the last he states his prowess in architecture and in sculpture: "In painting, also, I can do what may be done, as well as any other, be he who he may." The earliest documentary evidences of Leonardo's presence in Milan dates from April 25, 1483, and he remained there until his patron was driven from the city by the French in 1499. This was the most fruitful period of Leonardo's activity.

His work at Milan was important and varied. As a sort of general factotum for the ruler, he was principal engineer in his numerous military enterprises, constructed the Martesana Canal, and directed great festivities, as when Lodovico married his niece to the Emperor Maximilian. He was also active as an architect, being one of those employed upon the cathedral of Milan, and he probably designed other public buildings. He found time to prosecute his studies in anatomy, especially of animals, with Marco della Torre, and to assist Luca Pacioli in one of his mathematical works. At the same time he was at the head of a large and important band of pupils, whether or not they then constituted the supposed Milanese Academy: for them he probably wrote his *Treatise on Painting;* and it is certain he designed paintings which they carried out. The artistic task in which Leonardo took chief interest, and indeed the dearest plan of his life, was a colossal bronze monument to Francesco Sforza, the father of Lodovico. On it he labored constantly till his departure from Milan in 1499, without having brought it to completion. His interest is attested by the numerous studies of horses, in all manner of positions (Ambrosiana, Milan, and Windsor), in sketches for the monument and reliefs in wax and clay. The model for the horse, 26½ feet high, was complete when the French occupied Milan in 1500 and formed a target for the Gascon archers. Had Leonardo completed this monument it probably would have ranked as the greatest equestrian statue of the Renaissance, surpassing Verrocchio's Colleone as far as the latter did Donatello's Gattemelata.

Of his paintings during the early Milan period, the most important panel is the well-known "Virgin of the Grotto," in the Louvre, executed for the Confraternità della Concezione (1482–90). In this Leonardo has finally solved the problem of chiaroscuro, in the striking contrast of the faces of the Virgin and the two children in the darkness of the grotto. The supposed original in the National Gallery, London, is a copy by Ambrogio da Predis. From 1494 or 95 to 1497 Leonardo labored on his masterpiece of painting, the "Last Supper," a wall decoration in the refectory in the monastery of Santa Maria delle Grazie, Milan. Because of his use of tempera colors directly upon the wall, a surface unfit for the purpose, and because of neglect, and the vandalism of monks and soldiers, the grand original was reduced to a ruin. But while for purposes of study it is necessary to refer to the many pen and red-chalk sketches by Leonardo himself, the copies by his pupils, the best of which are those by Marco d'Oggiono in St. Petersburg and in the Royal Academy, London (see Illustration), and to Raffaello Morghen's excellent print, the original alone gives the true, though faint, idea of the wonderful lighting and melting color, especially since the recent effective restoration. (See LORD'S SUPPER, THE, also called THE LAST SUPPER.) The painting was epoch-making, no less in pictorial qualities than in the remarkable composition. The disciples are represented upon one side of a table, their faces to the spectator. They are divided into four groups of three, each complete in itself, but subordinated to the principal action emanating from the central figure of Christ. He is just pronouncing the words, "One of you shall betray me," and the painting represents the psychological effect of this announcement upon the Apostles. This effect is shown not only in the faces, the ineffable sadness of Christ, the wrath of Peter, the villainy of Judas, but also in the hands, which are treated with a subtle mastery of pantomime, never before attempted or since equaled. Were the heads gone, the hands alone might tell the story. The figures are twice life size and everything is subordinated to architectural effect and sculpturesque composition—the effect of perspective being gained by open windows with Lombard scenery in the distance.

All of the other pictures painted by Leonardo during this period have been lost. On the wall opposite "The Last Supper" portraits of the Duke, his wife, and two children may still be seen in the fresco by Giovanni Montorfano, in which they were painted by Leonardo. But his supposed portraits of the Duke and the Duke's wife, Beatrice d'Este, in the Ambrosiana are now more properly termed "A Musician" and "Bianca Sfzora" and are attributed to Ambrogio da Predis. The so-called "La belle Féronnière," of the Louvre, formerly supposed to represent Lucrezia Crivelli, the Duke's mistress, is now attributed to Beltraffio, while the beautiful "Madonna Litta" in the Hermitage, St. Petersburg, is most likely by Bernardino de Conti. The large "Resurrection" in the Berlin Museum is probably the work of Beltraffio.

In December, 1499, after the expulsion of Duke Lodovico, Leonardo left Milan for Venice. To a brief sojourn at Mantua we owe two beautiful drawings of Isabella d'Este (Louvre and Uffizi), though he never painted for her the desired portrait. He remained at Venice till about 1500, when he returned to Florence and assiduously devoted himself to the study of mathematics. Having received a commission for an altarpiece from the Servite monks, he designed the famous cartoon "Madonna with the Christ Child in the Lap of St. Anne" (1501), which set all Florence in commotion. Not only was it frequently copied, but motives and entire figures were adopted by other artists, as by Raphael in his "Madonna with the Lamb" (Madrid). Leonardo did not himself carry out the oil painting, now in the Louvre, of which it was the model, until a later period, and then with the aid of pupils. In this the Madonna, seated in the lap of St. Anne, is represented in the act of lifting

up the Christ child, who plays with a lamb. Contemporaries were particularly impressed by the position of the Christ child, the beautiful studies for which survive in the Academy of Venice. Other sketches for the cartoon are in the British Museum, in the Louvre, and at Windsor. The cartoon of the same subject, in possession of the Royal Academy, is not the original, but an earlier variation of the same theme.

In 1502 Leonardo entered the service of Cesare Borgia as a military engineer, rendering important services in different parts of Central Italy. In January, 1503, he was again in Florence, where he served on the commission of artists to decide upon the proper location for Michelangelo's "David," and served as an engineer in the war against Pisa. Towards the end of the year he entered upon his famous contest with Michelangelo (q.v.) in a design for the decoration of the great hall of the Palazzo Vecchio. The contest was of political importance, designed, by a glorification of past valor, to encourage the Florentines in their struggle with Pisa. Each prepared a cartoon for one of the long walls, Leonardo's subject being the "Battle of Anghiari." The centre of the cartoon was a cavalry struggle upon a bridge over a standard in which the fierce passion of battle was portrayed, as never before or since. To judge from Leonardo's report to the Signoria, based upon profound historical studies, it seems that on the left the Patriarch of Aquileja, leader of the Florentines, watched the battle, praying for success, and on the right the Milanese troops were in full flight. The execution of the painting upon the wall does not seem to have progressed beyond the central group about the standard, which survives in the "Battle of the Standard," a drawing in the Louvre ascribed to Rubens, and in the well-known engraving by Edelinck.

During this second Florentine period (1503–06) Leonardo painted several portraits, but the only one which survives is the world-famous "Mona Lisa," the pride of the Louvre, perhaps the most celebrated portrait in the world. The subject was the third wife of the Florentine Francesco del Giocondo, whence the name "La Gioconda," by which the portrait is known in France. The face has sadly suffered at the restorer's hand, Walter Pater to the contrary notwithstanding. The redness of the lips and the carnation of the face have disappeared, as have the subtle gradations of blue and red about the eyes, which Vasari praises so highly. But the eyes still have their dewy shimmer, as in life, a subtle smile plays about the mouth, and the wonderful hands are almost unspoiled. Leonardo is said to have employed musicians and jesters to produce the mysterious expression of her countenance, an effect heightened by the strange, rocky landscape in which she appears. After four years' labor on the work, he pronounced it unfinished; but to other eyes it seems one of the most highly finished works in modern art. A great sensation was caused by the disappearance of this masterpiece in August, 1911. Not until two years later was it discovered in Florence in the possession of the thief, Vincenzo Perugia, who alleged patriotic motives in bringing back the picture to Italy. It was exhibited to vast crowds in Florence, Rome, and Milan before its return to the Louvre, Dec. 12, 1913.

In 1506 Leonardo went to Milan on a three months' leave of absence from Florence. The powerful intercession of Chaumont, the French Governor of Milan, at length induced the gonfalonier of Florence to release him from his contract in the Palazzo Vecchio. Leonardo was named court painter to the King, Louis XII, and for the next few years he divided his time between the two cities. He was kept at Florence (1507–08) by a long lawsuit against one of his brothers, who tried to prevent him from claiming an inheritance left him by an uncle. At Milan he continued his engineering projects, and he had studios both there and at Florence. At this period, especially, he executed many designs for paintings carried out by his Milanese pupils. It has been the service of Morelli to distinguish these from his genuine works, and to rewrite the history of the Milanese school. Among such paintings now attributed to followers of Leonardo the "Holy Family with St. Catharine" and a half-nude female figure recalling "Mona Lisa" in the Hermitage, St. Petersburg; "Madonna with the Scales," the small "St. John," "Madonna with the Child and St. John Baptist," and a "Youthful St. John Baptist" in the disguise of a Bacchus, ascribed to Cesare da Sesto, all in the Louvre; and the fresco of a "Virgin with Donor" in Sant' Onofrio, Rome. Several copies of Leonardo's "Leda and the Swan," which we know he painted during the second Milanese period, survive, the best being the free copy formerly ascribed to Sodoma, in the Borghese collection, Rome.

When the French temporarily abandoned Milan in 1513 Leonardo paid a visit to Rome; but neither this nor his previous brief sojourn seems to have exercised any influence upon his art. In 1516 he returned to Milan. He was made court painter at a salary of 700 gold scudi annually, besides being confirmed in his previous possessions. By order of Francis I he bought up all of his own pictures that could be had, whence the collection in the Louvre, and the same year he accompanied the King to France. He passed the remainder of his days in the residence assigned him in Castle Cloux, devoted to scientific research, and died there soon after the date of his testament, May 2, 1519. He did not die in the arms of Francis I, as is often supposed on the evidence of Vasari, but in the presence of his friend Melzi, a young Milanese nobleman who had been his constant companion during the latter part of his life, and to whom he left his invaluable manuscripts and his various instruments.

Leonardo was the most extraordinarily versatile genius of that age of geniuses, the Renaissance. As a man of science he towered above all contemporaries, and had his views been known and generally published, they must have revolutionized the science of his day. That they were not known is perhaps due to the fact that his manuscripts were almost undecipherable, being written with the left hand, back-handed, and from right to left. With an almost inspired glance he divined the secrets of nature, making discoveries which it has been reserved for our own time to perfect. A consummate master of anatomy, he even divined the circulation of the blood and the action of the eye in vision. He made astounding observations in meteorology, knew the earth's annual motion and the effect of the moon upon the tides, foreshadowed the hypothesis of the elevation of continents, and discovered the nature of fossil shells. He originated the science of hydraulics, and probably

LEONARDO DA VINCI

"THE LAST SUPPER," AFTER THE PAINTING IN THE MONASTERY S. MARIA DELLE GRAZIE, MILAN
FROM THE COPY IN THE LOUVRE

invented the hydrometer; his scheme for the canalization of rivers is still of practical value. He invented a large number of labor-saving machines, very remarkable for his day, and as a mathematician he takes high rank, especially for his study of spirals.

In the art of painting he wielded the greatest influence. He was the pioneer of the High Renaissance, the first to achieve that complete mastery of form and technique which admitted of a new freedom of handling, a new truth to nature and life. He was the first to attain a sound and complete mastery of anatomy and to introduce color, in the higher sense, into Florentine painting. By the use of sfumato—a smoky, hazy quality—he achieved a remarkable melting tone and blending of color; he was the first great master of light and shade, which he made witching and lovely. His drawings reveal the consummate draftsman seeking rather after finesse than general effect; they may be found in the principal European collections, especially at Windsor. Among the principal are the studies for his principal paintings, such as the "Kneeling Leda" (Chatsworth and Ducal Palace, Weimar), "Neptune Driving his Team," "The Battle of the Standard," the "Last Supper," the magnificent head of Leonardo in old age (Royal Library, Turin), and the large series of caricatures in which he displays a remarkable sense of humor. The beautiful beardless head of Christ in the Ambrosiana is now generally ascribed to Luini. Especially characteristic of Leonardo's art are his landscape backgrounds, into which he was among the first to introduce atmospheric perspective, that mysterious quality which heightens most admirably the effect of the picture, and the subtle mysterious smile, which Vasari has characterized as more than human. The influence which he wielded over Italian art was profound and wholesome. The chief masters of the High Renaissance in Florence—like Raphael, Andrea del Sarto, and Fra Bartolommeo—all learned from him; he completely transformed the school of Milan (see PAINTING, *High Renaissance, Italy*), and at Parma Correggio carried his art to its logical development.

Bibliography. Leonardo's copious manuscripts, rich in drawings by his own hand, have been published, for the most part, in facsimile; those in the Paris libraries under the editorship of Ravaisson-Mollien (6 vols., Paris, 1881–91); the Codex Atlanticus in the Ambrosiana (Milan, 1895); and those in the Trivulzio collection (ib., 1891). His celebrated *Trattato della pittura*, compiled from the manuscripts by some pupils, has been published many times (London, 1802; Rome, 1890; Vienna, 1882). The best edition of his literary works is by J. P. Richter (London, 1883), with English translation. The first critical biography was by Amoretti (Milan, 1803). Uzzielli, *Ricerche intorno a Leonardo da Vinci* (2d ed., Turin, 1896 et seq.), has best used the documentary evidence. The most extensively planned biography, that of Paul Müller-Walde (Munich, 1889–90), remained unfinished. Others are by A. Rosenberg (Bielefeld, 1898; Eng. trans., 1903); E. Müntz (Paris, 1899; trans., London, 1898); Volynsky (St. Petersburg, 1900; trans. by Heaton and Black, London, 1904); R. McCurdy (London, 1904); H. P. Horne (ib., 1908); G. Gronau (New York, 1903); G. Séailles (Paris, 1912). Later works on Da Vinci are by Dr. Jens Thiis for the early period (London, n. d.), and Osvald Sirén (New Haven, rev. ed., 1916), both profound and scholarly. Of special importance for the criticism of his works are the researches of Morelli (q.v.).

VIN'CUM. See BINGEN.

VINDHYA (vĭnd'yȧ) **MOUNTAINS.** A range of mountains in British India. In its widest sense the name is applied to the whole northern escarpment of the great triangular plateau of the Deccan, stretching in an east and west direction from the mouth of the Ganges to the head of the Gulf of Cambay (Map: India, C 4). It is, however, chiefly along the middle course of the Nerbudda River that there is a well-defined ridge. This river has a deeply cut valley, which separates the ridge from the main plateau and gives it a steep southern slope. On the north there is a lower plateau, which falls towards the great Ganges-Indus lowland. The range consists chiefly of Mesozoic sandstone, and has an average altitude of 2000 feet, with a maximum of 5500 feet.

VIN'DINUM. See MANS, LE.

VINDOB'ONA. The Roman name of Vienna (q.v.).

VINE. See GRAPE; LIANAS.

VINEA, PETER DE. See PETER DE VINEA.

VINE FAMILY. See VITACEÆ.

VINEGAR (OF., Fr. *vinaigre*, from *vin*, from Lat. *vinum*, wine + *aigre*, sour, sharp, keen, from Lat. *acer*, sharp, keen). A sour liquid obtained by acetic fermentation of alcoholic products, usually wine, cider, or malt, used chiefly for culinary purposes and for preserving. The active principle of vinegar is acetic acid, which varies in amount from 2 per cent to 10 per cent and even more; the distinctive flavor and aroma are derived from the materials from which it is made or, in artificial products, from added substances. Small amounts of alcohol, and incidental products of fermentation, are usually present, together with extractive matters depending upon the nature of the materials from which it is made. Cider vinegar contains traces of malic acid, the acid of the apple. Formerly some mineral acid, usually sulphuric, was added to vinegar as a preservative and to reënforce it, but this practice is now regarded as an adulteration. In Europe wine and spirit vinegars are most commonly used, that from white wine being most highly esteemed; in Great Britain malt vinegar is extensively used; in the United States cider vinegar is preferred.

There are two methods of making vinegar—the slow or natural fermentation and the quick process. In both of these the production of acetic acid from the alcohol is effected through oxidation by the agency of microörganisms, which are supplied in the lees or the mother of vinegar. The latter is a soft, felted mass, commonly forming a scum on the surface of the fermenting liquid. It contains an aggregation of microörganisms, mainly acetic bacteria. The process as ordinarily carried on in casks or barrels is quite slow, requiring several weeks at a favorable temperature.

The quick process consists in bringing the alcoholic liquid into intimate contact with the air by means of beechwood shavings, which are placed in a tall vessel called a generator, and inoculated with warm vinegar to furnish the microörganisms and to start the process. The generator is usually a tall wooden cask, smaller at the top than at the bottom, and divided into

three horizontal sections, one of the dividing disks being near the top, and the other a false bottom. Several glass tubes that serve as air ducts extend through the upper disk, which is also perforated with numerous small holes, through which pack threads extend. The central or main part of the generator is filled with beech shavings. The alcoholic liquid is introduced intermittently at the upper part of the apparatus, trickles slowly down the pack threads, diffuses over the chips, coming in contact with the rising current of air, and collects in the bottom of the cask, where it is drawn off by a siphon pipe. It is necessary for the liquid to pass through the cask several times, or through several casks, before acetification is completed, the entire operation requiring from 24 to 36 hours. A temperature of about 30° C. or 86° F. is maintained.

The employment of the quick process in vinegar making enables a more uniform article to be produced with certainty than by the slow fermentation. The latter is more or less haphazard, depending upon the exact kinds of organisms present, and results in considerable loss of alcohol as well as a smaller yield of acetic acid. This has suggested the use of pure cultures of vinegar bacteria, but in practice they have been little introduced.

In addition to being a condiment, vinegar is used extensively in pickling and preserving various kinds of foods, and has an important action in softening the fibres of hard meats and the cellulose of green vegetables.

In pharmacy a solution of a drug in dilute acetic acid is known as a vinegar. Two such preparations are official in the pharmacopœia, *acetum scillæ*, or vinegar of squill, and *acetum opii* or vinegar of opium, popularly known as black drop, and used as a sedative. Vinegar of squill is employed for its expectorant properties. *Acetum aromaticum*, aromatic vinegar, is a solution of the volatile oils of cinnamon, cloves, juniper, lavender, lemon, peppermint, and rosemary in alcohol, vinegar, and water, and is used as a cooling lotion in headaches and fever. Vinegar is a popular domestic remedy, being frequently employed as a gargle. Consult: Brannt, *A Practical Treatise on the Manufacture of Vinegar and Acetates, etc.* (Philadelphia, 1890); Marshall, *Microbiology* (ib., 1911). See ACETIC ACID.

VINEGAR BIBLE. See BIBLE, CURIOUS EDITIONS OF THE.

VINEGAR EEL, or PASTE EEL. See EEL WORM.

VINEGAR FLY. A pomace or wine fly of the genus *Drosophila*, also called fruit fly, although it does not attack sound fruit. The majority of the 30 species breed in the juices of decayed and fermenting fruit. Their larvæ are small, white, slender maggots, and are frequently found in canned fruits and pickles which have been imperfectly sealed, occurring mostly near the top of the jars, but living without inconvenience in the briny or vinegary liquid, and transforming within brown puparia around the edges of the jar. Consult Howard and Marlatt, *Household Insects of the United States* (Department of Agriculture, Washington, 1896).

VINEGARONE, vĭn'ē-gā-rōn' (from *vinegar*, so called from its odor when alarmed). The local name in Texas for the whip-tailed scorpion (*Thelyphonus giganteus*). See SCORPION.

VINE INSECTS (OF. *vine, vigne*, Fr. *vigne*, from Lat. *vinea*, vine, fem. sing. of *vineus*, relating to wine, from *vinum*, wine). About 40 species of insects affecting grapes have been recorded in Europe, and a much greater number occur in the United States. The grapevine phylloxera (see PHYLLOXERA) is the most important and is cosmopolitan. The grapevine fidia (*Fidia viticida*) is a brownish beetle about a quarter of an inch in length, that feeds upon the leaves; the larvæ live at the roots of the vine and check growth. It has done serious damage in the Central States and in New York State. The yellowish eggs are laid in large batches in crevices in the bark of old wood, usually well aboveground, and the larvæ on hatching penetrate the cracks in the soil near the base of the plant. They feed at first upon the fibrous roots near the point of entrance, but soon reach the larger roots, sometimes penetrating three feet below the surface of the ground. They reach full growth in August and construct earthen cells, in which they remain until June of the following year, when they change to pupæ. The adult beetles emerge two weeks after pupation; these may be killed by applying arsenical spray to the vines, while the larvæ are destroyed by the underground injection of bisulphide of carbon or by a strong kerosene emulsion wash.

The grape cane borer (*Amphicerus bicaudatus*) is a botrichid beetle, common in the Central United States, which damages grape canes by boring small holes into them. The eggs are laid in May, and the larvæ, which also bore in the canes, develop during summer, transforming to pupæ and beetles in the fall, the beetles remaining in the burrows until the following year. This insect also breeds in other perennial plants. Prompt destruction of all infested wood is recommended.

The grapevine flea beetle (*Haltica chalybea*) is a stout metallic blue beetle about one-fifth of an inch long, which has enlarged hind thighs. It appears in the early spring, feeds upon the buds, and later deposits its orange eggs in clusters on the lower surface of the young leaves, upon which the larvæ, which are shining-brown, feed, entirely defoliating the plants when numerous. They reach full growth in a month, enter the ground for transformation, and appear in July as beetles, which hibernate and lay eggs in the spring. Spraying with arsenites and jarring the adults upon cloth soaked in kerosene are recommended remedies.

The grape leaf folder (*Desmia maculatis*) is a widely distributed small, shining-black moth, with wings bordered with white and marked with white spots. It lays its eggs upon grape leaves, which the active greenish larva folds together with silk, and skeletonizes them. There are two or three generations each summer, the last generation hibernating in the leaves. The destruction of the folded leaves with the early generation is recommended. Probably the larvæ of more than 50 species, including 10 hawk moths (Sphingidæ), feed upon the foliage. Climbing cutworms are frequently destructive in northern New York and California. See CUTWORM.

The grape berry moth (*Eudemis polychrosis*) is a European species which has been introduced into the United States. It is a small, slate-colored moth, which lays its eggs on the young berries, into which the whitish larva burrows. Infested berries shrivel, become discolored, and seem to be attacked by the black rot.

When full grown, the larva, then one-third of an inch long, changes to a chrysalis within a folded leaf, where it passes the winter. Bagging of grapes and burning of fallen leaves in the autumn are suggested remedies.

The grapevine leaf hopper (*Typhlocyba vitifex*), which is also sometimes known as grapevine thrips (see THRIPS), occurs upon the vines in June, frequently in great numbers, increasing through the summer and passing the winter as adults, laying its eggs upon the lower sides of the leaves the following summer. Burning the fallen leaves and other rubbish and spraying with kerosene emulsion are popular remedies. Tarred paper shields held close to jarred vines are also used; the insects fly against the tarred surface. Consult Marlatt, *The Principal Insect Enemies of the Grape* (Department of Agriculture, Washington, 1898).

VINE'LAND. A borough in Cumberland Co., N. J., 34 miles south by east of Philadelphia, Pa., on the Central Railroad of New Jersey, and the West Jersey and Seashore Railroad (Map: New Jersey, B 5). It has a Training School for Feeble-Minded Children, the State Institution for Feeble-Minded Women, and the State Home for Disabled Soldiers and Sailors. Other noteworthy features are the Carnegie Library; the Historical and Antiquarian Society, and the White King Squab Plant, with a building one-half mile in length. Its products include shoes, flint glass, chenille curtains, thermometers, clothing, pearl buttons, paper boxes, sashes, doors, and blinds. Vineland has adopted the commission form of government. Pop., 1900, 4370; 1910, 5282. Consult Nordhoff, *Communistic Societies of the United States* (New York, 1875).

VINE PEACH. See MUSKMELON.

VI'NER, CHARLES (1678–1756). An English jurist, born at Salisbury, Wiltshire. He attended Oxford for a time, and then resided at Aldershot, Hampshire. His great work was *A General Abridgment of Law and Equity* (23 vols., 1742–53). To the compilation of this work he devoted half a century of toil. The work was very irregular in its execution, hence it was not of much value until a better alphabetical index to it was published in 1758 by Robert Kelham. A second edition of the work and index appeared in London in 24 volumes in 1791–94, and a six-volume supplement was published in 1799–1806. At his death Viner left about £12,000 to the University of Oxford for the establishment of the Vinerian chair of common law and for fellowships and scholarships. The first incumbent of the chair was Sir William Blackstone.

VINES, RICHARD. An English merchant adventurer in the employ of Sir Ferdinando Gorges (q.v.). The date and place of his birth and death are unknown, though it is believed he was born near Bideford, England, and died at Barbados, W. I. He arrived at the mouth of the Saco River, Me., in the autumn of 1616 and passed the following winter there, whence the local name of Winter Harbor for the spot. He explored the surrounding country and continued to transport settlers there and trade in fish and furs with the Indians for his patron until 1630, when, in association with John Oldham, he received a patent of lands on the west side of the river. He acted as agent of Gorges until 1636. With Isaac Allerton of Plymouth, Mass., Vines attempted to establish a trading post at Machias, Me., in 1633, but they were driven out by the French under La Tour of St. John. He probably established the first permanent settlements within the limits of Saco and Biddeford, but was not the first to enter the Saco River, Martin Pring having done so in 1603 and Capt. John Smith in 1614.

VINES, SYDNEY HOWARD (1849–). An English botanist, born in London and educated at Christ's College, Cambridge. In 1888 he was made Sherardian professor of botany in Oxford. He served as president of the Linnean Society of London in 1900–04. His published works include *Lectures on the Physiology of Plants* (1886); *Student's Text-Book of Botany* (1895); *An Account of the Morisonian Herbarium* (1914). Vines assisted in founding the *Annals of Botany* and became its editor.

VINET, vē'nā', ALEXANDER RODOLPHE (1797–1847). A Swiss theologian and literary historian, born at Ouchy, Canton of Vaud. At the age of 20 he became professor of the French language and literature in the Gymnasium at Basel. He was professor of theology at Lausanne from 1837 to 1845, when he became a leading advocate of the entire separation of Church and State and aided in organizing the Free Church of Vaud. Of his numerous writings the following may be mentioned: *Sur la séparation de l'église et de l'état* (1842; Eng. trans., 1843); *Etudes sur Blaise Pascal* (1848; Eng. trans., 1859); *Théologie pastorale* (1850; Eng. trans., 1852); *Homilétique* (1853; Eng. trans., 1853; new edition, 1880); *Etudes sur la littérature française au XIXème siècle* (1849–51); *Histoire de la littérature française au XVIIIème siècle* (1853); *Moralistes des XVIème et XVIIème siècles* (1859); *Poètes du siècle de Louis XIV* (1862). Vinet's letters were edited by Secretan and Rambert (Paris, 1882), and by Pressensé (ib., 1890). There are biographies by Rambert (ib., 1875), L. Molines (ib., 1890), Lane (Edinburgh, 1890), and A. Schumann (Leipzig, 1907).

VINEYARD SOUND. A passage 20 miles long and 3½ to 7 miles wide between the Elizabeth Islands, off the southeast coast of Massachusetts, and the island of Martha's Vineyard (Map: Massachusetts, F 7). It is the customary course for coasting vessels.

VINGT ANS APRÈS, văN'tăN'sà'prā' (Fr., twenty years after). A romantic novel by Alexandre Dumas (1845). It is a sequel to *Les trois mousquetaires*, its incidents being supposed to take place 20 years later in the lives of D'Artagnan and his companions. It was, in turn, succeeded by *Dix ans plus tard, ou le vicomte de Bragelonne* (1848–50).

VINGT-ET-UN, văN'tā'ēN' (Fr., twenty-one). A card game of French origin, played with a complete pack of cards and by any number of players. The cards have no rank, but, instead, have a counting value, all the court cards having an equal value of ten points each, and the ace reckoned as 11 or one at the option of the holder. The pack is dealt to the players, the first to receive an ace becoming the dealer. The object of the game is to secure as near 21 as possible in the total pip value of cards held. Each player deposits an equal stake in the pool, after which two cards are dealt, one at a time, to each player. The cards all dealt, the dealer first examines his hand, and if he has exactly 21 (called a Natural) exposes it at once and claims the pool; or, if playing for stakes, the players pay him twice the amount of their stake. Should another player also have a Natural, it

is declared a stand-off. If, after examination, the dealer has not a Natural, each player in turn, beginning with the eldest hand, examines his hand to see how nearly its total value approaches 21. If he has a Natural he declares it, and the dealer pays him double the amount staked, or he takes the pool or any other winning determined upon beforehand. When none of the players has a Natural, each player in turn may draw another card or trust his fortunes to the two already in hand, which are not shown under any circumstances. If a player desires to draw a card, the dealer gives it to him face upward, and if the pips on the card drawn, added to those already in his hand, brings his total greater than 21, he is *crevé*, and passes over to the dealer his stake. The only skill required is for the player to know what hand to stand on, and what to draw to. MACAO is another variety of the game, in which but one card is dealt to each player; the ace value is fixed at one, and court cards and tens count nothing. Nine must be secured instead of 21.

VINITA, vĭ-nē'tà. A city and the county seat of Craig Co., Okla., 50 miles southwest of Joplin, Mo., on the Missouri, Kansas and Texas and the St. Louis and San Francisco railroads (Map: Oklahoma, F 2). The State Hospital for Insane and the Sacred Heart Institute (Roman Catholic) are situated here; and there are four fine parks. It has a large oil refinery. Pop., 1900, 2339; 1910, 4082.

VINJE, vĭn'ye, AASMUND OLAFSSON (1818–70). A Norwegian journalist and author, born in Vinje, Telemarken. He graduated in law at Christiania University, but did not practice. With Henrik Ibsen, an old schoolmate, and others he founded *Andhrimner*, a satirical weekly. Accepting Ivar Aasen's *Landsmaal* (q.v.), he founded (1858) the original and witty weekly *Dölen*, which he conducted to his death. In 1861 appeared his notable *Ferdaminni fraa Sumaren 1860*, a genial and realistic description of Norwegian country life, followed by *Diktsamling* (1863); *A Norseman's Views of Britain and the British* (1863; Norw. trans., 1873), the result of travels in England and Scotland; the epic cycle *Storegut* (1866; 7th ed., 1905); *Blandkorn* (1866), poems and prose. Many of his poems became popular songs in Norway. *Skrifter i Utval*, selections of his works, appeared in six volumes in 1883–90.

VINLAND, or **WINELAND.** The name given to that part of the continent of America visited by the Vikings of Norway. This coast was sighted in 986 by Bjarni Herjulfson (q.v.), who, in attempting to reach Greenland from Iceland, was carried out of his course by storms and the Arctic current. The land was not explored and named until 1000, when it was visited by Leif Ericson, who sailed along the coast from Labrador southward and gave the name of Wineland to one portion of the country because of the number of grapes he found growing there. Leif spent the winter felling timber with which to load his ship, and when spring came returned to Iceland. In 1002 Leif's brother Thorvald visited the land and spent the greater part of two years in exploration. He attempted a settlement, but was attacked and killed by the natives, whom the Norsemen called Skrællings. In 1007 a colony of 160 men sailed from Greenland to establish themselves in the new land. They put up houses, but were discouraged by the persistent hostility of the natives, and after one winter returned to their own country. The last recorded voyage was in 1347.

The Icelandic historian, Are the Wise, who wrote in the early part of the twelfth century, mentions the discovery of Vinland, and he is authority for the accounts dating for the three centuries next following. Rafn (q.v.), in his *Antiquitates Americanæ* (1837), sets forth such evidence as exists respecting colonization in America by the Norsemen. To this work may be traced the extended popular belief in the statements that the Old Mill at Newport, the Dighton Rock, and other supposed remains can actually be ascribed to the Viking settlements. Professor Eben N. Horsford (q.v.), in the last quarter of the nineteenth century, revived interest in these settlements by a series of publications in which he tried to prove that the Norsemen visited the Charles River above Boston. The actual sources of documentary information are best given in A. M. Reeves's *Finding of Wineland the Good* (London, 1895). Consult also John Fiske, *The Discovery of America*, vol. i (Boston, 1892); J. E. Olson, *The Northmen, Columbus and Cabot* (New York, 1906); W. Hovgaard, *The Voyages of the Norsemen to America* (ib., 1914). See NORUMBEGA.

VINNEN, KARL (1863–). A German landscape painter. He was born in Bremen, was a pupil of the Düsseldorf and Karlsruhe Academies, and continued his studies during travels in Belgium and Holland. He was associated for a time with the Worpsweder group of painters, but never resided there. His landscapes, usually of northern Germany, are excellently composed and strong and brilliant in color. They include "Repose" (Bremen Gallery); "Evening" (Berlin National Gallery); "In the Park" (Hanover Gallery), and "Bremen in the Seventeenth Century" (mural painting in the Bremen Rathaus). Vinnen belongs to the Munich Secession, and received great gold medals at Vienna and Dresden.

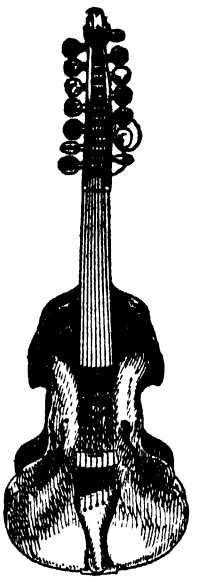
VINNITSA, vĭn'nyĕ-tsà (Polish, *Winnica*). A district town in the Government of Podolia, Russia, situated on both banks of the Bug, 100 miles northwest of Kamenets-Podolsk (Map: Russia, C 5). It has a Jesuit college founded in 1649. Pop., 1910, 47,841, about one-third Jewish.

VINOGRADOV, vē'nô-grä'dôf, PAUL (PAVEL GAVRILOVITCH) (1854–). A British social and legal historian, born at Kostroma, Russia. He became a professor at Moscow, but his educational activities brought him into conflict with the bureaucracy. Settling in England, he made a special study of the village community (q.v.) in England, and showed that the early Anglo-Saxon village was a free community and not a manor. His important works, dealing with this subject, include *Villainage in England* (1892); an essay on Folkland in the *English Historical Review* (1893); *The Growth of the Manor* (1905); *English Society in the Eleventh Century* (1908). After 1903 Vinogradov served as corpus professor of jurisprudence at Oxford. In 1907 he lectured at American universities, and in 1913–14 was reader to the University of Calcutta. He published also *Common Sense in Law* (1914); *The Russian Problem* (1915); *Self-Government in Russia* (1916).

VINOGRADSKY, vē'nô-grät'skĭ, ALEXANDER NIKOLAIEVITCH (1855–). A Russian musical conductor. He studied piano under Nikolai

Rubinstein at Moscow and the theory of composition under Soloviev at St. Petersburg. From 1884 to 1886 he was director of the music school at Saratov, and in 1889 he became director of the Kiev branch of the Imperial Russian Musical Society and conductor of its symphony concerts. He conducted orchestras also in various foreign capitals, where he did much to arouse appreciation of Russian music by Western audiences. Among his compositions the more important are: a violin sonata; two string quartets; a set of variations for orchestra; a symphonic poem, *La nonne;* and *Air finnois* for violin and orchestra.

VINSAUF, văn'sôf', GEOFFREY DE (called also ANGLICUS). A poet and rhetorician, who lived in England about 1200. His name, *de Vino Salvo,* seems to have been derived from a work on the vine preserved in a manuscript at Cambridge, once attributed to him. He was the author of a poem, variously known as *Poetria Novella, Nova Poetria,* and *Ars Poetica.* It is written in Latin hexameters.



VINSON, văn'sôn', JULIEN (1843–). A French philologist, born in Paris, and educated in the Nancy School of Forestry. For some time he was assistant inspector of forests, but later devoted himself to linguistic study, became editor of the *Revue de Linguistique,* and in 1879 was made professor of Hindustani in the Ecole des Langues Orientales Vivantes. His especial studies were the Dravidian languages, Basque, and the dialects of Central and Southern America. He wrote: *Le Basque et les langues mexicaines* (1875); *Le verbe dans les langues dravidiennes* (1878); *Etudes de linguistique et d'ethnographie* (1878), with A. Hovelacque; *Eléments de la grammaire générale hindoustani* (1883); *Les religions actuelles* (1887); *Essai d'une bibliographie de la langue basque* (1891–98); *Manuel de la langue hindoustani* (1899); *Légendes bouddhistes et djainas* (1900); *Manuel de la langue tamoule* (1903).

VINTAR, vĕn-tär'. A town of Luzon, Philippines, in the Province of Ilocos Norte. It lies 5 miles northeast of Laoag, in a well-watered plain, surrounded by mountains. Pop., 1903, 9435.

VIN'TON. A city and the county seat of Benton Co., Iowa, 24 miles northwest of Cedar Rapids, on the Red Cedar River, and on the Chicago, Rock Island and Pacific Railroad (Map: Iowa, E 2). It is the seat of the Iowa College for the Blind; and has a Carnegie library and the Tilford Collegiate Academy. There are creameries, canning establishments, a large printing establishment, and manufactories of bricks, manure spreaders, etc. Pop., 1900, 3499; 1910, 3336.

VIOL (OF. *viole,* It. *viola,* viol, probably from OHG. *fidula,* Eng. *fiddle,* from ML. *vidula, vitula,* fiddle, from Lat. *vitulari,* to keep holiday, originally probably to sacrifice a calf, from *vitulus,* calf). A musical instrument, which was the immediate precursor of the violin. It is to be seen represented on monuments as far back as the close of the eleventh century. The belly and back were flat; there were larger bends in the sides than in the violin; and frets, like those of the guitar, were placed on the neck of the instrument. There was great variety in the number of strings: in Germany, 3, 4, and 5 were all common; in Italy there were usually 6. The strings were tuned by fourths and thirds. The bridge was but slightly arched, so that in the case of instruments with many strings it was very difficult to play upon the strings in the centre. But, on the other hand, this low-arched bridge greatly facilitated chord playing. There were treble, alto, tenor, and bass viols, and they were often played together. Consult E. van der Straeten, *The Violoncello and the Viols* (London, 1915).

VIOLA, vē-ō'lä *or* vī-ō'lä (It., viol). The tenor violin. An instrument in size and compass midway between the violin and the violoncello. It has four gut strings, the lower two covered with silvered copper wire. It is tuned in fifths, c, g, d^1, a^1, which is exactly an octave above the violoncello. The compass is from c to g^2, or even higher, and the music is written in the alto clef. In the orchestra and string quartet the viola is a fixture, but, in spite of its clear, mellow tone, very little use has been made of it as a solo instrument. The *viola d' amore* is an obsolete stringed instrument popular during the early eighteenth century. It had from five to seven strings of catgut, and below them, passing under the bridge, were an equal number of wire strings, which were tuned in unison and vibrated sympathetically with them. The compass was about three octaves and a half. See Plate of VIOLINS.

VIOLA D' AMORE.

VIOLA, vī'ō-lä *or* vē-ō'lä. The heroine of Shakespeare's *Twelfth Night.* She is wrecked, with a friendly captain, on the coast of Illyria, and is forced to reveal her identity by the appearance of her brother.

VI'OLA'CEÆ (Neo-Lat. nom. pl., from Lat. *violaceus,* relating to a violet, from *viola,* violet), or THE VIOLET FAMILY. A family of herbs and shrubs which includes about 15 genera and 300 species of wide distribution, distinguished by the peculiar type of irregular flowers. The best-known genus is *Viola* (violets), which includes about 200 species, approximately 85 of which occur in North America.

VI'OLET (OF., Fr. *violette,* dim. of Lat. *viola,* violet), VIOLA. A genus of mostly perennial herbs of the family Violaceæ. The widely distributed and numerous species are confined to

SWEET-SCENTED VIOLET (*Viola odorata*).

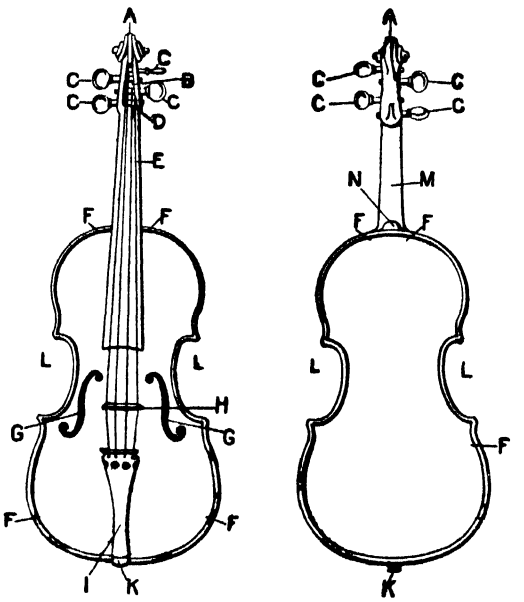
temperate climates. Among the extensively cultivated species are *Viola tricolor* and *Viola odorata. Viola tricolor,* a native of the Old World, is the wild species from which the common pansy

seems to have been developed. It has many varieties which surpass the natural species in beauty and diversity of color. The pansy runs in strains rather than in varieties, and florists frequently group the varieties according to different arbitrary schemes. This species belongs to the leafy-stemmed violets. The name pansy is derived from the French word *pensée*, thought. A strain of this species known as *Viola tricolor arvensis* has become naturalized in some places in the United States. The sweet violet (*Viola odorata*), one of the stemless species, is common in grassy places in Europe and northern Asia, with flowers of deep blue or rarely white. Cultivation has produced many varieties, including dwarf and double forms with great diversity of floral color. The wild plants are not as fragrant as improved garden varieties. *Viola canadensis* is an American species of which the cultivated varieties are frequently grown on sloping banks and rockeries. The bird's-foot violet (*Viola pedata*), also American, is the parent of several handsome cultivated varieties. *Viola altaica*, native to Siberia, has been introduced into cultivation, and by itself, or by hybridization with *Viola tricolor*, has become the parent of many garden violets. *Viola biflora* is widely distributed in the Northern Hemisphere. It produces small yellow flowers, usually in pairs, from April to June. Dogtooth violet is the common name of the genus *Erythronium* (q.v.), a genus unrelated to the violets proper.

Violets are of easy cultivation on various soils, best in cool, shady positions, with rich, moist, sandy loam, and good drainage. They are propagated chiefly by cuttings or divisions. Cuttings are made from vigorous shoots in the spring and set in fine sandy soil in a cool greenhouse or frame, and the resulting plants are transplanted to permanent quarters in the fall. Propagation by division consists in dividing the plants after the flowering period and replanting them immediately. Such plants flower the following spring.

There are a number of so-called diseases that are wont to attack violets. Rust, leaf blight, or spot (*Cercospora violæ*) causes the formation of circular grayish spots with dark centres upon the leaves. Badly infested plants and affected leaves should be destroyed to prevent the ripening of the spores. A spot disease attributed to *Alternaria violæ* attacks the parts above ground and is most troublesome upon rapidly growing plants. The spots have light-colored centres surrounded by darker zones, which become lighter in old spots. Care in the selection of plants, careful culture, removal of all diseased leaves and plants, and propagation of stocky, vigorous plants are suggested as preventive means. An anthracnose (*Glœosporium violæ*), often quite destructive, begins at the edge of the leaf and continues to spread until the whole plant is affected. Many diseases can be prevented by proper management of the plants. Fungicides may be used, but they usually discolor the leaves by the deposit of copper. A root rot due to *Thielavia basicola*, often destructive in beds, may be controlled by sterilization of the soil. Nematoda (q.v.), which are sometimes troublesome, may be destroyed by steam sterilizing the soil before the plants are set. Consult A. and D. Allen-Brown, *The Violet Book* (New York, 1913), and B. T. Galloway, *Commercial Violet Culture* (ib., 1914).

VIOLET FAMILY. See VIOLACEÆ.



VIOLET SNAIL. A small pelagic pectinibranch gastropod mollusk of the genus *Janthina*, nearly related to the wentletraps (q.v.). Several species are known, all inhabitants of the open sea, where they cling to floating seaweeds and the like. Their shells are fragile, purple in color, and in shape like small turban shells (q.v.). They are especially interesting from the curious float which they construct to support their egg capsules. This is a gelatinous raft in which a cluster of eggs is entangled with air bubbles, buoying them up; and thus the collection is dragged about by the mollusk until the young hatch. They occur in shoals and feed upon jellyfishes.

VIOLET SNAIL.

A *Janthina* seen from above, showing its bubble raft of eggs.

VIOLIN (It. *violino*, dim. of *viola*, viol). The most popular of stringed instruments played with the bow. In its primitive form it is a development of the lyre and monochord (qq.v.), the strings from the former, and the elongated resonant box with its sound holes, finger board, and movable bridge, from the latter. The history of the violin begins with the invention of the bow, which was first applied to the crwth, or crowd (q.v.), some time before the thirteenth century, when the viole, or vielle, of the troubadours appeared. The rebec (q.v.), the geige, the fidel,

and many kinds of viols and violas underwent changes until towards the middle of the sixteenth century the true violin model appeared, and superseded other instruments of its class, except the viola, violoncello, and double bass. The primitive violins had no contour, and it was not until the thirteenth century that the body of the vielle was scooped out at the ribs, forming a kind of waist. The corner blocks were added about the fifteenth century, and it is supposed

they originated in Germany. The foundation on which violin making was to rest was the viol with the double corners. These produced a new constructive feature, the bouts, the ribs which curve inward between the two corner blocks. These bouts rendered it possible for the first time for a player to get at the strings. At first they were of large size, but were tapered down later. For nearly a century the sound holes were shifted all over the violin, sometimes crowding with the bridge near the tailpiece. It was not until the violin model had been some time in use that they were cut in their proper place and the bridge fixed between them. The bridge was the last point perfected, and that by Stradivarius. Violins may be divided into two classes: those made on the high and those on the flat model. The former is characteristic of the Stainer pattern, the latter of the Stradivarius. The violin consists of 70 different parts, all of which, except the strings and loop, are made of wood.

The matter of varnish is important; for, aside from external appearances, varnish affects the tone. Two kinds are used, oil and spirit varnishes. The oil completely fills the pores of the wood and thus renders the tone of the instrument somewhat muffled at first; but when the oil in time evaporates the wood remains mellow and sensitive to the slightest vibration. Spirit varnish dries rapidly. It does not fill the pores completely and leaves the surface incased in a glassy substance which imparts a harsh, penetrating sound to the instrument. The Cremonese violins are especially famous for the superior quality of their varnish, but after 1760 its secret seems to have been lost. The strings also are an important consideration in the production of tone. The best are made in Italy—highly finished, durable, and with a pure, sympathetic tone. Next in rank are those made in Germany (Saxony). Owing to occasional overbleaching, German strings are more frequently found to be false than Italian strings. French strings rank next. Although well made, they are not as durable as either Italian or German strings. English strings are chiefly made in the cheaper grades. They are durable, but lack finish. The material from which all gut strings are made is the intestines of sheep. The number of strings varied at different times (from only two to six), but since the determination of the true violin model four strings have been universally used. The strings are tuned in fifths, g, d^1, a^1, e^2. In order to reduce the lowest string to a moderate thickness it is wound with silver or copper wire (overspun).

In playing the violin 11 positions are recognized. By means of shifting, the compass of the violin is extended to almost four octaves, g to c^4. Skillful players can go even beyond this compass. A peculiar veiled tone is obtained by placing a mute (q.v.) (sordino) upon the bridge to check the vibrations. The quality of tone depends chiefly upon the method of bowing. In many compositions the bowing is specially marked. The up-stroke is marked v, the down stroke ⊓; all the notes under a legato curve are to be played with one continuous stroke. A peculiar effect is obtained by plucking the strings with the finger. (See PIZZICATO.) By playing with the bow close to the bridge the tone becomes very hard and metallic. This effect is called for by the words "sul ponticello." Harmonics are tones of a very ethereal character and are produced not by pressing the string against the finger board, but by touching it lightly at certain points. (See HARMONICS.) Chords can be played when the different tones are produced on different strings. This is called double stopping. In the orchestra the violins are the principal instruments, being divided into first and second. See ORCHESTRA.

The art of violin making was at its height in Italy during the eighteenth century. For the sake of convenient arrangement, the principal makers—for such only it is possible to consider—will be grouped into schools.

1. **School of Brescia.** The founder of this school is Gasparo di Bertolotti (c.1542–1609), commonly known as Gasparo da Salo. He made chiefly viols and violas and very few violins. The latter are of a large pattern with very large sounding holes. The workmanship is clumsy and crude, but the wood and varnish are of excellent quality. His pupil, Giovanni Maggini (1581–1631), greatly improved Da Salo's model, and was among the first, if not the first, to introduce the use of corner blocks. With the rise of the opera, especially after Monteverde's reforms of the orchestra (1608), violins came into great demand. Maggini's instruments show a steady advance. In his later years he was evidently influenced by the beautiful models of Amati. Giambattista Ruggeri (c.1690) was a pupil of Amati and began his art in Cremona, but later removed to Brescia.

2. **School of Cremona.** The masters of this school produced the finest instruments. While Da Salo was making violins in Brescia, Andrea Amati (c.1520–80) set up a shop in Cremona, and thus became the founder of Italy's most famous school. His instruments are graceful, with a sweet but not powerful tone. Andrea's sons, Antonio and Geronimo, worked together from 1575 to 1625. They adopted their father's graceful model, but improved the playing qualities, so that their instruments are very sonorous. Geronimo's son Niccolò (1596–1684) is the most famous representative of the Amati family. Up to about 1650 Niccolò used the model of his father and uncle. But then he gradually introduced those changes which finally led to the model known as the Grand Amati, whose body is 14 inches long and strengthened throughout. Niccolò exerted a lasting influence upon the art of violin making, for among his pupils we find masters like Antonio Stradivari, Stainer, Albani, Grancino, and G. B. and F. Ruggeri.

The greatest of all violin makers was Antonio Stradivari (1644–1737). A pupil of Niccolò, it is natural that his earliest violins should be after the Amati pattern. In fact, the instruments made between 1670 and 1685 are known as Amatesse Stradivaris. When Amati died in 1684 he bequeathed all his tools, models, and large stock of choice wood to Stradivari. It is no wonder, then, that after 1685 a remarkable advance is noticeable in Stradivari's instruments. By 1690 the master had completely given up the Amati model and had established his own —a combination of Amati's feminine grace and his own masculine strength. Although Stradivari is not known to have possessed a technical knowledge of acoustics, he attained results for which modern science has established the underlying principles. The period from 1700 to 1720 is known as Stradivari's golden period. The later instruments show, indeed, no falling off in the quality of tone, but are not quite so

beautiful in appearance. Carlo Bergonzi (1715–47), a pupil of Stradivari, made instruments remarkable for brilliancy and mellowness. His work has been imitated chiefly by French makers. Francesco Ruggeri (1630–1720), a pupil of Amati, occupies a prominent place. His instruments are mostly modeled after the Amatis. Giuseppe Antonio Guarneri (1683–1745) is a master whose instruments are by many regarded as equal to those of Stradivari. There were several other members of the Guarneri family who made good violins, but none of them excelled those of Giuseppe Antonio, or Guarneri del Gesù, as he is usually known, on account of his labels, which generally bear the letters I H S, surmounted by a cross. Vuillaume divides the work of Guarneri into four periods. The instruments of the second period are small and elegant, those of the third and fourth are larger. Lorenzo Guadagnini (1690–1742), a pupil of Stradivari, rose to prominence through the excellent tone of his instruments, although their external finish is not as careful as that of others. His model is rather larger than the average. His son, Giovanni Battista (1711–86), surpassed him in the beauty of the wood and varnish. Lorenzo Storioni (1760–1800) is generally regarded as the last of the Cremonese masters. His work is not equal to the best of his predecessors, but shows certain characteristics of the school of Cremona.

3. **School of Venice.** This school did not become prominent until after 1700. Matteo Gofriller (c.1670–1724) seldom labeled his instruments, which thus have often been mistaken for Cremonese workmanship. Francesco Gobetti (1680–1720) made instruments on the Stradivari pattern. They are beautiful in appearance and possess a wonderful tone. Santo Serafino (1687–48) rivals the best makers in the surpassing beauty of design and varnish; but his instruments, though of delicate tone, lack power. The greatest of the Venetian masters is Domenico Montagnana (1690–1740). He was a pupil of Stradivari, and from the moment when he settled in Venice occupied the foremost place among violin makers.

4. **School of Naples.** In the number of instruments made Naples comes next to Cremona. Although, as a rule, all the violins have an excellent tone, they are inferior to those of the other schools in workmanship and beauty of finish. Alessandro Gagliano (1650–1730), a pupil of Stradivari, established himself in Naples. Most of his sons and grandsons devoted themselves to the art of violin making. Of these Ferdinando (1706–83) is the most famous. He adopted Stradivari's last model.

5. In addition to the above-mentioned schools fine instruments were made in Rome, Florence, Milan, Bologna, Padua, and other cities. But nearly all such violins can be classed as belonging to one of the four famous schools, because their makers either came from those cities or learned their craft there. David Tecchler (c.1660–?), a German, established himself at Rome. His cellos especially are highly esteemed. Giovanni Pressenda (1777–?), a pupil of Storioni, was undoubtedly the greatest Italian master of the nineteenth century. He worked in Turin. Carlo Testore (1680–1715) established himself at Milan. He employed chiefly Guarneri's model. Giovanni Grancino (1670–1730), also of Milan, shows considerable originality in his work.

6. **French School.** In France the art of violin making was not practiced generally until the eighteenth century. The French masters are rather skillful imitators of the Italians than original makers. The models imitated are those of Brescia and particularly Cremona (Stradivari). Many of the makers resorted to artificial means to give their instruments the appearance of old violins. Whereas the Italian masters always strove to produce only the best violins, many French makers, in order to supply the demand, made varying qualities of instruments. The most famous French master is Nicolas Lupot (1758–1824), who copied Stradivari almost exclusively. Others worthy of mention are F. Pique (1788–1822), J. B. Vuillaume (1798–1875), P. Silvestre (1801–59), F. Gand (1802–45), G. Chanot (1801–83), S. Bernardel (1802–70), J. Germain (1822–70). At the present day the art of violin making seems to have been driven to the wall by the wholesale factories of Mirecourt.

7. **German School.** Very few of the German violins rose above mediocrity. One of the earliest makers is also the greatest—Jacob Stainer (1621–83). His model is entirely original, but he adopted the famous Italian varnish. For a long time his violins were in exclusive demand in Germany; and not only German but also English connoisseurs ranked Stainer above the Italian masters. Among the many imitators of Stainer, Kloz and Widhalm deserve especial mention. Other German makers, notably Eberle, Bachmann, Jauch, Hunger, and Stainer's contemporary, Albani, worked after Italian models. But their work was not appreciated until later.

8. **English School.** Before the removal of duties on foreign violins violin making flourished also in England. Jacob Rayman, a Tyrolean by birth, settled in London about the middle of the seventeenth century, and became the founder of the English school. His model is that of Stainer. Barak Norman (1688–1740) in his later years began to copy Maggini, thus helping to bring the Italian models into favor. Benjamin Banks (1727–95) used the model of Amati, which soon was in greater demand than that of Stainer. William Forster (c.1800) did not attain a great reputation until he had abandoned the Stainer pattern and adopted that of Amati. Bernard Fendt (1775–1823) was perhaps the most famous English imitator of Italian models, particularly of Stradivari. For a century after the death of Stainer his instruments as well as those of his imitators were in great demand. But about the year 1800 the superiority of the Italian masters began to be appreciated. The Amati instruments were the first to bring high prices. In 1804 an Amati was sold for $150. Stradivari's instruments were the next to be recognized; then those of Guarneri, Maggini, and Bergonzi. As soon as this demand for Italian violins became general the prices rose rapidly. Paris and London became the principal markets for old Italian violins. Private individuals began to collect them. The man who devoted his whole life to discover old instruments, and thus saved scores of valuable violins, was Luigi Tarisio, who died in 1854. After Tarisio's death Vuillaume bought his whole collection. Among these was a Stradivari, which is valued at $15,000. The value of an instrument to-day depends upon its state of preservation, as well as the period of its maker. Sometimes older instruments are of less value than violins

of more recent date. See QUARTET; QUINTET; MUSIC, HISTORY OF, XVI; MUSICAL INSTRUMENTS.

VIOLLE, vē'ôl', JULES (1841–). A French physicist. He was born at Langres, and was educated at the Ecole Normale Supérieure. In 1870 he took the degree of doctor of science at the University of Paris. In 1883 he was appointed professor at the University of Lyons, and in 1890 became the head of the department of physics in the Ecole Normale. The following year he was made professor of applied physics in the Conservatoire des Arts et Métiers. Violle became best known for his researches in radiation, heat, and photometry, having proposed the platinum standard of light emitted by a square centimeter of melting platinum at the instant previous to its solidification. This was adopted by the International Electrical Congress of 1883, but never came into extensive use as a standard of light, on account of the experimental difficulties involved in preparing the platinum. He delivered two notable lectures, "Du rôle de la physique à la guerre" on Dec. 10, 1914, and Feb. 11, 1915, subsequently published. His publications include a *Cours de physique* (2 vols., 1883–86), scientific papers on photometry and other subjects, and contributions to the *Encyclopédie chimique.*

VIOLLE STANDARD. See PHOTOMETRY, *Standards of Light.*

VIOLLET, vyô'lâ', PAUL MARIE (1840–1914). A French historian, born at Tours. He studied at the Ecole des Chartes, where he became professor of civil and canon law in 1890. His work, which is most scholarly, deals principally with the history of the old French law. Among his writings are: *Précis de l'histoire du droit français* (1885); *Les établissements de Saint Louis accompagnés des textes primitifs et de textes dérivés* (4 vols., 1881–86); *Histoire des institutions politiques et administratives de la France* (3 vols., 1890–1903); *Histoire du droit civil français avec notions du droit canonique en notes bibliographiques* (1905); *Les communes françaises au moyen âge* (1906); *Le roi et ses ministres pendant les trois deniers siècles de la monarchie* (1912).

VIOLLET-LE-DUC, vyô'lâ'-le-dụk', EUGÈNE EMMANUEL (1814–79). The most prominent architect of the Gothic revival in France, equally well known as an author on architectural subjects. He was born in Paris, and was educated at the Collège Bourbon. After studying architecture with Achille Leclère, he traveled through France in the employ of Baron Taylor (see TAYLOR, I. S. J.) studying mediæval monuments, and became proficient in designs of the Gothic style. He was especially skilled in the restoration of works of mediæval architecture, and did more than any other man to arouse an intelligent interest in its monuments. After some works at Vézelay and Narbonne, he undertook, in association with Lassus, the restoration of the Sainte Chapelle in Paris and important additions and changes in Notre Dame, Paris, for which he designed the present central spire and sacristy. Almost as important was his restoration of civil and military monuments, such as the royal château of Pierrefonds, which he almost entirely reconstructed, and the mediæval walls of Carcassonne, the most marvelous relic of Gothic fortifications. In 1863 he was appointed professor of æsthetics in the Ecole des Beaux-Arts, but, meeting with strong opposition, he resigned, publishing his lectures, *Entretiens sur l'architecture,* the following year. At the time of his death he was engaged in restoring the cathedral of Lausanne.

He wrote a number of important books, admirable in their scholarly text and unrivaled illustrations. Among them are *Dictionnaire raisonné de l'architecture française* (10 vols., 1854–68) and *Dictionnaire raisonné du mobilier français* (6 vols., 1858–75). In his *Histoire d'une forteresse* (1874) and *Histoire d'un hôtel de ville et d'une cathédrale* (1878) he draws an imaginary history of these typical mediæval buildings. Others of his works are *L'Art russe: les origines* (Paris, 1877); *Monographie de Notre Dame de Paris* (ib., no date); *De la décoration appliquée aux édifices* (ib., no date). Consult Sauvageot, *Viollet-le-Duc et son œuvre* (Paris, 1880), and Saint-Paul, *Viollet-le-Duc, ses travaux d'art, etc.* (ib., 1881).

VI'OLONCEL'LO, *Ital. pron.* vē'ô-lŏn-chĕl'lô (It. diminutive of *violone,* augmentative of *viola,* viol). A large instrument of the violin class, held by the performer between his knees. It has four gut strings, the lowest of them covered with silvered copper wire, and is tuned in fifths: C, G, d, a. Its compass extends from C to a^2, and even higher. Its signature is usually the bass clef, the tenor or treble clef being used for the higher notes. In its present form the instrument dates from the latter half of the sixteenth century. Up to the eighteenth century its quality was little known, but since the time of Haydn the instrument has steadily gained in favor. It soon superseded the viola da gamba. The musical literature for the violoncello is exceedingly meagre. Consult L. Grillet, *Les ancêtres du violon et du violoncelle* (2 vols., Paris, 1901), and E. van der Straeten, *The Violoncello and the Viols* (London, 1915). See Plate of VIOLINS.

VIONVILLE, vyôN'vêl', BATTLE OF. The most desperately contested battle of the Franco-German War, fought on the plateau of Vionville, 12 miles west of Metz, between about 130,000 French under Marshal Bazaine and a German force of 67,000 under Prince Frederick Charles, Aug. 16, 1870; also known as the battle of Mars-la-Tour. The battle was one of the series of conflicts that prevented the retreat of the French army on Chalons, being preceded by the battle of Colombey-Nouilly on the 14th and succeeded by that of Gravelotte (q.v.) on the 16th. The battle began at 10 in the morning with an attack by the Third Prussian Corps on the French under Frossard at Vionville. It lasted for nearly 12 hours and was marked by great cavalry charges on the part of the Germans and desperate fighting on both sides. Bazaine overestimated the German strength and held himself on the defensive until the enemy had been reënforced sufficiently to repel all French attempts to break through their lines. The

Germans lost 711 officers and 15,079 men; the French 879 officers and 16,128 men.

VIOTTI, vē-ôt'tē, GIOVANNI BATTISTA (1753–1824). An Italian violin player, born at Fontanetto, in Piedmont, and chiefly educated under Pugnani at Turin. After holding for a short time the appointment of first violinist in the royal chapel at Turin, he relinquished that office (1780) in order to travel in Europe with Pugnani. In Berlin, St. Petersburg, Paris, and London his playing created a furore. He first visited London in 1782. An attempt to found an Italian opera was frustrated by the Revolution of 1791, and Viotti again went to London as a soloist. A groundless charge against him of being a revolutionary agent drove him from England; but after living a while in retirement at Hamburg he returned to London, where he became manager of the Italian opera, and in 1795 director of the opera concerts. Ill success caused his return to Paris, where he was director of the opera (1819–22). His compositions include violin concertos and quartets for violin, tenor, and violoncello, violin duets and solos, and a few pianoforte compositions. His playing was characterized by vigor and brilliancy. His compositions are still in use. Consult F. Baillot, *Notice sur Viotti* (Paris, 1825).

VI'PER (Lat. *vipera*, viper, adder, serpent, for **vivipara*, fem. sing. of *viviparus*, bearing living young, from *vivus*, alive + *parere*, to bear, produce). A venomous snake of the subfamily Viperinæ. (See VIPERIDÆ.) Nine genera and about 40 species are recognized by Gadow, all denizens of the Old World, and many known by other names and elsewhere described. (See ADDER; ASP; DEATH ADDER; PUFF ADDER; RATTLESNAKE; TREE VIPER.) The real vipers of the genus *Vipera* are European and Asiatic, and are typically represented by the common adder, viper, or kreuzotter (*Vipera berus*), whose range extends from Great Britain (except Ireland) to Sakhalin Island, and which is the only serpent in England except the water snake (q.v.). It rarely exceeds 2 feet long, and is very variable—gray, yellowish, olive, brown, red, or black, marked along the back with a zigzag band, most distinct in the lighter specimens. The head is flat and triangular, the neck small, the body comparatively thick, and the tail short and pointed. Vipers prefer stony places, where they can retreat to crevices. They do their hunting at night, when they are likely to creep near camp fires, as do other nocturnal venomous serpents. They gather into tangled masses when mating in the spring, and the young are born in the following July or August. They hibernate during cold weather in holes, several entwining, and they vary the degree and length of dormancy with the climate. Their bite is not as a rule fatal to a healthy man, but is followed by great depression and nervousness, and the wound is long and troublesome in healing.

The Mediterranean countries, along both shores, have another species (*Vipera aspis*), the asp (q.v.). From Italy to Armenia occurs the sand viper (*Vipera ammodytes*), which bears a fleshy horn upon its nose; and a third species (*Vipera latastei*) inhabits Spain and Portugal. The African vipers are the death adder, puff adder, and saw vipers (qq.v.). One, especially characteristic of the Egyptian deserts, but known from Algeria to Palestine, is the horned viper (*Cerastes cornutus*), which burrows in the sand during the day, leaving only its nostrils and eyes exposed, but goes abroad at night in search of the small animals upon which it lives, and then is most likely to approach Bedouin camp fires. It is a yellowish, faintly spotted snake, about 2½ feet long; and above each eye stands a large horny, spikelike scale. It is more vicious and aggressive than most vipers, and is greatly feared, for its bite is usually fatal. Another species (*Cerastes vipera*) is hornless.

The largest, most ornate, and deadly viper is that scourge of India, Ceylon, Burma, and Siam, Russell's viper (*Vipera*, or *Daboia, russelli*), called tic-polonga in Ceylon, bora around Calcutta, jessur, and sometimes carpet snake or chain viper, by Anglo-Indians. Its markings are shown on the Plate of FOREIGN VENOMOUS SERPENTS under SNAKE. It reaches a length of 5 feet, and its poison is swift and sure in fatal effect. Fortunately the snake is sluggish and not easily provoked; and its hisses when disturbed warn men away, so that fewer human lives are lost by it than by cobras. For an explanation of the poison apparatus, effects of poison, and bibliography, see SNAKE.

VIPER, DR. A character in Samuel Foote's (q.v.) play *The Capuchin*. It depicted, under a thin disguise, an Irish clergyman named Jackson, a tool of the notorious Duchess of Kingston (q.v.). Jackson suborned a servant to prefer infamous charges, of which Foote was acquitted in court.

VIPER, RAT-TAILED. See FER-DE-LANCE.

VIPER FISH. See LANTERN FISH.

VIPER'IDÆ (Neo-Lat. nom. pl., from Lat. *vipera*, viper, adder, serpent). The most specialized and venomous family of snakes, ranked as the highest of ophidians. It is characterized by a wide, angular, depressed head, causing the neck to appear small in comparison; a short thick body; and a tail tapering suddenly to a point. The head is mostly covered with scales, rarely plates (or only a few about the eyes and lips), or with extremely fine plates. The scales are carinated, often rough, even spinous. The ventral shields are broad, and the subcaudal plates in two rows. The nostrils are large, and in some species they close with a valve. The highly venomous serpents of this family are furnished with a pair of long, curved proteroglyph fangs attached on each side to the upper maxillary, which is movably articulated, and by special muscles swings or rocks to and fro, carrying the fang with it. When at rest, the fang, protected by a membranous sheath, lies supine along the jaw. The fang has a canal in its interior, connected with a poison gland, the contents of which are ejected into the wound made by the fang in the act of biting. (See illustrations under SNAKE.) Behind the pair of functional fangs, others, in a rudimentary stage, are found, and come forward to take their place when one or both of them are broken or shed. The lower jaw has numerous solid teeth of the ordinary form. All vipers except the African genus *Atractaspis* are viviparous, and produce comparatively few young. The family includes terrestrial, arboreal, semiaquatic, and burrowing types, and is almost world-wide in its distribution, but most numerous and highly developed in the tropics; Australia, Madagascar, and cold northern regions are free from these baneful serpents. The family includes two well-marked groups—the *Viperinæ*, or typical vipers (q.v.), which have no external pit between the

eyes and the nose, and the maxillary not hollowed out above, and which belong wholly to the Old World; and the American and Asiatic *Crotalinæ*, or pit vipers, which have a deep cavity between the eye and the nose lodged in the hollowed-out maxillary bone. The last named are frequently ranked as a separate family. See CROTALIDÆ; RATTLESNAKE.

VIPER'S BU'GLOSS, also called BLUE THISTLE (*Echium*). A genus of large, hairy herbs or shrubs of the family Boraginaceæ. The flowers are often very beautiful. The common viper's bugloss (*Echium vulgare*), a large biennial plant, is a native of most parts of Europe, and introduced and spreading in many parts of the United States. It grows in dry places, not infrequently in grain fields. Its flowers while in bud are reddish, and afterward blue. It derives its name, viper's bugloss, from spots on its stem, which somewhat resemble the spots on a viper; and the property of healing viper's bites was, therefore, ascribed to it.

VIQUE, vē'kå. A town in Spain. See VICH.

VIRACOCHA, vē'rå-kō'chå (CON TICI VIRACOCHA or TICI VIRACOCHA). A man with superhuman attributes in the traditions of Peruvian Indians. While accounts from various early sources vary greatly, he is generally represented as being much lighter in color than the Indians and as wearing a long beard. The Indians of to-day speak of all white men as viracochas. One account of this tradition runs that Viracocha appeared in the Province of Collasuyu in very ancient times when the land was in darkness, having neither light nor day. That he went to the village called Tiaguanaco, where, being moved by the condition of the people, he created the sun and caused it to move in its course, after which he made the stars and the moon. According to another version there had been two successive creations by Viracocha. On his first appearance he had created the earth, the sky, and the people, and disappeared, leaving darkness everywhere. Later he had come out of Lake Titicaca and created the sun, the stars, and the moon and regulated their course in the heavens.

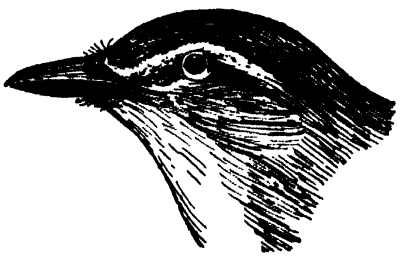
Still another version relates that at a time long before the Incas had ever been heard of, the Indians were a long time without seeing the sun, and in their distress offered up many prayers and vows to their gods. Presently the sun, shining very brightly, came forth from the Island of Titicaca, at which every one rejoiced. Then appeared a white man of great stature who, by his aspect and presence, called forth great veneration and obedience. This man had the power to change plains into mountains, and great hills into valleys, and to make water flow out of stones. The Indians say he performed other wonders, giving life to men and animals, and that through him marvelous benefits were conferred on the people. It is stated by the early chroniclers Francisco López de Gomara and Agustín de Zárate that Viracocha signifies froth or grease of the sea.

VIR'BIUS. See DIANA.

VIRCHOW, fir'kō, RUDOLF (1821–1902). A German pathologist, anthropologist, and political leader, born Oct. 13, 1821, at Schivelbein, Pomerania. He graduated in medicine at Berlin (1843), where he became prosector of anatomy, sharing the companionship of Henle, Schwann, Brücke, Helmholtz, Du Bois-Reymond, and other scholars who were destined to become distinguished as the discoverers of important medical facts. He became in 1847 lecturer at the University of Berlin. Soon afterward he was commissioned by the government to investigate the cause and cure of typhus in Silesia. In his report he severely condemned the Prussian government for its lax hygienic and social laws, and made a strong appeal for a democratic form of government. He founded at this time the *Archiv für pathologische Anatomie und Physiologie*, of which he remained editor till his death, and which is celebrated the world over by its official title *Virchow's Archiv*. The political commotions of 1848 dragged him, in common with many other votaries of science, into the revolutionary vortex. He established a journal entitled *Medizinische Reform*, and helped to found a democratic club, where he soon distinguished himself as an orator. On account of his political opinions Virchow lost his post in 1849, and, though reinstated afterward, he accepted in the same year a call to the chair of pathological anatomy in Würzburg. His lectures at that university were widely popular for the novel views which he advanced, particularly in cellular pathology. His reputation grew so great that he was recalled in 1856 to Berlin, where he occupied until his death the chair of pathological anatomy, and rendered it the most famous of its kind in Europe. In the same year he finished his researches on embolism, showing that a thrombus is the primary condition in phlebitis, thus overthrowing the older theories, which made the thrombus secondary. In 1861 he became a member of the Municipal Council of Berlin, and did much to improve city conditions. In 1862 he was chosen Deputy to the Prussian Diet, and soon rose to the leadership of the opposition, and proved a most effective antagonist of the encroachments made on the constitution by the conservative party under the cover of the royal prerogative. He was one of the founders of the Fortschrittspartei (Progressists), and both as such and as a subsequent member of the deutsch-freisinnige party he was one of the most prominent figures of the German Reichstag from 1880 to 1893. He was especially active as an opponent of Bismarck's policies, both domestic and foreign.

The first edition of his masterwork, *Cellularpathologie*, was published in 1858, and attracted at once the attention and admiration, and later won the acceptance of the medical world, displacing the former pathological systems and theories for all time. (See PATHOLOGY.) His views were so clear, his theory so perfect, and his grasp of the matter so comprehensive that his fame was at once assured. His work upon tumors is of especial value, as it holds the practical and clinical aspects of the matter as of prime importance—a circumstance that is remarkable in view of the fact that Virchow was not a practitioner of medicine. His views combated the dogmatic theories of Rokitansky and the prevailing Vienna school of pathologists. His work in pathology is distinctly a creation, establishing the biological principle that the laws working in disease are not different from those in operation in health, though subject to different conditions, *omnis cellula e cellula*, "a new growth of cells presupposes already existing cells." The cellular theory was finally established in 1858. During the wars of 1866 and 1870–71, Virchow devoted himself to arranging, equipping, and drilling hospital corps and am-

bulance squads, and directed the management of numbers of hospital trains, also taking charge of the immense Berlin military hospital, as well as of the sanitary arrangements of the troops in the field. The Franco-Prussian War ended, Virchow became a member of the Sanitary Bureau of the city of Berlin, with its great problem of the disposal of sewage. Under his direction immense sewage farms were established after such a plan that they have kept pace in adequateness with the tremendous growth of the city, while the revenue from them is sufficient to meet and defray the expense of their maintenance. But his researches in pathology and hygiene were many. He excelled also as a parasitologist, making discoveries in trichiniasis (q.v.). But the newer discoveries and views of Koch and Behring relative to toxins and antitoxins he did not accept readily.



Virchow was also distinguished as an archæologist. His advice and learning were of great advantage to Schliemann in the latter's researches in Hissarlik, and in the plains of ancient Troy. Archæological anthropology gained much from his description of the Neanderthal skull and of the bones found in the graves at Koban. He contributed more than 100 articles on anthropology, especially well known being his *Crania Ethnica Americana* (1892).

On Oct. 13, 1901, upon the celebration of his eightieth anniversary at a complimentary dinner in Berlin, a *Festschrift* was presented to him by a score of former students. Simultaneously testimonial dinners were given in other cities, notably New York and Chicago, in the United States, at which many physicians vied with each other in recounting the discoveries and sounding their praises of the great scientist, teacher, physician, and legislator. He died at Berlin Sept. 5, 1902.

Perhaps Virchow's greatest material monument is the Pathological Institute and Museum in Berlin, erected by the government in accordance with his desires. It contained 23,000 specimens at the time of his death, and by far surpasses all similar collections in the world.

He was a very voluminous writer. Among his works are *Mittheilungen über die Typhus-Epidemie* (1848); *Die Cellularpathologie* (1858; Eng. trans., 1860); *Handbuch der speciellen Pathologie und Therapie* (1854–62); *Vorlesungen über Pathologie* (1862–72); *Die krankhaften Geschwülste* (1863–67). He also wrote on political and social questions and on a variety of other topics—the gorilla, prehistoric syphilis, mediæval leprosy, plague in its relations to public health, Goethe, Morgagni, Schoenlein, Johannes Müller, spedalska (a disease peculiar to the Norwegian coasts), the relation between lupus and tuberculosis, etc. From 1866 he published with Von Holtzendorff *Sammlung gemeinverständlicher wissenschaftlicher Vorträge*. Consult Becher, *Rudolf Virchow* (Berlin, 1891); J. L. Pagel, *Rudolf Virchow* (Leipzig, 1906). A *Virchow-Bibliographie* was published in 1901 (Berlin).

VIREO, vĭr'ê-ō (Lat. *vireo*, greenfinch, from *virere*, to be green, vigorous), or GREENLET. The common name of a family of about 50 insectivorous birds, having a plumage more or less tinted with green and olive. In the genus *Vireo* the bill is short, straight, notched, and hooked at the tip; wings long and pointed; toes of moderate length; tail moderate and even. There are about 30 species in this genus, a dozen of which occur in the United States, most of them migrating to and from South America and the West Indies. It has been subdivided into several genera. Many of these birds are singers, and the variety of song in the genus is great. All subsist exclusively upon insects, and are of immense service to the gardener and orchardist. All agree, also, in constructing a very artistic nest in the form of a cup of ribbon-like materials, such as grape-vine bark, ornamented with cobwebs, lichens, and the like; the typical form is shown on the Plate of PENSILE NESTS OF BIRDS, under NIDIFICATION.

RED-EYED VIREO.

The most familiar and widespread species in the United States is the red-eyed vireo (*Vireo olivaceus* or *Vireosylva olivacea*), about 6 inches long; back and tail bright olive-green, crown ashy, and a characteristic double line, dusky and white, over the eye, the iris of which is red. The white-eyed vireo (*Vireo noveboracensis*, or *griseus*) is very similar, but has a white iris. A more southerly species is *Vireo barbatulus*. Of the others, the most striking is the yellow-throated (*Vireo*, or *Lanivireo*, *flavifrons*), which is bright olive-green above, pure white beneath, and with the throat and breast bright yellow.

VIRGIL. See VERGIL.

VIRGIL'IA (Neo-Lat., named in honor of the Latin poet *Virgilius*, *Vergilius*, *Vergil*, in allusion to his agricultural poem, the *Georgica*). A genus of leguminous trees, natives of South Africa. The only species, *Virgilia capensis*, is a handsome tree 15–20 feet tall occurring abundantly along streams in Cape Colony. The wood is light, soft, and easily worked, and is much used for yokes, spars, etc. See CLADRASTIS.

VIRGIN. See MADONNA; MARY.

VIRGIN. An instrument of torture. See MAIDEN.

VIRGIN, THE RED. See MICHEL, LOUISE.

VIR'GINAL (OF., Fr. *virginal*, from Lat. *virginalis*, maidenly, from *virgo*, maiden). A keyed instrument, one of the precursors of the pianoforte. It resembled in form a small pianoforte, with a compass of four octaves, furnished with a quill and jack like those of the spinet, and a single string to each note. Generally the case was elaborately ornamented.

VIRGIN BIRTH. In theology the term signifies the virginity of the mother of Jesus at his birth. The claim of her virginity is made in the story of Jesus' birth in Matthew and in Luke (see GOSPELS; MATTHEW), but nowhere else in the New Testament. Evidently the belief was not essential in the creed of the earliest Church. In the second century the acceptance of the virgin birth is attested by Ignatius, Justin Martyr, Aristides, and Irenæus. It was rejected only by the Gnostics and some Ebionites (qq.v.). After the passing of these sects the doctrine was universally held by the Church and found a place

in the creeds. The doctrine was forced into prominence by the high esteem in which virginity was held in the Church. It was used to emphasize the divinity and the sinlessness of Christ. While the divinity of Christ was seldom made dependent on his virgin birth, it was a common belief that a miraculous birth befitted a miraculous being. His sinlessness involved his freedom from original sin, which was held to consist of concupiscence and to be transmitted by natural generation. With the passing of this emphasis on the sexual in original sin, the Catholic church affirmed the doctrine of the immaculate conception (q.v.) of Mary as a means of assuring the release of Jesus from original sin, and the Protestant churches usually held that the sinlessness of Jesus was not due to his birth, but to his sanctification by God. In modern times the doctrine of the virgin birth has been attacked as being, according to the New Testament itself, not a necessary doctrine; as being based on biblical narratives whose accuracy is not above suspicion; as finding its natural explanation in Old Testament and pagan stories of miraculous birth; as constituting a degradation of marriage; and as being needless to the divinity of Christ. These objections have risen from the critical study of the Bible and from the modern objection to miracles. In 1892 the refusal of C. Schrempf to assent to this article of the Apostles' Creed created widespread discussion of the subject in Germany. In English-speaking churches the problem has been less acute. Many Protestant churches have ceased to maintain that belief in the virgin birth is essential to Christian faith.

Thorburn, *A Critical Examination of the Evidences for the Doctrine of the Virgin Birth* (London, 1908); G. H. Gilbert, *Jesus* (New York, 1912).

VIRGIN'IA. A city in Saint Louis Co., Minn., 75 miles north-northwest of Duluth, on the Duluth, Missabe, and Northern, the Duluth and Iron Range, the Great Northern, and the Duluth, Winnipeg, and Pacific railroads (Map: Minnesota, E 3). It is an important iron mining and lumbering centre, and has flour mills and a brewery. There is a Carnegie library. Pop., 1900, 2962; 1910, 10,473; 1915 (U. S. est.), 14,432.

VIRGINIA. See APPIUS CLAUDIUS CRASSUS.

VIRGINIA (Neo-Lat., named in honor of Queen Elizabeth, the "Virgin Queen"). One of the South Atlantic States of the Union, between lat. 36° 30′ and 39° 40′ N. and long. 75° and 84° W. It ranks thirty-third in size among the States, its total area being 42,627 square miles, of which 2365 square miles are water surface included in landlocked bays, harbors, and rivers. The extreme length from east to west is about 440 miles, and the greatest breadth from north to south is about 200 miles.

Topography. Virginia is divided into three major provinces, (*a*) coastal plain, (*b*) piedmont plateau, and (*c*) Appalachian Mountains, which differ markedly in the nature and origin of surface features and in the age and kind of rocks. The coastal plain is the easternmost province and comprises the area between the Atlantic Ocean and the piedmont plateau. It is more than 100 miles wide and includes approximately 9500 square miles, or about one-fourth the total area of the State. It is a low, flat-lying area, whose elevation gradually increases from sea level at the coastal border to a few hundred feet at its western edge. Much of the land over parts of it is marshy. In the southeastern corner is the great Dismal Swamp (q.v.), within the centre of which is Lake Drummond, having an area of 5 square miles. The coastal plain is composed of loose and partly consolidated sediments, chiefly sands, clays, and marls, which range in age from Lower Cretaceous to Quaternary. The beds may be locally indurated. They strike in general from north to south, with a low but variable easterly dip. The rivers within the coastal plain are tidal with low velocities and are navigable as far westward as the piedmont border, the "fall line." The piedmont plateau is bordered by the coastal plain on the east and extends to and along the southeastern base of the Appalachian Mountains. Its width increases from about 40 miles in the northern portion along the Potomac River to nearly 175 miles along the Virginia-Carolina boundary. Its surface is broadly undulating and shows a gently eastward slope from an altitude of 1000 feet at the western edge to near sea level along the eastern margin. The streams cross it in rather deep and narrow channels. Less reduced areas of the harder rocks, rising several hundred feet above the upland surface of the plateau, are not uncommon over the region, especially towards the western margin.

Geology. Geologically the region is formed of a complex of highly metamorphosed sedimentary and igneous rocks of early Paleozoic and Pre-Paleozoic age, largely concealed beneath a cover of residual material, with exposures of fresh rock less numerous than farther north. The rocks are crystalline and include chiefly gneisses and schists intruded by granitic and gabbroic rocks. Within the Virginia piedmont are areas of Triassic sediments (sandstones, conglomerates, and shales), one of the most important of which is the Richmond basin, where was mined the first coal in the United States. Over parts of the south-central portion of the province are areas of altered volcano-sedimentary rocks which extend southward into North Carolina. The schistosity, developed in most of the rocks from metamorphism, is in general coincident with the trend of the province, northeast and southwest, but varies in dip. The Appalachian Mountains embrace the western portion of the State. Its eastern boundary is the southeastern slope of the Blue Ridge. Like the piedmont and coastal plain, this province extends northeast and southwest far beyond the limits of Virginia. The topography of the Appalachian Mountains province is varied and picturesque. Three divisions of the province are recognized, which are (*a*) the Blue Ridge, (*b*) the Great Valley, and (*c*) the Alleghany Ridges. The Blue Ridge, the easternmost range of the Appalachian Mountains system, extends from Harper's Ferry in a southwesterly direction across the State. At Harper's Ferry it has a height of about 1200 feet, but it increases south-

westward, reaching elevations of more than 4000 feet. Southwest of Roanoke the Blue Ridge is of plateau-like character, having a steep descent to the southeast and a gentle slope to the northwest. It is crossed by the Potomac, James, and Roanoke rivers, which flow southeastward to the Atlantic, and by New River, which flows northwestward to the Ohio. The Blue Ridge is composed largely of Pre-Cambrian igneous rocks, flanked on the northwest side by Cambrian sandstones and shales and on the southeast side in places by siliceous sediments of the same age. Considered broadly, the Great Valley region, including the Shenandoah Valley and Alleghany Ridges, is composed of narrow valleys and linear ridges arranged in more or less complex relations. It is composed of Paleozoic sedimentary rocks (limestones, shales, and sandstones) which range in age from Cambrian to Carboniferous. The rocks have been folded and faulted and subsequently greatly eroded, resulting in the development of the well-known Appalachian type of topography.

Hydrography. The drainage of much the greater part of the State is directly into the Atlantic Ocean or its arm, Chesapeake Bay, through the Potomac, Rappahannock, York, James, and Roanoke rivers and their tributaries. These streams flow across the piedmont plateau and coastal plain provinces in parallel southeastward courses. The Blue Ridge forms the principal watershed in the State. West of the Blue Ridge lies the Great Valley province, the northern part of which is drained by the Shenandoah northward to the Potomac, the middle part by the headwaters of the James and Roanoke and farther southwest by New River, which flows northwestward to the Ohio, and the extreme southwestern part by the Holston and Clinch rivers and the tributaries of the Big Sandy.

Climate. The climate is variable, and differerences in temperature and precipitation are noted between the three larger topographic divisions of the State. Temperatures over the coastal plain are more equable than over the more elevated piedmont province to the west, and sudden and decided changes to warmer or colder weather are comparatively rare. In the mountain province, where elevation and topography produce marked effects, greater daily and monthly ranges of temperature are shown. The annual mean temperature varies from 57° in the coastal plain to 55° in the piedmont plateau and to 53° in the mountain province. East of the Blue Ridge the mean temperature for January is 36° and for July 78°; west of the Blue Ridge the mean temperature is 33° for January and 73° for July. The precipitation is abundant and fairly well distributed through the year, the annual average being 42 inches for the coastal plain, 43 inches for the piedmont plateau, and 41 inches for the mountain province. The annual snowfall varies from an average of 12 inches in the coastal plain to 16 inches in the piedmont plateau and to 25 inches in the mountain province.

Soils. The soils of the coastal plain are dominantly light gray to gray in color and are chiefly of the sandy-loam and silt-loam types with the clay loam less abundant. In the piedmont province the soils have been derived from the weathering of metamorphic crystalline rocks in place and vary in character according to the kind of rock from which they have been derived. In general they may be said to range from light sandy types to deep-red clay types, showing wide range in fertility and adaptability to farm crops. The soils of the Appalachian Mountains province have been derived from weathering of sandstones, shales, and limestones. The sandstone and shale soils are less productive than the limestone soils. The limestone soils of the Great Valley region form the most important agricultural region in the State.

Mineral Resources. Virginia has a large variety of minerals produced on a commercial scale, and, though ranking high in this regard, it ranked twenty-eighth in 1914 among the States in value of products. The value of the coal produced represented more than 50 per cent of the total mineral production for 1914. Coal is supposed to have been first mined in the United States in the eastern part of Virginia, from a small basin near Richmond. The chief production, however, is from the southwest portion, in the Appalachian region. The production in this region dates from 1883, and in 1888 there were produced more than 1,000,000 tons. The State ranked thirteenth in the value of coal produced and ninth in quantity in 1914. The production in that year amounted to 7,959,535 short tons, valued at $8,032,448. The production of pig iron in 1914 amounted to 197,981 long tons, valued at $2,481,197. This value is not included in the total mineral production. Coke, also not included in the total, had a production of 780,984 short tons, valued at $1,582,419. Clay is next in importance, and in 1914 the product was valued at $1,472,348; about 80 per cent of the production is common brick. Stone ranks third among the primary mineral products. The chief varieties produced are limestone and granite, the combined value of which in 1914 amounted to $2,152,378. Virginia ranks first in the production of iron pyrite (used in the manufacture of sulphuric acid), about 50 per cent of the entire supply in the United States coming from there in 1914. The production amounted to 141,276 long tons, valued at $556,091. Virginia also leads in the production of soapstone. The production, including that of talc in 1914, was 21,687 short tons, valued at $547,202. Other minerals produced in commercial quantities are barytes, cement, copper, feldspar, lead, mica, mineral paints, sand and gravel, slate. The value of the total mineral production in 1914 was $16,400,347.

Agriculture. Of an approximate land area of 25,767,680 acres, 19,495,636 were in farms in 1910. The area of improved land was 9,870,058 acres and the number of farms 184,018. The total value of farm property, including land, buildings, implements, and machinery, domestic animals, poultry, and bees, was, in 1910, $625,065,383. The average acreage per farm was 105.9, valued at $20.24 per acre in 1910, and the average value of farm property $3397. Of the total number of farms 135,289 were operated by owners and managers and 48,729 by tenants. The native white farm. operators numbered 134,155, the foreign-born white 1749, and the negroes 48,114. The owners among the native whites numbered 99,862 and among the negroes 32,228. The acreage operated by whites was 17,257,416 in 1910; by negroes, 2,238,220.

The following table shows the acreage, value, and production of the most important crops as estimated by the United States Department of Agriculture for 1915.

CROPS	Acreage	Prod. bu.	Value
Corn	2,125,000	60,562,000	$42,999,000
Wheat	1,230,000	16,974,000	18,332,000
Oats	225,000	5,625,000	3,094,000
Rye	70,000	1,015,000	944,000
Potatoes	140,000	17,500,000	10,675,000
Sweet potatoes	34,000	3,740,000	2,431,000
Hay	700,000	*945,000	14,836,000
Barley	12,000	348,000	261,000
Tobacco	192,500	†144,375,000	13,571,000
Cotton	36,000	‡16,000	870,000
Buckwheat	26,000	520,000	416,000

* Tons. † Pounds. ‡ Bales.

In 1909 there was devoted to corn an acreage of 1,860,359, from which were harvested 38,295,141 bushels of grain, valued at $28,885,944; to hay and forage, 773,577 acres, from which were cut 823,383 tons of fodder, valued at $10,256,998; to tobacco, 185,427 acres, the yield being 132,979,390 pounds, valued at $12,169,086; to wheat, 692,907 acres, with a production of 8,076,989 bushels, valued at $8,776,061; to oats, 204,455 acres, producing 2,884,495 bushels, valued at $1,609,973. Potatoes in that year had an acreage of 86,927 and a production of 8,770,778 bushels, valued at $5,667,557. There were also devoted 40,838 acres to sweet potatoes and yams, from which were harvested 5,270,202 bushels of tubers, valued at $2,681,472. The acreage of vegetables (other than potatoes, sweet potatoes, and yams) was 124,354 and their value $8,989,467.

The total output of orchard fruits in 1909 was 6,581,101 bushels, valued at $3,582,359. More than nine-tenths of that quantity was contributed by apples, while peaches and cherries constituted most of the remainder. The output of grapes in that year was 4,108,694 pounds, valued at $156,266, and that of nuts 841,572, valued at $22,161. There were devoted to sorghum cane 8288 acres, the production of which was 41,449 tons, from which 441,189 gallons of sirup, valued at $217,634, were made. In the same year were harvested 11,342,980 quarts of small fruit, valued at $671,843. Of this quantity strawberries constituted 10,761,381 quarts, valued at $626,649. Blackberries, dewberries, and raspberries contributed most of the remainder.

Live Stock and Diary Products.—The total value of live stock on farms in 1910 was $71,192,843. There were on the farms on Jan. 1, 1916, 361,000 horses, valued at $35,739,000; 64,000 mules, valued at $7,680,000; 359,000 milch cows, valued at $14,898,000; 472,000 cattle other than milch cows, valued at $13,310,000; 734,000 sheep, valued at $3,597,000; 1,023,000 swine, valued at $7,161,000. The total value of milk, cream, and butter fat sold and butter and cheese made in 1909 was $7,704,326. There were sold in the same year 8,577,893 gallons of milk, valued at $1,766,468, and there were made 26,651,244 pounds of butter, valued at $5,683,060. The total number of fowl of all kinds on the farms was 6,099,581 and their value $3,395,962.

Fisheries. In total value of fish products Virginia ranks second only to Massachusetts. In value of its shad, menhaden, alewife, croaker, caviar, sturgeon, crab, and hard-clam products it ranks first. Oystering is the most important branch of the industry, the yield in 1908 being 5,075,000 bushels, valued at $2,348,000, or about 50 per cent of the total value of all fishery products. Shad, with a catch valued at $486,000, were next in importance, while menhaden came third, with products valued at $429,000. While the fishing industry is carried on at almost every available point along the Atlantic coast, by far the most important fishing grounds are in the Chesapeake district. The total capital invested in the industry in 1908 was $2,984,000. The apparatus for capture reported for boat and shore fisheries was far greater than that for vessel fisheries. This industry gave employment to 20,066 persons in 1908 and yielded a total output valued at $4,716,000.

Forests and Forest Products. In the coastal plain two species of short-leaf pine and the scrub or spruce pine (the last only north of the James River) make up the bulk of the forests, with various deciduous trees in swamps and on the richer uplands, and a little long-leaf pine in the extreme south. Long-leaf pine, cypress, and tupelo gum are confined to the coastal plain. The piedmont region and Shenandoah valley are mostly under cultivation now, but have oaks and short-leaf pines on steeper hillsides, deciduous trees of several kinds along streams, and considerable cedar along roadsides and fence rows. The mountains are rather densely wooded, with white pine, hemlock, and hardwoods of many species on the slopes, and spruce and fir at higher elevations. The lumber industry is of considerable importance in Virginia. There were cut, in 1909, 2,101,716 M feet B. M. of rough lumber, 127,555 thousand laths, and 39,172 thousand shingles. Of the total cut yellow pine constituted some 58.1 per cent. (For further details regarding this industry, see *Manufactures.*) Other species cut in considerable quantities, in order of their importance, are oak, yellow poplar, white pine, spruce, chestnut, hemlock, tupelo gum, cedar, red (sweet) gum, basswood, maple, ash, hickory, cypress, walnut, beech, sycamore, and birch. In addition to figures cited above there were produced on the farms of the State in 1909 forest products valued at $10,118,851.

Manufactures. Although Virginia enjoys many natural advantages of excellent transportation facilities, water power, and raw materials, it has not developed the manufacturing industries to a high state. In 1909 it ranked twenty-second in value of such products. The table on the following page gives the chief facts with regard to the industries of the State as a whole and with regard to the ten leading industries.

The lumber and timber industry had 46 per cent of all the establishments, gave employment to nearly one-third of the wage earners in such industries, and reported nearly one-sixth of the total value of manufactured products. (See *Forest Products.*) The tobacco manufacturers reported 11 per cent of the total value of manufactured goods. The chief flour-mill and gristmill products are wheat flour, corn meal, and offal. Virginia ranked fourth in 1909 in the manufacture of fertilizers, fish being the chief material used. Other industries of importance not mentioned in the table are printing and publishing, foundries and machine shops, and slaughtering and meat packing. The average number of wage earners was 105,576, of whom 102,054 were over 16 years of age. The prevailing hours of labor for the large majority of wage earners were from 54 to 60.

The nine cities having a population of 10,000 or over—Richmond, Norfolk, Lynchburg, Petersburg, Roanoke, Danville, Alexandria, Portsmouth, Staunton—gave employment in 1909 to 34.8 per

cent of the total number of wage earners and produced 44 per cent of the total value of manufactured products. Richmond, which gave employment in 1914 to 17,282 wage earners and turned out manufactured products valued at $62,491,000, is the most important city. Norfolk, the second in importance, gave employment to 5900 wage earners and turned out products valued at $14,955,000. Lynchburg comes third, with 3445 wage earners and an output valued at $9,919,000. See articles on these cities.

SUMMARY OF INDUSTRIES FOR 1904 AND 1909

THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY: Total	PERSONS ENGAGED IN INDUSTRY: Wage earners (average number)	Capital	Wages	Value of products	Value added by manufacture
					Expressed in thousands			
All industries	1909	5,685	120,797	105,676	$216,154	$38,154	$219,794	$94,211
	1904	3,187	88,898	80,285	147,989	27,943	148,857	65,208
Lumber and timber products	1909	2,617	37,931	33,287	28,392	9,962	35,855	21,963
	1904	938	17,000	15,134	13,253	4,972	18,727	11,836
Tobacco manufactures	1909	104	8,978	7,882	13,131	2,162	25,385	14,196
	1904	143	8,597	7,931	23,478	1,829	16,768	10,104
Flour-mill and gristmill products	1909	458	1,817	1,014	8,700	398	17,598	2,434
	1904	365	1,597	957	5,503	349	13,832	1,661
Cars and general shop construction and repairs by steam-railroad companies.	1909	28	7,943	7,588	3,998	4.082	9,956	4,701
	1904	29	7,746	7,345	2,740	3,663	8,693	4,116
Leather, tanned, curried, and finished	1909	39	1,730	1,590	11,090	589	8,267	1,822
	1904	44	1,169	1,055	4,635	358	5,830	1,111
Fertilizers	1909	45	2,199	1,956	9,767	760	8,035	2,646
	1904	37	1,935	1,801	4,872	571	4,659	1,418
Peanuts, grading, roasting, cleaning, and shelling	1909	25	1,662	1,516	2,865	258	7,933	807
	1904	26	1,458	1,332	1,115	196	7,055	906
Cotton goods, including cotton small wares	1909	10	5,123	5,057	14,070	1,480	7,490	2,791
	1904	10	3,501	3,456	7,067	884	4,484	1,682
Boots and shoes, including cut stock and findings	1909	10	2,973	2,711	3,999	805	5,809	1,789
	1904	6	1,801	1,738	975	369	2,627	712
Iron and steel, blast furnaces	1909	14	1,425	1,320	6,305	546	5,389	971
	1904	10	1,150	1,081	3,157	346	3,343	626

Transportation. Virginia is fairly well supplied with water transportation. The James River, navigable for small steamers to Richmond, is one of the chief waterways. Besides this are the Rappahannock, Potomac, and other tidal streams, several canals, and a coast line with a number of good harbors. Virginia took an early interest in the construction of railroads and in 1840 had a mileage of 147 miles; in 1860 it was 1379. The mileage of main line single track in 1914 was 3793. The most important roads and their mileage in that year are: the Norfolk and Western, 954; the Chesapeake and Ohio, 537; the Southern, 420; the Virginian, 329; the Seaboard Air Line, 157.

Banks. Though there are no records of organized banks in Virginia before 1792, the banking business was known in the State for a century before and was conducted by private individuals. The special Act of 1777 prohibiting the issue of currency by private persons shows how common a practice it was. Lack of instruments of exchange forced the State to issue notes, and the necessities of the Revolutionary War increased their number, but the rapid depreciation of these notes left the State without a stable currency. In 1792 the banks of Alexandria and Richmond were established. In 1795 branches of the Bank of the United States were organized. In the first two decades of the nineteenth century there developed half a dozen large banking institutions with a great number of branches all over the State—altogether over 40 branches. The issue was strictly limited to three times their capital, and directors were made liable to loss. Because of the branch system these banks were very strong and did a profitable business. This called forth a large number of private or unchartered banks of issue, but they were all prohibited by the Law of 1816. In 1837 a free banking law was passed and a large number of banks of issue organized under it, and a still larger number of banks of deposit and discount. In 1860 there were 24 banks of issue with 41 branches and between 150 and 200 banks of deposit and discount. Not a bank survived the war. The national bank, however, soon appeared. State banks began to reappear in 1869, after the new constitution was adopted. There was no regulation at all of the State banks until 1885, when a law was passed requiring reports to the State Auditor. Not only the Legislature but circuit courts are empowered to issue banking charters. After 1885 the number of State banks greatly increased.

The condition of the banks in 1915 is shown in the following table.

	National banks	State banks
Number	136	231
Capital	$18,629,000	$7,044,000
Surplus	12,279,000	4,937,000
Cash, etc.	5,706,000	1,902,000
Deposits	97,824,000	39,477,000
Loans	113,513,000	43,741,000

Government. The constitution of the State in its present form dates from 1902. Amendments may originate either in the Senate or in the House of Delegates, but to become a part of the constitution must be passed by both of these bodies and by the Legislature next succeeding and be approved by the voters at large.

Legislative.—The legislative power is vested

in a General Assembly, consisting of a Senate and House of Delegates. The Senate consists of not more than 40 or less than 33 members. They are elected every four years. The House of Delegates consists of not more than 100 and not less than 90 members, who are elected every two years. A reapportionment of senatorial and house districts is made every 10 years, dating from 1902. The General Assembly meets every two years on the second Wednesday in January succeeding the election of its members.

Executive.—The chief executive power of the State is vested in the Governor, who holds office for four years, beginning on the first day of February succeeding his election. He is ineligible for immediate reëlection. The Lieutenant Governor is elected at the same time and for the same term as the Governor and is President of the Senate. Other executive officers are the Secretary of the Commonwealth, State Treasurer, and Auditor of Public Accounts. These are all elected and hold office for the same term as the Governor.

Judiciary.—The judiciary department consists of the supreme court of appeals, circuit courts, city courts, and such other courts as may be established by law. The supreme court of appeals consist of five judges, any three of whom may hold court. It has original jurisdiction in cases of habeas corpus, mandamus, and prohibition, but in all other cases it has appellate jurisdiction only. Judges of the supreme court of appeals are chosen by the joint vote of the two Houses of the General Assembly and hold office for 12 years. The State is divided into 31 judicial circuits, for each of which a judge who holds office for eight years is chosen by joint vote of the two Houses. For the purposes of a judicial system all cities in the State are divided into two classes. Those with a population of 10,000 inhabitants or more are of the first class, and all cities with less than 10,000 are of the second class. In every city of the first class there is in addition to the circuit court, a corporation court.

Suffrage and Elections.—Every male citizen of the United States, 21 years of age, who has been a resident of the State for two years, of the county, city, or town one year, and of the precinct in which he offers to vote 30 days, next preceding the election, and who has registered and paid his poll tax at least six months prior to the election in which he offers to vote, is entitled to vote. Any person is permitted to register for voting who prior to the adoption of the constitution served in the time of war in the army or navy of any of the States of the United States or of the Confederate States, or who is the son of such a person, or who owns property upon which for three years preceding that in which he offers to vote State taxes aggregating $1 have been paid, or who is able to read any section of the constitution submitted to him by the officers of registration, and to give a reasonable explanation of the same, or if unable to read such section is able to understand and give a reasonable explanation thereof, when read to him by the officers. The General Assembly may prescribe a property qualification not exceeding $250 in value for voters in any county, city, or town as a prerequisite for voting in any election for officers other than members of the General Assembly. A new primary law which went into effect in 1915 provided that primaries for the nomination of candidates to be voted upon at the general election be held on the first Tuesday of August of each year. Nominations for primaries are to a certain extent optional.

Local and Municipal Government.—All places of over 5000 in population are cities. Cities are governed by a mayor and city council, elected for a term of four years. Several of the cities are independent of county government. Provision is made for a special form of government for cities of 50,000 inhabitants or more.

Miscellaneous Constitutional and Statutory Provisions.—There is a child-labor law. The conduct of corporations is under strict control. A prohibition measure was approved by the people on Sept. 22, 1914, becoming effective on Nov. 1, 1916.

Finances. During the Colonial days the financial needs were very small, and for almost a century the budget increased hardly 50 per cent, being £4200 in 1660, £4500 in 1700, and £6500 in 1754. The main sources of income were a poll tax and an export duty on tobacco. The Revolutionary War necessitated expenses for which there was no provision in the system of taxation, and thus a debt of about $2,000,000 was created. The debt was assumed by the Federal government in 1790, and until 1820 the debt of Virginia consisted only of $343,139, borrowed only for purposes of the War of 1812. Several small issues of bonds were made between 1820 and 1835.

The idea of public improvements, which developed in the thirties, found enthusiastic supporters in the State. In 1835 the debt amounted to hardly $2,500,000, but, during the short period 1835–38, $4,132,700 was loaned, the main purpose being the construction of canals and railroads. By 1851 the debt had reached $12,000,000, and by 1861 it was $33,897,074. During the war part of the interest could not be paid and more loans were made: and although these loans for war purposes were repudiated by order of President Johnson, the overdue interest payments swelled the debt considerably. This interest was funded by special Act in 1867, and for a year Virginia met her obligations, but, passing under military control, was again forced to stop payment of interest. By 1870 the debt had grown to $45,872,778. A complicating circumstance was the organization of the western counties into a new State, West Virginia. Virginia, holding that the new State was responsible for part of the debt, was willing to pay only two-thirds of the interest, viz., 4 per cent. In 1871 the whole debt was funded. One-third of it was designated as the part of West Virginia, and the funding of this part was made dependent upon settlement with that State. This settlement was referred to the United States Supreme Court, which in 1915 declared that West Virginia should pay Virginia $12,393,929 as its share of the net debt. (See WEST VIRGINIA, *History.*) The rest of the debt was to be funded at its full value and old rate of interest, with the coupons made receivable for taxes. This clause is mentioned because it was the main political question in Virginia for the following 20 years. In the following year the readjusters, i.e., those who advocated the necessity of reducing the debt of the State, were victorious. Coupon-killing acts were passed in 1872, 1873, 1876, and until 1885; most of them were declared unconstitutional by the United States Supreme Court, which held that the objectionable clause

was a contract and therefore inviolable. The struggle lasted for 20 years. Meanwhile an effort was made to settle the question by an act passed in 1882. The basis of this act was the elimination of about $7,000,000 of compound interest since 1861, and the total debt was calculated at $21,035,377. Some of the bondholders refused to avail themselves of this offer, though under the Riddleberger Act of 1882 $15,013,973 were available for funding. The final adjustment came only in 1892, after long negotiations between the State and a committee of English bondholders, when the total debt of the State which was not yet refunded, estimated at $28,000,000, was funded at the rate of 19 to 28 by 100-year bonds, bearing 2 per cent for 10 years and 3 per cent for the rest of the time. On June 1, 1915, the State debt amounted to $24,183,882. A great part of the government income is as yet derived from a poll tax, a real-estate tax, and a personal-property tax, but many other sources have been added since the Civil War, as liquor and other licenses, an inheritance tax, taxes on insurance companies, railroads, oyster grounds, etc. The main items of expenditures are interest on the public debt, schools, and hospitals. The total receipts in the fiscal year ending Sept. 30, 1915, amounted to $8,210,615 and the total expenditures to $7,994,571. The balance in the treasury on Oct. 1, 1915, was $851,771.

Militia. The males of militia age in 1910 numbered 398,728. The organized militia was composed, on Jan. 1, 1915, of 2743 enlisted men and 202 officers. It included four regiments of infantry, a battalion of field artillery, a company of signal corps, and five detachments of sanitary troops.

Population. The population of Virginia at each Federal census was as follows: 1790, 747,610; 1800, 880,200; 1810, 974,600; 1820, 1,065,366; 1830, 1,211,405; 1840, 1,239,797; 1850, 1,421,661; 1860, 1,596,318; 1870, 1,225,163; 1880, 1,512,565; 1890, 1,655,980; 1900, 1,854,184; 1910, 2,061,612; 1915 (est.), 2,121,014. The average number of persons to the square mile was, in 1909, 51.2. The urban population, i.e., that in cities or incorporated towns with 2500 people or more, was 476,529 and the rural 1,585,083. The whites numbered 1,389,809 and the negroes 671,096. In the southeastern section a much larger percentage of the total population than elsewhere are negroes. Of the total white population 94.5 per cent is native born of native parentage. More than 90 per cent of the native-born population were born in Virginia. Of that born in other States North Carolina furnished 3.6 per cent, no other State contributing as much as 1 per cent. By sex the population was divided into 1,035,348 males and 1,026,264 females. The males of voting age in 1909 numbered 523,532. The 10 largest cities with their population for 1910 and 1915 (est.) are: Richmond, 127,628 and 154,674; Norfolk, 67,452 and 88,076; Roanoke, 34,874 and 41,929; Portsmouth, 33,190 and 38,610; Lynchburg, 29,494 and 32,385; Petersburg, 24,127 and 25,347; Newport News, 20,205 and 20,504; Danville, 19,020 and 19,859; Alexandria, 15,329 and 15,751; Staunton, 10,604 and 11,485.

Education. The task of popular education in Virginia, as in the other Southern States, is a difficult one, partly on account of the large illiterate negro population and partly from the preponderance of a widely scattered rural population. There were, in 1910, 232,911 persons, or 10.2 per cent of the population, of 10 years of age or over who could not read or write. In 1910 the illiterate whites of native parentage numbered 81,105, or 8.2 per cent. There were in the same year 148,950 illiterate negroes, or 30 per cent. The school population (ages 6 to 20) in 1910 was 697,649. Of these 392,499, or 56.3 per cent, attended school. The population of school age (ages 7 to 19 inclusive) in 1915, according to statistics furnished by the State Superintendent of Schools, numbered 657,513, of whom 470,000 were enrolled in the public schools. The schoolhouses numbered 6733 and the teachers 12,506. There were 12,343 schools, including primary, grammar, and high schools, 11 agricultural high schools, and 6 normal training schools. The expenditures for the schools' support in 1915 were $7,201,768.43. The colored schools in the State have made considerable progress in recent years, through the assistance derived from the Jeanes Fund, Hampton Institute, and large private contributions from the colored people themselves.

The system of standardized high schools receives liberal aid from the State. Provision is made for medical inspection, consolidation of schools, agricultural and normal-training courses in high schools, and a uniform system for the certification of teachers. The consolidation of schools has resulted in greatly improved conditions in the rural districts. There were 11 agricultural high schools in the State in 1915.

The school system is administered by a State Board of Education, a superintendent of public instruction, division superintendent of schools, and county, district, and city school boards. Valuable service is performed by the Coöperative Education Association in arousing public interest in education and reënforcing the efforts of school authorities for betterment of the schools. There are State normal schools for women at Farmville, Harrisonburg, Fredericksburg, and Radford, while the College of William and Mary offers normal instruction to men. The Virginia Normal and Industrial Institute at Petersburg provides training for male and female teachers of the negro race. The Hampton Normal and Agricultural Institute at Hampton is also for colored persons. There are many institutions of collegiate rank in the State. Of these the more important are the University of Virginia at Charlottesville, Richmond College at Westhampton (a suburb of Richmond), Randolph-Macon College at Ashland, Hampden-Sidney College at Hampden-Sidney, Washington and Lee University of Lexington, College of William and Mary at Williamsburg. These are all for men only. Standard colleges for women are the Martha Washington College at Abingdon, Hollins College at Hollins, Randolph-Macon Women's College at Lynchburg, Westhampton College at Westhampton, Elizabeth College at Salem, and Sweet Briar Institute at Sweet Briar. The Virginia Polytechnic Institute at Blacksburg is an institution for scientific and agricultural training, while the Virginia Military Institute at Lexington offers military as well as technical instruction.

Charities and Corrections. The supervision of the charitable and correctional institutions is in the hands of the State Board of Charities and Corrections. These institutions include the Virginia Penitentiary at Richmond, the State

Farm at Lassiter Post Office, the Central State Hospital at Petersburg, the Eastern State Hospital at Williamsburg, the Southwestern State Hospital at Marion, the Western State Hospital at Staunton, the Virginia State Epileptic Colony and Virginia Colony for the Feeble-Minded at Madison Heights, and the Catawba Sanatorium at Catawba. Educational institutions under the supervision of the board are the Virginia School for the Deaf and Blind at Staunton, the State School for the Colored Deaf and Blind at Newport News, and the Virginia Home and Industrial School for Girls at Bon Air. Institutions supported by the State, but owned and controlled by independent boards, are the Laurel Industrial School at School Post Office, the Negro Reformatory Association of Virginia at Hanover, the Industrial Home and School for Wayward Colored Girls at Peaks, and the R. E. Lee Camp Soldiers Home. Convicts are employed at work on the State roads. The State Board also has supervision over city and county almshouses and jails.

Religion. The Baptists number about one-half of the religious communicants, while the Methodists represent about one-fourth. Other important denominations, but much less numerous, are the Presbyterians, the Roman Catholics, and the Episcopalians.

History. The name of Virginia was given by Queen Elizabeth to the country explored by the expedition under Amadas and Barlow, sent out by Sir Walter Raleigh in 1584. (See NORTH CAROLINA.) Virginia in history proper begins, however, with the grant by James I on April 10, 1606, of territory 200 miles wide, between lat. 34° and 45° N., to two companies, usually called, from the residences of their chief incorporators, the London and the Plymouth companies. (See MASSACHUSETTS.) By this charter the London Company could colonize between 34° and 41° and the Plymouth between 38° and 45°, provided the Colonies were 100 miles apart. The government was vested in a Royal Council of Virginia in London, superior to resident councils nominated by the crown and governing by royal instructions. Sealed instructions provided for a local constitution and an annual president in the Colony. The land was to be held in free and common socage, and the settlers and their children were "forever to enjoy all liberties, franchises, and immunities enjoyed by Englishmen in England." The Virginia Company of London, holding the southern grant, was organized under Sir Thomas Smith, treasurer. With its Colony, 120 emigrants in three ships, Christopher Newport cleared England, December-February, 1607, reaching Cape Henry, April 26, 1607. Having explored Chesapeake Bay, they entered James River and founded on a peninsula 40 miles up the river Jamestown (Jamesfort), May 14, 1607, the first permanent English settlement in America. Malaria, Indian hostility, unaccustomed labor, and insufficient provisions left on Newport's return to England, reduced the Colony to half by September. Dissensions arose, and when Captain Newport returned, Jan. 12, 1608, bringing "near 100" more men, only 38 were left, Wingfield was a prisoner, Smith condemned, and Archer's "parliament" summoned. In the latter part of 1608 the Indians refused to sell corn, and but for the energy and tact of Capt. John Smith (q.v.) as president the Colony must have perished. In 1609 a new charter strictly incorporated the London Company, enlarged its territory, and vested the Colony's government in the company's Treasurer and Council in London, endowed with sovereign powers. On June 1, 1609, large reënforcements were sent, consisting of nine ships carrying 500 persons, including women and children. One ship sank, and one was wrecked on the Bermudas, now discovered by Somers. Seven ships with 300 persons reached Jamestown, and Smith returned to England on one of these ships. The winter was known as the "starving time," and the Colony was reduced from 500 to 60 within six months. Though 140 arrived in the *Sea-Venture*, Lieutenant Governor Gates abandoned Jamestown, June 7, 1610, and was halted only by the opportune arrival of Lord Delaware, the Governor. Delaware left George Percy as Deputy Governor in 1611 with some 150 colonists. Percy was succeeded by Sir Thomas Dale and Sir Thomas Gates.

Dale and Gates brought 500 colonists with cattle, built new towns (Henrico, Bermuda, Charles City), and by Dale's harsh martial rule effectually quelled lawlessness. Communism remained, but favored classes (officers, tenants, farmers, artisans) in 1613 and 1616 received conditional freedom for self-maintenance. A new charter in 1612 had added the Bermudas, established elective and legislative courts in the company, exempted it from duties, and authorized lotteries. John Rolfe established tobacco culture, and his marriage (1613) to Pocahontas, daughter of the powerful Indian sachem Powhatan, won that chief and further brightened Colonial prospects. Mismanagement by Sir Thomas Smith and the court party produced dissensions in the company; Sir Edwin Sandys (q.v.) and the popular party gained control in 1618 and commissioned Sir George Yeardley Governor to replace the rapacious Argall and establish personal freedom. On July 30, 1619, the first representative assembly in America (a Council elected by the company and a House of Burgesses chosen by the free colonists) met. The same year 21 negro servants (see SERVITUDE) were introduced by Dutch and English privateers. Women were sent as wives to the Virginia settlers, the husband paying 120 pounds of tobacco for his wife. The Laws of 1619 were approved by the company, and in 1621 a written constitution, the work of Sir Edwin Sandys, was granted. By 1620 the population of the Colony had reached 4000, including apprentices, indented servants, and some petty convicts sent over by the King, who was becoming bitterly hostile to the company. In the midst of this prosperity the Indians rose and massacred "about 400" of the settlers, March 22, 1622. The King's hostility to democracy in the company led to quo warranto proceedings in 1624. The charter was revoked June 26, and Virginia became a royal Colony.

Charles I (1625) reëstablished the government under two councils, depriving the Virginians of control over public officials and expenditures; but their acquiescence in his ecclesiastical and civil policy, and royal revenues from tobacco won his favor. His reign was marked also by the settlement of some Puritans in northeast Virginia, and by the grant of a part of the territory to Lord Baltimore in 1632. William Claiborne seized and claimed disputed territory, Kent Island, for Virginia, having settled it in

1631. Maryland by force and diplomacy from 1634 to 1654 vindicated her claims. A popular insurrection deposed Governor Harvey, who was arbitrary and supported Maryland. Though reinstated, he was soon (1639) succeeded by Sir Francis Wyatt. With the coming of Sir William Berkeley as Governor in 1642, a strong figure appears. The divine right of the King and the maintenance of the Established church were his creed. He captured Opechancano, who in his second massacre (1644) had killed 300 colonists and driven many Puritans into Maryland and New England. On the execution of Charles I thousands of cavaliers flocked to Virginia. Its Assembly alone resisted Parliament and declared guilty of treason all persons refusing to acknowledge the "King that now is." In retaliation Parliament in 1650 forbade all trade with Virginia and appointed (1651) four commissioners (two in Virginia) to force the surrender of the Colony. Virginia surrendered (1652) to Commissioners Bennett and Claiborne, stipulating that the act be regarded as "voluntary," not a "conquest," that full indemnity be granted, a year without oath be allowed for dissatisfied persons to remove, the use of the Prayer Book be permitted for a year, and that Virginia enjoy her ancient boundaries. In reality during the whole period of the Commonwealth the Assembly elected the governors and there was entire religious and political toleration. The circumstance of acknowledging Charles II sooner than any other part of the kingdom gave to Virginia the name of the Old Dominion. On the collapse of the Commonwealth the loyal Assembly elected Berkeley Governor before Charles II was crowned. Charles encouraged the servant and slave traffic, burdened the Colony with navigation acts (1663–72), and granted it in part to court favorites and wholly in 1673 for 31 years to Lords Arlington and Culpeper. These acts, restriction of the suffrage to freeholders, and Berkeley's refusal to protect the frontier from Indians precipitated a popular rebellion. Nathaniel Bacon (q.v.) asked for a commission to go against the savages in 1676, and, when it was refused, made a successful campaign without authority. Berkeley evasively answered a second popular demand for Bacon's commission, and upon his advance against the Indians proclaimed him and his forces rebels. A contest for the possession of Jamestown ensued. Bacon won, established a government, burned Jamestown to defeat Berkeley, and, preparing to pursue him to Accomac, suddenly died from previous hardships. Rumors of his poisoning are discredited. Berkeley regained power and took severe measures against his opponents, of whom 23 were executed, eliciting from Charles II the remark, "That old fool has hanged more men in that naked country than I have done for the murder of my father."

After this war on Berkeley and the crown, and reconstruction by English commissioners, royal governors (Jeffreys, Chicheley, and Culpeper) by incompetence or rapacity increased popular dissatisfaction. In 1677 a lasting Indian peace was secured, and in 1692 William and Mary College, the second oldest college in America, was chartered. A striking exception among royal governors was Alexander Spotswood (1710–22). He led the Knights of the Golden Horseshoe over the Blue Ridge in 1716, established iron manufactures, aided the Carolina colonists in their struggle with the Tuscarora Indians, and sent out an expedition which killed the notorious pirate John Teach (Blackbeard) and captured his men. The first newspaper in the Colony (the Virginia *Gazette*) was established in 1736, and Postmaster-General Spotswood organized a postal system in 1738. The population had steadily increased and by 1700 was fully 70,000, chiefly of English descent. In 1699 the Huguenot immigration was large, and under Queen Anne a number of German Palatines came over. After 1732 large numbers of sturdy Scotch-Irish and Germans from Pennsylvania filled the valley and piedmont Virginia with dissenters, liberty-loving freehold farmers, restive under British oppression. Col. William Byrd's project (1733) for founding Richmond and Petersburg instances expanding English settlement. The great article of export from the Colony was tobacco, the returns from its sale enabling the wealthier planters to surround themselves with luxuries of every kind and the refinements of European civilization.

The Charter of 1609 had fixed the limits of the Colony at 200 miles north and 200 miles south of Point Comfort and west and northwest from sea to sea. Under this vague description Virginia claimed that the northwest line was the upper one, and hence her territory increased as it went westward. Maryland and Pennsylvania had included territory that she claimed, but her title to the northwest was undisputed until French colonization expanded. Towards the middle of the eighteenth century English occupation of the territory began. The Ohio Company (chiefly Marylanders and Virginians) was formed in 1749, for the exploration of the territory which the French also claimed by Marquette's discovery. (See OHIO.) George Washington was sent by Governor Dinwiddie in 1753 to ask the removal of the French forts, but to no purpose. The French and Indian War (q.v.) followed. The Virginians saved Braddock's army from utter annihilation, and the pioneers organized by Washington held the Virginia frontier against the Indians and the French. Settlements were constantly made beyond the Alleghanies in spite of the King's proclamation in 1763. From 1750 to 1769 Walker, Gist, and Boone explored here. Kentucky was made a separate county of Virginia through the influence of George Rogers Clark in 1776.

On the announcement of the policy of parliamentary taxation of America Virginia became a leader in resistance. The colonists' claim of the rights of Englishmen and full representation, and pride in the Colony's relative position made her taxation without representation impossible. Patrick Henry (q.v.) and the jury in the Parsons' Cause defied the King. Henry's famous speech in opposition to the Stamp Act, delivered (1765) in the House of Burgesses at Williamsburg, was quoted everywhere, and three of his five resolutions were adopted denying Parliament's right to tax. They were heralded as the first important protest against this tax. "Virginia gave the signal to the continent," said General Gage. The Burgesses memorialized King and Parliament against the Tax Act of 1767 and in 1769 passed resolutions against this parliamentary "tyranny" and transportation of offenders to England for trial. They proposed Colonial correspondence and circulated an invitation for Colonial concurrence. Dissolved by Governor Botetourt, they met in revolutionary convention at the Raleigh Tavern and signed

and circulated Mason's nonimportation agreement. After the rude and unscrupulous Lord Dunmore succeeded Botetourt, the Assembly in 1773 appointed a standing legislative Committee of Correspondence (Jefferson, Lee, Carr, and others) for Colonial concert. When the news of the Boston Port Bill arrived, the Assembly passed sympathetic resolutions and was promptly dissolved (1774) by Dunmore. Its members met at the Raleigh Tavern and proposed a Virginia convention for August and a general congress of the Colonies. Committees of safety were organized and forces raised in every county. Dunmore attempted disarmament by seizing the magazine and removing the gunpowder, but was driven by a mob (June, 1775) to take refuge on shipboard. George Washington was elected commander in chief of the Continental armies, Patrick Henry of the Virginia forces, and in the Colony a remarkable group of leaders was developed (Jefferson, Henry, Richard Henry Lee, George Mason, Edmund Pendleton, and others) who pushed Virginia towards independence. Colonel Woodford defeated the British at Great Bridge, and Dunmore burned Norfolk, but was driven from Virginia by Andrew Lewis (1776). A State convention met in May, 1776, and passed resolutions asking Congress for a Declaration of Independence, afterward moved by R. H. Lee and drafted by Jefferson. On June 15 the convention adopted Mason's famous Virginia Declaration of Rights. This was followed by the adoption of a constitution on the 29th. Patrick Henry became Governor, and Jefferson afterward secured acts for religious freedom and the abolition of entails. Virginia troops won distinction in the battles of Brandywine and Saratoga, and George Rogers Clark captured (1778 and 1779) the Northwest Territory for Virginia, furnishing the United States its title by conquest against British claims. Virginia was invaded in 1781. Benedict Arnold burned Richmond, and Tarleton's cavalry devastated the James River region and nearly captured Governor Jefferson and the Assembly at Charlottesville. Finally Cornwallis was penned in at Yorktown and surrendered. The conflicting claims of other Colonies and land companies and the refusal of Maryland otherwise to join the Confederation led Virginia (1781–83) to cede her Northwest Territory to the Union, reserving only a small portion to her veterans. The transfer was conditioned on the erection therein of new States and was formally executed March, 1784.

Virginia was prominent in advocating a general convention to make necessary changes in the Articles of Confederation. When that body produced the Constitution of the United States, many able patriots (Lee, Mason, Monroe, and particularly Patrick Henry) bitterly opposed its ratification as destructive to State rights. Finally, after long debate, it was ratified, June 25, 1788, but by only 10 majority and chiefly through the ardent championship of James Madison. The addition of a Bill of Rights and 20 amendments was recommended. Lee, Grayson, and Madison helped to secure the first 10 amendments to the Constitution. The State was jealous of its rights, and on account of the passage of the Alien and Sedition Acts (q.v.) in 1798, put forward Madison's Virginia Resolutions (see VIRGINIA AND KENTUCKY RESOLUTIONS), which declared for a strict construction of the Constitution. Priority of settlement, character and amount of population, valuable staples, and distinguished men made the Colony powerful and kept the State prominent in the early years of the Republic. During the first 36 years of the nation a Virginian was President for 32, and the proportion of her citizens in other high offices was very large. The title "Mother of Presidents" as well as "Mother of States and Statesmen" seems deserved. The famous trials of John T. Callender and Aaron Burr at Richmond in 1806 intensified issues between Federalists and Republicans and brought into prominence John Marshall and John Randolph of Roanoke. The burning of the Richmond Theatre marked 1811 with public mourning. In 1813 Admiral Cockburn was repulsed at Craney Island and Norfolk saved from the British. The University of Virginia, planned by Thomas Jefferson and founded in 1819, was the first American university for advanced work. Slavery had been recognized by statute in 1661, but Virginia's first Assembly had prohibited the slave trade (1778), and Jefferson in his joint revision of the Virginia Code with Wythe and Pendleton in 1779 proposed emancipation and colonization of slaves. In 1796 St. George Tucker offered another plan for the abolition of slavery, while Monroe, Randolph, and the Legislature promoted the African Colonization Society (1800–16). A slave, Gabriel, futilely plotted (1800) to massacre the whites of Richmond. In 1831 an insurrection (see TURNER, NAT) by 40 negroes in Southampton County killed 60 persons, alarming Virginia and the South. Thomas Jefferson Randolph's bill for emancipation was fully and freely discussed with other plans and lost by a mere majority. In the Federal convention Virginia had fought for the immediate prohibition of the slave trade against a combination of New England and the extreme South demanding extension. A new or amended constitution, adopted by the State convention (1830), extended the suffrage, and its work was continued by a similar convention in 1850. This emphasized the opposition between eastern and western Virginia on the question of a mixed basis or white basis for representation and, reagitated by the Legislature (1845–46), hastened their separation in 1862. During nullification Virginia opposed the coercion of South Carolina, but endeavored to act as a pacificator.

In spite of the capture of Harper's Ferry in 1859 by John Brown (q.v.) and his plan to raise a general slave insurrection, the State opposed secession. It suggested the peace convention of the States and sent commissioners to Washington to endeavor to prevent hostilities. The State convention met Feb. 13, 1861, and as late as April 1 it voted (89 to 45) against secession. Two days after President Lincoln's call for troops to coerce the seceding States, an ordinance of secession and adhesion to the Confederacy was voted (88 to 45), April 17, which was ratified by a popular majority of 16,241. Meanwhile a temporary convention was formed with the Confederate government in July, 1861. Robert E. Lee followed his State and eventually became commander in chief of the Confederate army. Richmond became the strategic capital, and Virginia a great battleground of the Confederacy. Western Virginia had little sympathy with secession, and on May 13 delegates from 25 counties met at Wheeling, declared the ordinance of secession null and void, and called a convention to meet June 11, which elected Francis H. Pierpont (q.v.) Governor. Later the Restored Gov-

ernment of Virginia was established. Pierpont continued to exercise his office until the establishment of West Virginia (q.v.) as a separate State. In 1863 he moved his government to Alexandria under the guns of Washington and asserted authority over those counties within the Federal lines, and in 1864 a new constitution was adopted by these counties. At the close of the war Pierpont was recognized by the Federal authorities as the lawful Governor and moved to Richmond; he put the constitution of 1864 into limited effect, military authority still being paramount.

The Reconstruction Acts gave negroes the right to vote for convention delegates, and a new constitution was adopted in 1868 embodying negro suffrage and other new features, but so great was the popular feeling against it that it was not submitted to the people until a new act of Congress allowed a separate vote on the disfranchising clauses. These were rejected, but the State was readmitted Jan. 26, 1870, and at once came under control of the native-born whites. Trouble began, however, with legislation regarding the State debt. (See *Finances.*) In 1901–02 a constitutional convention was held, having for its chief objects retrenchment and suffrage restriction. The new constitution was proclaimed without submission to the people, May 19, 1902. One result was largely to suppress the negro vote. From the beginning the State has been Democratic in national politics. The hold was never broken until 1860, when the vote was cast for the Constitutional Union candidate, John Bell. Since its readmission the vote has been steadily cast for the Democratic national candidates, with the exception of 1872, when the Republican candidate, Grant, was preferred to Greeley, an old Abolitionist.

The chief political activity since 1905 has centred about the question of railroad regulation and prohibition. In 1907 a conflict arose between the Federal and State governments over the question of enforced legislation. (See STATE RIGHTS.) In the presidential election of 1908 Bryan received 82,906 votes and Taft 52,573. In November, 1909, William H. Mann, Democratic candidate, was elected Governor. In the presidential election of 1912 Wilson received 90,332 votes, Taft 23,888, and Roosevelt, 21,777. Henry C. Stuart, Democrat, was elected Governor on Nov. 4, 1913. On Nov. 22, 1914, a measure providing for State-wide prohibition was adopted by the people, to go into effect on Nov. 1, 1916.

GOVERNORS OF VIRGINIA

UNDER THE COMPANY

Edward Maria Wingfield, President King's Council	1607
John Ratcliffe, President King's Council	1607–08
Capt. John Smith, President King's Council	1608–09
Capt. George Percy, President King's Council	1609–10
Sir Thos. Gates, Deputy Governor	1610
Thomas West, Lord Delaware, Lord Governor	1610–11
Thomas West, Lord Delaware, Lord Governor (absentee)	1611–18
Capt. George Percy, Deputy Governor	1611
Sir Thomas Dale, High Marshal, Deputy Governor	1611
Sir Thomas Gates, Lieutenant Governor	1611–14
Sir Thomas Dale, Marshal and Deputy Governor	1614–16
George Yeardley, Deputy Governor	1616–17
Capt. Samuel Argall, Admiral and Deputy Governor	1617–19
Nathaniel Powell, President of Council	1619
Sir George Yeardley, Governor	1619–21
Sir Francis Wyatt, Governor	1621–24

UNDER THE CROWN

Sir Francis Wyatt, Governor	1624–26
Sir George Yeardley, Governor	1626–27
Francis West (elected by Council)	1627–29
John Pott (elected by Council)	1629–30
Sir John Harvey, Governor	1630–35
John West (elected by Council)	1635–36
Sir John Harvey, Governor	1636–39
Sir Francis Wyatt, Governor	1639–42
Sir William Berkeley, Governor	1642–44
Richard Kempe, President of Council	1644–45
Sir William Berkeley, Governor	1645–52

UNDER THE COMMONWEALTH

Richard Bennett, Governor	1652–55
Edward Digges, Governor	1655–58
Samuel Matthews, Governor	1658–60

UNDER THE CROWN

Sir William Berkeley, Governor	1660–61
Francis Morrison or Moryson (acting)	1661–62
Sir William Berkeley	1662–77
Herbert Jeffreys, Lieutenant Governor	1677–78
Sir Henry Chicheley, Deputy Governor	1678–80
Thomas, Lord Culpeper, Governor	1680–83
Nicholas Spencer, President of Council	1683–84
Francis, Lord Howard of Effingham, Governor	1684–88
Nathaniel Bacon, Sr., President of Council	1688–90
Francis Nicholson, Lieutenant Governor	1690–92
Sir Edmund Andros, Governor	1692–98
Francis Nicholson, Lieutenant Governor	1698–1705
Geo. Hamilton, Earl of Orkney, Governor (absentee)	1704–37
Edward Nott, Lieutenant Governor	1705–06
Edmund Jenings, President of Council; Lieutenant Governor after 1708	1706–10
Robert Hunter, Lieutenant Governor (appointed but captured by the French)	1707
Alexander Spotswood, Lieutenant Governor	1710–22
Hugh Drysdale, Lieutenant Governor	1722–26
Robert Carter, President of Council	1726–27
William Gooch, Lieutenant Governor	1727–40
William Keppel, 2d Earl of Albemarle, Governor (absentee)	1737–54
James Blair, President of Council	1740–41
Sir William Gooch, Lieutenant Governor	1741–49
John Robinson, President of Council	1749
Thomas Lee, President of Council	1749–51
Lewis Burwell, President of Council	1751
Robert Dinwiddie, Lieutenant Governor	1751–58
John Campbell, Earl of Loudoun, Governor (absentee)	1756–63
John Blair, President of Council	1758
Francis Fauquier, Lieutenant Governor	1758–68
Sir Jeffrey Amherst, Governor in Chief (absentee)	1763–68
John Blair, President of Council	1768
Norborne Berkeley, Baron Botetourt, Governor in Chief	1768–70
William Nelson, President of Council	1770–71
John Murray, Earl of Dunmore, Governor in Chief	1771–75
Interregnum	1775–76

STATE

Patrick Henry			1776–79
Thomas Jefferson			1779–81
Thomas Nelson, Jr.			1781
Benjamin Harrison			1781–84
Patrick Henry			1784–86
Edmund Randolph			1786–88

VIRGINIA, UNIVERSITY OF. An undenominational institution of higher learning at Charlottesville, Va., 4 miles from Monticello, the home of Thomas Jefferson, its founder. It was chartered in 1819 and opened in 1825. The group of college buildings, planned by Jefferson and erected under his personal supervision, together with the recent additions made to harmonize with and complete his designs, constitute one of the most characteristic and artistic pieces of academic architecture in America. The quadrangle is about 1000 feet long and 300 feet wide. The dominant structure is the Rotunda, set centrally at the northern end, and modeled from the Roman Pantheon. It is now devoted to the university library. The courses of instruction are comprised in five departments: academic, engineering, law, medicine, and agriculture, comprising in all 24 schools, of which each affords an independent course under professors who are responsible only to the board of visitors, appointed by the Governor. The courses are purely elective. The degrees of bachelor of arts, law, and science, master of arts, doctor of philosophy, medicine, civil, mechanical, mining, and electrical engineer are conferred only upon examination after residence. No honorary degrees are given. Qualified persons may be licensed by the faculty to form classes for private instruction in any school of the university. The university had in 1916 a student attendance of 1050 with 79 instructors, and a library of 100,000 volumes. In the same year its endowment was $2,211,472, its income $350,000, and its grounds, buildings, and equipment were valued at $2,207,000. The president in 1916 was E. N. Waterman, D.C.L., LL.D.

VIRGINIA AND KENTUCKY RESOLUTIONS. Two series of resolutions adopted in 1798 and 1799 by the Legislatures of Kentucky and Virginia in protest against legislation by Congress and in support of the strict constructionist view of the constitution. The resolutions were called forth by the steady extension of the powers of the Federal government at the expense of the States as a result of the liberal interpretation which the Federalist authorities were placing upon the constitution, and in particular by the enactment of the Alien and Sedition Acts (q.v.) in 1798. The Kentucky Resolutions were nine in number, were drafted by Thomas Jefferson, then Vice President, and were adopted by the Legislature in November, 1798. They affirmed that the Union was a compact; that whenever the Federal government assumed undelegated powers its acts were unauthoritative, void, and of no force; that the government was not the exclusive or final judge of the extent of the powers delegated to itself, since its discretion and not the constitution would then be the measure of its powers; but that, as in all other cases of compact among parties having no common judge, each party had an equal right to judge for itself as well of infractions as of the mode and measure of redress. The resolutions then formally denied the power of

Congress to pass the Alien and Sedition Acts, and declared that these acts were void and of no force. In the following year the Kentucky Legislature further resolved that "the several States, being sovereign and independent, have the unquestionable right to judge of the infractions of the constitution; and that a nullification by those sovereignties of all unauthorized acts done under color of that instrument is the rightful remedy."

The Virginia Resolutions, passed in December, 1798, were eight in number, were drafted by Madison, and were much milder in tone. They described the Union, however, as a compact, and declared that in case of a deliberate, palpable, and dangerous exercise of powers not granted by the said compact, the States, as parties thereto, had the right, and were in duty bound, to interpose for arresting the progress of the evil and for maintaining the rights and liberties appertaining to them. The resolutions of the two States were transmitted to the executives of the other States to be laid before their respective Legislatures. Responses were made by Delaware, Rhode Island, Massachusetts, New York, Connecticut, New Hampshire, and Vermont, but none of them were sympathetic, that of Massachusetts expressly denying the right of the State Legislature "to judge of the acts and measures of the Federal Government." Only Vermont, however, denied the compact theory of the Union. The replies of the various States were referred to a committee of the Virginia Legislature of which Madison was chairman, and on Jan. 7, 1800, this committee made an elaborate report. The texts of the resolutions may be found in Macdonald, *Select Documents of United States History, 1776–1861* (New York, 1898); Jefferson's draft of the Kentucky Resolutions may be found in Jefferson's *Works*, vol. ix (ed. 1856); and the answers of the State Legislatures and the text of Madison's report of 1800 are given in Elliot's *Debates*, vol. iv (ed. 1836). Consult: Warfield, *Kentucky Resolutions of 1798* (New York, 1887); Von Holst, *Constitutional History of the United States*, vol. i (Chicago, new ed., 1899); Bassett, *Federalist Supremacy* (New York, 1906).

VIRGINIA CITY. A city and the county seat of Storey Co., Nev., 52 miles southeast of Reno, on the Virginia and Truckee Railroad. It is situated at an elevation of 6205 feet in a region noted for its extensive mineral deposits (Map: Nevada, B 3). The mines here, known as the Comstock Lode (q.v.), were discovered in 1859, and the consolidated output since 1860 has been $900,000,000. The most important shaft in the belt is the Virginia, which for 40 consecutive months produced $1,800,000 worth of ore. The courthouse, the School of Mines, and the Miners' Union Library are noteworthy features of the city. Virginia City grew up around the Comstock Lode, and was called successively Ophir and Washoe. It received its present name from James Finney, an early settler who was familiarly known as Old Virginia. Pop., 1900, 2695; 1910, 2244.

VIRGINIA CREEPER. See IVY.

VIRGINIA MILITARY INSTITUTE. A State institution at Lexington, Va., established in 1839, when the General Assembly, in place of the company of soldiers hitherto stationed at the western arsenal at Lexington, authorized the creation of a company of cadets, who, in addition to the duties of an armed guard, should pursue a course of scientific and military studies. In 1861 the cadets marched for Richmond and were employed in drilling the recruits at Camp Lee. The school was reopened in 1862 on the demand of the Confederate military authorities, but was burned by order of Gen. David Hunter in 1864. After the close of the war the buildings were restored and the course of instruction was enlarged and extended. The courses are partly prescribed and partly elective. A cadet who attains the prescribed proficiency in one of the elective courses, in addition to the degree of graduate, may receive the degree of bachelor of science or bachelor of arts. Nearly the whole body of graduates prior to 1865 were officers in the Confederate army. Since 1898 about 170 alumni of the institute have been officers in the United States armies. Stonewall Jackson was professor of physics and artillery instruction from 1851 to 1861. The institute in 1916 had 390 cadets, 25 instructors, and a library of 14,000 volumes. Its grounds and buildings were valued at $775,000. It has no endowment, being supported by the State. The superintendent in 1916 was E. W. Nichols.

VIRGIN'IANS, THE. An historical novel by Thackeray, a sequel to *Henry Esmond*. It was published in 1859, with illustrations by the author.

VIRGINIA POLYTECHNIC INSTITUTE AND AGRICULTURAL AND MECHANICAL COLLEGE. An institution for scientific and agricultural training, founded in 1872 under the Morrill Land Grant Act of 1862. It offers courses in general science, agriculture, horticulture, applied biology, applied chemistry, veterinary medicine, chemical engineering, agricultural engineering, applied geology, applied metallurgy, civil, mechanical, electrical, and mining engineering, and shorter courses in agriculture. Agriculture, engineering, and the applied sciences are given the foremost place in the curriculum, but every course includes elements of general culture. They are all arranged so as to give as nearly as possible an equal amount of lecture work, and of laboratory and field work. The degrees conferred are B.S. in the undergraduate work, and M.S., M.E., E.E., C.E., and E.M. for graduate work. Students are required to take military drill. The total enrollment in all departments in 1915–16 was 567, and the instructors numbered 53. The value of the property is about $1,000,000, and the annual gross income about $220,000. The library contains 26,000 bound volumes, and 80,000 pamphlets. The president in 1916 was G. D. Eggleston, A.M.

VIRGINIA RAIL. See RAIL.

VIRGINIA SNAKE ROOT. See ARISTOLOCHIA; SERPENTARIA.

VIRGINIA THEOLOGICAL SEMINARY. A seminary of the Protestant Episcopal church, near Alexandria, Va. It had its inception in 1815, began its work in 1818, was transferred to the College of William and Mary in 1821, and removed to Alexandria in 1823. In 1827 the seminary was removed to its present location. In 1854 it received from the Legislature a charter the provisions of which were enlarged in 1884. Since 1899 it has granted the degree B.D. to graduating students who have attained a certain high standing. It also confers the honorary degree of Doctor of Divinity. In 1916 the faculty numbered 6, the students 46, and the alumni 1199, of whom 586 were living. The

endowment fund amounted to $500,000, exclusive of a library fund, and the library comprised about 30,000 volumes. The entrance requirements are relatively high and the course of study occupies three years. The seminary holds a unique work, having founded all the foreign missions of the Episcopal church. Of its alumni, 38 in 1916 had been advanced to the episcopate, including Phillips Brooks, Bishop of Massachusetts, and Henry C. Potter, Bishop of New York.

VIRGIN ISLANDS. A group of the Leeward Islands, consisting of upward of 100 islands, situated immediately east of Porto Rico (Map: West Indies, F 3). The area is estimated at about 465 square miles, of which one-third is inhabited and under cultivation. The climate is comparatively healthful. There are two wet and two dry seasons. Hurricanes and earthquakes are somewhat frequent. In the geological formation figure chalk limestone, serpentine, and eruptive stone. The coasts afford good fishing, nut trees abound in the forests, and there is fine pasturage. Among the exports are sugar, indigo, cotton, and salt. St. Croix, St. Thomas, and St. John belong to Denmark; Culebra, Culebrita, and Vieques to the United States (formerly to Spain); and the rest of the group, Tortola, Virgin, Gorda, and Anegada, to Great Britain. Pop., about 40,000. The Virgin Islands were discovered by Columbus in 1494. See WEST INDIES; WEST INDIES, DANISH.

VIRGIN'IUS. A tragedy by James Sheridan Knowles, produced at Covent Garden, May 17, 1820, with Macready as Virginius, Miss Foote as Virginia, and Charles Kemble as Icilius.

VIRGIN'IUS, LUCIUS. A Roman centurion, who killed his daughter to prevent her falling into the hands of the decemvir Appius Claudius Crassus. The story has been a favorite theme. It was the subject of tragedies by the French authors Mairet, Leclerc, and Campistron in the seventeenth century. Lessing in 1772 cast it in a modern Italian setting; and it was also treated by Alfieri in Italy (1773), by Miss Brooke in England (1760), and in France by La Beaumelle (1760), Chabanon (1769), Laharpe (1786), Guiraud (1827), and Latour Saint-Ybars (1845). See also APPIUS AND VIRGINIA.

VIRGINIUS MASSACRE. On Oct. 31, 1873, the *Virginius*, a vessel flying the United States flag, owned by an American, and commanded by Captain Fry, an American citizen, which was carrying arms and men to the aid of the Cuban insurgents, was captured on the high seas off Jamaica by the Spanish man-of-war *Tornado*, and was taken into the port of Santiago de Cuba, where on November 4 four leaders of the Cuban patriots, Céspedes, Ryan, Varona, and Del Sal, who had been captured on board, were executed in pursuance, it was claimed, of prior sentences. The remainder of the passengers and the crew were then hastily tried on a charge of piracy, and on November 7 and 8 Captain Fry, 36 of the crew, and 16 of the passengers were summarily executed, eight of the victims being American citizens. Further executions were prevented by the timely arrival of the British sloop *Niobe*, whose commander, Sir Lampton Lorraine, forced the Spanish officer, General Buriel, to reprieve the remainder of the prisoners. The affair caused widespread excitement in the United States, where the feeling against Spain was already strong by reason of the latter's course in Cuba, and for weeks war seemed imminent; but, after protracted negotiations, a peaceful settlement was agreed upon, and Spain surrendered to the United States, conditionally, the *Virginius* and the survivors of her passengers and crew. The vessel was overtaken by a storm on its voyage to New York, was abandoned by her crew, and sank off Cape Fear. England exacted and received pecuniary reparation for those of her subjects who were executed. Consult *Message of the President Relating to the Steamer Virginius, with Accompanying Documents* (Washington, 1874), and Rhodes, *History of the United States from the Compromise of 1850*, vol. vii.

VIRGIN MARTYR, THE. A tragedy by Massinger and Dekker, founded on the story of the martyr Dorothea. It was licensed in 1620, printed in quarto in 1621, revived at the Drury Lane in 1668, and adapted in 1715 by Griffin.

VIRGIN QUEEN. A popular and affectionate name given to Queen Elizabeth, suggested by her resolute refusal to marry. The popular conception was adopted by Spenser in the *Faerie Queene*, in his conception of *Belphœbe*.

VIRGIN'S BOWER. See CLEMATIS.

VIRGO, vĕr'gō (Lat., the virgin). The sixth sign of the zodiac (q.v.), denoted by the symbol ♍. The constellation Virgo was known to the ancients. Its principal stars are: α Virginis, or Spica, a star of the first magnitude, attended by a feebly luminous companion; and γ Virginis, a binary with variable components of magnitudes 3.0 and 3.2, their period of revolution being 194 years. There are also several nebulæ, the most interesting being the spiral nebula M 99.

VIRI'ATHUS. A Lusitanian patriot of the second century B.C. Originally a shepherd, he became a guerrilla chief, and supported himself by predatory excursions into the neighboring Spanish territory. This brought him into collision with Rome, and in 151 B.C. the proprætor, Servius Galba, was ordered to reduce the Lusitanians to subjection. At first Viriathus kept mainly to the mountains, and contented himself with harassing the enemy by sudden and fierce descents, but in 147 he gave battle to Vetilius, the Roman proprætor, near Tribola, south of the Tagus, and inflicted on him a severe defeat. In the next two years he repeatedly came off victorious, but in 144 the consul, Q. Fabius Æmilianus, encountered him in Andalusia with a large army and Viriathus was driven back into his native fastnesses. The proprætor, Q. Pompeius, was then sent against Viriathus, but the Roman force was crushed at the hill of Venus, and compelled to take refuge at Corduba, while Viriathus wasted all the country round the Guadalquivir. In 142 the Romans were more fortunate. Q. Fabius Servilianus, the consul, succeeded in driving Viriathus once more out of Spain and in annihilating several guerrilla bands: but in 141 the whole of his army was surrounded in a mountain pass and forced to surrender. Viriathus released his captives on condition that Servilianus would allow the Lusitanians to retain their independence. In 140 the consul, Q. Servilius Cæpio (brother of Servilianus), having received the command in Farther Spain, resumed the war against Viriathus, and bribed some Lusitanian envoys to murder their master, which they did while he lay sleeping in his tent. His death

was practically the end of Lusitanian independence. See LUSITANIA.

VIRICONIUM. See URICONIUM.

VI'RI RO'MÆ (Lat., Men of Rome). A popular Latin schoolbook compiled in the eighteenth century by Charles François Lhomond, a professor of the University of Paris. The material is taken from the works of various authors, chiefly Livy and Eutropius, simplified in language and construction.

VI'RUS (Lat., poison, venom, slime). The term used in medicine to denote a palpable morbid product causative of a contagious disease. If the contagium be fixed it is called a virus, while miasm was thought to be volatile. The term "virus" is still applied to the infective agents which cause smallpox, measles, etc., when the specific microörganism concerned has not been identified or is ultramicroscopic.

Virus is also used as a synonym of lymph, in speaking of vaccine material. We also speak of the virus of syphilis, glanders, hydrophobia, etc., meaning the morbific fluid which contains the germs of these diseases and is capable of propagating them if inoculated into the human body. In this way a culture of any bacteria may loosely be called a virus. See BACTERIA; DISEASE, GERM THEORY OF.

VIŚĀKHADATTA, vē-shäk'hà-dŭt'tà. The name of a Sanskrit dramatist, the author of the *Mudrā-rākṣasa,* or Signet Ring of Rākshasa. His date was presumably not later than 800 A.D. The plot of his elaborate drama turns on a political intrigue in the time of Chandragupta, or Sandrocottus (q.v.). The play has been repeatedly edited, as by Telang (Bombay, 1900), and by A. Hillebrandt (Breslau, 1912), and was translated into English by Wilson (London, 1871), into German by L. Fritze (Leipzig, 1886), and into French by V. Henry (Paris, 1888). Consult: Lévi, *Le théâtre indien* (Paris, 1890); A. A. Macdonell, *Sanskrit Literature* (London, 1913); Montgomery Schuyler, *Bibliography of the Sanskrit Drama* (ib., 1906).

VISA'LIA. A city and the county seat of Tulare Co., Cal., 249 miles southeast of San Francisco; on the Atchison, Topeka, and Santa Fe, the Visalia Electric, and the Southern Pacific railroads (Map: California, F 6). It has packing and canning houses, flour mills, and a beet-sugar factory. Pop., 1900, 3085; 1910, 4550.

VISAYA, vī-sä'yà, or **BISAYA.** The name applied to the closely related linguistic groups who inhabit the north coasts of Mindanao and the central islands of the Philippine archipelago. When first encountered by the Spanish they were broken up into many small divisions, each subject to the rule of a petty lord or dato. They understood the working of metals, had developed a crude agriculture, and were carrying on considerable trade with China, Borneo, and Siam. They were in possession of an alphabet and were in other ways somewhat advanced. Because of the habit of tattooing their bodies they were generally referred to by Spanish writers as pintados. They were early converted to the Christian faith, and under the guidance of their Spanish and American teachers made considerable advance towards civilization. See PHILIPPINE ISLANDS.

VISAYAS, vē-sä'yàs, or **BISAYAS.** The central group of the Philippine Islands, lying between Luzon and Mindanao in the Otón or Visayan Sea. It constitutes one of the four main insular groups or territorial divisions of the archipelago, the other three being Luzon with Mindoro, Mindanao with the Sulu Islands, and the Palawan group. The name is derived from the Visaya, the predominating race inhabiting the group. For details, see articles on the separate islands, the chief of which are Sāmar, Bohol, Cebū, Negros, Panay, Romblōn, and Masbate.

VISBY. See WISBY.

VISCACHA, or VIZCACHA, vīs-kä'chà (Sp., probably of Quichua origin). A curious and pretty burrowing rodent (*Lagostomus trichodactylus*) of the chinchilla family, found on the pampas in South America. It is nearly 2 feet long. The colors are varied and on the face are so arranged in masses of light and dark as to give it a very peculiar appearance. The burrows of the viscacha are so numerous and so deep that they constitute a dangerous feature of the pampas to horseback riders; and in general the habits and economy of these animals are like those of the prairie dogs (q.v.). Their fur has some commercial value. Interesting and detailed accounts of them may be found in Darwin, *A Naturalist's Voyage* (London, 1860; new ed., New York, 1908), and in W. H. Hudson, *The Naturalist in La Plata* (4th ed., ib., 1903). See Plate of CAVIES.

VISCAINO. See VIZCAINO.

VIS'CELLI'NUS, SPURIUS CASSIUS. See CASSIUS VISCELLINUS, SPURIUS.

VIS'CEROPTO'SIS. GLÉNARD'S DISEASE, so called after a French physician Frantz Glénard (1819–94). A prolapse or sinking of the abdominal viscera below their natural position. Any or all of the organs may be displaced downward. When the intestines are involved, the condition is known as enteroptosis; when the stomach is found below its normal position, the term gastroptosis is used. The disease exists in all degrees of severity and may give rise to no symptoms whatever. Generally, however, there is loss of appetite, nervous dyspepsia, constipation, or diarrhœa, abdominal distention, headache, vertigo, emaciation, and loss of sleep. Any or all of these symptoms may be present. The condition is brought about by loss of muscular tone, particularly of the abdominal muscles, intestinal autointoxication, with relaxation of the ligaments which hold the viscera in place. In women, tight lacing has been held to be a frequent cause. The symptoms may be alleviated by supporting the organs with a properly applied bandage, or other similar device. Rest in bed, attention to diet, hygiene, exercise, and general muscular upbuilding will cure the majority of cases. In others operation may become necessary.

VISCHER, fish'ĕr, FRIEDRICH THEODOR VON (1807–87). A German critic, born at Ludwigsburg, Württemberg. He was educated at Tübingen, after which he was for a year vicar of the country church of Horrheim, near Vaihingen. He then spent the years 1832 and 1833 in developing his æsthetic taste in the art centres of Germany and Austria. He was successively privatdocent (1836–37) and assistant professor (1837–44) in the University of Tübingen, and in 1844 was appointed professor of æsthetics. The too independent tone of his inaugural lecture, however, caused his suspension for two years. In 1848 he was elected to the National Assembly of Frankfort, where he voted with the Left. In 1855 he was called to the poly-

technic institute of Zurich, and in 1866 to that of Stuttgart. He resumed at the same time the professorship of æsthetics and German literature at Tübingen, but from 1869 taught only at Stuttgart. As a literary critic and student of æsthetics, Vischer was one of the most distinguished members of the Hegelian school. Among his numerous and valuable publications are *Kritische Gänge* (1844; new series, 1860–75); *Aesthetik oder Wissenschaft des Schönen* (1847–58; new ed., 1914); *Faust, der Tragödie dritter Teil* (1862; 4th ed., 1889), a satire on the second part of the tragedy; *Epigramme aus Baden-Baden* (1867); *Der deutsche Krieg 1870–71* (1874); *Goethes Faust: neue Beiträge zur Kritik des Gedichts* (1875); *Auch Einer* (1878; 41st ed., 1908), a novel; *Mode und Cynicismus* (1878; 3d ed., 1887); *Altes und Neues* (1881–82; new series, 1889); *Lyrische Gänge* (1882; 3d ed., 1900); *Allotria* (1892); and (posthumous) *Shakespeare-Vorträge* (1898–1905; 2d ed., 1905–07). Consult the monographs by Günthert (Stuttgart, 1888) and Ziegler (ib., 1893).

VISCHER, PETER, THE ELDER (c.1455–1529). A German sculptor and bronze founder, the foremost of the Renaissance. Born at Nuremberg, son of the brazier Hermann Vischer the Elder (died 1487), Peter was his father's pupil and assistant, and was admitted to the guild as a master in 1489. His productions increased the reputation of the foundry to such a degree that for half a century it was practically without competition in Germany, and also received important orders from other countries. Five sons assisted Peter in his extensive productions —HERMANN THE YOUNGER (c.1486–1516); PETER THE YOUNGER (c.1487–1528); HANS, who inherited the foundry, but removed to Eichstädt in 1549; PAUL, who died at Mainz in 1531; and JAKOB, about whom information is lacking. While there are scarcely any records of his life, the master's artistic development may be followed in his numerous works, all marked with his monogram and dated, with the exception of his earliest known work, the statue of "Count Otto von Henneberg" in the church at Römhild (c.1487). To his early period also belong several sepulchral slabs in the cathedrals of Bamberg, Würzburg, Meissen, and Breslau, among which that of Bishop John IV (1496) at Breslau is remarkable for its powerful realism. The most important monument of his early period is the stately memorial to Archbishop Ernst (1495) in Magdeburg Cathedral, with the majestic reclining figure of the Archbishop, and a rich base decorated with statues of the 12 apostles and two other saints. During the following years the transition from the Gothic to the Renaissance appears in Vischer's work. His treatment becomes freer, the design more elaborate, and the forms more refined and truer to nature. This is seen in a series of grave slabs designed for the churches of Cracow, of which that of Cardinal Frederick Casimir in the cathedral, completed in 1510, is the most important. It is seen also in the fine monument of Count Herman VIII of Henneberg and his wife in the church of Römhilde (1508), and especially in his master creation, the "Shrine of St. Sebaldus" (1508–19), in the church of that saint, at Nuremberg, the most important monument of German plastic art during this period. It consists of an elaborate Gothic canopy inclosing the silver sarcophagus of the saint, adorned with reliefs, many statuettes (including Peter Vischer himself), and astonishing wealth of Renaissance decoration. The execution of these works shows a difference of style that can only be explained by supposing the assistance of Peter's sons Hermann and Peter the Younger. While engaged on the shrine he modeled also the powerful statues of King Theodoric and King Arthur (1513), and the monument of Emperor Maximilian at Innsbruck. The King Theodoric shows mediæval reminiscences; but Arthur, conceived in the spirit of the freedom of the Renaissance, is one of the finest things of its kind produced by German sculpture.

A number of other bronzes, unquestionably the product of Vischer's foundry, are so purely Renaissance in spirit and conception that they are now attributed to his talented son, Peter the Younger, who visited Italy about 1507. They include the grave relief of Margaretha Tucher (1521, Regensburg Cathedral), representing the meeting of Christ with the sisters of Lazarus; the monuments of Cardinal Albrecht of Brandenburg (1525, Stiftskirche, Aschaffenburg), and of the Elector Frederick the Wise (1527, Schlosskirche, Wittenberg). Peter the Younger also designed a number of small bronzes, inkstands, and the like, and two reliefs of Orpheus and Eurydice, the better of which is in the Berlin Museum. The beautiful wooden statue of the Virgin in the Germanic Museum, Nuremberg, claimed by some as his design, is more properly ascribed to the Vischer atelier. Hans Vischer, who inherited his father's foundry, was less able and original than his brother. The best of his works are an "Apollo," a fountain figure in the court of the Nuremberg town hall; the double monument of the Electors Johann Cicero and Joachim I (1530, Berlin Cathedral); and the monument of John the Constant (1534, Schlosskirche, Wittenberg).

Bibliography. The earlier literature has been replaced by the researches of Georg Selger, *Peter Vischer der Jüngere* (Leipzig, 1897); Weizsäcker and Justi, in *Repertorium für Kunstwissenschaft*, vols. xxiii, xxiv (Stuttgart, 1900–01); and the very readable Berthold Daun, *Peter Vischer und Adam Krafft* (Bielefeld, 1905). Adapted from these are the popular monographs by Cecil Headlam (London, 1901), and Louis Réau (Paris, 1909).

VISCOID. See CELLULOSE.

VISCONTI, vēs-kôn'tē. A celebrated family of Lombardy. The first of the name who appears prominently in history is OTTONE, who became in 1078 Viscount of the archbishopric of Milan. In 1262 another OTTONE (1208–95) was appointed Archbishop of Milan by Pope Urban IV. His appointment was opposed by the popular party, headed by Martino della Torre, but Ottone came off victorious in the struggle with the Torriani, and established his sway in Milan. The contest was continued by his grandnephew, MATTEO (1255–1322). Matteo proved himself a prudent and temperate ruler. Expelled by the Torriani and their allies in 1302, he was restored in 1310 by the aid of the Emperor Henry VII, and appointed Imperial vicar in consideration of the payment of 40,000 florins. Pavia, Alessandria, Tortona, Cremona, Bergamo, and Piacenza were forced to acknowledge his authority. A quarrel, however, arose with Pope John XXII, regarding the appointment to the Milan archiepiscopate; and Matteo was excom-

municated. Matteo died in the same year, having previously abdicated. His son, GALEAZZO I (1277–1328), was chosen his successor, and immediately the Pope proclaimed a crusade against the heretical Visconti, and an army under Raymond of Cardona advanced in 1323 on Milan. The Emperor Louis IV sent aid to the Visconti and the Crusaders were totally defeated at Vaprio, on the Adda (1324). Soon after Galeazzo, by the intrigues of his ambitious brother Marco, was exiled, but his eldest son, AZZO (1302–39), succeeded him, while the Antipope Nicholas V confirmed the third son, GIOVANNI, in the archiepiscopate. Azzo was the greatest prince of the race, ruled Milan wisely and well, and extended his sway over almost the whole of Lombardy. The Council General of Milan elected his two uncles, GIOVANNI (1290–1354) and LUCCHINO (1287–1349), as joint rulers to succeed him; on the latter, who was able, resolute, and unscrupulous, devolved the government. Montferrat was added to the dominions of the Visconti and Pisa became a tributary. Lucchino's tyrannical acts provoked enemies, and he died by poison. From this time Giovanni, who had been since 1342 Archbishop, reigned alone. He bought Bologna in 1350; in 1353 accepted the lordship of Genoa, which had been almost crushed by its rival, Venice; and taking up the quarrel of his new subjects, equipped a fleet which, under Paganino Doria, gained a complete victory over the Venetians. He was the generous patron and friend of Petrarch. His three nephews conjointly succeeded him, but in 1355 the eldest was assassinated, and his dominions were shared between the other two, GALEAZZO II (died 1378) and BERNABO (died 1385). Bologna, which belonged to Bernabo, fell into the hands of the Pope, who excommunicated Bernabo for attempting to recover possession of it. Urban V proclaimed a crusade against Bernabo, which was joined by all the principal Italian princes; and he was ultimately forced to accept a sum of money in place of Bologna. His brother Galeazzo II, who had established his residence at Pavia, was the Mæcenas of his time: he steadily befriended Petrarch, founded the University of Pavia, and collected a considerable library.

On Galeazzo's death (1378) his son, GIAN GALEAZZO (c.1347–1402), succeeded him in Pavia and its dependencies; and by treacherously seizing and imprisoning his uncle, Bernabo of Milan, became sole ruler of Lombardy. He had all the great qualities and most of the vices of his race, and openly aspired to the sovereignty of Italy. He conquered Padua, Verona, and Vicenza; extended his dominions to the gates of Florence, which he also attacked; and in 1395 purchased from the Emperor Wenceslas the absolute sovereignty of his dominions, with the title of Duke of Milan. He was a great patron of letters and science, gathered eminent men of all classes around him, reorganized the University of Piacenza, established a magnificent library, constructed the famous bridge over the Ticino at Pavia, and commenced the erection of the cathedral of Milan. His daughter, Valentina, married Louis, the younger brother of Charles VI of France, and became the grandmother of Louis XII, who upon this relationship founded his claims to the Milanese. Gian Galeazzo's sons, GIAMMARIA (Giovanni Maria) (1388–1412) and FILIPPO MARIA (1391–1447), reigned in succession; the former, who was cowardly, suspicious, and of a cruelty verging on insanity, was murdered, and the younger brother became sole ruler. The Venetians on the east, the Marquis of Montferrat on the west, and the Pope on the south, were rapidly curtailing his dominions, when, by a happy stroke of policy, he espoused Beatrice di Tenda, the widow of a condottieri leader, and thus obtained the services of a veteran band of soldiers. His fortunate choice of Carmagnola (q.v.) as his general led to the restoration of the former boundary line of his dominions. In 1441 he engaged the services of the celebrated condottiere Francesco Sforza (see SFORZA), to whom he gave his natural daughter Bianca in marriage; and on his death the Visconti family was succeeded by that of Sforza (q.v.) in the lordship of the Milanese. Collateral branches of the Visconti still exist in Lombardy. Consult: Jakob Burkhardt, *The Civilization of the Renaissance in Italy* (Eng. trans., London, 1898); J. C. L. Simonde de Sismondi, *History of the Italian Republics in the Middle Ages* (Eng. trans., New York, 1906); J. A. Symonds, "Age of the Despots," in *Renaissance in Italy*, vol. i (new ed., London, 1913).

VISCONTI. A family of Italian archæologists and architects. GIOVANNI BATTISTA VISCONTI (1712–84), a native of Sarzana, settled at Rome and succeeded Winckelmann as prefect of antiquities. He was employed by Clement XIV and Pius VI to collect works of ancient art for the *Museo Pio-Clementino* in the Vatican. —ENNIO QUIRINO VISCONTI (1751–1818), eldest son of Giovanni, as a youth aided his father in the preparation of the first volume of the engravings of the *Museo Pio-Clementino*. In 1784 he edited alone the second volume of the same series, and in 1787 was appointed conservator of the Capitoline Museum. The series of engravings of the *Museo* was regularly issued, the seventh and last volume being published in 1807. During the French occupation of Rome Visconti was a member of the government, but in 1799 was compelled to flee to France, and settled in Paris, where he was made curator in the Louvre and professor of archæology. In 1801 appeared his great work, *Iconographie grecque*, and this was followed by the *Iconographie romaine* in 1817. In 1817 he went to London by express desire of the British government to appraise the value of the Elgin marbles (q.v.), and as a result of this visit published *Mémoire sur les ouvrages de sculpture du Parthénon*. He died in Paris, Feb. 7, 1818.—PIETRO ERCOLE VISCONTI (1802–80), nephew of Louis Tullius Visconti (q.v.), after studying at the papal archæological academy became in 1836 commissioner of antiquities, director of the collections in the Vatican, and professor at the University of Rome. He left uncompleted his *History of the Noble Families of Rome and the Papal States*.

VISCONTI, LOUIS TULLIUS JOACHIM (1791–1853). A distinguished French architect, born in 1791 in Rome, the son of Ennio Quirino Visconti. He was brought in his eighth year to Paris, where he studied in the Ecole des Beaux-Arts and in the atelier of Charles Percier. Among his varied works in Paris were the architectural designs of the Molière, Louvois, and St. Sulpice fountains, plans for a Bibliothèque Royale, and the transformation of the Dome des Invalides into a mausoleum for the remains of Napoleon Bonaparte (completed 1853). To

him is also due the masterly design for the union of the Louvre and the Tuileries, a problem which his master Percier, with Fontaine, had earlier endeavored to solve. This colossal enterprise was begun in 1852 under Napoleon III, and carried out during the following 30 years, chiefly under Visconti's associate, Hector Lefuel, who succeeded him on his death, in December, 1853. While the exterior detail of the new wings is largely Lefuel's, the general disposition of the plan was Visconti's.

VISCONTI-VENOSTA, vē-nôs'tà, EMILIO, MARQUIS (1829–1914). An Italian statesman, born in Milan. After his father's death, in 1846, he began to take part as a journalist in Liberal politics. He became an ardent follower of Mazzini, whom he left in 1853 to join Cavour, and in 1859, after a narrow escape from arrest by the Austrian authorities, he was named royal commissary to Garibaldi. In 1860 he was appointed adviser to the dictator Farini in Parma and Modena, in the interest of annexation to Sardinia, was elected to the Chamber of Deputies in the same year, and became Minister of Foreign Affairs in the Minghetti cabinet in 1863, but resigned in 1864 because of popular disapproval of the convention of September, which he had concluded with France. In 1866 he became Ambassador to Constantinople, but was recalled to take charge again of the Foreign Office and conclude peace with Austria, after which he was retired. Again in 1869 he was made Foreign Secretary in Lanza's cabinet and held the portfolio until the fall of the Right from power in 1876, when he retired, having put through (1870) the law which offered the Pope certain guaranties. Visconti-Venosta became Senator in 1886, and in 1896 again received the portfolio of Foreign Affairs under Rudini, but was forced out in May, 1898. In 1899–1900 he was Foreign Minister in the Pelloux cabinet, and in 1900–01 held the same post under Saracco. The most striking feature in Visconti-Venosta's foreign policy was his eager friendship for France, which bore fruit in the amicable relations established with that country after 1904.

VISCOSE. See CELLULOSE.

VISCOS'ITY (from Lat. *viscosus*, viscous, sticky, from *viscum*, *viscus*, birdlime). When currents are produced in fluids, forces are observed which retard the relative motion of the parts. These forces of friction are said to be due to viscosity; and the greater the friction, the more viscous the fluid. It is due to the motions of the molecules between the moving parts of the fluid and to the redistribution of momentum.

VISCOUNT, vī'kount (OF. *visconte*, *viconte*, Fr. *vicomte*, from ML. *vicecomes*, viscount, from Lat. *vice*, in place of + *comes*, companion, count). In English history, originally the officer who acted as deputy to the count or earl, the King's immediate officer within his county. The hereditary title of viscount is a degree of nobility unconnected with office. It was first granted in England to John Beaumont, created a peer by the title of Viscount Beaumont in 1440. A viscount's coronet consists of a chased circlet of gold, round which are ranged usually 12 to 16 pearls, smaller than those of a baron's coronet, and in contact with each other. The mantle is scarlet, and has two doublings and a half of ermine. A viscount is "right honorable" and is styled "My Lord"; his wife is a viscountess; his eldest son has no courtesy title of peerage, but all his sons and daughters are styled "honorable." The title has a not dissimilar history in France, Italy, and Spain.

VIS'CUM. See MISTLETOE.

VISH'NU (Skt. *viṣṇu ;* of uncertain etymology). The second god of the Hindu triad (see TRIMURTI), and regarded as the supreme deity by his worshipers, who are called Vaishnavas (q.v.).

In the Rig-Veda Vishnu is the wide-stepping god who goes swiftly and "establishes the vault of heaven" and "measures out the extreme spaces of earth," while his "dear path" is the heaven of pious men, or along the highest heavens. The deity thus described is obviously the sun, though some scholars are inclined to regard the Vedic Vishnu as merely a giant, his famous three strides through the universe being interpreted as across the ground rather than through the sky. In the second period of Hindu thought, however, the union of the sun god and Vishnu is complete, and at the same time Vishnu becomes more generally recognized as one of the supreme gods, appearing even as the supreme deity. The next phase of his character is that of a supreme All-god. About the beginning of the Christian era this pantheistic Vishnu, who represents the esoteric speculations of philosophy, as well as the figure of a popular godling, entered into so close rivalry with the orthodox supreme god, Brahma, and with the sectarian god, Siva, that to reconcile the conflicting claims of each cult the three were proclaimed to be forms of one supreme god. When this occurred, Vishnu became merged with Brahma and Siva, and thenceforward he represented only a personal condition of the one All-god. While Brahma tended to become a deity of philosophers and Siva remained an object of fear, Vishnu became especially the god of the easy-going middle classes, both in northern and southern India, and ended his divine career by absorbing most of the local cults of the Hindu and barbarian natives. He was believed to have descended from heaven and become incorporate in various guises. These are the famous avatars of Vishnu. (See AVATAR.) In them the Vishnu appeared only in part; for being the All-god, the individual form was only a portion of the whole. This theory of avatars aided greatly in making Vishnu a popular god; for, according to it, any local god might be a form of the All-god. This provided a means of bringing into the Brahmanic fold the worshipers of the most diverse divinities.

The oldest legends of the avatars have to do with mythical animals; then follow avatars in half human form, and finally come the great human avatars. Among these the oldest is the fish avatar. At first, before Vishnu was recognized as All-god, we find the legend of a deluge, and the story of a monster fish, which preserved from death in the flood the ancestor of all mankind. According to orthodox Brahmanic theologians the saving fish was an incarnation of the god Brahma. Only much later was Vishnu substituted for the earlier god. In no other instance is the historical genesis of the avatar so plainly preserved as in this, wherein a popular tale is transferred from one divinity to another.

The numerous avatars of Vishnu are given at first as 10, then as 20, then again as 22, and at last they become innumerable. First comes the fish avatar already referred to; then the tortoise and boar avatars. These comprise the first

group, in which possibly a totemic deity has been identified with Vishnu. The next group comprises the man-lion form of Vishnu and the dwarf form, in which the deity is half beast and half god respectively. The tortoise and boar forms, like that of the fish form, are assumed in order to save earth itself from disaster. Both tortoise and boar raise the sinking land, so that these are also merely forms of a deluge myth. In the dwarf avatar Vishnu tricks an evil demon, who possesses earth, by soliciting as much earth as he can cover with three strides. On this request being granted, the god renounces his dwarf form and with his ancient three strides covers the whole earth. The last group of avatars comprises those of the two Ramas and of Krishna (q.v.), together with the final claim or admission that Buddha was an avatar of Vishnu and the prediction that there is to be another avatar, that of the Saint Kalki. In this last group of avatars, beginning with the older Rama, the evil counteracted by Vishnu in human form is moral, not, as in the earlier legends, merely physical, evil.

The most important of these avatars are those in human form. As Rama or as Krishna, the god Vishnu is worshiped by millions of Hindus, whereas in other forms he has only a restricted circle of worshipers, generally limited to a local cult. Especially is this true of the speculative avatars, such as Buddha in the group of 10, or as Kapila (q.v.) in the later group of 22. In regard to these forms it may be said that the god is not really worshiped under them, but they are postulated merely on the general theory that the greatest men of the race, unless positively antagonistic to the Vishnu cult, must have been incarnations of the deity.

All these legends have resulted in swelling enormously the sectarian literature which clusters about Vishnu, and almost every legend has received its special gospel in the shape of a Purana (q.v.) or two.

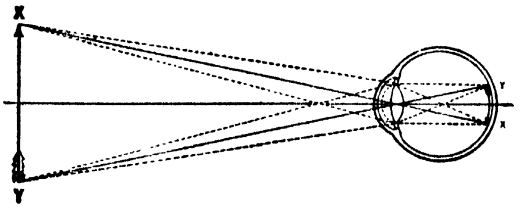
When freed from all avatars, Vishnu as the supreme god, or as a member of the Trimurti and not as a mere name for the pantheistic All-god, is conceived as having a special heaven, called Vaikuntha. His wife is Lakshmi (q.v.), and he is represented as dark in color, with four hands, his emblems being a disk (due to his solar attributes), a conch shell or trumpet (such as he bore in battle), a lotus (from the heart of which Brahma is supposed to have been born), and a mace or sword. Other representations picture his avatars as a beautiful youth, to typify Krishna or Rama. The epic gives him a thousand names, most of which are epithets describing him as all-glorious, all-powerful, the saviour, or the very great one.

There is, however, another aspect of Vishnu, which may be called his philosophical form. In this form Vishnu becomes a mere name (interchangeable with Brahma or Siva) of the All-god as philosophically conceived. As such Vishnu is not a demiurge (q.v.), which in all sectarian forms is his real position, but a being without parts or passions, having no attributes save those of being and knowledge. He is the name of the world spirit out of which comes and into which returns all the transient group of phenomena which have no real existence, and are due merely to ignorance on the part of those who live conditioned by these phenomena. This is the Vishnu of the Vedanta (q.v.), differing both from the Krishna-Vishnu of the sectary and from the Vishnu of the Trimurti. Since Vishnu may be and is worshiped under any of these conceptions, he comes nearest to the all-sufficing notion of God, and his cult appeals alike to all. In these phases may be seen a survival of the primitive sun god. On the one hand the identification of the sun's place with the place of departed spirits led to a mystic conception of the god, whose attribute of light was further identified with that of goodness. On the other hand, the fructifying power of the sun led to the apotheosis of the generative power in man as in nature, and it is this function which is the chief element in Krishna worship, Krishna being renowned as the amorous shepherd whose thousand wives are his principal delight.

In sharp contrast to Siva, Vishnu is at all times a kindly god, and his cult is indicative of this fact. To him are offered no bloody sacrifices. He desires only the sacrifice of fruit and vegetables, milk and honey. The esoteric rites in honor of his human incarnations are also bloodless, though licentious in their debased form. On the whole he is a deity of light and joy. Gay banners and brilliant illuminations are seen at his feasts, and his many temples are crowned with flowers, not with the skulls of victims. Under the form of Juggernaut, or Jagannath (q.v.), the saviour of the world, he has been credited with taking pleasure in human sacrifice, but this is a gross error.

The sacred scriptures of Vishnu are of two sorts. The first are the few early texts which express a belief in Vishnu as the supreme god. Such expressions of belief are always incidental in the first instance, and they would not be of influence if it were not for the later evolution of Vishnu into the All-god. The earliest Upanishads (q.v.) and the still earlier Brahmanas (q.v.) do not recognize Vishnu as in any way a supreme deity. The second class of scriptures includes the *Bhagavad-gītā* (q.v.), in which for the first time Krishna appears as Vishnu incarnate on earth, and the *Vishnu Purāṇas*, of which there are several, the oldest being called simply *Vishnu Purāṇa*, and the most popular being the *Bhāgavata Purāṇa*. These, together with a supplement to the *Mahābhārata* (q.v.) called the *Harivanśa* (q.v.) in which are told marvelous tales of Krishna's youthful exploits, are the classic texts in honor of the god, though each of the Vishnu sects (see VAISHNAVAS) has scriptures of its own. Wilkins, *Hindu Mythology* (2d ed., London, 1900); A. Hillebrandt, *Vedische Mythologie* (Breslau, 1910), and see VISHNU in Plate of HINDU DEITIES, in the article INDIA.

VISIBLE SPEECH. A form of universal alphabetics, devised by A. Melville Bell (q.v.) in 1848, which is equally adapted to every spoken language. As all phonetic elements can be reduced to their established standard of articulate correctness and accurately represented, visible speech presents the same linguistic sounds in every country. Human speech, however, consists of certain movements of the throat, tongue, and lips, associated in different countries with different sets of letters, so that one may know the letters in connection with a certain language, and yet be unable to pronounce them in



some other language. This difficulty is obviated by visible speech, as it consists of a form of writing which depicts the actual movements of the organs of speech. For the characters employed in the system, see DEAF MUTE. To modern phoneticians, however, Bell's alphabet appears cumbersome and insufficiently accurate, and hence has been discarded. Of the numerous alphabets that have been proposed in recent years the one created by Paul Passy (q.v.) and adopted by the Association Internationale Phonétique was in 1916 most universally used. See PHONETICS.

VIS'IGOTHS. See GOTHS.

VISION, or SIGHT. Vision or sight is, strictly, that mode of experience which is conditioned upon the eye. Generally the term "vision" covers the anatomical description and dioptrics of the eye and the physiological functions of the visual apparatus, as well as the psychological description of visual sensation and visual space perception. Since the mechanics of the eye has been discussed under eye (q.v.), little more need be said upon that topic.

The eye may be likened to a small photographic camera. It consists of a dark chamber, lined with a membrane, the choroid, which is pigmented with a coloring matter of dark brown. At the front of the chamber is a diaphragm, the iris, which has a small opening for the admission of light (the pupil). The size of the pupil automatically increases or diminishes according to the degree of illumination. The refractive media consist of the cornea, the aqueous humor, the lens, and the vitreous humor; most important of these is the lens. At the back of the chamber is a sensitive nervous layer, the retina, which receives the image. Functionally, the most noteworthy parts of the instrument are the focusing apparatus, by means of which the lens is adjusted to near and far objects (accommodation) and the retina.

Accommodation. When we look at a distant object, the lens is kept flat by the relaxation of the ciliary muscle, which is attached to the choroid and pulls upon the suspensory ligament, a membrane surrounding the edge of the lens. As a consequence the refractive power of the lens is decreased. For near vision the ciliary muscle contracts, the tension of the suspensory ligament is thereby lessened, and the lens by its own elasticity assumes a greater curvature. The fatigue of the eyes which follows upon their protracted use in near vision results from the prolonged contraction of the ciliary muscle; and it is this muscle also which furnishes the sensations of accommodation which are of importance in the visual perception of space (q.v.). In the emmetropic (normal) eye the range of accommodation is from infinite distance to about 6 inches; in the myopic (shortsighted) eye both the far and the near points are brought closer to the eye, and in the hypermetropic (far-sighted) eye the near point is abnormally distant. After the age of about 45 years the human lens becomes less elastic, and as a result there is a gradual loss of power to accommodate the eye for near distances (presbyopia or old sight). The accommodation of the lens, together with the size of the pupil, conditions the formation of a clear image upon the retina. The pupil admits only a small number of the rays which emanate from the object of vision, and the rays are so refracted that they cross in the optical centre (nodal point), and an inverted image is thrown upon the retina (see Figure). If accommodation and the adjustment of the pupil are inadequate, diffusion circles are

FORMATION OF AN IMAGE UPON THE RETINA.

formed, and the image is indistinct. Faulty accommodation is also thought to explain irradiation (q.v.). The technology which, without the use of drugs, corrects inadequate accommodation by fitting proper lenses is known as optometry (q.v.).

Retina. The sensitive film of the optical instrument consists of a thin and transparent membrane composed of several layers. The superficial layer is a neuroepithelium, consisting of small end structures called rods and cones, which are thought to be the receptors of the physical stimuli. Except at the point where the optic nerve enters the eyeball, and where both rods and cones are wanting, these receptors are irregularly distributed over the entire retina. The area which lacks rods and cones is called the blind spot (q.v.). At the posterior pole of the eyeball is situated a small area impregnated with a yellow pigment and hence named the macula lutea or yellow spot. At the centre of the yellow spot is a small depression, the fovea, where only cones are found. Here the cones are more slender and elongated than elsewhere; the diameter of a single cone has been variously estimated at from 2.5μ to 5.4μ. The rods contain in their end members a reddish-purple pigment, called the visual purple, which bleaches on exposure to light and is regenerated in darkness. It is significant that the temporal course of regeneration of the visual purple corresponds with that of dark adaptation, and that the relative amount of the light of different wave lengths absorbed by the visual purple is coincident with the distribution of tints in the spectrum of twilight vision (see VISUAL SENSATION). The cones undergo slight contractions under the influence of light and electrical stimuli; but the further effect of stimulation is not known; it is generally supposed, however, to be photochemical in nature. The inner layers of the retina, through which light must pass before it reaches the rods and cones, are, as has been said, transparent in the living eye, and the innermost layer contains blood vessels whose contents under certain conditions may be seen as floating spots or disks. The inner aspect of the eye may be readily observed by means of the ophthalmoscope, an instrument devised by Helmholtz for this purpose.

Duration of Visual Sensations. When the retina has been subjected to a bright stimulus, the excitation persists for some time after the stimulus has been removed. It is owing to this persistence of excitation that the spokes of a rapidly revolving wheel appear solid, or that black and white rotating disks will fuse into a grey. The time required for such fusion is about 24 revolutions per second. The duration

of persistence is conditioned upon the intensity and duration of the stimulus.

Visual Space Perception. The visual appearances of forms and objects, distances and depths, localities and magnitudes, are not simple but complex experiences: they are visual perceptions. All such experiences, when analyzed to their lowest terms, reduce to sensations, principally to visual sensations of light and color. The problem of visual space perception, therefore, is, as in perception (q.v.) in general, to determine the nature of the combination of these elements, the pattern in which they go together, and to distinguish between those that are essential to the perception and those which furnish its meaning (q.v.). Such an analysis has already been made, so far as present knowledge permits, in the case of the more important visual space perceptions. See LOCALITY; EXTENSION, EXTENT; ILLUSION.

There are two facts, however, which are important in all space perceptions. (1) The first is binocular vision; the fact that although we have two eyes we perceive, for the most part, as if we had but one. The two eyes are so placed in the head that the visual field of the one partially overlaps that of the other eye. These two fields combine in such wise that the result for perception is as if we had a single median or cyclopean eye. The fact that we do not see double is explained by the theory of corresponding points. Every part of the retina of the one eye has a corresponding point on the retina of the other; if we think of the two retinas as laid together, the one within or upon the other, and of a pin driven through them, then the two pin holes represent corresponding points. When an object is fixated, the eyes so converge or diverge, as the case may be, that every point of the object falls upon corresponding points of the two retinas; the object is accordingly seen as single. All other points in the field of vision except those which fall within the horopter (q.v.) are seen double. (2) The second fact is the importance of eye movement in visual space perception. Not only does the rotation of the eyes greatly increase the field of vision, but the sensations which take their origin in the muscles involved in eye movement are also, almost invariably, found to be a part of the perceptive complex. Whether these sensations are simply the carriers of meaning, or whether they actually fuse with visual sensations to furnish the perception of space, is a point in dispute. It is known, however, that in monocular vision, where all criteria are eliminated except sensations of accommodation, differences of depth may still be perceived; and there are experiments which show that under certain conditions there is a close correlation between the extent of eye movement and that of visual illusions. Consult Joseph Le Conte, *Sight: An Exposition of the Principles of Monocular and Binocular Vision*, in "International Scientific Series," vol. xxxiii (London, 1883); William James, *Principles of Psychology* (new ed., 2 vols., New York, 1905); W. M. Wundt, *Outlines of Psychology*, Eng. trans. by C. H. Judd (3d ed., ib., 1907); E. B. Titchener, *Beginner's Psychology* (ib., 1915); and references to W. Wundt and H. Helmholtz under VISUAL SENSATION.

VISION, DEFECTS OF. See AFTER IMAGES; ASTIGMATISM; EYE; MYOPIA; SIGHT, DEFECTS OF.

VISION IN ANIMALS. That sense which is evidenced by a specific response of animals to photic stimuli; or, more narrowly, such a sense when it is dependent upon an eye as an organ. Only in the more general significance are animals, such as the earthworm, which is eyeless and yet sensitive to light, said to possess vision. In this general way the capacity to respond to photic stimuli is very widespread. Single-celled organisms tend frequently either to have their activity altered by light (photopathy) or to take up a position with respect to the direction of the light (phototropism). (See PHOTOTAXIS; TROPISM.) In higher forms, such as the flatworms and earthworms, the skin appears to be the light-perceiving organ. It is possible that the skin is sensitive to light even in forms possessing a well-developed eye, e.g., in the frog. In general, however, sensitivity to light increases with the development of pigment spots in the skin, and may be regarded as vision in the restricted sense when the pigment spot becomes an eye. See EYE, COMPARATIVE ANATOMY OF THE.

Limits of Vision. The human eye is sensitive to light waves ranging from about 760$\mu\mu$ (red) to 396$\mu\mu$ (violet) in length. Those mammals which have been tested appear to have a lesser range, being insensitive to the longer wave lengths; in other words, they cannot see red light. The shorter wave lengths are probably relatively more effective for them than for man. Thus the eyes of these mammals respond to light somewhat as does a photographic plate.

With birds there is no deficiency in sensitivity to the red end of the spectrum. Many birds, when presented with grain illuminated by the spectrum, peck with avidity at grains in the red and yellow regions, take more hesitantly from the green, and fail to find the grains in the violet region. This observation has led investigators to suppose them insensitive to the shorter waves to which man responds. A recent study of the chick (which shows this form of behavior) has, however, brought out the facts that the limits of vision are practically identical with those in man, that the relative distribution of effectiveness of the wave lengths is approximately the same, and that the failure of the chick to peck at grains in the violet light means simply that the violet end of the spectrum is for the bird, as it is for man, the darkest and least effective region.

Fish, in general, are most sensitive to light which is seen by man as green or yellow green. Fish that tend to collect in the light will gather in the green region of a spectrum thrown on the aquarium. If the green region be shaded, they will select the adjacent regions. Orange and red light at the one end and violet light at the other have at best very little stimulating effect, and may not be discriminated by the fish from the complete absence of light. The range of vision is thus very much restricted.

The frog has a range of vision coextensive with man's. The turtle will snap up food illuminated by red light, when it fails to take the same food in violet light. Compared with man it is possibly defective in the violet region.

Brightness Discrimination. Undoubtedly differences of brightness (tint) play a preponderant rôle in the visual discriminations of most animals. Careful quantitative experiments are lacking; but it appears that the difference of illumination necessary for discrimination

varies from $\frac{1}{10}$ of the absolute value of the illumination with mice and monkeys to as little as $\frac{1}{25}$ with raccoons and porcupines. The implication of such a statement is that Weber's law (q.v.) holds for brightnesses; and in the case of the dancing mouse it has been definitely shown that that is the case. Thus, at an intensity of illumination of 5 hefners the mouse can learn to respond selectively to a difference of $\frac{1}{2}$ hefner; at 20 hefners, to a difference of 2 hefners; at 80 hefners, to a difference of 8 hefners.

Very little work has been done on the sensitivity of submammalian forms to intensity of light. Chicks learn to discriminate between brightnesses; and it has been shown that the less the difference of brightness, the greater is the number of trials necessary for them to learn the selective response. Fish, as we have seen, may respond positively to light. In some species this response seems to be conditioned in part upon the skin. In marine forms, however, the eyes appear to constitute the only organ. Frogs and turtles may discriminate gross differences in illumination.

Color Discrimination. The greater part of the work upon sensitivity to color has been of little significance, because investigators did not arrange their conditions in such wise as to prove conclusively that the animal was reacting to differences in wave length and not to differences in intensity of stimulation. We have seen that different wave lengths may be differently effective in different eyes. In man, e.g., the yellow wave length is a much more effective stimulus than the blue; in some other mammals, however, the blue is more effective than the yellow. Thus it might readily occur that a yellow, seen as brighter than a blue by man, would appear darker than that blue to another animal. It is clearly impossible, then, to say whether an animal, which has learned to act differently to a blue and to a yellow light, is really discriminating a difference in hue, or is responding merely to a difference in brightness. It is of no assistance to know that the two colors are of the same brightness to man; they may be of very different brightnesses to the animal, according to the particular constitution of the animal's retina. In the extreme case, where the spectral range of vision is less for the animal than it is for man, the one or the other of the lights may actually appear as does a lightless space (presumably black). Thus it has been held that red light looks black to the rabbit, and blue light black to the chick. The only assurance of color discrimination would be provided by a demonstration that an animal could learn to discriminate every intensity of one wave length from every intensity of another, zero intensity being included in one of the series to allow for the possibility of the discrimination of the other color on the basis of its complete ineffectiveness.

In the light of this criticism of method it is impossible to say with certainty that any of the mammals possess color vision. It is comparatively easy to train monkeys to reject food dyed with one color and treated with quinine, and to accept the same food dyed with another color and sweetened. They can also learn to take food exclusively from vessels of a particular color. Similar experiments have been made with dogs, cats, mice, and rabbits. Raccoons and porcupines do not respond readily to such tests, and some careful work upon the dog has been mainly negative. But even the careful tests prove nothing with regard to color sensitivity. The cat, e.g., can learn to discriminate colored papers; but for every colored paper there appears to be some tint of gray with which it is confused. Thus, dark grays are equivalent to blue and to green; white is equivalent to yellow; black, to red. The last fact means that the limits of vision for the cat do not extend in the spectrum as far as the red.

The same uncertainty exists concerning the facts of color vision in birds. Experiments indicate a sensitivity to difference in wave length, but do not prove it conclusively. A hen can be taught to pass a test in which a color-blind person fails. If red grains are fastened down to a cloth, the hen soon learns not to peck at them. If now green and gray grains be mixed with the red, the hen will take the green and gray and leave the red. She will likewise now refuse red grains which are not fastened down. She will also refuse violet grains. A partially color-blind person may, however, be unable to separate the red grains from the grays and the greens. It has therefore been suggested that the hen is not even partially color-blind—a suggestion which fails to take account of possible differences between the eye of the hen and the human eye. It seems probable that the greens and grays all look light gray to the hen; that the reds and violets, which are at the extreme limits of the visible spectrum, look dark; and that discrimination is therefore made on the basis of differences of brightness. An attempt has been made to demonstrate color sensitivity in pigeons by measuring the effect of colored stimuli upon breathing and circulation. Interpretation of the results meets with the same difficulty, however, that has invalidated so many other conclusions.

Of all the work upon fish, reptiles, and amphibians none is conclusive either for or against color vision. The controversy has been especially keen with regard to fish. It has been maintained both that they are totally color blind and that they can distinguish yellow, green, and blue from all shades of gray. The probability is against color vision.

Adaptation. (See VISUAL SENSATION.) Adaptation to darkness can be measured by determining the intensity of illumination which is necessary, after the animal has been in the dark for a given time, to enable it to see and take food. A chick, after five minutes in the dark, will begin to peck at grains when the illumination is increased to a certain amount; after an hour in the dark, it will peck under a less illumination. In birds which, lacking the retinal rods, have only daylight vision, the course of adaptation is similar to that in man, both in degree and in rate. Birds with twilight vision, like the kestrel, adapt more slowly than man and to a less degree. The owl is an exception, in that it is very sensitive under dark adaptation. In general, however, it appears that birds with daylight vision adapt more rapidly to the dark and discriminate better in the dark than do birds with twilight vision. This fact seems to prove that the visual purple of the retinal rods does not, as has been supposed, explain the adaptive process, for the birds with daylight vision have no rods.

Fish show a very great increase in visual

sensitivity in the dark. Reptiles in darkness may distinguish objects which are invisible to man. Frogs show a less degree of adaptation than does man.

Some animals, which show evidence of dark adaptation, do not seem to require time for the reverse process of light adaptation. Birds and turtles, unlike man, are not dazzled when brought from the dark to bright sunlight, but appear to be capable of normal powers of discrimination.

The Purkinje phenomenon (the shift of the region of most effective stimulation with dark adaptation towards the violet end of the spectrum: see VISUAL SENSATION) occurs in animals as in man. A chick which has been trained to choose the brighter of two white lights may, when light-adapted, choose a given red more often than a given green and, when dark-adapted, choose the same green more often than the red. The implication is that under light adaptation the red appears lighter than the green, but that the Purkinje shift, occurring with dark adaptation, makes the green lighter than the red.

Discrimination of Form. All vertebrates learn readily to distinguish between objects which constitute good and bad food. While absolute brightness and possibly color and at times movement may play a part in this discrimination, there is also probably a perception of size or form or pattern. In the most careful experimental work, monkeys have been taught to distinguish between circles and squares, triangles and hexagons. Dogs learn to give specific reactions to either the form or the size of illuminated areas. Rats have learned to respond to the difference between vertical and horizontal lines, or between large and small circles. Pigeons learn to select a given shape of feeding box from others placed with it in a row. If chicks are presented with triangles and circles cut from peas, the triangles under a pane of glass and the circles above, they learn not to peck at the triangles; later, if the glass is removed, they take only the circles. In the most recent experiments an attempt is being made to provide stimuli which are uniformly variable in size or form and to determine for different animals an exact differential limen of spatial discrimination.

Light has recently been thrown on the ability of some animals to perceive very slight movements. It was discovered that certain horses, which had been trained to answer questions or to perform simple mathematical operations by tapping out the answers with their feet, were unable to reply correctly when they could not see the experimenter or when the experimenter did not himself know the answer to the proposed question. It was shown that the horses took their cue from unconscious movements of the experimenter, movements which sometimes were as small as $\frac{1}{100}$ of an inch. This discovery is important, not only in its bearing upon animal vision, but also as showing the necessity that the experimenter remain out of view during expérimentation upon animals. Many conflicting conclusions have doubtless been due to this source of error.

VISIT AND SEARCH. See SEARCH, RIGHT OF.

VIS'ITA'TION, SISTERS OF THE. A religious order for women in the Roman Catholic church, sometimes also known as Salesian Sisters, from St. Francis de Sales, to whom the idea of its foundation was due. It was established in 1610 at Annecy, in Savoy, with the purpose of visiting and caring for the sick and needy. It took its name and its example from the visit paid to Elizabeth, mother of John the Baptist, by the Virgin Mary (Luke i. 39–42). The actual founder, under St. Francis's direction, was St. Jeanne Françoise de Chantal (q.v.). A second house was established in Lyons, but the archbishop of that see, Cardinal de Marquemont, desired St. Francis to change his original plan of a congregation without regular vows into a professed order. This was accordingly done, with the adoption of the rule of St. Augustine. Pope Paul V confirmed it in this form in 1618. It spread through France and Italy, and now numbers about 170 convents. In the United States, to which it came in 1799, it has 21 convents and about 800 sisters, whose principal occupation is teaching. The devotion to the Sacred Heart of Jesus, now so widespread in the Roman Catholic church, had its formal beginning in this order, of which Margaret Mary Alacoque (q.v.) was a member. Consult Currier, *History of the Religious Orders* (New York, 1896).

VISITING ANT. See DRIVER ANT.

VIS MAJOR (Lat., superior force). A term borrowed from the civil law and employed to denote an inevitable accident, i.e., one which results from the operation of the forces of nature and which could not have been prevented by the exercise of care. See CARRIER, COMMON; CONTRACT.

VISON'TIUM. See BESANÇON.

VISSCHER, fĭsh'ĕr, CORNELIS (c.1629–62). A Dutch engraver. He was a native of Haarlem, and is thought to have been a pupil of P. Soutman, but little is known of his life. His portraits and subject pieces, after his original designs, are among the highest examples of Dutch engraving and helped to form the Dutch style. They show a firm, delicate touch and powerful rendering of color. Among the best are the portraits of Gellius Bouma, Guilliam de Ryck, Robertus Junius, Jan de Paep, and the "Seller of Rat Poison." He engraved altogether about 180 plates.

VIS'TULA (Polish *Wisła*, Ger. *Weichsel*). A river of central Europe. It rises on the north slope of the Carpathian Mountains in Austrian Silesia, and its course, a great S, lies first between Galicia and Poland, then across the latter, and finally through the Prussian Province of West Prussia, emptying into the Frisches Haff and the Baltic Sea through several arms (Map: Germany, H 2). Its length is 650 miles. Its upper valley has steep, wooded sides, but in north Poland the banks become low and the

country more open until the river breaks through the Prussian ridge, where the banks are again high. In its lower course it divides repeatedly into parallel arms, inclosing wooded islands. The arms of the delta are subject to extensive change in their channels and in the volume of their discharge, and large sums are expended by the Prussian government in works of regulation, partly to keep open a navigable channel, partly to protect the fertile delta region from inundation. The river is navigable for large river craft to the Austrian boundary, and for smaller vessels to Cracow. The traffic in grain, lumber, and other products is considerable, but navigation is rendered very difficult by constantly and rapidly shifting sand banks. The chief cities on the Vistula are Cracow, Warsaw, and Danzig. Its chief tributaries are the San, the Bug, and the Pilica. A canal connects the river with the Oder.

VISUAL SENSATION (Lat. *visualis*, relating to sight, from *visus*, sight, from *videre*, to see). Stimulation of the retina by ether waves gives rise to sensations of color and to colorless sensations. There are three chief characteristics of color sensations (hue, tint, chroma) which correspond respectively to three chief moments (wave length, amplitude, purity) in the physical vibrations set up in the ether. (1) Hue or color tone (as red, orange, yellow, blue) corresponds in the first instance to wave length. The longest wave (answering to red) has a length of about 700 $\mu\mu$; the shortest (which corresponds to violet), a length of about 400 $\mu\mu$. Intermediate wave lengths condition the color qualities orange, yellow, green, blue, etc. (2) Tint or brightness corresponds to the amplitude of the ether wave. A stimulus of wide amplitude gives rise to a sensation of great brightness, i.e., a tint that approaches white. Black, which is as positive a sensation quality as red or white, is correlated with a stimulus of small amplitude or with the total absence of peripheral stimulation. (3) Chroma or saturation depends upon the purity or homogeneity of the stimulus. A light of a single wave length produces a sensation of a high degree of chroma: a light which includes many or all wave lengths of the physical spectrum, a sensation of a low degree of chroma (as a yellowish or reddish white) or one whose chroma is zero (black, white, or gray). While this correlation of physical and psychical moments is a general one, it has, nevertheless, several exceptions and modifications, the most important of which are considered below.

The colorless sensations form a one-dimensional system running through the grays from light to dark, with white at the one end of the series and black at the other. The series may be represented by a straight line, at any point of which there is a quality shading gradually on the one side towards black, and on the other towards white. The place in the series of any given gray is determined, theoretically, by the number of just noticeably different qualities between it and the one or the other end of the series, or practically by the position of the qualities which most resemble it on either side. The capacity for discriminating these qualities is known as sensible discrimination (q.v.) for light. It has been found that for a middle range of lights the relative difference limen, i.e., the ratio of a just noticeable difference to the absolute light value with which the observation is made, is practically constant at about $\frac{1}{100}$; e.g., a gray of 100 photometric units is just noticeably different from one of 101 units. At the two extremes of the series (the dead blacks and the brilliant whites) discriminability is much less. (See INTENSITY OF SENSATION.) It has been estimated, on the basis of experimental work, that there are almost 800 different colorless sensations.

The series of hues runs through the spectrum from red to violet and embraces also the purples. They may be conceived as lying around the periphery of a quadrilateral figure with red, yellow, green, blue at the four corners and the intermediates (oranges, yellow-greens, green-blues, purples, etc.) lying along the sides. A quadrilateral form is chosen instead of a circle because there are distinctive changes at the four points indicated, more or less abrupt changes in direction. The figure also provides for the fact that the ends of the spectrum resemble each other more than either end and the middle. Just noticeable differences have been worked out for hue as well as for the grays. Qualitative changes are much more rapid in some parts of the spectrum than in others. Sensible discrimination is greatest in yellow and blue-green and least in red and violet. In yellow and blue-green one can, under favorable conditions, detect a change of hue in a difference of wave length of less than $\frac{1}{1,000,000}$ mm. Under the same conditions (comparison of two spectra bit by bit) about 160 hues can be discriminated in the whole spectrum. It should be noted that language is misleading in regard to the names of color qualities. The compound terms "yellow-green" and "green-blue" indicate that these colors are less simple than red, green, or blue. This is not true. Any one of the 160 qualities is for introspection as simple and as ultimate as any other.

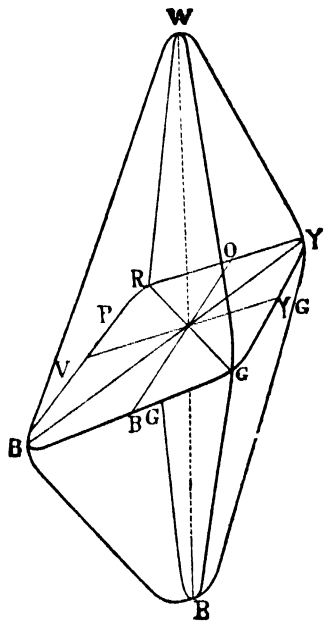

FIG. 1. THE COLOR PYRAMID.

The combination of color with grey or, as it was stated above, the homogeneity or heterogeneity of the stimulus, gives rise to a third moment, viz., chroma or saturation. Chroma denotes the likeness or unlikeness of a color to gray. The relation of chroma to hue and to tint is most easily shown by mixing, in various proportions (e.g., with revolving disks), a color (say, a red) with a gray of the same tint. Whatever the ratio of the two, the hue and the tint remain constant, but the chroma, the richness, the purity, the depth, changes. The more gray is added, the less saturated becomes the color, until finally no hue remains and the chroma becomes zero. The whole number of visual qualities may be represented by a solid figure of the form of a double pyramid with a common base. The tints will lie along the vertical axis of such a figure, the

hues (at their maximal chroma) about the periphery of the base, and the various chromas along horizontal lines connecting the black-white axis with the periphery. The base will be tipped in such a manner that yellow will be nearer than blue to white. This indicates that yellow is intrinsically lighter than blue. Every point on or within the figure will express, then, some definite hue of a certain chroma and a certain tint, while the vertical axis itself represents the series of colorless sensations. It is to be noticed that although change of chroma does not affect hue, it introduces, nevertheless, new visual qualities. A red, or a green, or a violet that is washed over with gray is qualitatively different from the original saturated color. Hence, in making an exhaustive enumeration of visual sensations, we must include the tints, the hues, and the various chromas. The total has been estimated at about 50,000 sensation qualities.

We have seen that hue depends upon wave length. It also depends (1) upon amplitude (intensity of stimulus) and (2) upon the composition of stimulus (mixture of radiations of different wave lengths). (1) If the solar spectrum be made very bright or very weak, the relations of the colors change. In a very bright dazzling series of colors (got, e.g., by looking at the sun through colored glasses) all the colors but yellow and blue tend to change in hue. The green-blues and violet-blues pass over into blue, the yellow-greens, yellow-reds, and even the reds grow yellowish, and the greens become whitish. In the darkened spectrum (called the Purkinje spectrum) it is the red, the green, and a bluish violet that spread at the expense of the other colors. At the same time the lightest point migrates from yellow to green, so that the red end of the spectrum grows dark faster than the violet end. The result is that blue, which at a moderate intensity looks darker than red, at a lower intensity grows lighter than red, before it disappears into gray. This shift of brightness in the darkened spectrum is known as Purkinje's phenomenon, after the physiologist who first called attention to it. Adaptation (see below) to the new intensity is, of course, assumed. We shall see later that the range of vision is also changed by decrease of the intensity of stimulus below a certain point: all phenomena thus conditioned are included under the term "twilight vision," to distinguish them from daylight vision or those occurring with intensities above the critical point. (2) The production of different hues by the mixture of wave lengths is known as color mixture. It is carried out by the mixture of spectral lights, of colored shadows, or reflections; of pigments, by the irradiation of neighboring colored spots (as in a mosaic); and by the rapid alternation of stimuli by means of revolving disks. There are three chief laws of color mixture. (*a*) The law of complementaries: "For every color there can be found another, complementary or antagonistic color, which if mixed with it in the right proportion gives a sensation of light (white or gray), and if mixed in any other proportion a color sensation of low chroma and of the hue of the stronger component." Some of the complementary pairs are red and verdigris, orange and greenish-blue, yellow and blue, green and purple. (*b*) The law of neighboring colors: "The mixture of any two colors which are not complementaries gives an intermediate color, varying in hue with the relative amounts of the two original colors, and varying generally in chroma with their nearness or remoteness in the color series." The mixtures of yellow and green, red and orange, blue and purple, are instances. (*c*) "The mixture of any two combinations which match will itself match either of the original combinations, provided that the illumination of the colors remain approximately the same." Mix, e.g., a gray made from red and verdigris with a like gray made from yellow and blue. The result is a gray which matches either of the component grays. The fact that this law does not hold when the illumination is diminished (failure of Newton's law of color mixtures)—that the mixture which contains green will then be far too bright—constitutes the phenomenon known as the extended Purkinje phenomenon (i.e., for colorless light).

Visual sensation is not solely conditioned, however, upon the wave length, amplitude, and composition of ether vibrations. It is further dependent upon the time and space relations of the stimulus. (1) As a result of the first we have the phenomena of adaptation and negative after-image. By adaptation is meant the change which the visual experience undergoes with continued stimulation. Adaptation may be general (over the entire field of vision) or local (in a part of the field); and it may be adaptation to a stimulus of normal intensity (light adaptation) or to a stimulus of very weak or zero intensity (dark adaptation). When, e.g., the yellow cast which appears as we pass from daylight into an artificially lighted room, or as we put on yellow glasses, gradually fades out, we have a case of general adaptation to a light stimulus. Again, when we go from a light into a completely dark room and after a time the inky blackness gives way to a gray, we have an example of general adaptation to a stimulus of zero intensity. Finally, when we fixate a patch of blue and the sensation gradually loses in chroma until at length the blue disappears and the sensation becomes gray, we have local adaptation. The law of adaptation is that "all sensations of color tend towards neutrality, and all sensations of light towards a middle gray." The negative after-image is an after effect of adaptation. If, after adaptation to the yellow of artificial light, we come out into daylight, all colors and lights are tinged with blue. The typical after-image, however, appears after local adaptation; if, after adaptation to the blue patch, the stimulus is removed, a spot of yellow appears in its stead. The first law of the negative after-image is that "the color or tint of the image is always antagonistic (complementary) to the color or tint of the stimulus." (See AFTER-IMAGE.) (2) As a result of the space relations of the stimulus we have the various phenomena of contrast (q.v.). Here it is necessary only to recall that every patch of light or color in the field of vision affects and is affected by all the others; that contrast is immediate, and therefore opposed to adaptation; and that the contrast effect is always in the direction of greatest qualitative opposition (a yellow makes its surroundings bluish, a black makes its surroundings light).

We have thus far taken for granted the physiological conditions of visual sensation. We should, of course, have no visual experience if we had not an eye with a retina sensitive to

the stimulation of ether waves. The retina, however, is not equally sensitive at all points. In daylight vision stimulation at and around the fovea gives all the color qualities (spectral colors and purples); farther out towards the periphery only yellows and blues are visible; farther out still, only gray, black, and white. As regards color sensitivity, therefore, the retina may be said to be divided into three zones, a black-white zone (outermost), a black-white and blue-yellow zone, and an inner black-white, blue-yellow, and red-green zone. Hence it is found that as a mixed color stimulus moves outward from the fovea the resulting color changes at certain points and finally goes over into a gray. The method of determining the zones is called campimetry (with constant fixation at the centre of a neutral field, a colored object moving out and in, to and from the limits of the field), or perimetry (with constant fixation, the object moving in a similar manner along the arc of a great circle which lies in a hemispherical surface concave to the observer's eye). In twilight vision, on the other hand, the fovea, which in daylight is the place of clearest vision, is blind; a faint star can be seen only in indirect vision. Furthermore, when the intensity of the stimulus is reduced below the limit at which colors appear, stimulation at all parts of the retina, except the fovea, gives only a slightly bluish gray. In daylight vision, then, the outermost zone is color blind, and in twilight vision the entire retina is color blind except for the slight bluish tinge of the gray. There is also an abnormal color blindness (see COLOR BLINDNESS). In the typical and congenital form of the defect (dichromatic vision) red and green sensations are lacking, i.e., the red-green zone is insensitive. There are two modes of dichromatism: deuteranopia, in which the distribution of tint (brightness) in the spectrum is the same as for normal eyes in daylight; and protanopia, in which the distribution conforms to that of twilight vision. The vision of the totally color blind (achromatic), in which both the red-green and the yellow-blue zones are insensitive, resembles twilight vision; the fovea is probably blind, and the brightest part of the spectrum lies in the region of normal green. A few cases of blue-yellow blindness (tritanopia) have been reported; the defect, however, is rare, and usually at any rate is the result of disease. Certain irregularities in normal vision (anomalous trichromatic vision) occur in the central zone: when a yellow is matched with a mixture of red and green, some individuals require much more red, others more green, than the normal amount.

Before we consider the theories of visual sensation, a knowledge of two further sets of facts is important: the nature of that part of the sense organ which is the immediate condition of visual experience, and the results of physical and physiological experiments with pure and mixed spectral lights. The former has already been discussed in another connection (see VISION, *Retina*); the latter will be described in some detail. The physical and physiological experiments with color stimuli are important for psychological theory, even though the points of view of the three sciences are different. The physicist, e.g., seeks to determine the particular wave lengths which produce the colors of the spectrum, and the relations of these wave lengths to one another. The physiologist is interested in the physiological reaction to the various wave trains; while psychology directs its attention to the qualities of visual experience. We have already spoken, in general terms, of the correlation of wave length with hue. The wave lengths usually given for the best blue, green, and yellow of the spectrum are 470 $\mu\mu$, 505 $\mu\mu$, and 576 $\mu\mu$ respectively; spectral red is said to be slightly yellow, so that the best red lies outside the spectrum (Hering). Recent experiments have shown, however, that for some observers a red which is neither yellowish nor bluish is found in the spectrum; and that in the case of the other primary colors individual differences are such that variations from the above values are to be expected; individual variation is least in the case of blue (Westphal). These four best colors may be regarded, psychologically, as the principal colors. The principal colors of physiology are the four stable colors which do not change in hue within the retinal zones to which they belong. They have been determined as a purplish red, a bluish green of about 490 $\mu\mu$, a yellow of about 570 $\mu\mu$, and a blue of about 460 $\mu\mu$. It will be noticed that the psychological yellow and blue are practically the same as the physiological.

The physical primaries are a certain triad of colors which, when mixed in proper proportions, produce all the colors of the spectrum. The principal colors of psychology, as we have seen, are four in number, and lie at the angles of the base of the color pyramid (Fig. 1); but the physical primaries and their mixtures, together with the color matches of trichromates and dichromates, can best be shown by a triangular figure (color triangle). The reasons are that the color square does not necessarily show either exact complementaries or the actual changes in chroma which result from color mixture. For instance, yellow and blue, at opposite ends of a diagonal of the square, are complementary colors, but red and green are not complementary; red is complementary to verdigris, and green to purple (red-blue). Moreover, red and green when mixed together give yellow. It is only necessary, however, to substitute a triangle for a square, with red, green, and blue at its vertices, white in the centre, and yellow on the line connecting green and red (Fig. 2) to secure from the physical point of view a good diagrammatic representation of the whole color

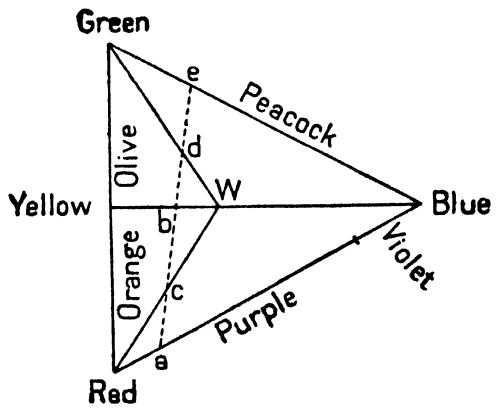

FIG. 2. THE COLOR TRIANGLE (DIAGRAMMATIC).

scheme, including the large body of fact comprehended under the term color mixture. (For different intensities, this plane figure must be made the basis of a double pyramid with intense white and black at the two apices.) The

underlying principle which makes this possible is, in the first place, that color sensations constitute a twofold continuum (intensity being kept constant), since they vary by just perceptible degrees in both hue and chroma. The further condition that is satisfied in the actual representation is (among others) that all colors that can be got by the mixture of any two are on a line joining the points which represent those two, and nearer to the point representing the color that they most resemble. Thus if a certain color *c* (Fig. 2) can be composed from two parts of one color *a* and one part of another color *b*, then it must be represented on the color plane by a point on the line *ab* twice as far from *b* as from *a;* this is the point which would also be the centre of gravity of weights of two pounds and of one pound suspended respectively at the points *a* and *b*. All complementary colors, when mixed in the right proportion, make white light; hence all such colors are on opposite ends of lines which pass through a common point, *W*. Any color can be made up (with some loss of chroma) out of mixtures of a certain three, red, green, and blue (or violet). Hence the general outline of the figure is a triangle. The fact that these mixtures lack something of chroma requires the assumed fundamental colors to be taken at least outside of the actual spectral color line (Fig. 3).

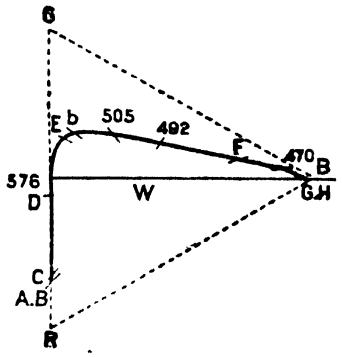

FIG. 3. THE ACTUAL COLOR TRIANGLE.

The color triangle of Fig. 2 expressed (as do all the color diagrams of Hering) the vague idea of the representation of the color continuum by the points of a plane. Clerk-Maxwell was the first to construct a triangle which should represent exact quantities obtained by experiment. The one here given is that of König; it is the result of a vast amount of work done with the aid of the color-mixing apparatus of Helmholtz. This curve is therefore at once the expression of a large number of definitely observed facts, and also, in consequence, extremely serviceable in enabling one to keep all these facts in mind (Ebbinghaus). The choice of the exact wave lengths which represent the pure red, yellow, green, and blue is based upon observations made on the color blind, to be mentioned below. The proportions in which the three physical color constituents must be mixed in order to reproduce all the colors of the spectrum is shown on a different plan in Fig. 4. These curves are also the result of actual measurement, of the most exact kind; the color triangle, in fact, represents the same measurements in terms of trilinear coördinates.

It is unfortunate that nomenclature is in a very backward stage in the subject of light and color. Both these words are used with perfect ambiguity to denote now the sensation and now the physical cause of the sensation; viz., certain trains of ether waves, the photogenic radiations. For instance, the fact of color which is exhibited in the color triangle is that

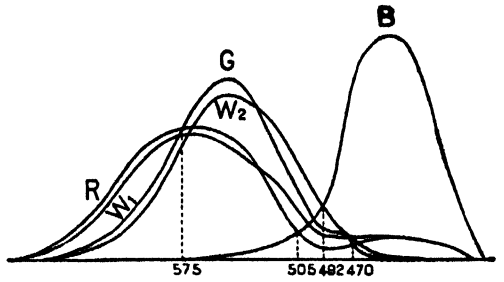

FIG. 4. THE CONSTITUENTS OF THE COLORS OF THE SPECTRUM.

erythrogenic radiations mixed with chlorogenic radiations in a certain proportion suffice to produce the yellow-color sensation. This has nothing to do with the question whether yellow, in the subjective sense, is a color blend of green and red—it is evidently not that. So white (the sensation) is not compounded of yellow and blue sensations, but it is caused by the working together of the causes (physical and physiological) of the sensations of yellow and of blue. If these two very different things were to be kept distinct, there would be no difficulty in reconciling the different views in regard to color; the facts of three-color mixture would be accepted by the psychologists, and the physicists would not imagine that they constitute a theory of color sensation. Helmholtz called his book *Physiological Optics*. The psychological facts of color are to-day so much more in evidence that one writing on the subject now would write on psychological optics.

The color triangle should therefore be thought of rather as consisting of four contiguous color triangles, or, to make use of a convenient device of the mathematicians, portions of different sheets of four coincident planes, each the locus of the (more or less unsaturated) four possible binary color blends. If, e.g., a slightly bluish green have added to it more and more of a slightly purplish red (*a*, Fig. 2), there will result four separate series of color changes: a series of whitish bluish greens (*c* . . *d*), greenish yellows (*d* . . *b*), yellowish reds (*b* . . *c*), and reddish blues (*c* . . *a*).

The characteristics of color blindness may now be restated in the light of these physical measurements. All the color equations of the dichromates are accepted by those having normal eyes, but many distinctions which are made by the latter are not recognized by the former. The fundamental colors of the color triangle (Fig. 3 or Fig. 4) can be chosen (and have been here so chosen) that all the sensations of the red-green blind can be reproduced by mixtures of those elements in the proportions represented by either the pair of curves W_1 and *B* or the pair W_2 and *B;* in both instances, however, the sensations perceived are yellow and blue. Red-green blindness is therefore of two types, according as the distribution throughout the spectrum of the undifferentiated yellow sense follows the curve of red or the curve of green. The sensations of the achromate would be represented on a line at right angles to the plane of the color triangle through the point *W*. The color scale of the yellow-blue visioned (yellow, whitish yellow,

white, bluish white, and blue) will be represented on the line *YB* (Fig. 2). The degree of chroma of the different spectral colors will be got by projecting the spectrum upon the yellow-blue line by means of lines drawn through the points *R* or *G* according to the type of blindness. Thus the neutral points of the defectives of the first class are the points in which the line *RW* cuts the color curve; that of the defectives of the second class the points in which that curve is cut by the line *GW*. As there is only one particular hue which is a pure green or a pure red with no admixture of blue or yellow, it follows that most of the reds or greens of nature appear to these defectives to be not absolutely colorless, but either blue or yellow (brown) of a very poor chroma. Hence they learn to use the fourfold nomenclature of the normal person with a remarkable degree of good luck; it is no worse for them to say scarlet for the whitish yellow in which they see the soldier's coat than for us to coin a fresh term, pink, for what is merely a whitish red.

We are now ready to discuss theories of visual sensation. An explanation must consist in a hypothetical statement of the physiological conditions which underlie the various psychological phenomena. Historically, there are two principal theories; the one sets out from the physical, the other from the psychological facts. All subsequent theories, with perhaps a single exception, may be regarded as modifications or amplifications of these two. They are known as the Young-Helmholtz and the Hering theories.

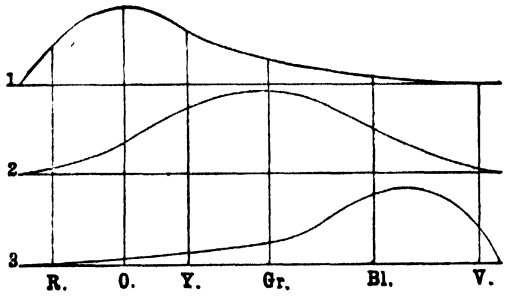

FIG. 5. The Young-Helmholtz theory. The letters *R*, *O*, *Y*, etc., designate the spectral colors. The three curves show roughly the relative values of the excitatory process, 1, in the red-sensitive fibres, 2, in the green-sensitive, and 3, in the violet-sensitive.

The Young-Helmholtz theory sets out from the laws of color mixture as derived by Newton. It posits the existence, in the visual apparatus, of three kinds of nerve fibres, a red fibre, a green fibre, and a blue or violet fibre, each one of which if it were excited alone would give its particular sensation. These three colors, red, green, and blue, are chosen as the primary colors because they give, by mixture, all the various colors and lights at a relatively high degree of saturation (although approximately the same result may be obtained with other combinations of three). Any light stimulus is said to excite all three kinds of nervous elements, but in varying proportions. Red, e.g., excites the red fibre maximally and the green and blue fibres minimally. The color seen under any kind of stimulation depends upon the proportion in which the three kinds of nervous apparatus are affected. Yellow, e.g., results from a strong excitation of the red and green fibres and a weak excitation of the blue fibre. White is due to the equal excitation of all three fibres.

The Hering theory says that there are three visual substances which undergo metabolic changes under the influence of light rays. Each substance is the seat of antagonistic processes: processes of dissimilation (decomposition) and assimilation (recomposition). Dissimilation in one substance gives white, assimilation black; dissimilation in a second gives yellow, assimilation blue; dissimilation in a third, purplish red, assimilation bluish green. From these six principal sensations all others are derived by combined excitation of the three substances. We may call these three substances the *Bk-W*, the *R-G*, and the *B-Y* substances. They are not equally distributed over the retina; all are present in the central zone; only the *Bk-W* is in the outer; and *R-G* substance is wanting in the intermediate zone. In dichromatic vision the *R-G* substance is congenitally lacking.

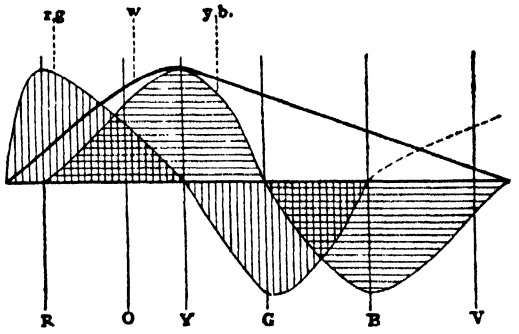

FIG. 6. The Hering theory. The line *rg* shows the effect of rays of different wave lengths on the red-green visual substance; the effect is dissimilative to the point *Y*, assimilative from *Y* to *B*, and then again dissimilative to the end of the spectrum (broken line). The line *yb* shows the effect upon the yellow-blue substance. The line *w* indicates the dissimilation of the black-white substance throughout the whole length of the spectrum.

Both theories have been extraordinarily fruitful in stimulating further investigation, but neither has proved adequate to all the facts. The most important addition, in principle, that has been made to them is von Kries's theory of dual vision. It is supposed that the rods are the organs of twilight, and the cones the organs of daylight vision. The theory explains the blindness of the fovea at night, the Purkinje phenomenon, and the failure of the third law of color mixture with low intensity of stimulus. Dark adaptation is said to be a function of the visual purple. For daylight vision von Kries accepts the principle of the Young-Helmholtz theory, though with numerous amendments.

G. E. Müller, on the other hand, has added important hypotheses to the Hering theory. Black and white in color mixture seem to follow the second law; they mix to give a gray; but in adaptation and contrast they seem to follow the first law. Hering regards them as antagonistic, and, since a balance of assimilation and dissimilation means an absence of function, the gray of the *Bk-W* mixture is unaccounted for. Müller excludes gray from the retina and posits a cortical gray, a sensation of central origin, which is always present in visual experience. Müller's theory differs further from that of Hering in that he assumes four peripheral processes corresponding to the four pure colors, and six central values, red, yellow, green, blue, black, and white. The stimulation of a peripheral process excites usually three central values. This tendency to go to the brain for supplementary hypotheses has also found expression in the theories of Donders and von Kries.

Numerous other theories have been devised with a view to meeting the outstanding difficulties of visual sensation. Thus the Franklin theory supposes that at an early period of development the eye is sensitive only to luminosity and not to color; at this period it possesses only a gray-perceiving substance, present in all parts of the retina, which is affected by all luminous vibrations, but most markedly by those corresponding to the middle of the spectrum; stimulation of this substance produces the sensation of white of all shades. In the course of development of the eye, this gray-perceiving material becomes differentiated in the cones first into two different substances, which are especially affected by the two halves, respectively, of the spectrum; this is the stage of development which corresponds to the yellow-blue color system of the partially color blind, and also to that of the intermediate zone of the normal retina. In the final stage of development, the yellow constituent becomes again differentiated into two substances which respond respectively to red and to green light. The mixed colors are produced by simultaneous stimulation of two or more color substances in varying proportions. The Hering theory is formulated in static, not in genetic, terms; but if we put a genetic interpretation upon it, we must say that for it, too, the black-white substance is the earliest, the blue-yellow the next, and the red-green the last to appear in the course of evolution. Such an interpretation is borne out especially by the facts of color blindness and of indirect vision, as understood by Hering and his school.

Another important theory is that of Wundt, who posits only two excitatory processes, a chromatic and an achromatic, and regards the former as a multiform, the latter as a uniform, photochemical process. Wundt thus gives up altogether the idea of primary components of visual sensation (the three ultimate colors of Helmholtz or the four of Hering) and substitutes for these component theories a theory of gradations within a single process. It may be remarked that Wundt's recognition of a separate achromatic process antedates the formulation of Hering's theory.

VIŚVĀMITRA, vĭsh-vä'mĭt-rà. A celebrated sage of ancient India. He belonged originally to the Khatriya or warrior caste (see CASTE), being King of Kanauj (q.v.), but by extraordinary acts of religious austerity he exalted himself to the dignity of the priestly class, an example without parallel in ancient India. In the *Rig-Veda* (see VEDA), especially in the third book, a number of hymns are ascribed to him, and his bitter rivalry with the sage Vasishtha (q.v.) for the position of chief priest of King Sudās, together with his competitor's greater success, form incidents that are reflected on an historic background. The traditional rivalry between the two appears likewise in the epic and in the *Purāṇas* (q.v.). The first book of the *Rāmāyaṇa* (q.v.) gives a legendary account of the way in which Viśvāmitra rose. An incident of Viśvāmitra's life also forms the subject of Kshemisvara's *Caṇḍa-Kāuśika*, or Wrath of the Descendant of Kuśika, which is one of the best of the Sanskrit dramas. Consult: William Muir, *Original Sanskrit Texts*, vol. i (2d ed., London, 1868); Kaegi-Arrowsmith, *The Rigveda* (Boston, 1886); W. J. Wilkins, *Hindu Mythology* (2d ed., London, 1900); A. Hillebrandt, *Vedische Mythologie* (Breslau, 1910). See HARIŚCHANDRA.

VIS'-VI'VA. A term devised by Leibnitz (1695) and formerly used to denote the product of the mass of a body into the square of its velocity. It was applied to one-half this quantity, or $\frac{1}{2}mv^2$, by Coriolis. This is now known as kinetic energy. See ENERGETICS.

VITA'CEÆ (Neo-Lat. nom. pl., from Lat. *vitis*, vine, from *viere*, to twine; connected with Eng. *withy*), or THE VINE FAMILY (or AMPELIDACEÆ). A family of climbing woody vines or erect shrubs, including about 10 genera and over 500 species, widely distributed. The most important genus is *Vitis* (grape), which includes about 50 species, natives of warm temperate regions, about half of which occur in the United States. *Ampelopsis* and *Parthenocissus* (Virginia creeper or woodbine) are also well-known members of the North American flora, the latter genus often being called *Psedera*.

VITA'LIA'NUS, SAINT, POPE (657–672). He was born in Campania and came to the papal throne when the Greek Emperor Constans II (died 668) was persecuting those who opposed monothelitism. Tactfully he ignored this opposition and cultivated friendly relations with the Emperor, with such success that the latter made him a visit at Rome in 663. He also put Constans's successor Constantine IV under obligation to the papal see by helping him in his campaign against a rival. This Pope is also remembered as the sender of the distinguished Theodore (see THEODORE OF TARSUS) to the see of Canterbury. Consult Sangen, *Geschichte der römischen Kirche*, vol. ii (Bonn, 1885).

VITA'LIS, ORDERICUS (1075–c.1143). A Norman historian. He was the son of Odelerius, confessor to Roger of Montgomery, and was born at Atcham, near Shrewsbury, England. He entered the monastery of St. Evroult in Normandy in 1085, and with the exception of short intervals spent the remainder of his life there. At the suggestion of Rober du Sap and Guérin des Essarts he began to compose the annals of St. Evroult, and afterward expanded his work into a general history of 13 books, bearing the title *Historia Ecclesiastica*. The work, which begins with the apostolic era, is of value chiefly for the period in which Ordericus himself lived. The original manuscript is now in the Bibliothèque Nationale at Paris. It was first pub-

lished in Duchesne's *Historiæ Normanorum Scriptores* in 1619. There is a French translation in Guizot's *Collection des mémoires relatifs à l'histoire de France* (1825–27), and an English translation in Bohn's *Antiquarian Library* (4 vols., 1853–55).

VITAL STATISTICS (Lat. *vitalis*, relating to life, from *vita*, life, from *vivere*, to live). That branch of statistics which studies the growth and changes of population. The facts which it seeks to interpret are derived from two main sources, censuses and registration reports. Censuses give information regarding population at a certain day, and show the changes and growth of population only by comparison between the results of two or more censuses. Registration reports are obtained by tabulating the records of certain important events made at or near the time of their occurrence. The scope and accuracy of these registration reports vary greatly with time and place. They usually include deaths, marriages, and births, and sometimes divorces, with various statistical facts about each. The number of such occurrences is controlled mainly by the number of people in the community for which the report speaks. To exclude this, the most important cause of difference in the figures, it is usual to compute the average number of births, deaths, or marriages occurring in a fixed unit of time, usually a calendar year, and in a fixed unit of population, usually 1000. The result of such a computation has been named a rate. The death rate means the average number of persons dying in a year to each 1000 of the population. The marriage rate and the birth rate have similar meanings, except that the first term of the ratio is the number of persons marrying or the number of children born, respectively. Rates of this class are sometimes known as crude or simple rates in distinction from refined or corrected rates in which the unit of population may be a group each of whom possesses certain specified characteristics. Thus death rates are computed for a specified age and sex and occupation and race, both terms of the ratio being correspondingly limited, as for example the death rate of negro married women between 25 and 34 years of age.

The main statistical facts regarding population being found under the heading STATISTICS, the present article is confined to the statistical results derived from rates.

General Death Rate. Perhaps the highest death rate for great countries where records are kept occurs in Russia, with 31.2 per 1000 on the average for 1901–05; Chile, with 30.4 for 1901–08; and Rumania, with 25.8 for 1901–08. The lowest death rates are found in the Australian Commonwealth, Great Britain, the Scandinavian countries, Holland, and some of the American States. The lowest averages for the years 1906–10 were: New Zealand, 9.7; Australian Commonwealth, 10.7; Denmark, 13.7; Norway, 13.8; England and Wales 14.7; and United States (registration area) 15.1. The death rate is usually somewhat higher in cities than in rural districts, but with the increase of sanitary precautions and the development of preventive medicine the difference between city and country is steadily decreasing. Thus in the United States in 1890 the average death rate of the cities of the registration States was 22.1 and that in the rural districts 15.3. In 1913 the death rate of the cities had fallen to 15.1, while that of the rural districts had fallen to 14.1, so that the apparent difference between the two was nearly eliminated. Deaths are recorded with less completeness in the rural districts, and it is probable that the foregoing figures for the rural districts understate the true death rate.

Sex. Wherever records exist the average death rate for males of all ages is higher than the death rate for females. Thus, in England and Wales on the average of the five years 1901–05 the death rate of males was 17.1 and that of females 15.0, and similarly in the registration area of the United States in 1913 the death rate of males was 14.9 and that of females 13.1.

Age. The first year of life and the years of extreme old age are those in which danger of death is greatest. Thus the death rate of male children in England during the first year of life was 161.0, a rate that is not equaled for any subsequent year of life until the age of 81 is reached. The lowest death rate for each sex is reached at about 11 to 13 years of age, when the death rate in healthy communities is from 4.0 to 5.0, not more than one-fourth of the average for all ages. The ages from three to 50 or slightly above 50 are the healthy years of life, or the years at which the death rate is below the average for all ages. The larger the proportion of the population belonging to these ages, the lower the death rate is likely to be. Cities usually contain a much smaller proportion of persons over 50 than do the country districts about them and not much if any larger a proportion of children. They also contain a larger proportion of females than the country districts in their vicinity. These differences in age and sex composition of the population of cities, giving them a disproportionate number of the healthy ages and the healthier sex, tend to mask the real difference between the death rate of city and country districts.

Age and Sex. The lower death rate of females holds for nearly all periods of life, the main exception being during 10 or 15 years below the age of 20, when the death rate of females is as high as or a little higher than that of males. Modern civilization has so reduced the perils of childbirth that women in early adult years, although subject to this special danger in addition to those common to both sexes, have a death rate lower than men of the same ages. The death rate of English women, ages 25 to 34, was five for the years 1896–1905, that of English men of the same age, 6, and the relation in other western nations is similar. The following figures give the death rate of each sex in England and Wales in the 10 years 1896–1905:

AGE	Death rate		Ratio of male rate to female taken as 100
	Of males	Of females	
Under 1	191	153	124
1–4	22	21	105
5–14	3	3	100
15–24	4	3.5	114
25–34	6	5	120
35–44	10	8.5	117
45–54	18	14	128
55–64	33	26	127
65–74	68	57.5	118
All ages	18	16	112

The salient fact shown by the figures is that the differences are at a maximum during the years of infancy and above the age of 45, and at a minimum at the healthiest period of life. This minimum is explained in part by the effects of child bearing. In Servia the death rate of females appears to be higher than that of males for all ages combined, while Denmark, Holland, Spain, Italy, Austria, Hungary, and Russia show higher rates for females for one or more age groups.

Infant Mortality. The death rate of children constitutes a very sensitive barometer of sanitary conditions, partly because that class of the population migrates little, but mainly because of its extreme sensitiveness to sanitary and hygienic conditions. There is hardly any difference between different countries, different social classes, or different periods of time, more pronounced than in infant mortality. In Norway, Sweden, and Ireland only about 10 per cent of the children born alive die before they reach one year old; in Prussia, Bavaria, and Russia the proportion rises to one-fourth. In Massachusetts about one-seventh of the children born die under one year of age. The combined statistics for Washington, D. C., Baltimore, and New Orleans show that in 1911 the death rate of whites under one year of age was 134, that of the negro 315, indicating that the infant mortality of the colored population exceeds that of Prussia, Russia, or Bavaria.

Race. The influence of race upon vitality is one which cannot be clearly distinguished from that of other factors usually associated with it. In the countries of Europe which still furnish most of our information regarding vital statistics the differences of race are elusive, and in consequence this distinction is seldom, if ever, drawn in the vital statistics of those countries. For the native population of Australia and New Zealand vital statistics are almost entirely lacking, but what indications there are point to a high death rate and a low vitality. Statistics on this subject from South Africa have been but recently organized and are still too slight to be significant. The largest body of evidence on this topic is that furnished by the vital statistics of the United States.

The report of the Bureau of the Census on "Mortality Statistics 1911" gave data for the registration area which included 63 per cent of the total population of the country. It reported 779,770 deaths of whites and 59,514 deaths of colored persons. Of the colored 94 per cent were negroes. The death rate for whites was 13.7 and for colored, 23.7. The census of 1900 had reported a rate of 30.2 for negroes, so that a marked reduction is shown. The colored population shows a higher death rate than the white for both sexes and for every age group. This is no doubt due largely to differences in economic and social conditions as well as race. The mortality of the colored population is more than twice that of the native whites in the age groups under 20 years. Thereafter the difference is decidedly less, though it does not decline uniformly. In the age groups 20 to 44 years inclusive the colored mortality is two-thirds greater than that of the native whites; it rises to nearly double that of the whites in the age group 45 to 54, but thereafter the difference in the two rates falls steadily, nearly disappearing after age 75.

Various studies of vital statistics of negroes in northern cities have shown that their death rates nearly equal their birth rates and that consequently the increase in number is due mainly to migration from southern States. Thus the Department of Health of New York City found that in 1914 the death rate of negroes was 26.31 per 1000 as compared with 13.40 for the entire city. The deaths from tuberculosis were four times as great proportionately as among whites. The infant death rate was 181 per 1000 for negroes and 95 for whites.

Marital Condition. The death rate of married men is almost always, if not always, less than that of the unmarried of the same age. Thus, in Prussia in the decade 1896–1905 the death rates of males were as follows:

AGE	DEATH RATE OF		
	Single	Married	Widowed and divorced
1–19	9	3.5	...
20–39	7	6	17
40–59	26	16	33
60 and over	74	57	110

The death rate of the married is uniformly least and that of widowers, uniformly greatest. Various reasons for the difference have been assigned. Among them are the more regular life of husbands, their better economic condition, and their better health at the start, the weak and sickly being unable or unwilling to enter matrimony. Probably all of these reasons are at work. An interesting evidence of the beneficial influence of marriage upon the health of men has been drawn from the figures for Norway and Sweden. As a rule the death rate rises slowly but steadily from the minimum in the early teens to the maximum at the end of life. But if marriage is a healthier state than single life, then during the years when large numbers of men are passing from the less healthy to the more healthy condition the tendency to an increase of the death rate with age might diminish or disappear. And that is precisely what is observed. The death rate of bachelors and of husbands taken separately increased steadily with age, but the death rate of all males between 30 and 34 was less than between 20 and 24, an anomaly which Kiaer explains by pointing to the much larger proportion of married men at the later age period. The effect of marriage on the vitality of women is not so clearly beneficial. During the early years of married life the difference is decidedly to the disadvantage of wives compared with spinsters, due doubtless to effects of child bearing; it gradually declines, disappears at about the age of 40, and at later ages the health of wives is better than that of unmarried women. This change, however, may be due mainly to the selection of the more vigorous and healthy women for marriage.

Occupation. The leading source of information regarding the mortality in various occupations is the English statistics. It should be noted in the first place that the mortality of occupied males of ages 25 to 65 is less than that of all males of the same ages and only one-third that of the unoccupied males of these ages. The English data show that the death rate of occupied males in cities is somewhat

above the normal, and that the rate in agricultural districts is only three-fifths that in industrial districts. For the purpose of comparison between the several occupations the comparative mortality figure is computed. This takes as the basis of comparison a mortality rate of 1000 for all males of ages 25 to 65. A comparative rate of more than 1000 signifies that the mortality of men engaged in the occupation indicated is greater than the normal rate for men of ages 25 to 65 and vice versa. These comparative rates for the six healthiest occupations in 1900–02 were: clergymen, 515; gardeners, 527; gamekeepers, 586; farmers, 562; railway engine drivers and stokers, 582; farm laborers, 572. The rates for the six occupations with highest mortality were: copper miners, 1609; innkeepers, publicans, and spirit dealers, 1669; inn and hotel servants, 1767; costermongers, 1778; general laborers, 1987; tin miners, 2169. In the decade 1891 to 1901 there was a decline in the mortality rate in nearly every occupation in England. The comparative rate for all occupied males ages 25 to 65 in 1891 was 1102 and in 1901, 925. But the rate for general laborers rose from 1413 in 1891 to 1987 in 1901 and the rate for tin miners from 1628 to 2169. In recent years widespread study of occupational, health, and accident hazards has shown that the mortality from diseases incident to various occupations is astonishingly high. In the United States the annual number of deaths from industrial accidents is from 25,000 to 30,000 while metallic poisons, noxious gases, vapors, fumes and fluids, irritant dusts, organic germs, and such conditions as compressed air, excessive humidity, light, or heat affect adversely the mortality rate of numerous occupations.

Birth Rate. As a rule in old and long-settled countries the birth rate is high where the death rate is high. The converse, however, is not true, a number of countries having a moderate or high birth rate and at the same time a low death rate. The birth rate of female children is lower than that of males. It is usual to state these facts by computing the number of males born to every 100 or 1000 females. In general there are from 104 to 106 male children born to every 100 female. In the United States there are no trustworthy statistics of births for any large sections of the population. An indication of the birth rate may be found by computing the number of children under five years of age reported by the census to each 1000 women between 15 and 44. The children under five are selected rather than those under one, because many of the latter class are erroneously reported as one year and a smaller number are omitted by the enumerators. In 1890 there were 529 children in the United States under five years of age to each 1000 women between 15 and 44. In 1900 the ratio had declined to 518, and in 1910 to 488, indicating that in the United States, as elsewhere, the birth rate has slightly declined. The figures for the whites fell from 517 in 1890 to 509 in 1900 and to 477 in 1910, while those for the colored, mainly negroes, fell from 619 in 1890 to 584 in 1900 and to 515 in 1910, indicating that the birth rate among the colored is decidedly higher than among the white, but that the decline among them has also been more rapid, so that the birth rates of the two races are approaching equality. The facts may be obtained separately at each census for the cities having at least 25,000 inhabitants and for the rural districts. They show that the proportion of children in the rural districts has declined only slightly while the ratio in the cities has declined sharply. This indicates that the birth rate in cities having at least 25,000 inhabitants is lower than it is elsewhere and that the difference between city and country is increasing. The census data show for the colored population, mostly negroes, that the difference in birth rate between city and country is far greater than it is for the white, the proportion of negro children in cities being much less and the proportion of negro children in country districts much greater than the corresponding proportions among the whites.

It is also shown that the lowest birth rates are found in some of the New England States while the highest rates are found in some of the new agricultural States, as North Dakota and Oklahoma.

Whether the native population of the United States is maintaining itself by excess of births over deaths is a much-disputed question regarding which the statistical evidence is so meagre as to afford no certain reply. It is probable that in the New England States the native population is not maintaining itself, but it is inadmissible to generalize from conditions there to those throughout the country. Indeed, the figures for the country as a whole seem to indicate that the native population is increasing from its own loins.

In western nations generally and in Australia and New Zealand, the birth rate has declined since 1880. The extent of this decline from 1881–85 to 1909 is shown for principal countries in the following table:

COUNTRY	Av. rate 1881–85	Rate in 1909	Per cent of decline
Ireland	23 9	23.5	1.6
Spain	36.4	32.6	14.4
Italy	38.0	32.4	14.7
Prussia	37.4	31.8	14.9
Hungary	44.6	37.0	16.6
Victoria	30.8	24.6	20.1
France	24.7	19.6	20.6
Scotland	33.3	26.4	20.7
England and Wales	33.5	25.8	23.0
New Zealand	36.3	27.3	25.5
Queensland	36.5	27.2	25.5
New South Wales	37.7	26.9	28.4
South Australia	38.5	24.7	35.8

Numerous causes are assigned for this decline. It is popularly explained by the postponement or avoidance of marriage, but neither of these conditions are revealed by statistical evidence. An increase of sterility due to rich diet or venereal disease explains it only in slight degree. It is generally agreed that the main cause is conscious limitation of family increase which in turn is directly related to higher standards of living.

Marriage Rate. In most civilized countries the marriage rate declined slightly from 1860 to 1890 but showed a tendency to rise in the 10 years 1895–1905. Thus in England and Wales the mean annual marriage rate per 1000 total population fell from 16.6 for the decade 1861–70 to 14.9 for 1881–90 but rose to 15.6 for 1891–1900. For the past half century Ireland has had the lowest marriage rate of all European countries, the rate per 1000 total population averaging 9.6 in 1891–1900. Sweden,

Chile, and Uruguay also have low rates, while Saxony, Russia, Hungary, and Servia have the highest rates. The following table gives the mean annual marriage rates per 1000 marriageable persons, i.e., bachelors 18 years of age and over, spinsters 15 years of age and over, and all widowed and divorced persons.

AVERAGE ANNUAL MARRIAGE RATE PER 1000 MARRIAGEABLE PERSONS

COUNTRY	1876-85	1886-95	1896-1905
England and Wales	56.8	52.9	53.1
Scotland	44.5	42.1	43.2
Ireland	26.0	24.1	25.3
Denmark	53.9	50.1	50.8
Switzerland	43.1	42,3	45.4
Prussia	58.0	59.1	61.6
Bavaria	47.0	47.1	51.7
Saxony	69.8	69.8	70.0
Netherlands	53.1	49.6	52.0
Belgium	43.6	45.3	55.3
France	49.7	48.2	51.3
Italy	54.2	54.6	54.1

The United States lacks marriage statistics obtained through registration, and in this, as in other fields of vital statistics, is compelled to rely mainly upon inferences derived from the census. Only for the censuses of 1890, 1900, and 1910 has information on this subject been afforded. Of all persons in the United States rather more than one-third (38.9 per cent) were married in 1910; about 1 in 20 (5.0 per cent) were widowed; and nearly 4 in 1000 (0.38 per cent) were divorced, the remainder, not quite three-fifths (55.4 per cent), being single. The proportion of married increased from 35.7 per cent in 1890 to 36.5 per cent in 1900. On the other hand the proportion of single has diminished, the proportion of widowed and divorced changing but slightly. A part of this change is due to the decreasing proportion of children and in consequence the increasing proportion of persons of marriageable age. Yet even when attention is confined to the population over 15 years of age, the proportion of married in the United States slightly increased from 1890 to 1900 and again from 1900 to 1910. Examination of the figures for conjugal condition by sex and age shows that this slight increase in the per cent married was confined to the periods of early adult life. The per cent of married persons among men in the age group 15 to 19 rose from 0.5 in 1890 to 1.0 in 1900 and to 1.1 in 1910; in the age group 20 to 24 the increase was from 18.9 in 1890 to 21.6 in 1900 and to 24.0 in 1910. For the age group 25 to 34 the proportion married fell from 61.5 in 1890 to 60.6 in 1900 but rose to 62.8 in 1910. The per cent of married females from 15 to 19 years of age increased from 9.5 in 1890 to 10.9 in 1900 and to 11.3 in 1910; in the age group 20 to 24 there was a decline from 46.7 per cent in 1890 to 46.5 per cent in 1900 but a rise to 49.7 per cent in 1910; while in the age group 25 to 34 the percentages for the three censuses were respectively 75.2, 73.0, and 75.1. Moreover for both sexes there was a very slight increase in the proportion of those of ages 35 to 44 who were married. This tendency to marry earlier than 10 or 20 years ago was shown by every nativity class, i.e., by the native whites of native parentage, native whites of foreign or mixed parentage, foreign born, and negro. These increases in early marriages are probably an index of the unusual prosperity of the country. They indicate clearly that any decline in the birth rate in the United States is not to be explained by a tendency to avoid or postpone marriage.

Bibliography. For general treatment of this subject consult Tarr, *Vital Statistics* (London, 1885); Newsholme, *Elements of Vital Statistics* (2d ed., ib., 1889); M. G. Mulhall, *Dictionary of Statistics* (4th ed., New York, 1903); W. B. Bailey, *Modern Social Conditions* (ib., 1906). English statistics are summarized in the *Annual Report of the Registrar General* (London). A notable collection of international data will be found in *Statistique internationale du movement de la population* (Paris, 1907); also in A. D. Webb, *New Dictionary of Statistics* (New York, 1911). Numerous articles in the *Journal* of the Royal Statistical Society (London, annually) should be consulted. American statistics in this field are weak and defective, the best sources of information being the volumes of the United States Census and the annual registration reports of a few States, especially Michigan, Massachusetts, and Rhode Island. For mortality tables see LIFE INSURANCE. See also BIRTHS, REGISTRATION OF.

VITAMINE, vī-tăm'ĭn *or* -ēn (from Lat. *vita*, life + amine). A term proposed by Funk to include the peculiar health-giving and disease-preventing element of the rice grain, which exists chiefly in its outer envelope (pericarp), and which is thought to be lost in the usual process of polishing rice. Vitamine now expresses the idea that in addition to the usual proteins, fats, carbohydrates, etc., contained in ordinary foodstuffs there must be present also a sufficient amount of vitamine in order that normal metabolism can be maintained. In all attempts which have so far been made to isolate vitamines in sufficient quantities for experimental studies, only very small amounts have been obtained. (See BERIBERI.) Butter and some other fats and yeast are believed to contain vitamine. Consult C. Funk, *Die Vitamine* (Wiesbaden, 1914). Athertan Seidel, "Vitamines and Nutritional Diseases," in *Public Health Reports* (Washington, Feb. 18, 1916).

VI'TASCOPE. See KINETOSCOPE; MOVING PICTURES.

VITEBSK, vē-tyĕpsk'. A government of west Russia, bordering on the Baltic Provinces. Area, about 16,983 square miles, about one-third forested (Map: Russia, C 3). It has a flat and somewhat undulating surface, with low hills in the southeast and the north, and extensive marshes in the west. The region is watered principally by the Düna and its tributaries. There are about 2500 small lakes and ponds. Agriculture is the principal occupation. The peasants migrate for the winter months in considerable numbers to the more industrially developed regions of the country. Pop., 1897, 1,489,246; 1912, 1,875,100.

VITEBSK. The capital of the Government of Vitebsk, in west Russia, situated on the Düna, 387 miles south of St. Petersburg (Map: Russia, D 3) It is an old town (1021) poorly built, but containing some noteworthy specimens of ecclesiastical architecture, notably the Upensky Cathedral (1771), the cathedral of St. Nicholas (1664), and the Roman Catholic churches of St. Anthony and St. Michael, the last possessing an interesting library. At the junction of two important railroads it is of

considerable commercial importance as a distributing point for its own region and the two neighboring governments of Pskov (q.v.) and Mogilev. Pop., 1911, 103,840, of whom the Jews constituted about two-thirds. In the beginning of the eleventh century Vitebsk formed a part of the Principality of Polotsk, and 100 years later it became the capital of the independent Principality of Vitebsk, which was annexed in the fourteenth century to Lithuania and later to Poland. In 1772 it was annexed to Russia. Napoleon entered it in 1812.

VITEL'LIN. See GLOBULINS.

VITEL'LIUS, AULUS (15–69 A.D.). A Roman emperor (January–December 69 A.D.). He was consul in 48 and later served with distinction as proconsul in Africa. He won and kept the favor of Tiberius, Caligula, Claudius, Nero, and Galba. Having been made by Galba commander of the legions in lower Germany, Vitellius won over the soldiers by extreme familiarity and liberality, and on Jan. 2, 69, they proclaimed him Emperor. In this the troops in Gaul concurred; and two armies under Valens and Caecina, who had commanded legions on the Rhine, set out for Italy, and soon secured Rome through the overthrow of Otho (q.v.). Vitellius ruled with great moderation, but by his personal depravity and gluttony he lost favor, and the legions of Pannonia and Illyricum, having proclaimed Vespasian (q.v.) Emperor, advanced into Italy under Antonius Primus. The Vitellian troops were decisively defeated on two consecutive days, near Bedriacum, but further south, Vitellius's brother, Lucius, won several victories. Rome, however, was soon in the possession of Antonius Primus. Vitellius was killed, his head carried about Rome, and his body thrown into the Tiber. Consult his *Life*, by Suetonius; B. W. Henderson, *Civil War and Rebellion in the Roman Empire*, 69–70 A.D. (London, 1908); and the article "Vitellius, 4," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

VITERBO, vē-tĕr'bō. A city in the Province of Rome, Italy, situated at the foot of the Monte Cimino, 54 miles by rail north-northwest of Rome (Map: Italy, D 3). It is encircled by old Lombard fortifications and has well-built streets. It is noted for its handsome examples of architecture and its interesting palaces. The fine Romanesque-Gothic cathedral, in the extreme southwest corner of the city, contains the tomb of Pope John XXI, while in San Francesco Clement IV and Adrian V lie buried. It dates from the twelfth century, and has a Gothic campanile. The splendid Municipal Palace stands in the centre of the city. It dates from 1264, and has a fine portico and attractive frescoes. It contains the municipal museum of Roman and Etruscan antiquities. The church of Santa Maria della Salute has an artistic portal, and the small church of Sant' Angelo an interesting façade. The former church of Santa Maria della Verità, with a beautiful Gothic cloister, now serves as the public hall. The public garden lies near the north end of the city. In the vicinity of the city are Etruscan cemeteries and also the beautiful pilgrimage church of Santa Maria della Quercia. The manufactured articles of Viterbo include leather, paper, cloth, soap, matches, and playing cards. There are warm medicinal springs in the neighborhood, and mines of alum and sulphur. Pop. (town), 1911, 17,517.

Viterbo was the capital of the patrimony of Peter—the extensive grant to the Pope by the Tuscan Countess Matilda (died 1115). It was often a papal residence, and has been the scene of five papal elections.

VITET, vē'tā', LUDOVIC (1802–73). A French author and political leader, born in Paris. He was educated at the Ecole Normale, but after spending some time in travel gave up the profession of teaching for that of letters. In 1824 he began contributing literary and artistic criticisms to the *Globe*. In his first books, *Les barricades* (1826), *Les états de Blois* (1827), and *La mort d'Henri III à St. Cloud* (1829; the trilogy united in 1844 under the title of *La Ligue*), Vitet opened a romantic vein new to French literature by presenting historical occurrences in vivid dramatic form. After the Revolution of 1830 Guizot created for the young writer the post of inspector of historic monuments. He was a member of the Chamber of Deputies from 1834 to 1848, of the Legislative Assembly in 1849, and of the Constituent Assembly in 1871. In 1845 he became a member of the Academy. He was the author of *Histoire des anciennes villes de France* (1833); *Histoire de Dieppe* (1833); *Fragments et mélanges* (1846); *Histoire financière du gouvernement de Juillet* (1848); *Les états d'Orléans* (1849); *Le Louvre* (1852); *Essais historiques et littéraires* (1862); *Etudes sur l'histoire de l'art* (1863–64); *La science et la foi* (1865); *Lettres sur le siège de Paris* (1870–71); the posthumous *Etudes philosophiques et littéraires* (1874); and *Le Comte Duchâtel* (1875).

VI'TEX (Lat., chaste tree, Abraham's balm). A genus of trees or shrubs of the family Verbenaceæ. *Vitex agnuscastus*, the chaste tree, a native of the Mediterranean region, is downy, with digitate leaves, white on the back, and has an acrid fruit. It derives its name from the practice of Grecian matrons of strewing their couches with its leaves, especially during the sacred rites of Ceres, in order to banish impure thoughts, for which purpose a sirup made of its fruit was also used in convents in southern Europe. *Vitex negundo*, an Indian species, has aromatic leaves, which are bruised and applied to the temples for relief of headache. In Australia *Vitex acuminata* and *Vitex lignum-vitæ* yield close-grained, hard wood used in cabinet-making.

VITI (DELLA VITA), vē'tē (dĕl'là vē'tà), TIMOTEO (1467–1524). An Italian painter of the Renaissance. He was born at Ferrara, and was the principal pupil of Francia, with whom he studied at Bologna (1490–95), and also of Costa. He then settled at Urbino, where he stood in high favor with the reigning Duke and became chief magistrate of the town, residing there until his death in 1524. He was the teacher of the youthful Raphael, and his works show those qualities which are called Raphaelesque—subtile grace of line, harmonious balance of all elements, poetic charm. Timoteo's earliest efforts show the influence of Francia and Costa; as, e.g., the "Madonna with Two Saints" (1495, Brera, Milan), formerly ascribed to Raphael; the beautiful figures of Saints Margaret (Bergamo) and Apollonia (Urbino); an "Annunciation" with Saints John the Baptist and Sebastian (Brera); and the fine altarpiece of the cathedral of Urbino (1504). Gradually the Umbrian influence replaced that of Francia; and to this later period belong the "Magdalen"

(1508–09, Pinacoteca, Bologna), a signed altarpiece at Cagli, and another in the cathedral of Gubbio, representing the "Legend of Magdalen" (1521). Consult Morelli, *Italian Painters: Critical Studies of their Works*, vol. ii (London, 1892–93), and Bernhard Berenson, *North Italian Painters of the Renaissance* (New York, 1907).

VIT'ICUL'TURE. See GRAPE.

VITI (vē'tē) **ISLANDS.** See FIJI ISLANDS.

VIT'ILI'GO (Lat., a skin disease). Acquired albinism; leukodermia. A disease characterized by the disappearance of pigment from the skin. Vitiligo is common in tropical countries, comparatively rare in Europe and America. In most cases the pigment disappears so that white patches are formed around whose edges the pigment is darker. The patches grow larger with time, coalesce, and finally the white area may spread so as to cover the whole body. The complete process involves many years. No disturbance of dermal secretion or sensation occurs. Either sex may suffer from it; and, though seen at as early an age as four years, it rarely begins before 10 or after 30 years of age. It is more common in the dark races. The cases of negroes who gradually become white are examples of vitiligo. It is thought to be a tropho-neurosis, and in many instances it has been preceded by wasting illness, such as scarlet fever, typhoid fever, or severe intermittent fever; and may be associated with alopecia areata (a form of baldness), morphea, or exophthalmic goitre. It generally progresses symmetrically, and thus differs from congenital white patches, as well as from the maculo-anæsthetic leprosy of India, with which it has been confounded. Spontaneous arrest may occur, but the prognosis is not hopeful for recovery.

The use of general tonics, especially arsenic, and hygienic measures may stay the progress of the decolorization, while never restoring the pigment.

VITIVERT. See VETIVER.

VITORIA, vē-tō'rē-ä, or **VITTORIA.** The capital of the Province of Alava, Spain, 30 miles south of Bilbao, on the left bank of the Zadorra River (Map: Spain, D 1). The upper, or old town, with some ancient ruins visible, is narrow, gloomy, and dirty, while the new town, on a lower level, is more open and elegant, with finer buildings and charming paseos and plazas. The cathedral of Santa María de Vitoria is a twelfth-century church and fortress, and was restored in the fourteenth century. Its companion fortress church, San Vicente, was reconstructed in the fifteenth century. Among the secular structures the Municipal Building is interesting architecturally and contains many memorials of Isabella the Catholic; the Palace of the Provincial Deputation, a nineteenth-century structure, is filled with mementoes of the life of the province. The poorhouse occupies the former Colegio de San Prudencio. Here was the first modern prison in Spain.

The climate of Vitoria is cold and humid. The occupations of the inhabitants are dependent upon the industries of the city, which comprise the manufacture of chairs, mirrors, picture frames, iron bedsteads, woolens, leather, oilcloth, chocolate, pastas, crockery ware, malt liquors, and chemicals. Pop., 1910, 32,377.

Vitoria appears in history as early as the sixth century, under the Visigoths, but did not attain importance until the tenth century, when it was an important fortress with extensive local privileges. During the Middle Ages there were many fierce conflicts within its walls, between the aristocratic and democratic factions. Its part in the War of the Communes told heavily against it in loss of population and privileges. It was the scene of the decisive victory, June 21, 1813, by which Wellington drove the French out of Spain. Here, in 1833, originated the Carlist struggle.

VITRÉ, vē'trā'. The capital of an arrondissement in the Department of Ille-et-Vilaine, France, 23 miles by rail east of Rennes, on the left bank of the Vilaine (Map: France, N., D 4). The remnants of the fortifications, into some of which the houses are built, the gloomy seventeenth-century houses with their balconies nearly meeting over the narrow streets, and the half ruined fourteenth–fifteenth century castle with its massive restored donjon, give the town a strikingly feudal aspect. In the court of the castle, which now contains a library, a museum of natural history, and a prison, stands a collegiate chapel dating from the twelfth century. The famous Château des Rochers, the occasional residence of Madame de Sévigné, lies a short distance south of Vitré. Hosiery, cloth, and goatskin clothing are manufactured. Pop., 1901, 10,775; 1911, 9874.

VIT'REOUS TEXTURE. See IGNEOUS ROCKS.

VIT'RIFIED FORTS (from Lat. *vitrum*, glass + *facere*, to make, do). The name applied to ancient rude structures, a portion of whose walls shows the action of intense heat in solidifying the rocks by fusion. These archæological enigmas are found chiefly in Scotland, but they also exist in Ireland, Germany, Austria-Hungary, and France. They seem to represent a first step in glassmaking.

VIT'RIOL (OF., Fr. *vitriol*, from ML. *vitriolum*, vitriol, neut. sing. of *vitriolus*, variant of Lat. *vitreolus*, glassy, dim. of *vitreus*, glassy, from *vitrum*, glass). A name given by early chemists to certain vitreous or glasslike salts, especially sulphates, including chiefly blue vitriol or copper sulphate, green vitriol or ferrous sulphate, red vitriol or cobalt sulphate, and white vitriol or zinc sulphate. Oil of vitriol or vitriolic acid, the old name given to sulphuric acid, and still retained in manufacturing parlance, refers to the primitive method of production from ferrous sulphate. Elixir of vitriol was the name given to the aromatic sulphuric acid of the Pharmacopœia. See GREEN VITRIOL; ZINC.

VITRU'VIUS POL'LIO, MARCUS. A Roman architect and engineer of the first century B.C., author of the earliest extant work on architecture. He was probably born in Formiæ in the first quarter of the century and died during the later years of the reign of Augustus (30–14 B.C.). His fame rests chiefly on his great work, *De Architectura;* but he was also the architect of the basilica and Ædes Augusti at Fano, and the custodian of the Imperial engines of war. He was pensioned for life by Julius Cæsar.

The work *De Architectura Libri Decem*, by which he is chiefly known, was composed in the later years of his life, and consists of dissertations upon a wide variety of subjects relating to architecture, engineering and sanitation, practical hydraulics, acoustic vases, and the like. It was long lost, but was rediscovered in the fifteenth century in a manuscript at St. Gall; the oldest manuscript dates from the tenth century, and much doubt has been cast upon

the authenticity of certain portions of the text, which suggest the age of Diocletian rather than of Augustus. It has been studied for the past four centuries as a thesaurus of the practice and theory of building in the Augustan age; but the tendency is now to regard it rather as the work of a theorizer and student of Greek authorities than as the product of practical experience. It was the object of special study, comment, and annotation during the period of the Renaissance. The earliest printed edition was that of Sulpitius (Rome, 1486); the standard modern edition is by Rose (Leipzig, 1889); see also Nohl, *Index Vitruvianus* (Leipzig, 1876). English translations are by Newton (London, 1771–91), Gwilt (ib., 1826; reprinted 1874), and Morgan (Cambridge, Mass., 1914).

VITRY, JACOB OF. See JACOB OF VITRY.

VITTORIA, vē-tō'rē-à. A town in the Province of Syracuse, Sicily, 18 miles by rail northwest of Modica (Map: Italy, E 6). The surrounding district produces excellent wine, besides honey, fruit, silk, and cattle. Vittoria is reputed to have the largest wine trade in the island. Pop. (town), 1911, 30,832. Near by are the ruins of the ancient Camarina (q.v.).

VITTORIA. A town of Spain. See VITORIA.

VITTORIA, FRANCISCO DI (c.1480–1549). A Spanish theologian and one of the forerunners of Grotius (q.v.) in the study of international law. He was born at Vittoria, in Navarre, was educated at Burgos, Valladolid, and Paris, joined the Dominican Order, was appointed a teacher in the University of Paris (1516), became professor at Valladolid (1522), and (1524–44) held a chair at Salamanca. Through his teaching and his disciples he exercised a profound influence, and has been called the father of the new scholasticism. In dealing with the law of nations he maintained that the Pope's authority was limited to religious matters, that the right to life, liberty, and property could not be denied to the pagans beyond the Atlantic because of their unbelief, that noncombatants—women, children, farmers, strangers, and clergy—should not be slaughtered in war, that slavery was not a legitimate consequence of war, that hostages could not rightfully be put to death on a breach of faith by an enemy, and that looting was illegitimate. Among his works, published after his death, are *Relectiones XII Theologicæ* (1557); *Summa Sacramentorum Ecclesiæ* (1561); *Instrucción y refugio del alma* (1552); *Confesionario* (1562). There is an unpublished manuscript of *Commentaria in Universam Summam S. Thomæ*. On his theological significance consult Joseph Schrœder, "Francis of Vittoria," in the *Catholic Encyclopedia* (New York, 1909); on his importance as a student of international law, E. Nys, *Les origines du droit international* (Paris, 1894); Thomas A. Walker, *A History of the Law of Nations* (Cambridge, 1899); Percy Bordwell, *The Law of War between Belligerents* (Chicago, 1908); The Carnegie Institution has announced a translation into English of the two treatises, *De Jure Belli* and *De Indis Insulis*.

VITTORIA, TOMMASO LUDOVICO DA. See VICTORIA, TOMÁS LUIZ DE.

VITTORIA COROMBONA, kō'rôm-bō'nà. See WHITE DEVIL.

VITTORINO DA FELTRE, vē'tô-rē'nô dà fĕl'trà (1378–1446). An Italian educator, born at Feltre. His family name was Rambaldoni, but he took from his birthplace the name by which he is commonly known. About 1422 he became professor of rhetoric in Padua, and also opened a school for young men. In 1423 he removed to Venice, and afterward became tutor to the children of the Marchese Gian Francesco Gonzaga of Mantua. In 1425 he with his charges established himself in a villa allotted for the purpose. Other noble youths were permitted to enter the school, and in another department poor youths were received upon an equal footing with those more favored by fortune. Throughout the course there was a close contact between student and teacher. Vittorino's methods, which have been compared with those of Pestalozzi, were so successful that his school was looked upon as a model throughout all Italy. A *Vita de Vittorino* was written by Rosmini (Bassano, 1801). Consult also: W. H. Woodward, *Vittorino da Feltre and Other Humanist Educators* (new ed., New York, 1905); J. A. Symonds, *History of the Renaissance in Italy* (vol. i, new ed., London, 1913; vol. ii, 1897).

VITTORIO, vē-tō'rē-ô. A town of the Province of Treviso, Italy, at the entrance of the vale of Santa Croce, 25 miles by rail north of Treviso (Map: Italy, D 2). It was formed in 1879 by the union of the towns of Ceneda and Serravalle. There is a masterly altarpiece by Titian in the cathedral of Serravalle. Vittorio has saline and sulphur springs and is a pleasant summer resort. The breeding of silkworms is extensively carried on, and woolens, paper, cement, and lime are manufactured. Pop. (town), 1911, 11,055.

VI'TUS, SAINT. A martyr of the time of the Roman Emperor Diocletian. He is supposed to have been put to death in Lucania or in Rome, and his festival day is June 15. Relics purporting to be of him are preserved at Corvei and at Prague. His name is commonly applied to the peculiar nervous disorder scientifically known as chorea. The manner in which the disease came to be known as St. Vitus's dance is in dispute. A probable explanation is that in the Middle Ages sufferers from the dancing mania were accustomed to repair to the chapels of St. Vitus in Swabia and elsewhere for relief, and that in this way a connection grew up between the saint's name and the disease. Another explanation is that in certain places in Germany in the seventeenth century it was believed good health could be obtained for a year by dancing before the saint's image on his festival day, and that in this way the original St. Vitus's dance was confounded with the disease. The aid of the saint is also invoked against sudden death, hydrophobia, and so on. See CHOREA.

VIVALDI, vē-väl'dē, ANTONIO (c.1675–1743). An Italian violinist, born at Venice. He studied music with his father, a violinist at San Marco, but entered the priesthood at an early age. He was in Darmstadt for a time, and in 1713 returned to Venice, where he was appointed director of the Conservatorio della Pietà. This position he occupied till his death. His most important works are his sonatas and concertos for violin. He produced 38 operas, mostly in Venice. Some of his concertos for the violin and his sonatas are still considered valuable.

VIVANTI, vē-vän'tē, ANNIE (MRS. CHARTRES) (1868–). An English author, especially known for her lyric verse. Born in London, the daughter of Anselmo Vivanti, an Italian patriot, she was married to John S. Chartres, who in 1915 became a member of the British Ministry of Munitions. She was educated in Switzerland, England, Italy, and Germany, and

became able to write with ease in Italian, French, German, or English. Annie Vivanti's poems were translated into Danish by George Brandes, into German by Paul Heyse, and into Czech by Jaroslav Vrchlicky. She became a member of the Société des Gens de Lettres of France and of the Società degli Autori of Italy. Her writings include: *Lirica* (1890; 5th ed., enl., 1898); *Marion artista di caffè-concerto* (1891); *The Ruby Ring* (1900), a one-act comedy; *Winning Him Back* (1904); *The Devourers* (1910), a novel; *I Divoratori* (1911); *Circe: il romanzo di Maria Tarnowska* (1912); *Le Roman de Maria Tarnowska* (1912); *Marie Tarnowska, a Study in Slav Psychopathy* (1915); *L'Invasore* (1915), a drama.

VIVARINI, vē'vȧ-rē'nē. A family of Venetian painters of the late Gothic and early Renaissance, from Murano, near Venice. The earliest known members of this family, GIOVANNI DA MURANO (active 1443–46) and ANTONIO DA MURANO (active 1440–64), were the founders of the school. The best-known example of joint activity, the "Madonna Enthroned" (1446, Venice), is still mediæval in conception. Two signed paintings by Antonio, an altarpiece in the cathedral of Parenzo and the "Adoration of the Magi" (Berlin), show freshness of invention and charming detail.—Antonio's younger brother BARTOLOMMEO (active 1450–99) first assumed the name Vivarini. From c.1450 to 1459 he worked with Antonio. His work is distinctly individual and progressive, and he is rightly considered the leader of the school. "The Madonna Enthroned" (1465, Naples) belongs to his early style. A triptych, "The Madonna of Mercy" (1478, Santa Maria Formosa, Venice), and an altarpiece, "Madonna and Child with Four Saints" (1482, Frari, Venice), represent his mature period.—His nephew and pupil, ALVISE VIVARINI, the most able of the Vivarini (active 1461–1503), showed still more the influence of the Renaissance, and owed much to Antonello da Messina. His drawing and color are fine and restrained, and his work exhibits dignity and sentiment. He had many pupils, and was Giovanni Bellini's chief rival, but was not his equal in technique nor breadth of composition. The "Virgin and Child" (1475, Monte Fiorentino) is his earliest known work. To his more mature style belongs "The Madonna Enthroned" (1480, Venice); "Madonna with Saints" (1485, Naples); "St. Anthony" (Frari, Venice); a series of saints, including the grandiose "Santa Clara" (Academy, Venice); and his masterpiece, "The Resurrection" (1498, San Giovanni in Bragora). After Alvise's death the Muranese school ceased to be distinct from the Venetian.

VIVER'RIDÆ (Neo-Lat. nom. pl., from Lat. *viverra*, ferret). A family of small carnivorous mammals comprising the civets, ichneumons, and the like. The group is represented by fossil forms that range back to Eocene times. The early members are interesting in that they show points of resemblance to animals of other families, such as cats, weasels, bears, and hyenas, and thus present a very generalized type of early carnivore. The principal genera are *Amphictis*, *Ictitherium*, and *Palæoprionodon*, all from the Tertiary deposits of Europe. An allied and ancestral family, Viverravidæ, includes still more generalized types comprised in the genus *Viverravus* from the Eocene of North America. Consult: F. E. Beddard, "Mammalia," in *Cambridge Natural History*, vol. x (London, 1902); Wortman and Matthew, "The Ancestry of Certain Members of the Canidæ, Viverridæ, and Procyonidæ," *Bulletin of the American Museum of Natural History*, vols. xii and xiv (New York, 1899, 1901). See CIVET.

VIVES, vē'vȧs, JUAN LUÍS (1492–1540). A Spanish philosopher, born in Valencia. He studied at Valencia, Paris, and Louvain, and taught at the latter university. He was a friend of Erasmus. He was invited to England by Henry VIII, who made him tutor of the Princess Mary, in 1523; wrote for her *De Ratione Studii Pueritis Epistolæ Duæ;* was imprisoned for opposing the divorce of Queen Catharine of Aragon, 1528, and when released the following year went to Bruges, where he lived till his death, May 6, 1540. His principal works are *De Disciplinis* (comprising seven books, *De Causis Corruptorum Artium*) and *De Anima et Vita* (1539); in addition to these and several other metaphysical works, he wrote commentaries on Augustine's *City of God* (Eng. trans., 1620). He was one of the most important logicians of his time. His works were collected and published by Coccius in two folio volumes, Basel, 1555, and by Majori in eight folio volumes, Valencia, 1782–90. Consult Namèche, *Mémoire sur la vie et les écrits de J. L. Vives* (Brussels, 1841); *Tudor School Life; the Dialogues of Juan Luis Vives translated into English, together with an Introduction* by Foster Watson (New York, 1908); *Vives and the Renascence Education of Women*, translated by Foster Watson (ib., 1912).

VIV'IAN, VIVIANE, or **VIVIEN.** An enchantress in Arthurian romance, the nymph who brought up Lancelot in her fairy palace in the lake, whence she was called the Lady of the Lake, also the mistress of Merlin.

VIVIAN, HERBERT (1865–). A British traveler and writer, born at Pencalenick, Cornwall, and educated at Harrow and at Trinity College, Cambridge. In 1891 and 1906 he contested seats for Parliament. He traveled extensively in Russia, Turkey, the Balkans, and Africa, and served as special correspondent of the *Morning Post* (1898–99) and of the *Daily Express* (1899–1900). In 1901 he revived Dr. Johnson's *Rambler*. Vivian received Servian and Montenegrin decorations. His publications include: *Servia, the Poor Man's Paradise* (1897); *Tunisia and the Modern Barbary Pirates* (1899); *Abyssinia* (1901); *The Romance of Religion* (1902), with Mrs. Vivian; *The Servian Tragedy* (1904); and articles in the reviews.

VIVIAN GREY. An early novel by Benjamin Disraeli (1826–27).

VIVIANI, vē'vyȧ'nē', RENÉ (1863–). A French statesman. He was born in Sidi Bel Abbès, in French North Africa, Nov. 8, 1863. At an early age he associated himself with the Socialist party, soon becoming one of its most brilliant orators and prominent leaders. When the party was reorganized in 1904 into the Unified Socialist party, Viviani, like Briand (q.v.), stayed outside, and thenceforth called himself an Independent Socialist. His parliamentary career began in 1893, when he was elected deputy of the fifth ward in Paris. He retained this office until 1902, when he failed of reëlection, but four years later he was elected deputy of the Department of Creuse. In the same year he entered the cabinet of M. Clémenceau (q.v.) with the portfolio of the Department of Labor. Subsequently, in the ministry of M. Doumergue (q.v.), he was Minister of Public Instruction. In the spring of 1914

an exceptionally radical chamber was elected, and for a while it seemed that they would be unable to agree upon any one for Premier, but finally, on July 13, President Poincaré (q.v.) appointed Viviani, who received a vote of confidence of 370 to 137. The chief issues were the maintenance of the law requiring three years' service in the army and provision for a loan of 1,800,000,000 francs ($360,000,000) for military preparations. Viviani supported both of these measures. Shortly afterward the war with Germany commenced, and in August, 1914, Viviani reorganized his cabinet on a war basis. He retained the premiership for over a year, but resigned on Oct. 27, 1915, being succeeded by Briand. Viviani remained in the cabinet, however, as Minister of Justice.

VIV'IANITE (named in honor of J. H. Vivian, an English mineralogist). A mineral hydrated ferrous phosphate crystallized in the monoclinic system. It has a pearly lustre, and is blue to green in color. It occurs associated with copper, iron, and tin sulphides in veins, and also with iron ores, as limonite, and sometimes in cavities of fossil or buried bones, being derived from the phosphorus contained in them. It is sometimes called blue iron earth or native Prussian blue.

VIVIEN DE SAINT-MARTIN, vē'vyăN' de săN'mär'tăN', LOUIS (1802–97). A French geographer, born in Caen, Normandy. He went to Paris in 1814, and devoted his life to the writing of works on geography. Among his works are two volumes of a *Histoire universelle des découvertes géographiques* (1845–47); *Etudes de géographie ancienne et d'ethnographie asiatique* (1850–54); *Etude sur la géographie et les populations primitives du Nord-Ouest de l'Inde d'après les hymnes védiques* (1860); *Etude sur la géographie grecque et latine de l'Inde* (1858–60); *Le nord de l'Afrique dans l'antiquité grecque et romaine* (1863); *Histoire de la géographie et des découvertes géographiques* (1873); *L'atlas universel* (1877–85), finished by Franz Schrader. He also issued the first two volumes of the monumental work, *Nouveau dictionnaire de géographie universelle,* and the next two with the assistance of Louis Rousselet, who completed the work (7 vols., with two supplements, 1879–99).

VIVIP'ARY (from Lat. *viviparus,* bearing living young, from *vivus* alive + *parere,* to bear, produce). (1) The development of young separable shoots in those regions of the plant usually devoted to the formation of reproductive structures of other kinds; or (2) the development of young plants from unshed seeds. Vivipary of the first sort is exhibited often in the regions of the flower, where either the entire flower or only those parts of it which would produce sporangia (sporophylls) are replaced by a purely vegetative structure capable of growing at once into a new plant. The sporangia of ferns are sometimes replaced by young plants (apospory, q.v.), a form of vivipary. The term is sometimes applied also to the formation of plantlets in any unusual position, as on the winged leaves of *Bryonia.* (See MALFORMATION.) Vivipary from seeds is best illustrated by the mangrove (q.v.).

VIV'ISEC'TION (from Lat. *vivus,* alive + *sectio,* a cutting, from *secare,* to cut). A term originally employed to designate cutting operations upon living animals for experimentation, but now including experimentation of any kind upon living creatures, to demonstrate or discover physiological facts or theories. This comprises inoculation with disease, subjection to different temperatures, atmospheric pressure, food changes, or the action of various drugs and medicines, as well as to cutting operations involving ligature of arteries, exposure of nerves, or removal of vital organs. Physiological investigations on living animals were carried out by Galen and the Alexandrian school, and all the important discoveries during later centuries were made in this way. The method was accepted as a necessary means to scientific knowledge until the nineteenth century, when the needlessly cruel experiments of Majendie and other investigators in France, Germany, and Italy caused public displeasure. Agitation in England resulted in the appointment, in 1876, of a royal commission to investigate vivisection in that country, and the passage of the Vivisection Act, which regulated, and somewhat restricted, the practice. Experiments performed for instruction were permitted only under stringent limitations. Invertebrate animals were not protected, but horses, dogs, mules, asses, and cats were safeguarded. An active propaganda for the total suppression of vivisection has been steadily maintained in Great Britain and in the United States. Antivivisection protests include objections to alleged experimentation upon human beings in pauper hospitals and insane asylums. The chief argument against vivisection (based mainly on the undoubtedly cruel experiments carried on before the days of anæsthetics) is that the practice is unnecessary and cruel. The whole weight of scientific opinion is in favor of vivisection conducted in a humane manner. Experiments as at present performed involve no avoidable suffering. Cutting operations are done under complete anæsthesia, with ether or chloroform, as in the human subject. Animals seriously mutilated are killed before regaining sensibility. There is nothing to gain and much to lose by infliction of pain, in most experiments, and the investigator for this reason is led to avoid it.

The benefits to mankind derived from animal experimentation are incalculable. Practically all our knowledge of physiology, of the effect of medicines, and of bacteriology is gathered from this source, and there is hardly a life-saving or pain-relieving appliance, measure, or operation that has not been directly derived through vivisection. Only a few benefits can be mentioned here. The whole subject of the circulation of the blood, of transfusion of blood and saline fluids, was worked out on animals. All the facts concerning respiration were discovered in the same way, and the practical application of the knowledge thus derived has led to the life-saving procedure of artificial respiration in cases of asphyxiation from gases, drowning, etc., to the use of oxygen for failing respiration, and to the science of ventilation. Our knowledge of digestion is based on observations on animals. The functions of the nerves, spinal cord, and brain and the location of the various nerve centres are among the most difficult and important problems solved by vivisection. The treatment of aneurysm by ligature, the repair and transplantation of bone, skin grafting, absorbable ligatures, the arrest of hæmorrhage by torsion of the arteries, the epoch-making discovery of general anæsthesia, the diagnostic and therapeutic uses of electricity, hypodermic medication, and the phenomena of inflammation are examples of the use-

having subsequently routed the Polovtzes in several engagements, became so popular that in 1113 he was chosen Grand Prince of Kiev, and for 12 years he displayed his eminent qualities as a ruler and a warrior. Most of Vladimir's fame, however, rests on his writings, which present an interesting picture of the internal life of Russia at the beginning of the twelfth century. Vladimir's mother was a daughter of the Byzantine Emperor, Constantine Monomachus; and Alexis Comnenus, who wished to be on good terms with his powerful northern neighbor, is said to have sent him the crown, sceptre, and sword of his grandfather, which are still shown as such, and which are employed in the coronation of the Czar. Consult Rambaud, *History of Russia*, vol. i (Boston, 1886), and V. O. Kluchevsky, *History of Russia* (Eng. trans., New York, 1911).

VLADIMIR-VOLHYNSK, vŏ-lĭnsk′ (Polish, *Wlodzimierz*). An ancient town in the Government of Volhynia, Russia, situated on a tributary of the Bug, 210 miles west-northwest of Zhitomir. The church of Mstislav, originally erected in the twelfth century, has been rebuilt several times. The town is mentioned by Nestor (q.v.) in 988, and, judging from the writings of contemporary chroniclers as well as from existing remains, it was a place of considerable prominence and splendor as the chief town of Volhynia. Pop., 1911, 18,795, more than half Jewish.

VLADISLAV, vlă′dĭs-lȧv. The name of several Polish kings. See LADISLAS.

VLADIVOSTOK, vlȧ′dyĕ-vŏs-tŏk′. The capital of the Amur Government of Siberia, and the chief Russian commercial and naval port on the Pacific, situated at the south end of the Muraviev-Amursky Peninsula and on the Golden Horn (Map: Asia, P 4). The harbor is spacious, safe, and ice-free for nine months in the year. The mean annual temperature is somewhat over 40° F. The town is well built. The commerce is very important and is largely in the hands of the Chinese. The imports consist principally of manufactures, and the exports of raw materials. Pop., 1909, 91,464. There are a number of Chinese, Japanese, and Koreans. Vladivostok was founded as a military post in 1862 and was declared a free port in 1873. Its position as the eastern terminus of the Trans-Siberian Railway greatly adds to its importance. Since 1912 it has steamship communication with north Siberian ports. Its commercial position was at one time menaced by the rise of Dalny, which was specially favored by the Russian government. Some of the richest iron deposits of Siberia are found north of the city. It was of great importance to the Russian government during the European War of 1914 as a port of entry for much war material which could not be imported via the Baltic ports by reason of war conditions. More than $100,000,000 worth of merchandise from the United States was sent to Vladivostok and thence transported by the Siberian Railway to Petrograd, Moscow, and other centres for distribution to the Russian armies.

VLISSINGEN, vlĭs′ĭng-en. See FLUSHING.

VLOZLAWEK, vlyŏts-lyȧ′vĕk, or **VLOTSLAVSK**, vlŏts-läfsk′. A town in the Government of Warsaw, Poland, situated near the left bank of the Vistula, about 90 miles northwest of Warsaw. It has extensive manufactures. Pop., 1910, 38,000.

VLUGT, flŭkt, WILLEM VAN DER (1853–). A Dutch political writer. He was born at Haarlem, and was educated at Leyden University, where he became professor of philosophy in 1880. In 1902–06 he served as a member of the Second Chamber of the States-General. His writings include: *De rechtstaat volgens de leer van Rudolf Gneist* (1879); *Transvaal versus Great Britain* (1899); *Finland, de rechtsvraag*, which was translated into French as *Les vrais coupables* (1900); papers on crime and criminals, and on Dutch politics in the monthly *Onze Eeuw* (1901–05); and articles in the periodical *De Gids*.

VOCAL RESONANCE. See PECTORILOQUY.

VOCATIONAL EDUCATION. That type of education that has for its primary purpose preparation for some wage-earning occupation. In its broadest sense the term should include preparation for the professions. The generally accepted definition, however, limits the scope of the term to preparation for the manual occupations or those occupations in which the intellectual preparation is elementary. For a discussion of the subject of vocational education in its different phases, see AGRICULTURAL EDUCATION; EDUCATION, COMMERCIAL; INDUSTRIAL EDUCATION; MANUAL TRAINING; SCHOOLS; TECHNICAL EDUCATION. For professional training, see LEGAL EDUCATION; MEDICAL EDUCATION; TECHNICAL EDUCATION; ETC.

VOCATIONAL GUIDANCE. An educational movement that has for its aim the collection and dissemination of information regarding conditions and prospects in occupations for boys and girls. The purpose of vocational guidance is dual—to furnish boys and girls about to start their life careers with advice on the proper choice of a vocation, and to determine their fitness for such vocations. The movement was philanthropic in origin and arose out of a desire to save boys and girls from blind-alley occupations and the consequent evils of unemployment. The more recent phase of the movement is to set the individual youth "to thinking, at the proper time, about the problem of choosing a life work, as a problem to be seriously faced and prepared for—to make him fully conscious of its existence as a problem to be seriously faced and prepared for, and aware of the sources of data having any bearing on its solution." (*Report, United States Commercial Education*, 1915, vol. i, p. 264.)

The movement received definite form in 1907 by the establishment of a bureau for giving vocational advice to young men. This was opened at the Civil Service House in Boston, and in 1909 was organized as a Vocational Bureau under a director. Information was collected, and the coöperation of various organizations and interests was secured. Thus the Boston School Committee appointed a committee on vocational guidance; lectures were given to pupils about to leave school; and vocational advisers were placed in both elementary and high schools. To carry out further the purpose of the bureau a number of bulletins were issued on various careers, e.g., *The Machinist*, *Banking*, *The Baker*, *Department Stores*, etc. The bureau has conducted special courses for training vocational counsellors both in connection with Harvard University and Boston University. Similar work was done chiefly for girls by the Boston Home and School Association, the Girls' Trade Association, and the Women's Municipal League. In New York vocational guidance in the high schools was promoted by the High School Teachers' Association in 1908, and two years

later a small grant was obtained for the work from public funds. In the elementary schools the work of vocational guidance has depended largely on the interest of individual teachers. The movement has spread to other cities, and has been taken up by a number of colleges and universities. The psychologists are also applying their attention to the subject with a view to determining mental and other fitness for certain occupations.

In Great Britain the movement began, as in the United States, as a philanthropic endeavor. Since the enactment of the Labor Exchange Act (1909) and the Education (Choice of Employment) Act (1910) power has been granted to education authorities "to make arrangements, subject to the approval of the Board of Education, for giving boys and girls under 17 years of age assistance with respect to the choice of suitable employment, by means of the collection and communication of information and the furnishing of advice." The Board of Trade is closely associated in this work with the Board of Education and the local education authorities. Consult: Meyer Bloomfield, *The Vocational Guidance of Youth* (Boston, 1911); "Elementary Education in England," in United States Bureau of Education, *Bulletin No. 57* (Washington, 1913); Meyer Bloomfield, "The School and the Start in Life," and "Vocational Guidance," in United States Bureau of Education, *Bulletin No. 1¼* (ib., 1914); I. L. Kandel, in United States Bureau of Education, *Bulletin Nos. 4, 1¼* (ib., 1914).

VODENA, vō-dā′nȧ. A town in the Kingdom of Greece situated about 50 miles west-northwest of Saloniki (Map: Balkan Peninsula, C 4). It has many churches and mosques and produces tobacco, cotton, and woolen goods. It was wrested from the Turks in 1912, in the course of the Balkan War (q.v.). Pop., 1913, 8850.

VODKA, vŏd′kȧ. Russian brandy, a strong spirituous beverage. Originally vodka was made almost exclusively of rye, but later it was also obtained from barley and oats mixed with rye, as well as from potatoes and maize. In 1914, 60 per cent of the vodka was distilled from potatoes, 30 per cent from various grains and 10 per cent from molasses. Vodka, as manufactured at that time, contained about 90 per cent of alcohol, but was diluted in order to reduce the percentage of alcohol to 60 and 40. Alcohol distillation and vodka manufacture were largely in the hands of private persons, but rectifying and selling were made a government monopoly in four eastern districts in 1895 and then extended over the Empire. Government sales stations were opened in all the cities and villages of Russia, and vodka was sold in sealed containers for outside consumption only. The maximum and minimum prices for the unrectified spirits purchased by the government from the private distillers, as well as for the vodka sold by the government, were fixed by legislative enactment. The state received an ever-increasing revenue from the monopoly. In 1911 this revenue amounted to 595 million roubles; in 1912 to 626 million, and in 1913 to 680 million roubles; during the later year the revenue from its sale formed 26 per cent of the total receipts of the Imperial treasury. Vodka has been the national Russian drink for centuries, and excessive drink has been the scourge of the Russian village, carrying off more than 200,000 persons a year in premature death. There has always been a current of public opinion opposed to the sale of vodka as a means of raising revenue. The sale was suspended time and again in order to prevent drunkenness, particularly in times of military mobilizations, or during war, as in 1877 and 1904. But it was not until August, 1914, that the first attempt to enforce prohibition on a large scale was made. The first step was to suspend the sale of vodka until army mobilization could be carried out. The effects were beneficial, and the government was flooded with petitions from city and county councils and village communities, as well as from industrial, commercial, and labor organizations, to make the prohibition permanent. On Oct. 25, 1914, the government passed a law permitting cities and villages to pass ordinances in favor of and to enforce local prohibition, but limiting the enforcement of national prohibition to the period of the war only.

VOËTIUS, vō-ē′shĭ-ŭs, Gisbert (1588–1676). A Dutch theologian. He was born in Heusden, became a minister at Blymen in 1611, and in 1634 was made professor of theology and Oriental languages in the University of Utrecht. He was engaged in numerous bitter religious controversies; at the synod of Dordrecht combated Arminianism with great violence; afterward attacked the works of Descartes and Cocceius; and exercised great influence upon the theology of his time. His works were published under the title of *Selectæ Disputationes Theologicæ* (1648–69), and again as *Politica Ecclesiastica* (1663–76).

VOGEL, fō′gĕl, Eduard (1829–56). A German explorer, born at Crefeld. He was educated at Leipzig and at Berlin, where he studied with Encke; and was for two years at Bishop's Observatory in London. In 1853 he was commissioned by the British government to assist Overweg and Barth in explorations of western Sudan. He reached Murzuk in August, 1853, Kuka in January of 1854, and in December met Barth near Bundi. Returning with the latter to Kuka and Lake Chad, he went southward alone to Yakuba, the first white man ever seen in that region. The remainder of 1855 he spent in the vicinity of Yakuba and the Benue River. In November he went back to Bornu and Kuka. Early in 1856 he started eastward for the Nile, reaching Wadai. In Wara he was apprehended by the Sultan and killed, probably about February 8. Several expeditions were undertaken in search of him. It was not until 1873 that his fate was finally ascertained by Nachtigal. His sister, Elise Polko, published his notes in her *Erinnerungen an einen Verschollenen* (1863). Consult Pahde, *Der Afrikaforscher Eduard Vogel* (Hamburg, 1889).

VOGEL, Hermann Karl (1841–1907). A German astronomer, born in Leipzig. He studied at Dresden and at Leipzig, where he became assistant (1865) and later second observer in the observatory. In 1870 he became astronomer in the private observatory of Von Bülow at Bothkamp near Kiel, and here he devoted himself with great success to astrophysics. In 1874 he became observer in the new astrophysical observatory at Potsdam and in 1882 director of this institution. In 1892 he was elected member of the Berlin Academy. The first spectroscopic star catalogue ever published was that by Vogel in 1883. He also published: *Beobachtungen und Positionsbestimmungen von Nebelflecken und Sternhaufen* (1867–76); *Bothkamper Beobachtungen* (2 vols., 1872–73); *Untersuchun-*

gen über die Spektra der Planeten (1874); *Der Sternhaufen χ Persei* (1878); *Sternspektraltafel* (1888); *Ueber den neuen Stern im Fuhrmann* (1893).

VOGEL, HERMANN WILHELM (1834–98). A German photochemist. He was born at Dobrilugk (Lower Lusatia), and was educated at the Royal School of Technology in Berlin. To that institution he was called in 1864 as instructor of photochemistry and later became full professor. He carried on researches in photography, devised a photometer (1864), and was first to discover the ultra violet rays of hydrogen (1878), and to enlarge the knowledge of spectral photography. His publications include: *Lehrbuch* (4th ed., as *Handbuch*) *der Photographie* (1867–70; 4th ed., 4 vols., 1890–99; part i, *Photochemie*, 5th ed., 1906); *Die chemischen Wirkungen des Lichts und die Photographie* (1874; trans. into English, French, Italian, Russian, and Japanese); *Praktische Spektralanalyse irdischer Stoffe* (1877); *Lichtbilder nach der Natur* (1879); *Das photographische Pigmentverfahren* (5th ed., 1905).

VOGEL, HUGO (1855–). A German historical, portrait, and genre painter, born at Magdeburg. He studied at the Düsseldorf Academy under Gebhardt and Wilhelm Sohn and in Paris under Lefebvre, and further perfected himself during travels in Italy, Spain, Holland, and Belgium. He then settled in Berlin, where he was professor at the academy from 1887 to 1892. Vogel first turned to historical subjects with his "Luther Preaching at the Wartburg" (1883, Kunsthalle, Hamburg). Later he painted landscapes, portraits, genre scenes, and flower pieces, but his reputation rests chiefly upon three important series of mural paintings representing appropriate subjects in the city halls of Berlin, Merseburg, and Hamburg (completed 1908). Pictorial in conception and well composed, they show the application of the principles of plein-air painting with an inclination towards naturalism, held in check by a strong feeling for beauty.

VO'GEL, SIR JULIUS (1835–99). A British colonial statesman, born in London. He was educated at the London University School and the Government School of Mines, emigrated to Melbourne in 1852, and after engaging in journalism in that city, went in 1861 to New Zealand, where he established the Otago *Daily Times*, the first daily paper in the colony. He became a member of the Otago provincial council in 1862, and was the head of the provincial government, 1866–69. He was a member of the House of Representatives in 1863; was Colonial Treasurer, Commissioner of Stamps, and Postmaster-General from 1869 till 1872; and was Premier in 1873–75, and again in 1876. Vogel was agent-general of New Zealand in London (1876–81). Returning to the colony, he was Colonial Treasurer, Postmaster-General, Telegraph Commissioner, and Commissioner of Customs (1884–87). His published works are *Great Britain and her Colonies* (1865) and *Anno Domini 2000; or Woman's Destiny*, a novel (1889; 3d ed., 1890).

VOGELSANG, fō'gel-zäng, HERMANN (1838–74). A German mineralogist. He was born at Minden, and studied at Bonn. In 1865 he was appointed professor at the Polytechnic School of Delft. He is remembered for his pioneer work in the use of the microscope for geological purposes, for his demonstration of the presence of liquid carbonic acid in many minerals, for his researches in the formation of crystals, and for his beginning of a new classification of rocks. He published: *Ueber die mikroskopische Struktur der Schlacken und Beziehungen zur Genesis der kristallinischen Gesteine* (1864); *Ueber die Systematik der Gesteinslehre* (1871); *Ueber die natürlichen Ultramarinverbindungen* (1873); *Die Kristalliten* (1875).

VOGEL VON FALCKENSTEIN, fō'gel fŏn fäl'ken-shtīn, EDUARD (1797–1885). A Prussian general, born at Breslau. In 1813 he entered the army and distinguished himself at Montmirail in 1814. He became a lieutenant general and commander of the Fifth Division in 1858, and was chief of staff in the Schleswig-Holstein War of 1864. At the breaking out of the Seven Weeks' War in 1866 he was put in charge of the army in western Germany that was to act against the allies of Austria. He defeated the Hanoverians in the battle of Langensalza on June 28th, and forced them to capitulate. On July 2d he set out for Frankfort by way of Fulda and Hanau, defeated the Bavarians at Kissingen on the 10th, then the troops of Hesse-Darmstadt on the 13th; on the 14th drove back a reinforcement of Austrian and Hessian troops; and on the 16th entered Frankfort. A few days afterward he was appointed commander. After the war he was made commander of the First Army Corps, and in 1867 he was elected to the North German Reichstag. In 1870 he commanded the forces upon the Baltic, and in 1873 was retired. Consult Wengen, *General Vogel von Falckenstein und der hannoversche Feldzug, 1866* (Gotha, 1886).

VOGELWEIDE, WALTHER VON DER. See WALTHER VON DER VOGELWEIDE.

VOGHERA, vō-gā'rä. A town in the Province of Pavia, Italy, on the left bank of the Staffora, 39 miles by rail southwest of Milan (Map: Italy, B 2). The church of San Lorenzo (eleventh century) was remodeled in the barocco style in 1660. The fortifications which were erected in the Middle Ages by the Visconti have been replaced by shady promenades. It has a lively trade in raw silk, grain, and wine. Pop. (town), 1911, 14,651.

VOGL, fō'g'l, HEINRICH (1845–1900). A German tenor, born in Munich. He was a schoolmaster at Ebersberg from 1862 to 1865, during which period he devoted much time to the study of vocal music. Later, he studied under Franz Lachner and Hugo Jenk in Munich. His début occurred in *Der Freischütz* at the Munich Court Opera, in 1865, in which he achieved immediate success. Afterward he succeeded Schnorr von Carolsfeld as the model Tristan, and became famous as a Wagnerian singer. His compositions include songs, part-songs, and chamber music, as well as one opera, *Der Fremdling*, produced in Munich (1899). In 1868 he married Therese Thoma, a dramatic soprano, also famous in the portrayal of Wagnerian rôles, especially that of Isolde.

VOGL, JOHANN NEPOMUK (1802–66). An Austrian poet. He was born in Vienna and from 1818 until his death was in the service of the government in Lower Austria. He is known for his ballads, which are still popular. Among his works may be mentioned: *Oesterreichisches Wunderhorn* (1834); *Balladen und Romanzen* (1837); *Soldatenlieder* (1849; 3d ed., 1856); *Twardowsky der polnische Faust* (1853); *Jägerbrevier* (1862); and *Aus dem alten Wien*

(Vienna, 1865). Consult Schmidt, *J. N. Vogl* (Vienna, 1868).

VOGLER, fō'glĕr, GEORG JOSEPH, better known as ABBÉ or ABT VOLGER (1749–1814). A German organist, theorist, and composer, born at Würzburg. He went to Rome and took holy orders. He founded the "Mannheimer Tonschule" at Mannheim and received the appointment of chaplain and second kapellmeister. From 1786 to 1799 he was court conductor at Stockholm, where he founded a music school. In 1807 he was appointed court kapellmeister at Darmstadt and founded a third "Tonschule" where both Weber and Meyerbeer received instruction. His contribution as a theorist was especially important. Among his works are the operas *Der Kaufmann von Smyrna* (1780), *Albert III von Bayern* (1781), *Castor und Pollux* (1784), *Gustavus Adolphus* (1791), *Samori* (1804), and *Der Admiral* (1810), besides much church music. Browning wrote a famous poem on Abt Vogler.

VOGRICH, fō'grĭk, MAX (WILHELM CARL) (1852–1916). An Austrian pianist and composer born in Szeben, Transylvania. At the age of 14 years he was a proficient pianist and went to Leipzig for special studies under Reinecke, Richter, Hauptmann, Wenzel, and Moscheles. He completed this in 1869, and was engaged in concert tours throughout Continental Europe, South America, and the United States (1870–78). From 1882 to 1886 he was engaged in tours and teaching in Australia, after which he went to New York, where he lived for some time. His works include the operas *Vanda* (1875), *Lanzelot* (1890), *King Arthur* (1893), and *Buddha* (1904); an oratorio, *The Captivity* (1891); the cantatas *The Young King and the Shepherdess* and *The Diver;* several masses, symphonies, violin and pianoforte concertos, and sonatas, besides duets, songs, and chamber music.

VOGT, vōkt, AUGUSTUS STEPHEN (1861–). A Canadian organist and choral director, born at Washington, Ontario. He studied piano and organ at the New England Conservatory (Boston), and especially theory and composition at the Royal Conservatory, Leipzig. He was organist of churches at Elmira, N. Y., St. Thomas, Ont., and Toronto. In 1894 he founded the Mendelssohn Choir, which he reorganized in 1900, and which gained an enviable reputation on a tour of the leading American and Canadian cities. Vogt was secretary of the College of Organists (1889–92) and president of the Canadian Society of Musicians (1893–95), and in 1913 was appointed director of the Toronto Conservatory of Music. He published *The Standard Anthem Book* (1894); *Modern Pianoforte Technique* (1900).

VOGT, fōkt, KARL (1817–95). A Swiss naturalist and materialistic philosopher, born at Giessen. He studied medicine there and at Bern, and in 1847 he became professor of zoology in Giessen, but being compelled to leave the country a year later, on account of his share in the political agitation of 1848, he accepted the professorship of natural history in Geneva in 1852, remaining there until his death. He became a member of the Swiss Federal Council in 1878. Vogt was one of the most eloquent exponents of Darwinism. He published authoritative works on geology, anthropology, and zoölogy, of which the following are important: *L'Histoire naturelle des poissons d'eau douce de l'Europe centrale* (1839), with L. Agassiz; *Lehrbuch der Geologie und Petrefaktenkunde* (2 vols., 1846; 4th ed., 1879); *Physiologische Briefe für Gebildete aller Stände* (1845–46; 4th ed., 1874); *Lehrbuch der praktischen vergleichen Anatomie* (2 vols., 1885–94; Fr. trans.), with E. Yung. Consult his *Aus meinem Leben* (Stuttgart, 1895).

VOGÜÉ, vō'gu'ā', CHARLES JEAN MELCHIOR, MARQUIS DE (1829–1914). A French archæologist and historian. He was born in Paris and was privately educated. In 1853–54 and in 1861 and 1862 he traveled widely in the Orient. In 1868 he was elected a member of the Académie des Inscriptions et Belles-Lettres. In 1871 he was appointed by Thiers Ambassador to Turkey, and in 1875 was transferred to Austria, but after the retirement of MacMahon in 1879 he left the diplomatic service. In 1901 he was elected a member of the French Academy. He wrote: *Les églises de la Terre Sainte* (1860); *Mélanges d'archéologie orientale* (1869); *L'architecture civile et religieuse du Ier au VIème siècle dans la Syrie centrale* (1865–77); in history, *Le maréchal de Villars* (1888); *Les mémoires de Villars,* edited (1884–92); *Le duc de Bourgogne et le duc de Beauvilliers* (1900); *Le maître de la mer* (1904); *Catalogue de la collection de Clerq* (1911–12); *Une famille vivaroise* (2 vols., 1912).

VOGÜÉ, EUGÈNE MARIE MELCHIOR, VISCOUNT DE (1848–1910). A French critic and historian, born at Nice, cousin of the preceding. During the Franco-Prussian war he served as a volunteer and was wounded at Sedan. After 1871 he was attaché to the French embassies at Constantinople, Cairo, and St. Petersburg, respectively. At the latter court he passed seven years, but in 1882 gave up the diplomatic service to devote himself to literature. In 1888 he was made a member of the French Academy. It was through Vicomte de Vogüé that Russian novelists first became widely known in France and afterward throughout the English-speaking world. His more important publications include: *Syrie, Palestine, mont Athos* (1876); *Histoires orientales* (1879); *Le roman russe* (1886; 11th ed., 1912; Eng. trans., *The Russian Novel,* new ed., 1916), which had a great influence in arousing interest in Russian literature; *Regards historiques et littéraires* (1892); *Heures d'histoire* (1893); *Cœurs russes* (1894); *Le rappel des ombres* (1900); *Pages d'histoire* (1902); *Le maître de la mer* (1903); *Maxime Gorky* (1905); *Les routes* (1910); *Trois drames de l'histoire de Russie* (1911); *Pages choisies* (1912), with a preface by Bourget; *Les morts qui parlent* (1899). Consult Rod, "Le Vicomte E. M. de Vogüé," in *Les idées morales du temps présent* (Paris, 1891); E. W. Gosse, *Portraits and Sketches* (New York, 1912).

VOGULS, vō'gulz. A Finno-Ugrian tribe living in the northern Urals, Russia. They are of short stature and robust, dolichocephalic, with blue or gray eyes, flat concave nose, long blonde or brown hair, and light skin inclined to yellow. They live by the chase, using as weapons the bow and arrow, the flintlock gun, and traps. Their domestic animals are the dog and cattle. Their tents and domestic utensils are made from birch bark: their birch canoes are made watertight with resin. They dress like the Russians and are nominal Christians, but worship idols and make sacrifices of animals. They practice totemic tattooing; polygamy is common. Consult: Müller, *Ugrischer Volksstamm* (Berlin,

1837); Ahlqvist, *Unter Wogulen und Ostjaken* (Helsingfors, 1885); Rabot, *A travers la Russie boréale* (Paris, 1894).

VOICE (OF. *vois, voiz, vuiz*, Fr. *voix*, from Lat. *vox*, voice). The audible sound produced in the larynx (q.v.) of any animal possessing that organ. The primary vocal elements originating in the larynx are modified in their passage outward through the pharynx and mouth so as to form articulate speech or musical sounds, i.e., speaking and singing. The whole respiratory apparatus is concerned in the production and modulation of the voice. The lungs force a column of air, under varying degrees of pressure, through the trachea or windpipe against the vibrating portions of the larynx, generating a sound which is modified by the tongue, teeth, lips, etc. The study of the varying conditions in the interior of the larynx is made possible by the use of the laryngoscope (q.v.). On attempting phonation, the arytenoids (movable cartilages to which are attached the posterior ends of the cords) are seen to raise themselves in the fold of mucous membrane which covers them, and rapidly approach each other. This movement approximates the edges of the vocal cords, and consequently narrows the opening of the glottis. During the emission of the most acute sounds the glottis contracts into a mere line. The arytenoid cartilages are raised and meet in the median line, the epiglottis is drawn outward, and a short, stiff tube is then formed above the glottis, all these parts being in a state of extreme tension. It is impossible to study with the laryngoscope the manner of formation of the gravest chest tones, because the arytenoid cartilages approach each other closely and bend under the border of the epiglottis, which is depressed, so that the cords are hidden. The larynx possesses within itself more delicate powers of adjustment than any musical instrument. In addition to the movements already mentioned, the vibrating portions of the cords can be shortened or lengthened, or limited to their edges; the free edges can be sharpened or blunted, and the whole cord can be flattened out like a ribbon. The entire mechanism is adapted to meet varying degrees of pressure of the column of air in the trachea, and the quality of the sound produced is further modified by the adjustable centres or ventricles of the larynx.

Tone has three attributes: strength or loudness, pitch, and quality or timbre. Strength depends upon the energy of the expirating blast, and upon the structure and adjustment of the vocal organ and the resonance apparatus. Pitch depends upon the rapidity of the vibrations, this being determined by the length and tension of the cords. Quality, as has been shown in the article ACOUSTICS (q.v.), depends upon the character and number of the partial tones (overtones) accompanying any fundamental note sounded; and this is determined mainly by the form and thickness of the cords.

The principal difference between male and female voices lies in their pitch; they are also distinguished by their quality, the female voice being softer. There are two kinds of male voice, bass and tenor, and two kinds of female voice, contralto and soprano, all differing from each other in quality. The boy's larynx is like that of the female, and his voice is similar in range and pitch, but is somewhat louder and different in timbre. At puberty the boy's larynx undergoes a rapid change, into the bass or tenor, and is said to crack or break, the peculiarity then noticed being due to imperfect control of the muscular mechanism, and also, in some degree, to the congested and swollen state of the mucous membrane of the cords, incident to active growth. See SINGING.

In each larynx different parts or regions of the scale are produced by different laryngeal mechanisms. Laryngoscopic observations show that for each region or system there is a particular setting of the larynx, which is maintained throughout each register, the chief change being an increasing tension of the cords as the notes rise in pitch; at the break or change of register there is a sudden shifting of the setting. In most voices the ear recognizes three registers, the lower, middle, and upper, also termed the thick, thin, and small registers. In the first the cords vibrate as thick masses, in the second only their thin edges vibrate, and in the last the vibrating chink of the glottis is much reduced in length. Ease and smoothness of transition from one register to another is one of the principal objects in training the singing voice. Besides the musical tones formed in the larynx a large number of other sounds can be produced by the vocal apparatus. Speech consists in the modification of the laryngeal tones by other organs superior and anterior to the larynx (as the tongue, the cavity of the fauces, the lips, teeth, and palate, with its velum and the uvula acting as a valve between the throat and nostrils), so as to produce those articulate sounds of which language is formed.

Ventriloquism appears to consist merely in the varied modification of the sounds produced in the larynx in imitation of the modifications which distance imposes upon the voice. The essential mechanism of ventriloquism consists in taking a full breath, then keeping the muscles of the chest and neck fixed, and speaking with the mouth almost closed and the lips and lower jaw as motionless as possible, while air is very slowly expired through a narrow glottis. Care is also taken that none of the expired air is allowed to escape through the nose. Much of the ventriloquist's skill, however, in imitating sounds coming from particular directions depends on deceiving other senses than hearing. The direction from which sounds reach the ear is never very clearly distinguished, and when the attention is directed to a particular point, the imagination is apt to refer to that point whatever sounds we may hear. See PALATE; ACOUSTICS. Consult: Helmholtz, *Die Lehre von den Tonempfindungen* (Brunswick, 1877); H. Jennings, *The Voice and its Natural Development* (London, 1911); R. B. Faulkner, *The Tonsils and the Voice* (Pittsburgh, 1913); J. Bell-Ranske, *Voice and Nerve Control* (New York, 1915); W. H. Howell, *A Text Book of Physiology* (6th ed., Philadelphia, 1915).

VOICE. See DEPONENT; GRAMMAR.

VOICES, LEADING OF. See LEADING OF VOICES.

VOICES OF THE NIGHT. A collection of poems by Longfellow (1839), including the well-known "Psalm of Life." Most of the poems appeared originally in the *Knickerbocker Magazine.*

VOICING. A term applied to regulating the quality of tone in organ pipes. Tuning has to do only with correctness of pitch; but in voicing a certain quality is aimed at. The first requirement is, that all the pipes must be made

uniform. This is done by carefully regulating the amount of wind admitted and the angle at which it strikes the upper lip, and also by slightly changing the edge of the lip. Flue pipes and reed pipes require different treatment, so that voicers to-day generally make a specialty of either of these pipes. Voicing requires a very fine ear.

VOID (OF. *voide, vuide,* Fr. *vide,* empty, probably from Lat. *viduus,* bereft, deprived, widowed; connected with OPruss. *widdewu,* OChurch Slav. *vidova,* Skt. *vidhavā,* Goth. *widuwō,* OHG, *wituwa,* Ger. *Wittwe,* AS. *widewe,* Eng. *widow*). In law, an act or agreement which has no legal force or effect is said to be void. A clear and substantial distinction is made between void and voidable. That which is void is a nullity in law from its inception, but a voidable act or agreement has full legal force and effect until set aside. For example, an illegal contract is void, whereas one induced by fraud is only voidable at the option of the defrauded party. See CONTRACT; VOIDABLE.

VOID'ABLE. In law, an act or agreement which may be set aside or rendered of no effect by a party thereto, at his option, is voidable. However, it continues to have full legal effect until such action is taken. Thus the contracts of infants are said to be voidable. See CONTRACT, and consult the authorities there referred to.

VOIGT, fōgt, GEORG (1827–91). A German historian, born at Königsberg, son of Johannes Voigt. He was educated in Königsberg. In 1858 he became professor at Munich, in 1860 he went to Rostock as professor of history, and in 1866 to Leipzig, where he remained till his death. In 1854 appeared his *Wiederbelebung des klassischen Altertums oder das erste Jahrhundert des Humanismus* (3d ed., 1893); and from 1856 to 1863 his chief work, *Enea Silvio de' Piccolomini als Papst Pius II, und sein Zeitalter.*

VOIGT, JOHANNES (1786–1863). A German historian. He was born at Bettenhausen, Thuringia. In 1817 he was called to Königsberg as professor of history, which position he held during the remainder of his life. His best-known works are *Hildebrand als Papst Gregor VII und sein Zeitalter* (1815), the first unprejudiced treatment of Gregory by a Protestant; *Geschichte Marienburgs* (1824); the excellent *Geschichte Preussens* (9 vols., 1827–39;) *Codex Diplomaticus Prussicus* (6 vols., 1836–61); and *Geschichte des Deutschen Ritterordens* (1857–59).

VOIR DIRE, vwär dēr (OFr., to say the truth). A Norman French term employed to denote the preliminary examination of a witness or juror in order to determine his legal competency. By the common law, a person having a financial interest in the result of a cause could not be a witness therein, and a person called as a witness might be examined to determine his competency in this respect. This rule no longer prevails in the United States. It is customary to examine jurors on voir dire in order to ascertain whether they have any bias or prejudice for or against either party, and whether they possess the necessary qualifications to act as jurors in the cause. So in the case of a witness, e.g., an infant or an alleged insane person, or an alleged expert, it is customary to conduct a preliminary examination to ascertain the fitness of such a person to testify. See JURY; WITNESS.

VOIRON, vwä'rôn'. A town of the Department of Isère, France, on the left bank of the Morge, 14 miles northwest of Grenoble (Map: France, S., K 3). The modern church of St. Bruno is attractive. A conspicuous copper statue of Notre Dame de Vouise stands on a tower 50 feet high. Silk, cloth, paper, straw hats, and chemical products are manufactured. Pop., 1901, 12,625; 1911, 12,503.

VOIT, foit, KARL VON (1831–1908). A German physiologist. He was born at Amberg, Bavaria, and was educated in Munich, Würzburg, and Göttingen. He entered the Physiological Institute of the University of Munich in 1856 as Bischoff's assistant, and was professor of physiology there from 1863 till his death. In 1865 he founded, with Buhl and Pettenkofer, the *Zeitschrift für Biologie,* in which most of his important writings on the subject of nutrition and metabolism appeared. These include: *Physiologisch-chemische Untersuchungen* (1857); *Ueber die Theorien der Ernährung der tierischen Organismen* (1868); *Ueber die Kost in öffentlichen Anstalten* (1876); *Untersuchung der Kost in einigen öffentlichen Anstalten* (1877); *Physiologie des allgemeinen Stoffwechsels und der Ernährung* (in vol. vi of Hermann's *Handbuch der Physiologie,* 1881).

VOITURE, vwä'tur', VINCENT (1597–1648). A French poet and courtier. He was born at Amiens, and educated at the College of Calvé et Boncour and at the University of Orléans, where he pursued the study of law. He was introduced to the fashionable life of Paris and soon became a favorite at the Hôtel de Rambouillet among such men as Corneille, Balzac, and Chapelain. His wit was redoubtable. On the formation of the French Academy in 1635 he was one of the first members admitted, but took no active part in its proceedings. Voiture's brilliant verse delighted the salons during his lifetime, but remained unpublished till 1650, when his *Œuvres* appeared. They have gone through many editions, as successive generations have been pleased by the lightness of his touch (e.g., ed. Roux, 1856). The *Lettres* were published by Uzanne (1880). Consult: Sainte-Beuve, *Causeries du lundi,* xii (Paris, 1851–62); Rahstede, *Wanderungen durch die französische Litteratur, Vincent Voiture* (Oppeln, 1891); E. Magne, *Voiture* (Paris, 1911).

VOKES, vōks, ROSINA (1858–94). An English actress, the youngest of the famous Vokes family, which included her brother Frederick (1846–88) and her sisters Jessie (1851–84) and Victoria (1853–94). She participated in many of the early successes of the family, including the popular *Humpty Dumpty* and other pantomimes during the sixties. In 1870 she was married to Cecil Clay and retired from the stage. Fifteen years afterward she appeared in America, where for several successive seasons her vivacious talents were warmly appreciated in light comedies like *A Pantomime Rehearsal* (written by her husband), *The Schoolmistress, The Circus Rider, Wig and Gown,* and others. She left the stage late in 1893 because of ill health, and died at Torquay, England.

VO'LANT. In heraldry (q.v.), a term meaning flying and used of a bird or insect.

VOLAPÜK, vō'lä-pük. An artificial language invented in 1879 by Johann Martin Schleyer (born 1837), a German priest, and intended to be used as an international language (q.v.). The sounds admitted into Volapük are those represented by the following 27 letters: *a ä e i o ö u ü b c d f g h j k l m n p r s t v x y z.*

These letters, with a few exceptions, are used in their Latin, Italian, or German values. The vowels are nominally long. The "umlaut" vowels, *ä ö ü*, are admitted to fill out the inflexive scheme, which depends much on vowel distinctions. The consonants, *q*, *w*, *ng*, *th* (*thin*), *dh* (*this*), *zh*, etc., are excluded; *c* and *j* are perversely used. The Latin, English, German, or other national word for a given concept is chosen, and is reduced to its simplest form, with the omission or alteration of sounds or sequences of sounds not allowed in the scheme. Thus for "house" the Latin *domus* is taken, reduced to *dom* (pronounced dōm); for "time" the English *time*, reduced to *tim* (pronounced tēm); for "teaching" the English *teach* (tētsh), reduced to *tit* and altered to *tid* (pronounced tēd). The words are often disguised beyond recognition, as *kod* (English *cause*), *dan* (German *Dank*), *nam* (Latin *manus*). All stems except particles must end in a consonant. To these are added many inflexive and formative endings, and some prefixes. In nouns the ending *a* indicates the genitive, *e* the dative, and *i* the accusative (*dom, doma, dome, domi*).

The verb formations are rather numerous. The six vowels *a ä e i o u* indicate the six tenses. Passive forms begin *pa-*, *pä-*, etc. Prepositions are used to supplement inflexions (*a, bei, de, ko*, etc.). Throughout, synthesis, as in Latin and Greek, is the rule, and cumulation is the result. Polysyllables abound.

International congresses of Volapük were held (1884, 1887, 1889), a governing council was formed (1887), and statutes were adopted. The second stage soon arrived. Proposals for the improvement or extension of the system were at first decided by the council, with a right of veto conceded to the inventor. But the apparatus became unwieldy, and dissensions increased. Individual reforms of the language were published, and independent inventors put forth new schemes of their own. As a result the whole movement almost collapsed. But at length a number of the leaders, with a reorganized council, under the directorship of Woldemar Rosenberger (1893–98) and Rev. M. A. F. Holmes (1898–1903), formed practically a new system, called *Lingu international*, or specifically *Idiom neutral*, "the neutral language." Consult: Schleyer, *Entwurf einer Weltsprache* (Sigmaringen, 1879); *Wörterbuch* (Constance, 1880; 4th ed., 1888); Kirchhoffs, *Le Volapük* (Paris, 1886 et seq.); Hain, *Grammar of Volapük* (London, 1888). See ESPERANTO; INTERNATIONAL LANGUAGE.

VOLATILE LIVER OF SULPHUR. See BOYLE'S FUMING LIQUOR.

VOLBACH, fōl'bäĸ, FRITZ (1861–). A German composer, organist, and writer, born at Wipperfürth (Palatinate). He studied philosophy at Heidelberg and Bonn, and in 1886 entered the Royal Institute for Church Music at Berlin, where he was a pupil of Grell (q.v.). In 1892 he accepted the conductorship of the Liedertafel at Mainz, and in 1907 was appointed music director at the University of Tübingen. His compositions include a comic opera, *Die Kunst zu lieben* (1910), a symphony in B minor, three symphonic poems, a piano quintet in D minor, several choral works with orchestra. His more important books are biographies of Handel (1898) and Beethoven (1905); *Die deutsche Musik im 19. Jahrhundert* (1900); *Das moderne Orchester in seiner Entwickelung* (1910); *Die Instrumente des Orchesters* (1913).

VOLCANIC BRECCIA, brĕch'ä. See TUFF.

VOLCA'NO. As generally understood, a mountain which in a period of activity throws out molten or other material from the earth's interior, this material, taken collectively for all volcanoes, being lava (or its disrupted parts, scoriæ, or cinders and ashes), steam, and gases —sulphurous, sulphureted hydrogen, hydrochloric, methane, etc. There is no limitation as to the size (in height or diameter) of the "mountain"; therefore volcanoes vary from small hillocks to giant excrescences of the earth's surface, many of its loftiest summits (as Orizaba and Popocatepetl, in Mexico; Cotopaxi and Aconcagua, in the Andes; Kilimanjaro, in East Central Africa; Demavend and Ararat, in the Caspian region of Asia—between 17,000 and 23,000 feet in altitude) being of a volcanic nature. It would seem that a great part of the mass of most volcanoes is formed by the materials which they throw out. Therefore these mountains develop in size as the eruptions continue in time and magnitude. The size of a volcano is, however, in no way a measure of the force of its activity, unless, perhaps, one may assume the reverse proposition of what is very generally believed. Many violent or paroxysmic and destructive eruptions have taken place from comparatively low volcanoes, like Vesuvius, Skaptar Jökull, in Iceland, the Soufrière of St. Vincent, Coseguina in Nicaragua, Krakatoa in the Sunda Sea, Bandai-San in Japan, and Pelée on the island of Martinique, mountains measuring only a few thousand feet high.

Parts of a Volcano. The fundamental parts of a volcano are the basal portion or mountain proper; a more steeply rising and conical portion or "cone"; and the pit or basin-shaped depression on the summit of most active volcanoes known as the crater—the seat of eruptivity. There is no exact line delimiting these parts or making them necessary parts of a volcano, for in many there is no separation between the cone and the base proper—or the whole mountain might be said to be the cone—and in some volcanoes eruption takes place without any opened crater (Giorgios in Santorin, 1866, Pelée, and some of the ancient puys of central France). When present, as it is generally, the crater is on the actual summit of the mountain, but its true relation is frequently masked by the breaking away of a portion of the crater wall, when the caldron appears subcentral or lateral, with its base some distance down the slope of the volcano. True lateral craters or craterlets are formed when the main mountain has broken out over its surface supplemental or parasitic cones, which are sometimes very numerous, as in the case of Ætna. The persistently active Kilauea, situated at the 4000-foot level on the slope of Mauna Loa, is a supplemental crater of that volcano, but its activity is mostly, if not entirely, independent of the mountain on which it is parasitically placed. The size of the crater bears no relation to the height of the mountain carrying it. Orizaba, three and a half miles high, has a crater less than 1000 feet in diameter; the crater of Popocatepetl is hardly more than double that size. On the other hand, Haleakala, a Hawaiian volcano on the island of Maui, 10,000 feet in height, has a crater (seemingly the largest in the world) 20 miles in circumference; and the ancient crater surrounding Aso-San, 5630 feet, in Japan, is perhaps still larger. The size of the crater in no

way measures the intensity of an eruption. Krakatoa, Vesuvius, and Pelée, at the times of their greatest paroxysms, had craters of only moderate dimensions, that of Pelée being about 2500 feet in diameter.

Building Up of a Volcano. It has been said that probably much the greater number of volcanoes have made their own masses through the accumulation in time of their ejected products—the heaping up about the points of activity of lava, cinders, or ashes; usually of all three. As these are thrown out with a certain amount of alternation or regularity, the mountain itself acquires a regular internal structure, which, in section, would appear in alternating layers (strata) of deposition. Some volcanoes, whose eruptive energies are of a greater kind, and are not expressed in steam eruptions, are built up almost entirely of lava, and their outer dress, depending upon the viscosity or liquidity of the outflows, is either steep (like the mamelons of the island of Bourbon, and some of the puys of the Auvergne region of France) or very gentle, descending in a gradient of from 15° to 5° or less, as in some of the Hawaiian volcanoes. Other volcanoes are constructed almost wholly of cinders or scoriæ, but the composite cone is the most general.

It was once thought that volcanoes, instead of being accumulations of ejected material, were massive upheavals of the earth's surface, caused by pent-up force within acting upon the depressing surface. The more accurate study of volcanic phenomena has not given proof of the existence of "craters" or "cones of elevation," as these assumed structures have been called. But it is not improbable that in the initial formation of some (even many) volcanoes a preparatory step has been the upheaving of the deeper strata through magmatic intrusions, a condition fairly well indicated by the uplifts which are recognized in or associated with the structures known as laccolites—intruded lava-masses which have forcibly domed up the strata lying over the areas of upward passage of escaping lava. The Henry Mountains of southeastern Utah, the Euganean Hills (or portions of them) in Northern Italy, are familiar examples of this type. The prodigious force of this uprising lava is measured by the thousands of feet of thickness of sedimentary strata which it has bodily uplifted.

Material Ejected. The quantity of material ejected in the course of eruption is ordinarily dependent upon the force or violence of the eruption, and the period of its continuance. Skaptar Jökull, in its great eruption of 1783, threw out a mass of lava the cubical contents of which are thought to have equaled the bulk of the Mont Blanc massif. In the historic eruption of Vesuvius of the year 79 there was no lava flow, but the discharge of fragmental products (cinders and ashes) was very large, burying, as is well known, a considerable portion of Campania with débris several feet thick. The cataclysm of Krakatoa in 1883 was responsible for the extrusion of material which, it has been thought, could not have measured less than 4.3 cubic miles; and this again, we are informed by some geologists, could hardly have been more than the one-hundredth part of the material that was thrown out by Temboro, on the island of Sumbawa, in 1815. It seems not unlikely that on certain days of its eruptions in May and August, 1902, the ejecta of Pelée, chiefly ashes, more than equaled in bulk the quantity of sediment discharged by the Mississippi River in the course of a full year. The projectile force of eruption is such that light materials are thrown many miles into the air, where they may be suspended for months or even years, as in the Krakatoa outburst, moving about with the upper atmospheric currents, and giving rise, through the sifting out and reflection of the sun's rays, to those remarkable phenomena which are known as the "red glows" or "volcanic afterglows." These usually follow the true sunset by the period of about a half-hour (20–40 minutes), and rise to a position in the sky possibly exceeding 45° above the horizon. The afterglows of the Krakatoa eruption, the first to be carefully observed, were thought to have been deflected from dust particles sailing at a height above the earth's surface of from 30 to 50 or even 70 miles, and were continued for a period of considerably over a year. The gaseous emanations are an important feature of all volcanic activity; and often form the only outward evidence of an eruption, while they precede, accompany, and follow the main outburst when lava and ashes are ejected. They issue normally in a vertical column which soon condenses and spreads out as a cloud or canopy overhanging the crater. The cloud is white, changing to gray or black when accompanied by ash. Steam is the most abundant vapor emitted, although A. Brun claimed that it plays a subordinate rôle and is not an original constituent of the deep-seated emanations. Day and Shepherd, however, found water vapor in the gases given off by the Hawaiian volcanoes. The other common gases are carbon dioxide, hydrogen sulphide, sulphur dioxide, methane, hydrochloric acid, nitrogen and oxygen; they vary in nature and proportions with each eruption.

Electric, Magnetic, and Acoustic Disturbances. The ordinary electric disturbances which are associated with volcanic eruptions have long been recognized. These are the lightning flashes and peals of thunder which appear or are generated (perhaps as the result of friction) in the furious steam-cloud which is shot out from and overhangs the vent of the active volcano. In addition to the commoner or true flash-lightning, other forms of electric or pyro-electric discharge have been observed in association with volcanic discharges—balls or "stars" of electric luminosity appearing in the volcanic cloud, as has several times been noted in the case of the Vesuvian eruptions, and again noticed at the time of the eruption of Tarawera, in New Zealand, in June, 1886. But the most wonderful displays were those which were associated with the outbreaks of Pelée, notably those of the evenings of May 26th and August 30th. On the latter date the "electric" figures appeared as clustered or rocket stars, moving in straight and serpent lines (sometimes in parallel series), normal circles, and circles with zigzag streamers. These were observed simultaneously with the ordinary zigzag lightning, and lacked but little of the latter's blinding brilliancy. It has been impossible to determine the exact or absolute nature of these vivid lights traversing the volcanic cloud, but there can be no question as to their electric character.

Perhaps the most remarkable feature of the great Pelée eruption of May 8, 1902, was the violent disturbance in the magnetic field which it occasioned. While minor disturbances of the

magnetic needle had already been noted in earlier eruptions, these had generally been in close proximity to the scene of action, and in some instances had been referred to as an effect of the ejection of rock material containing magnetic iron. But at the time of the Pelée eruption the disturbance seems to have been of world-wide penetration, as it was noted by careful observers at most widely removed stations of meteorological and magnetic research. At most of the stations, the disturbance was noted almost exactly two minutes after the time of the destruction of St. Pierre, and in some places its continuance was extended over several hours. No satisfactory interpretation has up to this time been given regarding the nature of these magnetic phenomena.

The Krakatoa eruption of 1883 seems to have made itself felt as a distinct nonseismic shock or tremor through the entire diameter of the earth, and perhaps the same is true of the May eruption of Pelée. At any rate, a barograph record made at Zi-ka-wei (China) indicates a distinct concussional wave arriving at the station four hours after the magnetic disturbance was initiated. There is hardly room to doubt that the more rapid of the shock-pulsations were transmitted directly through the earth, and were followed later by the surface waves, which, traveling in opposite directions over the globe, gave interference areas as well as areas of most pronounced concentration. The sound waves following volcanic eruptions travel, doubtless, both through the earth's interior and over its surface. Eruptions are frequently heard at great distances, and yet, anomalous though it may appear, need not be audible near by. Humboldt called attention to this in connection with the eruption of the Soufrière in 1812, the noise of which was well noted in the valley of the Orinoco and beyond, at a distance in direct line of perhaps 750 or 800 miles. The May eruption of Pelée was likewise transmitted by sound to the most distant parts of the Orinoco valley, and to the northern coast of Venezuela (Maracaibo, 800 miles distant), and yet all evidence points to the conclusion that it was not heard at Fort-de-France, the capital of Martinique, at a distance of 14 miles from the scene of the great disaster. Similarly, no true shock of the eruption of August 30, 1902, was detected on the slope of the volcano itself at a distance of four miles in a direct line from the crater, although it was remarked at Port-of-Spain, on Trindad, and at Carupano, on the Venezuelan coast, with the distinctness and intensity of the discharge of siege guns. These anomalies in sound carriage are not unlikely to be due to forms of acoustic opacity—alternating layers, with different degrees of tension, density, and temperature of the atmosphere.

Atmospheric Disturbances. These appear mainly in winds of great violence which pass in advance of the clouds of eruption (in this sense comparable with the wind that is forced ahead of a snow avalanche), and others whose course is directed towards the volcano, and which are seemingly indraughts into vacual areas made by sudden explosion of steam. These so-called contrary currents have been noted in the eruptions of Tarawera, in 1886, of Bandai-San, Japan, in 1888, and of Pelée. They are at times very destructive, almost as much so as the direct winds scattered about by the outgoing blasts. It is not unlikely that most of the destruction that followed the explosion of Bandai-San, in 1888, and which resulted in the annihilation of the greater part of seven villages, was the work of this form of wind. Many attempts have been made to associate volcanic outbursts with particular phases of the moon and sun (sun-spot periods) and with special meteorological conditions of our atmosphere; and on these assumed relations special prophecies as to future volcanic happenings have been built. But no relation of this kind has so far been found, nor is there well-founded reason for believing that it in any way exists. Many of the most violent eruptions have taken place during storm periods; others of equal violence at times of almost absolute atmospheric stability. For at least six days preceding the May eruption of Pelée the barometric variation at noon was only one millimeter, the barometer marking steadily at this time 762 millimeters. This condition also existed at and before the time of Pelée's eruption of Aug. 30, 1902, and it was noted in the great eruption of Vesuvius in 1794.

Geographical Distribution of Volcanoes. With hardly an exception all volcanoes are situated in what can reasonably be assumed to be areas of weakness in the earth's crust, such areas being the ocean basins themselves, the border lands of these basins, or the mountain ranges which flank or construct the continental outlines. It follows then that volcanoes are either insular (oceanic) or suboceanic—i.e., placed on the continents close to the oceanic border. No distantly inland (active) volcano is known unless it can be shown to be in a region of crustal instability (Southern Mexico) or one in which a comparatively recent disruption has taken place (the volcanoes of the Great Rift valley, of East Central Africa—Mfumbrio Group). Mount Wrangel, in Alaska, is a possible exception to this rule. The main line of areas of volcanic distribution are: (1) The Pacific-Caribbean belt following the Andes of South America, with many dormant, extinct, or active summits (Aconcagua, Mistí, Cotopaxi, Sajama, Chimborazo, Tolima); the Lesser Antilles (Soufrière, Pelée, and many peaks on St. Lucia, Dominica, Guadeloupe, etc.); Central America and Mexico (Irasú, Coseguina, Izalco, Santa María, Agua, Fuego, Popocatepetl, Orizaba, Colima, Jorullo); the west coast of North America (Shasta, Hood, Rainier, Baker, Wrangel, Illiamna, Sheshalden, Makushin); Kamchatka, the Japanese Islands (Fujiyama, Aso-San, Bandai-San, Asamayama); the Philippines (Mayon) and Sunda Sea Islands (Gelunggung, Papadayang, Tengger, Temboro, Krakatoa); New Zealand (Egmont); and Victoria Land (Antarctica; Erebus and Terror). All of these seem to define a nearly continuous line or belt of weakness or disruption in the earth's crust. (2) A Mediterranean-Caspian region is defined by the positions of the Lipari Islands (with Stromboli), Etna, Vesuvius, the Ægean Islands (with Santorin), Demavend, and Ararat. (3) An Atlantic region, defined by the mainly quiescent volcanoes of Iceland (Hecla, Skaptar Jökull), the Azores (Pico), Madeira, Canaries (Teneriffe), Cape de Verde Islands, Tristan da Cunha, etc. (4) A Pacific region, with the numerous volcanoes on the small islands of the Polynesian group and the Mauna Loa volcanoes of Hawaii, Mokuaweoweo, the summit, and Kilauea the lateral crater.

Cause of Volcanic Eruptions. There is still much obscurity regarding the causes that condition volcanic eruptions—that permit of the generation of steam within the earth's interior, of its explosive escape through the "crust," and of the formation or existence of the molten magmatic mass that reaches the surface as lava or in its disrupted form, as scoriæ and ash. The accessible facts seem to point to the conclusion that the steam or vapor of water is derived from the hydrated rocks of the earth's superficial mass, and its sudden evolution is due to release from pressure of the rock or magma with which it is inbound, or to steady and increasing superheating. These conditions, as well as that of the uplifting and outhrow of lava, might be supplied as the result of deep rock displacements, which, by squeezing, would bring the more highly heated deeper crust nearer to the surface or to the critical point of dismemberment. And these displacements can readily be ascribed to vast subsidence, notably of the sea bottom.

VOLCANO. See VULCANO.

VOLE, vōl. An English name, little used in America until recently, for the smaller members of the rat family (Muridæ) of the genera *Arvicola*, *Erotomys*, *Calomys*, *Microtus*, and their near allies. The species are numerous and widely distributed, being found in Europe, Asia, Africa, and North and South America. Some of them are completely terrestrial in their habits, others are aquatic. (See MOUSE; MEADOW MOUSE.) Consult G. S. Miller, "Genera and Subgenera of Voles and Lemmings," in *North American Fauna*, No. 12 (Washington, 1896).

VOLGA. The largest river of Russia and of Europe. It rises among a cluster of lakes and marshes in the Valdai Hills in the Government of Tver, 205 miles southeast of St. Petersburg, and flows in a generally southeasterly course, though it describes a large zigzag with sharp bends at Samara and Tsaritsyn, between which its course runs to the southwest. It empties through a large delta into the Caspian Sea, after a course of about 2300 miles (Map: Russia, G 5). Its total fall from its source to its mouth is less than 900 feet, and its current is throughout tranquil and regular, wholly without falls or rapids, so that the river is navigable almost to its source. The extreme upper portion flows between wooded hills, but after leaving the Valdai plateau its course lies within the great plains. The right bank is generally higher than the left, and for a considerable distance along the middle course it is lined by a limestone escarpment with steep, wooded cliffs, a spur of which deflects the river at Samara in a long, narrow loop 50 miles to the eastward. The left bank is low, and in some places along the middle course it is lined with great marshes and trembling forests, in which the trees are supported by soil floating on soft mud. In the lower course both banks are low, but dry, owing to the rapid evaporation. Here the river receives practically no tributaries, and flows through saline steppes lying below sea level. Below Tsaritsyn the river begins to divide into a number of parallel arms, but the true alluvial delta begins only a short distance above Astrakhan. The delta is about 70 miles wide, and consists of eight large and numerous smaller arms which are all merged together under a single sheet of water during the floods. The main channel near its mouth is several miles wide; below the confluence of the Kama the width of the river is 1500 yards, and at Tver it is about 200 yards.

In some places the channel is nearly 100 feet deep, but the navigable depth is reduced by shoals to four or five feet in the lower and two or three feet in the upper reaches. The quantity of sediment deposited seems to increase from year to year; shoals and sand bars are continually formed, and a number of dredging machines have to be kept constantly at work. The chief tributaries of the Volga are the Kama from the east, a large river in itself, and the Oka from the west. The whole system waters 22 of the Russian governments, and has a total navigable length of over 7000 miles. Steamers ascend the main stream 1650 miles to Tver. Though the river is icebound more than one-third of the year, the traffic is large, amounting to over 14,000,000 tons of goods annually, or more than one-fourth of the total traffic on all the Russian railroads. The principal articles carried are timber, grain, salt, and naphtha. The chief ports on the river are, in the order of their shipping, Astrakhan, Nizhni-Novgorod, Tsaritsyn, and Saratov. Connected with the Volga is a vast canal system, through which communication is established between the river and the Black, Baltic, and White seas. The fisheries in the Volga are very important.

VOLHYNIA, vōl-ĭn'ĭ-ȧ. A government of southwest Russia, bordering on Austria and Poland. Area, over 27,700 square miles (Map: Russia, C 4). The northeastern part belongs to the region of Poliessie (q.v.) and is mostly marshy. The southern part is hilly and intersected by deep river valleys. The chief river is the Western Bug. There are numerous lakes. The climate is moderate but unhealthful in the north. Forests cover a considerable part of the area and are exploited on a large scale, timber being extensively exported. In the south, where the soil is fertile, agriculture has attained a considerable degree of development, especially among German colonists. Rye, wheat, oats, sugar beets, tobacco, and hops are produced. Stock raising is also important. The chief manufactures are beet sugar, spirits, and leather. Pop., 1912, 3,995,700—Russians, Jews, and Poles. Capital, Zhitomir (q.v.). The region of Volhynia was inhabited by Slavs and belonged to Russia at the very beginning of Russian history. In the fourteenth century it passed to Lithuania and was united with Poland in 1569. With the annexation of Poland (1793–95) it passed to Russia.

VOLITION, vō-lĭsh'ŭn. See WILL.

VOLK, DOUGLAS (1856–). An American

figure painter and teacher, son of Leonard Volk. He was born in Pittsfield, Mass., and studied in Paris under Gérôme (1873–78). After his return to America he organized and became director of the Minneapolis School of Fine Arts (1893) and afterward taught at the Cooper Union art school, the Art Students' League, and the National Academy of Design, New York. His paintings, which usually combine figure and landscape, are good in drawing, carefully composed, and pleasing in color. Good examples of his work, which is found in most American public collections, include: "The Young Pioneer," a portrait of Dr. Felix Adler, and "Little Mildred" (all in the Metropolitan Museum, New York); "Boy with Arrow" (National Gallery, Washington); "Accused of Witchcraft" (Corcoran Gallery, Washington); "Puritan Mother and Child" (Carnegie Institute, Pittsburgh). Among his mural decorations are those in the Minnesota capitol at St. Paul and the Des Moines (Iowa) courthouse. He was elected a member of the National Academy in 1899, and of the Architectural League in 1912 and received many prizes, including gold medals at Charleston (1907), the National Academy of Design (1910), National Arts Club, New York (1915), and the Panama-Pacific Exposition, San Francisco (1915).

VOLK, LEONARD W. (1828–95). An American sculptor. He was born at Wellstown, N. Y., and after working as a marble cutter and modeling by himself in St. Louis studied for two years in Rome. On his return in 1857 he settled in Chicago, where he did much to further art education and assisted in founding the Academy of Design, of which he was president eight years. He modeled the monument to Stephen A. Douglas in Chicago and various soldiers' monuments, but is at his best in his faithful and dignified portrayals of prominent Americans. These include the statues of Lincoln and Douglas (Illinois State House), General Shields (Capitol, Washington), and the bust of Lincoln. For his son, see VOLK, DOUGLAS.

VOLKELT, fôl'kĕlt, JOHANNES IMMANUEL (1848–). A German philosopher, born at Lipnik, Galicia, and educated at Vienna, Jena, and Leipzig. He became professor of philosophy at Basel in 1883 and at Würzburg in 1889 and in 1894 was made professor of philosophy and pedagogy in Leipzig. In philosophy he opposed positivism on the ground that thought by its demands enables us to transcend the subjectivity of experience. Volkelt wrote on æsthetics as well as on philosophy proper. His more important works are: *Pantheismus und Individualismus im System Spinozas* (1872); *Die Traumphantasie* (1875); *Kants Erkenntnistheorie* (1879), a searching piece of criticism; *Aesthetische Zeitfragen* (1895); *Arthur Schopenhauer, seine Persönlichkeit, seine Lehre, sein Glaube* (1900; 3d ed., 1907); *Die Kunst des Individualisierens in den Dichtungen Jean Pauls* (1902); *System der Aesthetik* (3 vols., 1905–14); *Zwischen Dichtung und Philosophie* (1908); *Was ist Religion?* (1913).

VOLKMANN, fôlk'män, RICHARD VON (1830–89). A German surgeon, born in Leipzig, son of the physiologist Alfred Wilhelm Volkmann (1801–77). He studied medicine at Halle, Giessen, and Berlin and in 1867 became professor of surgery and director of the clinic at Halle. He was a prominent surgeon in his day and a pioneer in the introduction of antiseptic methods in Germany. In 1885 he was ennobled. He edited (1870–89) *Sammlung Klinischer Vorträge* and contributed to the Pitha-Billroth *Handbuch der Chirurgie,* a section on diseases of the locomotory organs (1865–72); he also wrote *Beiträge zur Chirurgie* (1875). Under the pseudonym Richard Leander he wrote a juvenile *Träumereien an französischen Kaminen* (1871), which passed through many editions; *Aus der Burschenzeit* (1876); *Gedichte* (3d ed., 1885); *Kleine Geschichten* (1888); *Alte und neue Troubadourlieder* (2d ed., 1890). His collected stories appeared in 1899.

VOLKMANN, ROBERT (1815–83). A German instrumental composer, born at Lommatzsch. He studied both organ and piano with his father, violin and cello with Friebel, and composition with Anacker at Freiberg and K. F. Becker at Leipzig, where he received great encouragement from Schumann. From 1839 to 1842 he taught music at Prague and finally settled at Pesth, where he remained, except for four years at Vienna (1854–58). He was professor of harmony and counterpoint at the National Academy of Music for several years. Among his works are: two symphonies (D minor and B flat); three *Serenades* for string orchestra; two concert overtures; a cello concerto; a *Concertstück* for piano and orchestra; six string quartets; two trios; numerous works for piano (two and four hands). Among his vocal works are two masses, offertories, sacred songs, and a Christmas carol of the twelfth century. Consult C. Preiss, *Robert Volkmann* (Graz, 1912).

VOLKMANN, WILHELM FRIDOLIN, RITTER VON VOLKMAR (1821–77). An Austrian psychologist, born in Prague. In 1846 he became a lecturer in æsthetics, afterward in philosophy, at the University of Prague, and in 1856 was appointed to a professorship in philosophy there. His chief studies were in the exact psychology of the school of Herbart. His most important publication is the *Grundriss* (later *Lehrbuch*) *der Psychologie vom Standpunkte des philosophischen Realismus* (1856; 4th ed., by Cornelius, 1894–95).

VOLKOV, vôl'kôf, FEODOR GRIGORIEVITCH (1729–63). A Russian composer and theatrical director, born at Kostroma, Central Russia. He was summoned to the court of Empress Elizabeth in 1752 and a few years later was made first court actor at a Russian theatre then founded at Moscow by Imperial command. The libretto of the opera *La Clemenza di Tito,* to music composed by Araja in 1751, is important because it is the first opera written on a Russian text. His authorship of the opera *Taniushka, or The Fortunate Meeting,* the first Russian comic opera, with which Volkov's biographer credits him, has not been fully established.

VOLLMAR, fôl'mär, GEORG HEINRICH VON (1850–). A German Socialist leader, born at Munich. He entered the Bavarian army at an early age and served as lieutenant in the war with Prussia in 1866. He then enlisted in the papal army and later entered the Bavarian railway service, which he left to take part in the Franco-German War, in which he served as an officer until badly wounded at Blois. Having become interested in social studies, he embraced Socialism and (in 1878–86) was imprisoned several times for activity in propagating Socialistic ideas, organizing secret societies, etc. Vollmar became prominent in the German Reichstag, to which he was repeatedly elected after

1881, except during the period 1887–90; in the Legislature of Saxony (1883–89); and in the Legislature of Bavaria, of which he became a member in 1893. He became a leader of the conservative wing of the Social Democrats. He showed himself ready to make concessions to the principle of private ownership in the case of the small landowners or peasants. His publications include: *Der isolierte socialistische Staat* (1880); *Ueber die nächsten Aufgaben der Socialdemokratie* (1891); *Ueber Staatssocialismus* (1892).

VOLLMÖLLER, fôl'mĕl'ĕr, KARL (1848–). A German Romance philologist, born in Ilsfeld, Württemberg, and educated in Tübingen, Bonn, Munich, Berlin, and Paris. He traveled in Spain in 1874–75 and became a lecturer in Strassburg in 1875. He was professor at Erlangen (1877–81) and then at Göttingen until 1891, when he retired, settled in Dresden, and devoted himself to Romance philology. He was editor of the *Sammlung französischer Neudrucke* (9 vols., 1881–89), *Romanische Forschungen* (1883 et seq.), and of the valuable yearly summary, *Kritischer Jahresbericht über die Fortschritte der romanischen Philologie* (1890 et seq.), and published: *Kürenberg und die Nibelungen* (1874); *Der Münchener Brut* (1877), a twelfth-century French version of Geoffrey of Monmouth's work (with Konrad Hoffmann); *Octavian* (1877), an old French romance; *Poema del Cid* (1879); *Beiträge zur Litteratur der Cancioneros und Romanceros* (1897); *Rezensionsexemplar und bezahlte Rezension* (1902); *Briefe K. Hofmanns an Ed. von Kausler* (1907); *Einer alte Familiensitz* (1911).

VOLLON, vô'lôn', ANTOINE (1833–1900). A French still-life, landscape, and figure painter, born in Lyons. He studied at the Lyons School of Fine Arts and under Ribot. Vollon is one of the greatest of modern still-life painters. His coloring is rich and harmonious, and in the rendering of metals, the color and bloom of flowers, and in the painting of fish he has few equals. He also painted figure subjects. His works include "Sea Fish," "Curiosities," "The Port of Antwerp," and the portrait of the artist, all in the Luxembourg; "The Kettle" (1872, Lyons Museum).

VOLNEY, vôl'nâ', CONSTANTIN FRANÇOIS CHASSEBŒUF, COUNT DE (1757–1820). A French philosophic writer and politician. He was born in Craon. He studied medicine and Eastern languages, spent some years in Egypt and Syria, wrote *Voyage en Egypte et en Syrie* (2 vols., 1787; trans., 1787), was elected to the States-General (1789), joined the Republican movement and contributed to its anti-Christian "philosophy" the famous *Les ruines, ou méditations sur les révolutions des empires* (1791; trans., New York, 1796; London, 1827), and to its pedagogy *La loi naturelle, ou le catéchisme du citoyen français* (1793), in spite of which he fell under suspicion of Royalist leanings and was saved from execution only by the fall of Robespierre. Soon afterward (1794) he was made professor in the Ecole Normale, traveled in the United States (1795–1808), was made Senator (1799), Academician, and Commander of the Legion of Honor. He was created Count by Napoleon (1808) and a peer by Louis XVIII (1814). His later works are: *Tableau du climat et du sol des Etats-Unis* (2 vols., 1803; trans., 1804), and *Recherches nouvelles sur l'histoire ancienne* (3 vols., 1814–15; trans., 1819). Consult Eugène Bergers, *Volney: Etude sur sa vie et sur ses œuvres* (Paris, 1852), and J. R. Barni, *Les moralistes français au 18me siècle* (ib., 1873).

VOLNEY POWDER. See EXPLOSIVES.

VOLO, vô'lô, or **VOLOS.** The capital of the Nomarchy of Magnesia, Greece, 37 miles southeast of Larissa, on the Gulf of Volo (Map: Greece, D 4). It is situated near the sites of the three ancient cities of Demetrias, Pagasæ, and Iolcus and has interesting remains of the early Greek and Roman periods. The citadel, the church of Hagios Nikolaos, and the monument modeled after the Parthenos of Phidias are noteworthy. Volo has a good harbor. It is an important exporting centre of the products of Thessaly. Pop., 1896, 16,232; 1907, 23,563.

VOLOGDA, vô'lôg-dà. A government of northeast Russia. Area, 155,500 square miles (Map: Russia, F–J 2). It is a flat region, marshy and wooded in the north, and with some offshoots of the Ural Mountains in the east, reaching an altitude of nearly 5000 feet. This mountainous region is barren and almost uninhabited. The western part contains the bulk of the population. Vologda is amply watered by the Dvina, with its headstreams and tributaries, the Mezen and the Petchora. The climate is continental and exceedingly severe. The agricultural area is very restricted, and the larger part of the inhabitants find a source of livelihood in fishing, hunting, and lumbering. In the southern part the crops are abundant, and some products, especially flax, are even exported. The forests cover over three-fourths of the entire surface and belong largely to the crown. Stock raising is favored by the abundance of pasture land, and dairying is assuming an industrial character in the southwest. Pop., 1912, 1,678,600, chiefly Russians, but containing also many Zyrians, a people of Finnish stock, who have retained many of their national traits.

VOLOGDA. The capital of the Russian government of the same name, situated on both banks of the river Vologda, 289 miles northnortheast of Moscow (Map: Russia, F 3). It trades extensively with Archangel and St. Petersburg in agricultural and forest products, spirits, and leather. Lace making is an important industry. Pop., 1911, 38,700. The town was founded in the twelfth century (1147) and attained considerable commercial importance in the sixteenth century, when Archangel carried on an extensive trade with England and Holland. The foundation of St. Petersburg removed the centre of the foreign trade of Russia to the west, and Vologda lost its former importance.

VOLPE, vôl'pĕ, ARNOLD (1869–). A Russian-American orchestral conductor, born in Kovno. He studied the violin with Isidor Lotto at the Warsaw Institute of Music in 1884–87 and then for four years with Leopold Auer at the Imperial Conservatory in St. Petersburg. Two years later, in 1893, he returned to the conservatory, taking a four years' course in composition under Nicholas Soloviev. In 1898 he went to the United States, settling in New York, where he became conductor of several orchestral societies. In 1902 he established the Young Men's Symphony Orchestra for the purpose of training orchestral players. The more advanced players he formed in 1904 into the Volpe Symphony Orchestra, constantly recruited from the older organization. In 1910–14 he was con-

ductor of the municipal concerts in New York City.

VOLPO'NE, or THE FOX. A comedy by Ben Jonson, produced in 1605, printed in 1607.

VOLSCI, vŏl'sī. A people of ancient Italy, closely related to the Umbrians. (See ITALIC LANGUAGES, *Volscian;* UMBRIA.) To the south of them lay the sea, to the east the Samnites (q.v.), to the north the Æqui and the Hernici, to the west the Latini. The Volsci were brave and hardy mountaineers and fine warriors; they were incessantly at war, in conjunction with the Æqui (q.v.), with the Romans, but about 383 B.C. they were finally subdued by Rome. Consult J. Jung, *Grundriss der Geographie von Italien und dem Orbis Romanus* (2d ed., Munich, 1897); "Volsci," in Friedrich Lübker, *Reallexikon des klassischen Altertums,* vol. ii (8th ed., Leipzig, 1914).

VOLSINII, vŏl-sĭn'ĭ-ī. See BOLSENA.

VOLSK, vôl'y'sk. A town in the Government of Saratov, Russia, situated on the right bank of the Volga, 91 miles northeast of Saratov (Map: Russia, G 4). It has extensive ironworks, tanneries, etc. Pop., 1911, 36,134.

VOLSUNGA SAGA, vŏl'zụng-ȧ sä'gȧ. A thirteenth-century mythical history of the renowned old Germanic family of the Volsungs, descendants of Odin. Sigurd or Siegfried, son of Sigmund, is the most noted hero of the race. Consult: Morris and Magnusson, *The Volsungasaga* (London, 1870); Sophus Bugge, *Die Heimat der altnordischen Lieder von den Welsungen und Nibelungen* (Halle, 1909); H. Bartels, *W. Morris' Story of Sigurd the Volsung and Fall of the Niblungs* (Münster, 1906).

VOLT, vōlt (from It. *Volta,* name of the discoverer of the voltaic cell). A unit of electromotive force. It is defined to be the electromotive force which, steadily applied to a conductor whose resistance is 1 ohm, will produce a current of 1 ampere. It is therefore practically equivalent to 10^8 C. G. S. electromagnetic units. (See ELECTRICAL UNITS.) The electromotive force of two cells, the Clark and the Cadmium (or Weston), are known fairly accurately; and so for practical purposes the electromotive force of a Clark or a Cadmium cell is used as the standard, and its value substituted in the result. Consult the paper by Gouy in the *Reports* of the International Congress of Physics (Paris, 1901). See VOLTAIC CELL OR BATTERY.

VOL'TA. A river of west Africa formed in the northern part of the British Gold Coast Colony by the confluence of the Black and the White Volta. It flows in a southerly course, partly on the boundary of German Togoland, and empties into the Gulf of Guinea, 400 miles west of the mouths of the Niger. Its total length, including the Black Volta, is about 900 miles. The headstreams rise in the savanna regions of French Sudan, but the main river flows within the forest belt. It is broken in several places by rapids, which, together with the bar at the mouth, are impassable at low water; but during the floods large vessels can ascend it about 50 miles, and smaller vessels 250 miles.

VOLTA, ALESSANDRO, COUNT (1745–1827). An Italian physicist, inventor of the voltaic battery. He was born at Como and was educated at the public schools of his native town, showing a marked taste for literary effort and for physics. His first important essay, with the Leyden jar, was followed in 1771 by a discussion of the phenomena of frictional electricity. In 1774 he became professor of physics in the Royal School at Como and in the following year devised the electrophorus. In 1776–77 he applied himself to chemistry, one of his important discoveries in this science being the organic nature of marsh gas. Volta's work now became known abroad. He studied atmospheric electricity and devised many experiments, such as igniting gases by the electric spark in closed vessels. In 1779 he became professor of physics at the University of Pavia, a chair he occupied for 25 years. In 1872 he traveled in Europe, meeting in Paris Franklin, Buffon, and Lavoisier and in London other famous scientists. Galvani's discovery of what he termed "animal electricity" led Volta to experiments with two different metals in contact, and in 1794, with his condensing electroscope, he virtually proved his theory that the action of the current was due to the two metals. By 1800 he had developed his electric pile of dissimilar metals in contact and separated from a corresponding pair by a piece of moistened cloth or paper. Then came the crown of cups, or first voltaic battery, in which strips of metal were placed in cups containing brine or weak acid. The diverse theories of Galvani and Volta led to a scientific controversy, but Volta's ideas triumphed and persisted until modern times. In 1801 Volta was called to Paris, where he repeated his more important experiments before the Institute of France and was received by Napoleon, who made him Count and Senator and gave him a gold medal. A centennial exposition commemorative of the discovery of the voltaic cell was held at Como in 1899, but unfortunately a number of valuable Volta relics and manuscripts were destroyed by fire. Many of Volta's investigations were communicated to the Royal Society of Great Britain and were printed in the *Philosophical Transactions,* while his complete works were published at Florence in 1816. Consult D. F. T. Arago, "Eulogy," English translation in Smithsonian Institution, *Annual Report,* 1875 (Washington, 1876). See VOLTAIC CELL OR BATTERY.

VOLTA'IC CELL or **BATTERY.** Johann Sulzer observed in 1752 that "if you join two pieces of lead and silver and then lay them on the tongue you will notice a certain taste resembling that of green vitriol, while each piece apart produces no such sensation." The significance of this observation was not appreciated until Volta had described his crown of cups in 1800. Any two metals, copper and zinc, e.g., and the saline saliva compose, as is now known, a voltaic couple or cell.

While pursuing his experiments to explain Galvani's discovery (see GALVANIC BATTERY), Volta, of the University of Pavia, was led to the invention of the voltaic pile, where two dissimilar plates, as zinc and copper, were placed the one on the other. Then followed a piece of cloth moistened with a weak solution of common salt. The cloth was surmounted by another pair of metal plates in the same order as the first, and so on, each pair being separated from adjacent ones by moist cloth.

Volta's *couronne de tasses,* or crown of cups, was in principle essentially the same as a single couple of the pile. A series of cups contained brine or dilute acid; into the liquid dipped

metallic strips, half zinc and half copper. The zinc end of a strip dipped into one cup, and the copper end into the next one. An electric current was taken from the terminal wires of the series. Such was the first voltaic cell on record. Volta announced his discovery in a letter dated March 20, 1800, and addressed to Sir Joseph Banks, president of the Royal Society. In the words of Sir Humphry Davy, "the voltaic battery was an alarm bell to experimenters in every part of Europe." On April 30, 1800, Nicholson and Carlisle discovered that water could be decomposed by the electric current, and this important discovery was followed by Davy's production of the electric arc light between two pencils of carbon, the source of the current being a large voltaic battery; and in 1807 he accomplished the electrolysis of the fixed alkalis, potash and soda, and discovered the corresponding metallic elements, potassium and sodium.

Volta's battery will be best understood by considering a single simple cell. If a plate of zinc be placed in sulphuric acid, diluted with about 20 times its volume of water, bubbles of hydrogen will at first collect on the zinc, but visible chemical action will soon cease. If now a plate of copper be placed in the same solution, no change will be observed so long as the two metals are kept out of contact; but as soon as they are made to touch or are joined by wires (Fig. 1), vigorous chemical action sets in, the zinc wastes away, and hydrogen gas is freely liberated from the surface of the copper plate instead of the zinc. This chemical action goes on only so long as the two plates are electrically connected. Such a combination of two conductors, immersed in a compound liquid, called an electrolyte, which is capable of reacting chemically with one of them, is a voltaic cell or element. Several such cells joined together compose a battery. If the zinc and copper plates are connected with a wire, an electric current flows around in a circuit, from the copper to the zinc through the wire, and from the zinc to the copper through the liquid. The copper plate, or its equivalent, is accordingly now called the positive electrode, or cathode, and the zinc plate the negative electrode, or anode.

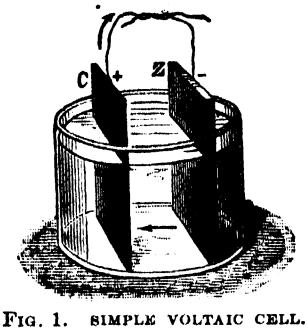

FIG. 1. SIMPLE VOLTAIC CELL.

The modern theory of dissociation furnishes an explanation of the manner in which an electric current is conducted through a liquid. It is briefly as follows: When an alkali, a salt, or an acid, such as hydrochloric acid (HCl), is dissolved in water, some of the molecules, at least of a binary compound, split into two parts (H and Cl, e.g.), one part having a positive electric charge and the other a negative one. The two parts of the dissociated substance with their electric charges are called ions. An electrolyte is a compound capable of such dissociation into two or more ions. It conducts electricity only by means of the migration of the ions resulting from the splitting in two of the molecules. The separated ions convey their charges with a slow but measurable velocity through the liquid. Electropositive ions, such as zinc and hydrogen, carry positive charges in one direction; electronegative ions, such as chlorine and sulphion (SO_4), carry negative charges in the opposite direction; and the sum of the two kinds of charges carried through the liquid in a second is the measure of the current. The appearance of the hydrogen at the cathode only is thus explained. See ELECTROCHEMISTRY.

Local Action. When acid is used in a cell as the electrolyte, with commercial zinc, there is always evidence of chemical action which contributes nothing to the current, for it goes on when the circuit is open. This is known as local action. It is probably due to particles of carbon, iron, etc., in the zinc; these form with the zinc itself miniature voltaic couples, the currents flowing in local short circuits between the foreign particles and the zinc. For this reason the zinc is eaten away locally with the formation of pits in its surface. The remedy for this local action was found by Sturgeon in 1830 to be amalgamation of the zinc, i.e., the formation on its surface of a mercury-zinc amalgam. The amalgam brings pure zinc to the surface, covers the foreign particles, and, above all, forms a smooth surface to which a film of hydrogen adheres and protects it from chemical action, save when the circuit is closed. If this protecting film of hydrogen be removed by exhausting the air above the liquid, the acid will attack the amalgamated plate as if it were impure zinc. Hydrogen is found to afford a similar protection from chemical action in other cases.

Polarization. If a simple voltaic cell is put in circuit with a galvanometer, it may be observed that the current gradually diminishes. If now the adhering film of hydrogen be brushed off the copper plate with a glass rod, the current will increase to nearly its original value. This decrease of the current is due to several causes which are included under the term polarization. The hydrogen at the positive electrode is the chief agent in decreasing the electromotive force of the cell, by means of the negative or counterelectromotive force which it produces.

To prevent polarization means are adopted to replace the hydrogen ions with others, such as copper or mercury, which do not produce polarization; or else the positive electrode is surrounded with a chemical which furnishes oxygen or chlorine to unite with the hydrogen before it reaches the electrode.

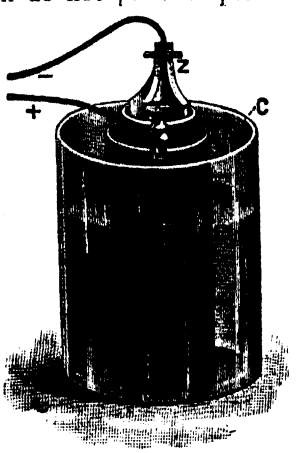

FIG. 2. DANIELL CELL.

The Daniell Cell, invented by Professor Daniell, of London, in 1836, was the first successful attempt to prevent polarization by chemical methods. It consists of a glass jar containing a saturated solution of copper sulphate ($CuSO_4$) and in it a cylinder of sheet copper (*C*, Fig. 2), which is usually cleft down one side. Within the copper cylinder is a porous pot of unglazed earthenware containing dilute sulphuric acid, or preferably a dilute solution of zinc sulphate

($ZnSO_4$). The porous pot contains also the zinc prism, *Z*. The object in using the unglazed pottery to separate the two solutions is to prevent their rapid admixture, while the ions readily pass through the pores.

With sulphuric acid in the porous pot, the hydrogen ions are intercepted at the porous partition by the copper sulphate. The positive copper ions then migrate towards the copper electrode and are there deposited as metallic copper. The SO_4 ions go to the zinc electrode with their negative charges, as in the case of the simple voltaic cell.

When the zinc is immersed in dilute zinc sulphate, both sulphates in the Daniell cell undergo partial dissociation, and no hydrogen ions are then present. Only zinc and copper ions travel towards the copper electrode. The zinc ions are not deposited on the copper plate, because zinc in copper sulphate invariably replaces the copper, forming $ZnSO_4$ in place of the $CuSO_4$. Zinc sulphate is formed at the negative, and metallic copper is deposited on the copper electrode. At the same time there is a loss of copper sulphate corresponding exactly to the increase of zinc sulphate. The Daniell cell is one of the most constant elements yet devised, for in it polarization by hydrogen is entirely avoided.

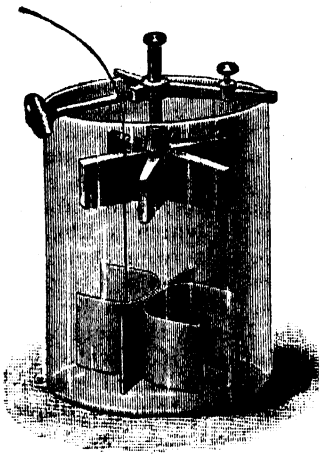

FIG. 3. GRAVITY CELL.

The Gravity Cell is a modified Daniell (Fig. 3). The porous pot is omitted, the partial separation of the liquids being secured by difference in density. The copper electrode is placed at the bottom in saturated copper sulphate, while the zinc is suspended near the top in a weak solution of zinc sulphate. The zinc should never be placed in the copper sulphate solution. The saturated copper sulphate is more dense than the dilute zinc salt; it therefore remains at the bottom, except as it slowly diffuses upward.

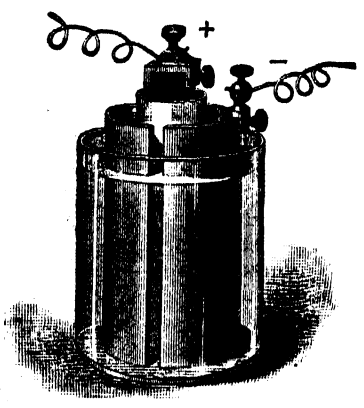

FIG. 4. BUNSEN CELL.

The Bunsen Cell, devised by Bunsen in 1841, consists of a glass jar containing dilute sulphuric acid, and a hollow cylinder of amalgamated zinc immersed in it (Fig. 4). Within the zinc cylinder is a porous pot containing strong nitric acid (HNO_3) and a prism of dense carbon. The hydrogen ions from the sulphuric acid are intercepted on their way to the positive electrode by oxygen from the nitric acid and are oxidized with the production of water. The nitric acid molecule is broken up and yields a brownish-red gas which is very corrosive and irritating.

The Chromic Acid Cell usually consists of a plate of zinc between two of carbon dipping into a vessel containing dilute sulphuric acid, to which is added either chromic acid or the bichromate of potassium or sodium. The sodium salt is much to be preferred to the potassium salt. When the bichromates are used an additional quantity of sulphuric acid is needed to liberate chromic acid, which is the real depolarizer. Fig. 5 illustrates one form of this cell, which is very convenient, but is open to the objection that since the carbon plates are usually left standing in the solution, the liquid soon works upward and attacks the connections at the top. The zinc is attached to a sliding brass rod, *A*, so that it may be lifted out of the liquid when the cell is not in use. The hydrogen coming from the ionized acid is oxidized to water by the chromic acid, and polarization is prevented.

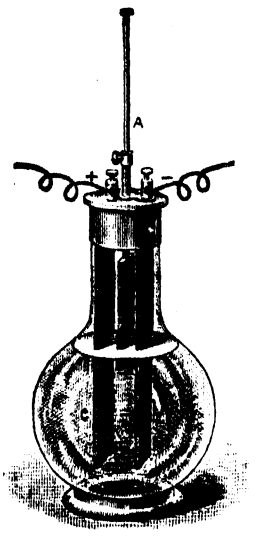

FIG. 5. GRENET CELL.

Fig. 6 illustrates a form of chromic acid battery, where the several cells composing it have their carbons and zincs suspended from a frame. It is known as a plunge battery and is convenient for experimental work.

The Edison-Lalande Cell is an example of the use of a solid depolarizer, viz., black oxide of copper. It was originally due to Lalande. The electrolyte is a solution of caustic soda, one part of the alkali to three of water by weight.

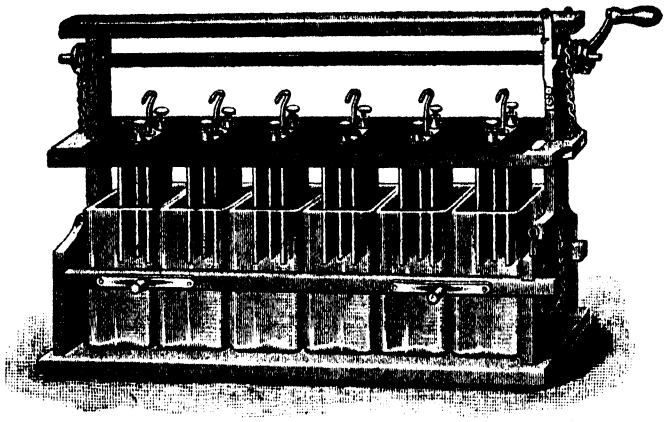

FIG. 6. PLUNGE BATTERY.

When the cell is working, the zinc forms with the alkali sodium zincate, which is soluble, while hydrogen is released at the cathode. Copper oxide readily gives up its oxygen to a reducing agent like hydrogen. In this cell the copper oxide is employed as a compressed plate, supported in a light copper framework, which is

attached to the cover of the jar and forms the positive electrode. In the larger sizes two zinc plates are used, one on each side of the copper oxide slab. The solution is covered with a layer of heavy paraffin oil to prevent access of the carbon dioxide of the air, which would convert some of the caustic soda into a carbonate and shorten the useful life of the cell. The serious disadvantages of this cell are high first cost and low electromotive force. When freshly set up the cell may have as high an electromotive force as one volt, but the working value is only about three-quarters of a volt.

All of the preceding cells, except the simple one of Volta, are adapted to work on a closed circuit. They do not polarize very seriously and are able to furnish a fairly constant current for a long period.

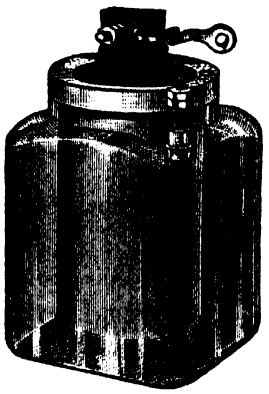

FIG. 7. LECLANCHÉ CELL.

The Leclanché Cell stands in quite a different class. It is usually free from local action, but it polarizes easily and is therefore employed for domestic purposes requiring intermittent currents for short periods only. For such service it is good for months and even years, without replenishment of anything except water. The Leclanché cell consists of a glass jar containing a saturated solution of ammonic chloride (sal ammoniac) in which is immersed a rolled zinc rod (Fig. 7). The porous pot contains a bar of carbon tightly packed in a mixture of manganese dioxide and granulated carbon. When the circuit is closed, the sal ammoniac acts on the zinc, forming zinc chloride and liberating ammonia and hydrogen. The hydrogen is slowly oxidized by the manganese dioxide. On a closed circuit the hydrogen is liberated faster than it is oxidized, and the cell polarizes. If it is allowed to rest it recovers from polarization. The form shown in the illustration has a porous pot provided with a flange which fits the top of the glass jar. The zinc rod enters the jar through a small hole, which is closed by a piece of rubber tubing surrounding the rod at this point. The jar is thus practically closed for the purpose of preventing evaporation.

Investigation has shown that the manganese dioxide furnishes only about half the oxygen to effect complete depolarization in a cell worked intermittently. It can hardly be doubted that an additional source of oxygen is the gas absorbed by the carbon and dissolved in the electrolyte. With ready access of air and frequent intervals of rest, it is quite possible that nearly enough oxygen may be supplied from the air without any other depolarizer. It is for this reason that the carbon cell, which is the Leclanché with the porous pot and the manganese dioxide omitted, is quite effective for easy and intermittent service.

Dry Cells have come into extensive use in recent years for the purpose of securing portability, which is obviously lacking in a cell with a liquid electrolyte. The name is a misnomer, since a so-called dry cell is practically a Leclanché cell in which the electrolyte is in the form of a moist mixture. The chief difficulty in devising a dry cell is to find an absorbing medium for the mixture sufficiently hygroscopic to keep it wet. Dry cells deteriorate by local action and by loss of water.

Fig. 8 shows in section a dry cell of modern design. The zinc can forms the negative electrode. Inside this can, at the bottom and sides,

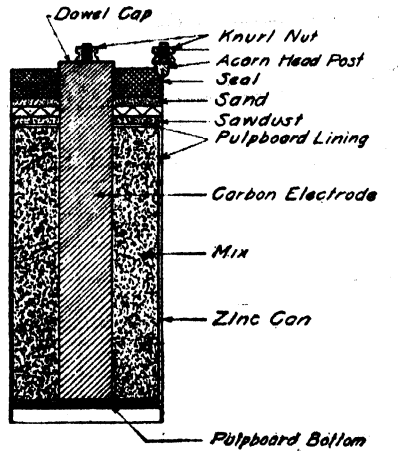

FIG. 8. DRY CELL.

is a pulpboard lining, which serves two purposes: as an insulator between the zinc and the mixture, and as a medium for carrying a part of the electrolyte. The positive electrode consists of the carbon rod, which is surrounded by the portion designated "mix" in the figure. This mixture consists of crushed carbon, graphite, manganese dioxide, zinc chloride, and ammonium chloride. It is packed tightly around the carbon electrode. The whole is held in place and made air-tight with a wax or pitch seal. A cell constructed in this manner will have a voltage of from 1.5 to 1.6 and will show a short-circuit current of from 25 to 30 amperes. The standard dimensions of these cells are 2½ inches by 6 inches.

Small dry cells, for use in pocket flashlights, millions of which are sold annually, differ from the standard size in the use of a muslin bag instead of the pulpboard to separate the zinc from the mixture. Two or three of these cells are connected in series according to the voltage of the lamp used.

Figures 9 and 10 exhibit graphically tests of a Leclanché and an Obach dry cell respectively. Each cell was on a closed circuit through an external resistance of five ohms for one hour; the recovery from polarization was traced for the following hour, the data for the latter being plotted backward towards the starting point. The polarization of the dry cell was somewhat less than that of the Leclanché; but after the first five minutes the current through the Leclanché was more constant in value than that through the dry cell.

Standard Cells. A standard cell is employed as a standard of electromotive force. It is not intended to furnish any current, but only electric pressure. The first standard cell was invented by the late Latimer Clark in 1873. In 1894 it was made a legal standard in Great Britain and the United States; and, in accordance with the best determinations up to that time, its electromotive force was assumed to be 1.434 volts at 15° C. Its value now is 1.4324 volts.

It consists of zinc in a saturated solution of zinc sulphate, and mercury in contact with a

paste of mercurous sulphate mixed with zinc sulphate. All the materials must be neutral and specially prepared in accordance with standard

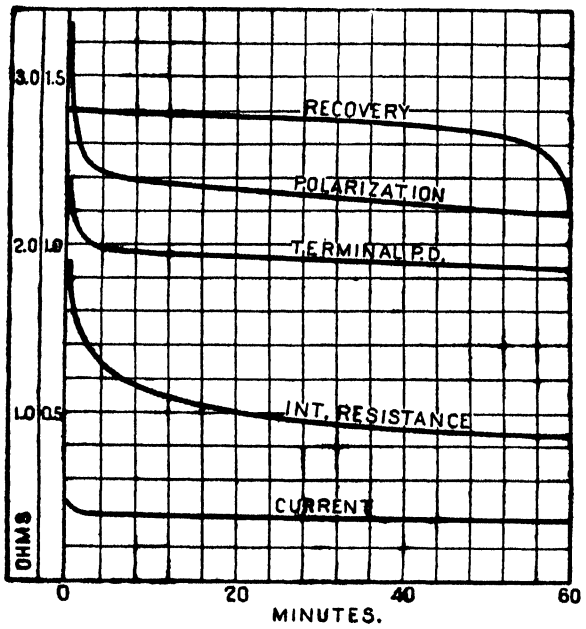

FIG. 9. DIAGRAM SHOWING TEST OF A LECLANCHÉ CELL.

specifications. The Carhart-Clark cell, a modified form of the above, was also used.

The H form devised by Lord Rayleigh is now universally used. In one limb of the H is the negative electrode, consisting of a mercury-zinc amalgam containing 10 per cent of zinc. This is covered to the depth of one centimeter with zinc sulphate crystals. The positive electrode in the other limb is pure mercury, and

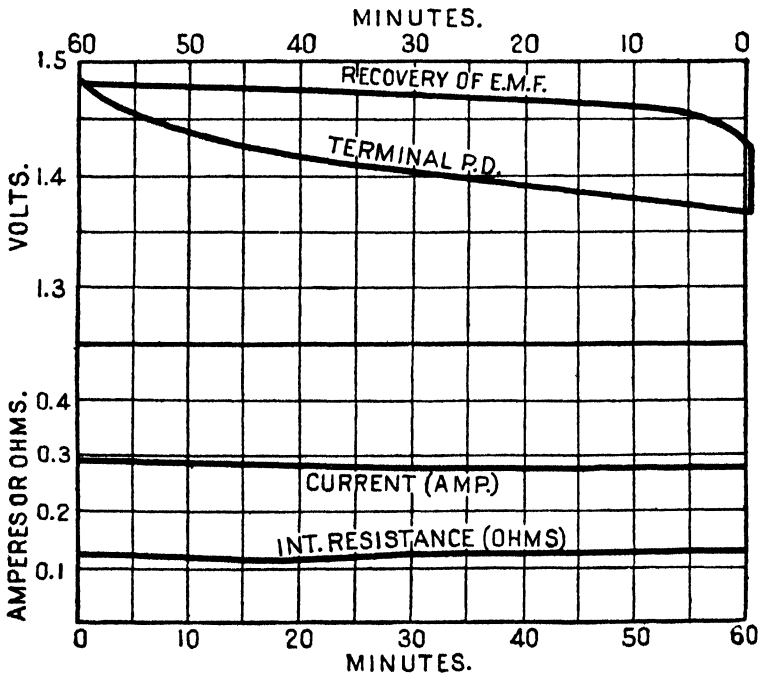

FIG. 10. DIAGRAM SHOWING TEST OF AN OBACH CELL.

on this is placed the mercurous sulphate paste; the paste in turn is covered with crystals of the zinc salt. The cell is finally filled with a saturated solution of zinc sulphate, and the vessel is securely closed. Platinum wires sealed into the two limbs of the cell make connection with the zinc amalgam and the mercury respectively.

The change of electromotive force with temperature is large in the Clark cell. The formula expressing the electromotive force of the cell at any temperature is

$$E_t = E_{15} - 0.00119\,(t - 15) - 0.000007\,(t - 15)^2.$$

Thus near 15° C. a change of temperature of 1° C. changes the electromotive force about 0.0012 volt. This formula is good between 10° and 25° or 30° C.

Weston Normal Cell. The International Conference on Electrical Units and Standards, held in London in 1908, decided unanimously to adopt the Weston normal cell as the international standard of electromotive force. Since that time the Weston normal cell has everywhere displaced the Clark cell as the international standard. In the Weston cell cadmium amalgam is used instead of zinc amalgam, and saturated cadmium sulphate instead of zinc sulphate. In other respects the Weston cell is like the Clark. It is made in the H-form (Fig. 11). Both limbs are completely closed by sealing them before the blowpipe.

A signal advantage of the Weston normal cell over the Clark is its small change of electromotive force with temperature. The international value of its electromotive force at 20° C. is 1.0183 volts, and the formula expressing the electromotive force at any temperature is

$$E_t = E_{20} - 0.0000406\,(t - 20) - 0.00000095\,(t - 20)^2.$$

The Weston normal cell should be distinguished from the Weston standard cell of commerce, which is set up with a nearly saturated solution of cadmium sulphate but without any crystals of the cadmium salt. The electromotive force of the latter is somewhat higher than that of the normal cell, and the effect of a change of cadmium sulphate are present; but this cell is not reproducible to the degree required in a standard. The average of small groups of Weston normal cells made in different countries agrees in electromotive force to within about two parts in a hundred thousand.

Energy Relations. From the point of view of energy a voltaic cell is a device for the direct conversion of potential chemical energy into the energy of an electric current. Long ago the question arose whether all the chemical energy transformed in a voltaic cell is thus converted in its entirety into electrical energy. The chemical processes going on in the cell involve a loss in the intrinsic energy of the materials. Does this loss equal the energy which takes the form represented by the electric current? Lord Kelvin and Helmholtz at first answered the question in the affirmative. According to this view it is a simple matter to calculate the electromotive force of any given voltaic combination from the heats of formation of the compounds undergoing chemical change. The quantity of electricity transported through a cell, when a gram equivalent of zinc enters into solution, and a gram equivalent of other substances undergoes a concurrent change, may be obtained by dividing the atomic weight of zinc

by its electrochemical equivalent. The result is 96,540 coulombs. This quantity multiplied by the electromotive force of the cell must equal the electrical energy given out while one gram equivalent of zinc goes into solution. If this product is placed equal to the algebraic sum of the heats of formation of all the chemical changes involved in the cell, the value of the electromotive force is readily obtained from the equation. Thus the heat of formation of a gram equivalent (32.5 grams) of zinc as $ZnSO_4$ is 121,000 calories; of copper (31.7 grams), as $CuSO_4$, is 95,700 calories. The difference is 25,300 calories. In other words, the reaction in the Daniell cell may be written

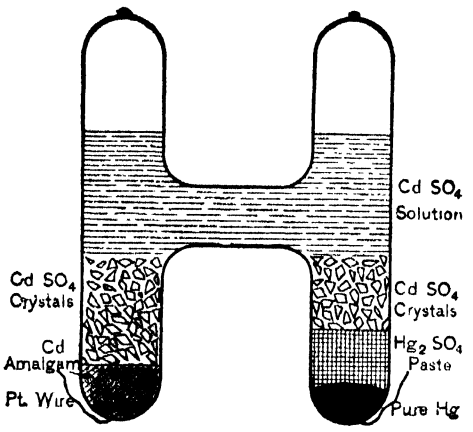

FIG. 11. WESTON NORMAL CELL.

$$CuSO_4 + Zn = ZnSO_4 + Cu + 25{,}300 \text{ calories.}$$

Then $EF = 25{,}300 \times 4.186$ watts, where F is the quantity of electricity (96,540 coulombs) corresponding to one gram equivalent. From this equation E is 1.098, the electromotive force of the Daniell cell. This value agrees very closely with the observed value. It was soon found, however, that other cells did not show equally good agreement with the theory. In some the electromotive force is smaller than the value calculated from the heats of formation, and in a few it is larger. Finally, Willard Gibbs in America and Helmholtz in Germany independently expressed the true relationship between the chemical energy transformed and the electrical energy developed. The Helmholtz equation may be written as follows:

$$E = \frac{H}{nF} + T\frac{dE}{dT},$$

in which H is the algebraic sum of all the heats of formation expressed in mechanical measure, n is the valence of the cation, F is the quantity of electricity transported through the cell by one gram equivalent of any substance, T is the absolute temperature (on a scale whose zero is $-273°$ C.), and dE/dT is the temperature coefficient of the electromotive force of the cell. From this equation it is obvious that the actual electromotive force is smaller than the value calculated from thermal data alone whenever the temperature coefficient of the cell is negative, and it is larger when the temperature coefficient is positive. In the former case, only a portion of the transformed chemical energy appears as the energy of the current; the remainder heats the cell. In the latter case the electrical energy given out by the cell is in excess of the chemical energy transformed, and the cell converts some of its heat into electrical energy and so cools in action. The Gibbs-Helmholtz equation represents our most assured knowledge of the relations between the chemical, electrical, and thermal quantities involved in a voltaic cell, and it has been fully established by experiment. Consult Walker, *Introduction to Physical Chemistry* (London, 1891), and Carhart, "Thermodynamics of a Voltaic Cell," in *Physical Review* for July, 1900.

It has been demonstrated also by experiment that the change in the electromotive force of a cell per degree of temperature is equal to the sum of all the thermal electromotive forces per degree, taken with their proper sign, at all contacts of dissimilar substances in the cell.

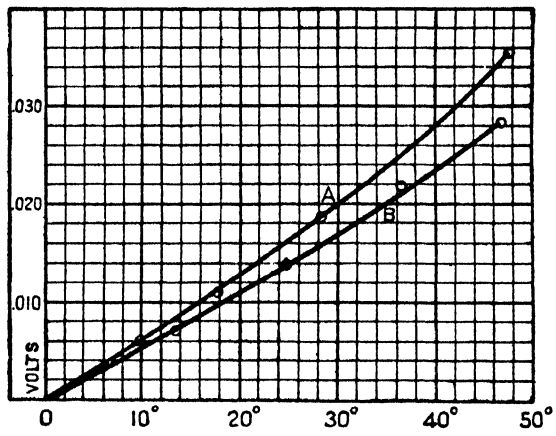

FIG. 12.

The thermoelectromotive force between zinc and a solution of zinc sulphate is directed from the solution to the metal. The same is true of copper and copper sulphate, while the thermoelectromotive force between equidense solutions of the sulphates of zinc and copper is practically zero. If a Daniell cell be so constructed that one side or electrode may be heated independently of the other, it will have a positive coefficient if the positive electrode and the solution about it be heated, and a negative coefficient if the negative side be heated. Since both zinc and copper, each in a solution of its sulphate, tend to become positive when heated, or to play the rôle of copper in a simple voltaic element, it follows that the thermoelectromotive force at the copper electrode of a Daniell cell is in the same direction as that of the cell itself, while that at the zinc electrode is in the opposite direction. These two thermoelectromotive forces per degree C. are very nearly equal to each other, and

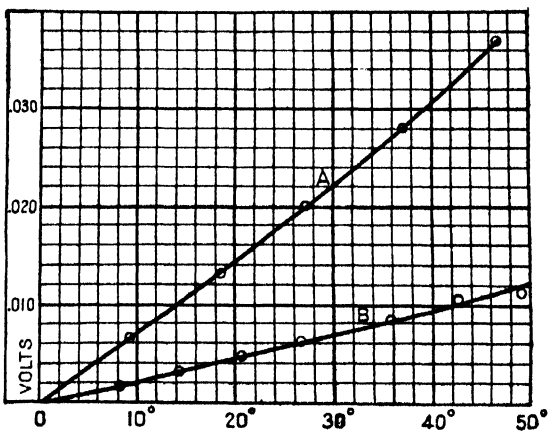

FIG. 13.

the temperature coefficient of the Daniell cell is accordingly very small. The curves of Fig. 12 represent the changes in the electromotive force of a Daniell cell produced by heating the two sides separately. Curve *A* is for the zinc side, and curve *B* for the copper side. The two changes have opposite signs, but both are plotted as positive ordinates in the figure, since their difference expresses the change of electromotive force when the whole cell is heated.

In Fig. 13 curve *A* is again the curve for zinc —zinc sulphate—and curve *B* is the curve for mercury—mercurous sulphate—in the same solution of zinc sulphate. In other words, the cell was set up as a Clark standard cell without any crystals of the zinc salt. The difference in the values of these thermoelectromotive forces for say 10° and 40°, divided by the temperature difference, 30°, gives the change in electromotive force of this type of Clark cell for 1° C. It is 0.00055 volt. The actual change determined by heating the whole cell was 0.00056 volt; and if a much smaller term, depending on the square of the temperature difference, be taken into account, the result will be identical with that obtained from the curves of Fig. 13.

The same method of synthesis applied to a cell composed of zinc in a solution of zinc chloride and mercury in contact with mercurous chloride (calomel), which has a small positive temperature coefficient, again gives a result agreeing perfectly with the coefficient obtained by direct measurement.

It thus appears that the heat generated or absorbed by a voltaic cell, corresponding with the sign of the temperature coefficient, may be localized in the cell. In the Daniell cell the passage of a current generates heat at the zinc electrode, where the current flows against the thermoelectromotive force at that point; at the same time heat is absorbed at the copper electrode, because the thermoelectromotive force there is in the same direction as the current, and energy is given to the circuit. This energy is supplied by the heat of the cell itself. On account of these two opposite heat effects a difference of temperature is established between the two sides of the cell proportional to the quantity of electricity that has passed through it. If a current is passed through the cell from some outside source, in the opposite direction, the heat effects at both electrodes will be reversed. These results have been established by experiment. If heat is generated on one side and absorbed at the other in equal quantities, then the temperature of the cell as a whole will remain unchanged, the temperature coefficient is zero, and the chemical energy transformed equals the electrical energy given out.

Nernst's Theory. The modern theory of dissociation has given rise to another view of voltaic cells in the hands of Nernst and his school. Van't Hoff accounts for the phenomena of osmotic pressure by the theory that the molecules and ions in a solution exert a pressure which conforms in all respects to the laws of Boyle and Gay-Lussac for gases. According to this view, the ions are forced out of the solution against the electrodes in a voltaic cell and give up their charges to them.

Further, it is assumed that metals exhibit a tendency to go into the ionic state when immersed in an electrolyte. This tendency is known as electrolytic solution pressure. It is analogous to vapor pressure, and measures the tendency of a metal to pass into the state of free ions in an electrolyte. Let P denote the solution pressure, and p the osmotic pressure due to the metallic ions present in the electrolyte. If now P is greater than p, some of the metal will go into the solution as positively charged ions, leaving the metallic mass negatively charged. If P equals p, no more ions are formed and the metal does not become charged. If P is less than p, the osmotic pressure drives the positive ions out against the smaller solution pressure, and the metal to which they give up their charges becomes positively charged. The charging of the metal is equivalent to the production of a difference of potential between the metal and the solution.

Starting from the well-known gas equation, $pv = RT$, and assuming that when the ions pass from the pressure P to the pressure p, work is done to the same extent as if the ions were in the gaseous state, Nernst found that the electromotive force between a metal and an electrolyte may be expressed by the following formula:

$$E = 0.0002 \frac{T}{n} \log \frac{P}{p}.$$

In this equation n is the valence of the metal. Taking into consideration the potential difference at both electrodes, we have as the equation for the electromotive force of a voltaic cell, neglecting the small potential difference at the contact of the two electrolytes,

$$E = 0.0002\, T \left(\frac{1}{n} \log \frac{P}{p} - \frac{1}{n'} \log \frac{P'}{p'} \right).$$

The Gibbs-Helmholtz and the Nernst formulas denote two methods of viewing the action taking place in a voltaic cell. They are not antagonistic, but complementary. Nernst's formula gives perhaps a more detailed insight into the mechanism of a cell; Helmholtz's, especially when the heat effects are localized, considers a voltaic cell entirely from the point of view of the chemical and thermal energy involved. The Nernst formula gives no definite account of the temperature coefficient of a cell, nor of the relation of this coefficient to the electrical energy evolved. The thermodynamic method of Gibbs and Helmholtz furnishes the most secure foundation for the investigation of the transformations of energy in a voltaic cell, without exposing to view, however, the exact mechanism beyond the application of thermoelectromotive forces to the problem.

Concentration Cells. In the extreme case in which there is no chemical energy to be converted into work, the cell becomes a device for the conversion of heat alone into the energy of the current. It is then known as a concentration cell. Thus, when two electrodes of the same metal are immersed in a solution of a salt of this metal, the concentration of the solution at one electrode being greater than at the other, the cell has a small electromotive force which will produce a current. When the solutions are so dilute that there is no further heat of dilution, this electromotive force is the residual obtained from the Gibbs-Helmholtz equation, or $T \times dE/dT$. It is proportional to the absolute temperature of the cell. Fig. 14 represents a Zn-$ZnSO_4$ concentra-

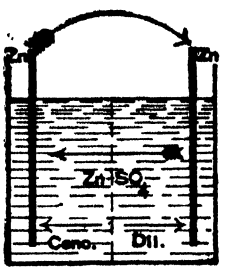

FIG. 14. CONCENTRATION CELL.

tion cell. The direction of the electromotive force within the cell is shown by the long arrow in the solutions. The short arrows show the direction of the thermoelectromotive forces at the two electrodes. This thermoelectromotive force increases in value with an increase in the concentration of the electrolyte, and the relation between the two is a perfectly definite one. Hence the origin of the electromotive force in a concentration cell, with solutions of extreme dilution, may be regarded as thermal entirely and equal to the difference of the two thermoelectromotive forces on the two sides of the cell. There is also probably a small electromotive force at the contact of the two solutions. Such a cell converts the heat of its surroundings into the energy of a current, but it does not contradict the second law of thermodynamics, because the process involved does not constitute a cycle of operations. Such a system as this cannot by repeated cooling convert into work the heat of neighboring bodies, because the concentrations are equalized by the flow of current, and then there is no further electromotive force.

On the Nernst theory the formula for the electromotive force of a concentration cell becomes

$$E = 0.0002\frac{i}{n}\cdot\frac{2v}{u+v}\cdot T\log\frac{c_1}{c_2}.$$

In this formula i expresses the degree of dissociation of the dissolved salt, u and v are the migration velocities of the positive and negative ions respectively, and c_1 and c_2 are the two concentrations.

Nernst has applied his theory to a concentration cell consisting of silver electrodes in solutions of silver nitrate, the concentrations being as 1 to 10. The measured electromotive force was 0.055 volt at 18° C., and the calculated value, 0.0574. The two are in very satisfactory agreement.

Similar concentration cells may be made by employing a single solution and amalgams in contact with it, the two amalgams containing the metal ion in different degrees of concentration. For example, zinc-mercury amalgams in contact with a solution of zinc sulphate give an electromotive force from the concentrated to the dilute amalgam through the cell. When a current flows the zinc goes into solution from the more concentrated amalgam, and zinc ions are set free at the surface of the weaker amalgam. In this case the larger thermoelectromotive force is at the junction of the less concentrated amalgam and the solution; and more heat is absorbed at the cathode than is generated at the anode. As in the other case, therefore, this cell converts heat into electric energy.

When the heats of dilution of the solutions in the two sides of the cell differ, the difference is available as energy to produce electromotive force, represented by the first term of the Gibbs-Helmholtz equation. The Nernst equation does not take this energy into account; it is therefore applicable to solutions of extreme dilution only. (*Physical Review*, vol. xxvi, March, 1908, pp. 210–219.) To illustrate: The difference between the known heats of dilution of the solutions $ZnSO_4\cdot 50H_2O$ and $ZnSO_4\cdot 200H_2O$ is 67 calories per gram molecule. If a concentration cell is set up with these two solutions, the electromotive force derived from this heat of dilution is

$$\frac{67\times 4.186}{2\times 96.540} = 0.00145 \text{ volt.}$$

The coefficient dE/dT of this cell with zinc amalgam electrodes was found to be 0.0000344. Hence at 25° C. (or 25° + 273° = 298° absolute) the term TdE/dT is

$$298\times 0.0000344 = 0.01025 \text{ volt. Then}$$
$$E = 0.00145 + 0.0125 = 0.0117 \text{ volt.}$$

The measured voltage was 0.0116 volt. Other concentration cells gave computed values agreeing equally well with the observed ones, as shown in the following table:

SOLUTIONS	$\frac{dE}{dT}$	$T\frac{dE}{dT}$	E_h	Comp. E.M.F.	Obs. E.M.F.
$ZnSO_4$. 50 H_2O

VOLTAIRE, vôl'târ'. The assumed name of JEAN FRANÇOIS MARIE AROUET (1694–1778). A French philosopher and a versatile author, born in Paris in February, 1694. His father was first a notary and afterward a treasurer attached to one of the high courts of the kingdom. Jean François was educated first at the Collège Louis le Grand, then by the Jesuits, becoming a brilliant scholar. His education was directed partly by his father, partly by a worldly

ecclesiastic, the Abbé de Châteauneuf, who introduced him to the best society of the last years of Louis XIV. His school days were followed by a few years of rather dissipated life, which ended when he was taken to The Hague as secretary by the French Ambassador to Holland, the Marquis de Châteauneuf, a kinsman of the Abbé. Having fallen into a love intrigue with a young lady of a refugee Huguenot family, Olympe Dunoyer, he was sent back to Paris, and his father determined to send him to the colonies, but relented on the young man's promise to reform and to study in an attorney's office. In the freer life of the Regency he soon became known as a brilliant and sarcastic wit. His caustic repartees more than once brought him into trouble. He had twice to leave Paris by order of the Regent, and finally, on account of something he had written, and of other things wrongly ascribed to him, he was imprisoned in the Bastille, remaining 11 months (1717–18). His release was soon followed by the performance at the Théâtre Français of his first tragedy, *Œdipe*, based on the *Œdipus Tyrannus* of Sophocles. The play was received with great applause, and the author was at once hailed as the legitimate heir of the great masters of French tragedy. About this time Arouet assumed the name of Voltaire, the origin of which has never been satisfactorily explained.

The production of *Œdipe* (1718) may be considered the beginning of his extraordinary literary career. For a long time he was considered mainly a dramatic poet; yet even then he had conceived the idea of an epic poem devoted to the glory of Henry IV, and intended as a eulogy of the principle of religious toleration, and he had planned a great historical work relating the events of the reign of Louis XIV. From 1719 to 1726 he was occupied mainly with the production of plays, none of which repeated the success of *Œdipe*, and with the composition of his epic poem, which, under the strict laws then governing the printing of literary works, he was unable to publish. This poem, known first as the *Poème de la Ligue*, was printed in Geneva (1723) and issued secretly, but met with considerable success. In his first philosophical poem, *Le pour et le contre*, both his anti-Christian views and his deistic philosophy found clear and eloquent expression. This period of Voltaire's life is also marked by the beginning of his enmity towards a man who was then considered the greatest lyric poet of France, Jean Baptiste Rousseau. A quarrel with a member of a very high family, the Chevalier de Rohan, led in 1726 to a second imprisonment in the Bastille, which was ended in a few days by his promise to leave the kingdom and to move to England. He remained there 26 months, acquainting himself with the social and intellectual life of the country. His visit had been preceded by his acquaintance with Bolingbroke, who introduced him to the greatest literary men of the time, Pope, Congreve, Young, and Chesterfield. He soon mastered the language, and, in order to prepare the British public for the appearance of an enlarged edition of his epic poem, wrote in English two remarkable essays, one on epic poetry, the other on the history of civil wars in France. The poem itself, under its permanent title of *La Henriade*, soon followed. Although the French government took great precautions to prevent the introduction of the book into France, its success all over the continent of Europe was unprecedented. Voltaire, already considered the most brilliant dramatic poet of the age, was proclaimed a not unworthy rival of Homer and Vergil. This judgment is far from having been indorsed by posterity. The success of *La Henriade* was due to temporary circumstances and conditions, and especially to its eloquent presentation of the idea of religious toleration.

Permission to return to France was granted to Voltaire in 1728. Until 1732 he resided in Paris, and it is not too much to say that all that he did during this period bears witness to the deep influence exerted upon him by his stay in England. His chief works during these active years were dramatic. The tragedies of *Brutus* (1730), *Zaïre* (1732), and *Sémiramis* (1748) show the influence of Shakespeare, *Zaïre* being, to a certain extent, an adaptation of the theme of *Othello* to the French stage. Voltaire wrote also a series of letters, very likely based upon actual letters sent by him to his friend Tiariot during his stay in England, and tending to make the intellectual life of England known to the French public, and he composed a *Histoire de Charles XII, roi de Suède*, the elements of which were received by Voltaire from the Swedish Ambassador to England. The publication of the letters just mentioned forms one of the most curious incidents in Voltaire's career. After having had them printed, he feared the effect of their publication. He therefore decided to defer the publication of the work, at least in French, and it appeared first in England, in an English translation entitled *Letters Concerning the English Nation* (1734). A spurious edition of the French version, however, due to the purloining of some of the volumes printed by order of Voltaire, soon found its way to the public, and brought about a wrangle between the author and his intended publisher, Jore. There was even some danger of Voltaire's being sent for the third time to the Bastille. This was averted only by his clearly demonstrating that he had had nothing to do with the publication of the work. It is now known as *Lettres philosophiques*, and is considered not far from the first of what may be called Voltaire's revolutionary works. They touch upon various subjects as to which he thought the French sorely needed enlightenment: the system of religious toleration followed in England; the guarantees for individual freedom enjoyed by British subjects; liberty of speech and of the press; the political life manifested in the existence of a free Parliament; the esteem in which literary men were held; a literature unknown to France and one which gloried in the names of Shakespeare and Milton; the scientific and philosophic labors of Newton and Locke, destined soon to supplant in the minds of Frenchmen the theories of Descartes; the practice of inoculation against smallpox, etc. Few works ever published contain so much matter as these letters, which led every Frenchman who read them to think about the conditions under which he was compelled to live and to question whether the French political and social system was as perfect as it had been held to be by the preceding generations.

A new period now began in Voltaire's life, owing to his peculiar association with a woman of high aristocratic rank, Madame du Châtelet, with whom, by the strange moral code then accepted in high French society, he was permitted to live in the closest intimacy until her death in

1749, without even causing a break between her and her husband. These years were spent mostly at Madame du Châtelet's château at Cirey on the boundaries between Champagne and Lorraine. Voltaire was then wealthy, having been enriched by speculations, some of them of a dubious character, during preceding years, and this improvement in his fortune was manifested by his style of life. His years in Cirey in companionship with a woman of high intellectual gifts and scientific attainments, to whom the French were indebted for the first translation in their language of Newton's *Principia*, were years of prodigious intellectual activity. Play upon play was sent by him from the Château de Cirey to be performed in Paris. He worked on his history of Louis XIV and on a still more ambitious historical work, the composition of which was undertaken at Madame du Châtelet's request, a universal history from the death of Charlemagne to the accession of Louis XIV. He published the *Eléments de la philosophie de Newton*, intended to acquaint the French public more thoroughly with the system, only a glimpse of which had been given them in the *Lettres philosophiques*. His lighter productions, tales, novels, satires, light poetry, are almost numberless; one, the poem *Le mondain* (1736), a defense of refined and luxurious life, brought him into serious trouble, as he was accused of having cast ridicule upon religion by the way in which he had spoken of Adam and Eve. To the same period belongs in part the composition of another and longer poem which Voltaire's admirers wish he had never written, the celebrated *La pucelle* (1739; first published, 1755), the mock heroine of which is no other than the purest incarnation of French patriotism, Joan of Arc. In truth Voltaire never intended in this poem to cast ridicule upon the historical figure of the Maid of Orleans, as is shown by the pages devoted to her in his historical writings. His satire is directed only against the absurdly mystical idea of her career presented in Chapelain's *Pucelle* (1730 or 1731). Voltaire's stay in Cirey was not continuous. He often went from there to Paris, and to Versailles, where through the influence of Louis XV's famous mistress, Madame de Pompadour, he even became a court character. His first step in this direction was his appointment as historiographer of France and then as one of the gentlemen of the King's bedchamber, soon followed by his election to the French Academy (1746). His *Poème de Fontenoy* (1745), describing a battle won by the French over the English during the War of the Austrian Succession, and his *Précis du siècle de Louis XV*, as well as his two dramatic court entertainments, *La princesse de Navarre* and *Le triomphe de Trajan*, were the outcome of the connection of Voltaire with the court of Louis XV. The performance of the *Triomphe de Trajan* marked the end of his favor at court. While still holding his court offices Voltaire returned to Cirey, meaning to remain there for life. There should also be mentioned the comedy *L'Enfant prodigue* (1736) and the tragedies *Mahomet* (1742) and *Mérope* (1743). His plans were upset in 1749 by the death of Madame du Châtelet, who had formed a new and secret connection with the poet Saint-Lambert; and he returned to Paris, where he tried to make himself a home, kept by one of his nieces, a young widow, Madame Denis. He found the French public somewhat estranged; rivals had arisen during his absence, and he determined to fight them upon their own ground and to put on the stage dramas written on themes already treated by them.

This is one of the most unsatisfactory periods of Voltaire's life. He was dissatisfied with himself as well as with the rest of the world, and therefore determined to accept the offers made to him by Frederick II, King of Prussia. His intercourse with this great man had begun in 1736, when Frederick had asked him to become one of his regular correspondents. Both as Prince Royal and after 1740 as King of Prussia, Frederick overwhelmed the great writer with all sorts of flatteries. After his accession he used every effort to induce Voltaire to live permanently at the court of Prussia, but at first failed. There were meetings between the two men, visits of Voltaire to Berlin and Potsdam, during one of which he performed an important diplomatic mission in behalf of the French government. The death of Madame du Châtelet removed the obstacle that kept Voltaire from accepting Frederick's offers. He managed to get the permission of the King of France for this step, and in 1750 went to Berlin. He was received with demonstrations of the deepest affection; but the opposition of their characters soon manifested itself in quarrels due largely to Frederick's autocratic temper and to the freedom with which Voltaire ridiculed, not without good reasons, the president of the Royal Academy of Berlin, the French scientist Maupertuis. Within two years Voltaire left Berlin, never to return. His stay in Prussia, however, had not been barren of literary results. While there he completed and had published in Leipzig (1751) his *Siècle de Louis XIV*, the success of which was greater than that of any other history previously published. An epilogue of Voltaire's stay with Frederick happened in Frankfort, where, by order of Frederick, he was arrested and made to suffer harsh treatment, under the pretext of his having carried away a volume of Frederick's poems. This added to his rage, and made Frederick exceedingly unpopular for a time among men of letters.

Voltaire returned to France and for a while he was without abode. Louis XV had been offended by his request to leave France for Berlin while holding the title of Gentleman of the King's Bedchamber, and would not permit him to return to Paris. Seeing him unwelcome at the court, those in power elsewhere declined to welcome him, and finally he determined again to move out of France, and in 1754 settled in the Republic of Geneva, where he bought a house. He also bought a small estate in the Vaud country, then under the government of the Republic of Bern. But he soon discovered that he was not likely to enjoy much more freedom under republican and Protestant governments than under the King of France, and conceived the idea of being, as it were, his own sovereign. He bought, for his lifetime, two estates in France near the boundaries of the Republic of Geneva, the estates of Tournay and of Ferney. This gave him the possession of feudal rights, transferred to him and secured through the good offices of the Duke of Choiseul, who had recently become the Prime Minister of Louis XV and by whom he was greatly admired. He settled in Ferney in 1758, there to spend the last 20 years of his eventful life. In the interval between his return from Berlin and his

settlement at Ferney, he had published his most ambitious historic work, *Essai sur l'histoire générale et sur les mœurs et l'esprit des nations*, the title given to the universal history already mentioned above.

When Voltaire settled in Ferney, all his extensive works, with the exception of his *Dictionnaire philosophique*, had been published; but his work was not yet half done. In Ferney he felt secure; persecution could hardly reach him. He therefore assumed a very aggressive attitude towards all the abuses which he desired to destroy. Instead of undertaking large compositions, he sent forth hundreds of short writings issued under all sorts of names, seldom under his own, printed in many different places and finding their way to the public in spite of the severe restrictions placed upon the production of literary works. His main theme was the fight against religious intolerance and religious fanaticism, against belief in miracles, and in favor of the sovereignty of reason. Every man who suffered on account of his belief found in him an eloquent and, as the event demonstrated, a powerful defender. The clearest demonstration of this fact was given by him in his labors in favor of the Calas family. (See CALAS, JEAN.) A touching episode of this period of Voltaire's life is his conduct towards a grandniece of the great tragic poet, Pierre Corneille, of whose poverty he had heard and whom he invited to Ferney, acting to her as a father and educator, and preparing, in order to secure a dowry for her, a complete edition of Pierre Corneille's works. Every person of note in Europe, from the King of France down, showed eagerness to subscribe. The romance *Candide* appeared in 1759 and the tragedy *Tancrède* in 1760.

In the year 1778 his friends besought him to pay a visit to Paris. Louis XV was dead and Louis XVI had not energy enough to forbid what he disliked. In spite of the opinion of his physician, the celebrated Tronchin, who told him that an oak cannot be transplanted when more than 80 years old, Voltaire yielded to the temptation. The Parisians received him with demonstrations of the greatest enthusiasm. His bust was crowned in his own presence at the Théâtre Français on the occasion of the first performance of his tragedy of *Irène;* the French Academy held a special meeting in which he heard eulogies of his own deeds and writings. He was visited by every person of note. Benjamin Franklin, then in Paris as the agent of the newly founded Republic of the United States, took to him his own grandson, on whom he asked Voltaire to pronounce a blessing. Voltaire placed his hand upon the young man's head, uttering at the same time in English, "God and Liberty." Voltaire has been represented as an atheist, but without warrant as far as his written or spoken utterances are concerned.

To the success of his fight for liberty a comparison between the condition of things at the time of his death and at the time when he began to write bears sufficient witness. His exertions while in Paris had the effect which Tronchin had foreseen, and he died there on May 30, 1778. His body, which was first carried away from Paris by his nephew, Abbé Mignot, was afterward taken to the Panthéon, where, in spite of various statements that it had been disinterred, it is believed still to be resting.

As a writer, Voltaire is not, perhaps, the author of a single great masterpiece; but every one of his productions, at least in prose, presents to us an unsurpassed example of clearness, perspicuity, and wit. He wrote in order to convince, and so far succeeded that many of his writings have to a certain extent lost their interest because of the very destruction of the abuses against which they were directed. One who wishes to appreciate his greatness must look upon him more as a man of action who used literature as a weapon than as a mere writer.

Bibliography. The best editions of his works are those published at Kehl (70 vols., 1785–89); the Beuckot edition (70 vols., Paris, 1839 et seq.); the Moland edition (50 vols., ib., 1875 et seq.). The best collection of selected works is the one edited by Georges Bengesco (10 vols., Paris, 1887–92). Consult also: Gustave Desnoiresterres, *Voltaire et la société française au XVIIIème siècle* (2d ed., Paris, 1871–76); James Parton, *Life of Voltaire* (2 vols., Boston, 1881); Georges Bengesco, *Voltaire; Bibliographie de ses œuvres* (4 vols., Paris, 1882–90); Francis Espinasse, *Life of Voltaire* (London, 1892); Emile Faguet, *Voltaire* (8th ed., Paris, 1895); T. Tallentyre, *Life of Voltaire* (2 vols., New York, 1905); id., *Friends of Voltaire* (ib., 1907); J. Churton Collins, *Voltaire, Montesquieu, and Rousseau in England* (London, 1908); Gustave Lanson, *Voltaire* (2d ed., Paris, 1910); W. R. Price, *Symbolism of Voltaire's Novels* (New York, 1911).

VOLTAM'ETER (from *voltaic*, from It. *Volta*, name of the discoverer of the voltaic cell + Gk. *μέτρον*, *metron*, measure). An instrument designed to compare the intensities of electric currents by means of their effects when passed through electrolytes. (See ELECTRICITY.) It has been shown by Faraday and others that when an electric current is passed through an electrolyte the quantity of matter liberated at either of the electrodes—anode or cathode—varies directly as the quantity of current carried, i.e., as the product of the intensity of the current and the time. Therefore, if different currents are passed through any one electrolyte, their intensities may be compared by noting the quantities (number of grams) of matter liberated in given intervals of time. It has been observed, however, that this law of Faraday is true only if the same specifications are followed in the use of the apparatus for containing the electrolyte and obtaining the liberation of the matter. Such an apparatus is called a voltameter. There are various forms of voltameters in use; one is so arranged as to collect any gases that may be liberated at the electrodes, which in this case are made of platinum, and the electrolyte is generally dilute sulphuric acid; another consists of a solution of copper sulphate in water, having two copper plates as electrodes; in another the electrolyte is a solution of silver nitrate in water contained in a platinum bowl which serves as the cathode, the anode being a disk of silver. There are excellent discussions of the subject in *Bulletins of the National Bureau of Standards*, especially volumes ix and x (Washington, 1913–14), and various scientific and other papers from this institution. See AMPERE.

VOLTERRA, vôl-tĕr'rȧ. A town of the Province of Pisa, Italy, on a hill, 39 miles by rail southeast of Pisa (Map: Italy, C 3). Volterra is very irregular in outline, the main portion

being grouped on the southern side of the hill. It is surrounded by a high, massive, and remarkable wall, 4½ miles in circumference. Outside this wall is the ancient Etruscan necropolis. The notable cathedral, consecrated in 1120, was enlarged and embellished by Niccola Pisano. The superb Palazzo Municipio, dating from 1208, contains a few good pictures. In the Palazzo Tagassi is the fine National Museum, founded in 1731 and including a library of more than 17,500 volumes, and the municipal archives. It contains, in addition, a wonderful collection of Etruscan cinerary urns, also sculptures, bronzes, gold ornaments, coins, etc. The imposing citadel is now used as a prison.

The leading industries are alabaster working —for which the town is famous—and the manufacture of salt from the brine springs at Leopoldo, 5 miles south of the town. The salt industry supplies all Tuscany. The chemical products are of importance. There are also ironworks. Pop. (commune), 1901, 14,433; 1911, 16,784.

Volterra, the Etruscan Velathri (Roman Volaterræ), was one of the 12 league cities of Etruria. During this period it was a large and important town. It was destroyed during the tenth century. It was for a time a free town. It came under the rule of Florence in 1361.

VOLTERRA, DANIELE RICCIARELLI DA (1509–66). An Italian painter of the Late Renaissance, born at Volterra, in Tuscany. He was a pupil first of Sodoma, and later became a follower of Michelangelo, occupying himself with painting after his designs. A more ungrateful task was the clothing of the nude figures in Michelangelo's "Last Judgment," from which he derived his nickname, *Il Braccatone* (breeches maker). His best picture, "Descent from the Cross," after Michelangelo, in Trinità de' Monti, at Rome, is a great composition, full of emotional power; and in the same church are his frescoes of the "Life of the Virgin." Other well-known paintings are: "Baptism of Christ," in San Pietro in Montorio (Rome), "David Killing Goliath" (Louvre); "Massacre of the Innocents" (Uffizi, Florence), containing more than 70 figures. Volterra also frescoed many façades of Roman palaces, now destroyed.

VOLTERRANO GIUNIORE. See FRANCESCHINI, BALDASARRE.

VOLTIGEURS, vôl'tē'zhĕr'. In the French army, infantry composed of short but athletic men, organized by Napoleon in 1804, and intended to operate as scouts and skirmishers. In case of need, they could even mount behind cavalry and then be rapidly transported to threatened points. Each battalion had a voltigeur company. Later (1814) the Imperial Guard contained no fewer than 19 regiments of voltigeurs. Suppressed at the abdication, restored upon the return from Elba, suppressed again at the second restoration, these troops reappeared during the second Empire, when four regiments were created in the Imperial Guard, only to disappear definitely from the *cadres* of the army in 1871.

VOLT'ME'TER. A direct-reading instrument used to measure the difference of potential or voltage. The voltmeter for direct current is usually a galvanometer of portable form so arranged with pointer and scale that volts may be read directly, and any form of ammeter (q.v.) can be used as a voltmeter if given sufficient resistance. For direct-current measurements the most accurate voltmeters are based on the principle of the Darsonval galvanometer (see GALVANOMETER) and have the movable coil formed by a number of coils of fine wire, mounted on jeweled bearings and kept in position by a fine spiral spring. Using a galvanometer with a high resistance in circuit the current is proportional to the difference of potential. This idea is the basis of voltmeters of this type and the resistances are so adjusted that the pointer deflects over an evenly divided scale and by varying the resistances the same scale can be used in indicating several ranges of differences of potential. There are different types of voltmeter some of which may depend on the movement of a small piece of soft iron with respect to a coil through which a current passes, or of one coil with respect to another. There are also voltmeters of the moving magnet type where a permanent magnet or polarized vane carrying a pointer is deflected under the influence of a current in an adjacent coil. In the hot wire voltmeter originally devised by Cardew the difference of potential is indicated by the expansion of a long fine platinum wire which is heated on the passage of a current. Most voltmeters for alternating currents are either a form of electrodynamometer or based on the principle of the quadrant electrometer. (See ELECTROMETER.) Where the dynamometer principle is employed the current passes through two coils connected in series, but with one arranged so that it may rotate within the other. The attraction of one coil for the other produced by the current enables the difference of potential to be measured. See ELECTRICITY.

VOLTUM'NA. A goddess of the Etruscans. The deputies from the 12 divisions of the Etruscans met at her temple in the territory of Volsinii (see BOLSENA). She can scarcely be separated from the Roman god Vortumnus, or Vertumnus (see POMONA), whose temple on the Aventine seems to have been built in 264 B.C., at the time of a war with Volsinii. The god is expressly called the chief god of that city, and his temple seems to have been vowed to induce him to desert to the Romans.

VOLTURNO, vôl-tur'nō. A river of south Italy, flowing southeastward, then westward past Capua, and emptying, after a course of 115 miles, into the Tyrrhenian Sea (Map: Italy, D 4). On its banks Garibaldi defeated the Neapolitan army in 1860.

VOLUME. See MENSURATION.

VOLUME, CRITICAL. See CRITICAL POINT.

VOLUM'NIA. The mother of Coriolanus in Shakespeare's drama of the latter name.

VOL'UNTARISM. A metaphysical theory which holds that reality is at bottom will; it is thus a form of idealism, differing from intellectualistic idealism in making will more fundamental than sensation and idea. In modern times Schopenhauer (q.v.) is the best-known voluntarist; but perhaps the philosophy of Wilhelm Wundt (q.v.) is the most thoroughly developed voluntarism of recent times. Münsterberg and Royce are also voluntaristic. See METAPHYSICS.

VOL'UNTARYISM. The principle or system which advocates the complete separation of church and state, and the support of the church by voluntary contributions. The term "voluntaryism" first came into use in the early part of the nineteenth century in connection with discussions between churchmen and dissenters in Scotland, although there had been advocates of the principle long before this, nota-

bly the Baptists, Congregationalists, and Friends (qq.v.). The principle is held to be based on the express law of Christ respecting the church, as well as on conscience, the nature of civil government, and considerations of general equity and policy. It is the principle embodied in the relation of the United States government to churches. See the articles on CIVIL CHURCH LAW, AMERICAN; ESTABLISHMENTS, ECCLESIASTICAL; NONCONFORMISTS.

VOLUNTARY ASSOCIATION. An organization of individuals for moral, benevolent, social, or political purposes, or for any object other than pecuniary profit. Such associations are not legal entities as are corporations, nor have they the legal status and incidents of partnerships. In order to bind any member of a voluntary association for debts and liabilities incurred by another member or by a committee thereof it must be shown that a relation of principal and agent existed between them, and this relation will not be presumed from the mere fact of the association, except where the liability contracted was for something absolutely necessary for the preservation of the association. Therefore, a member of such an association acting without authority becomes personally responsible for debts contracted for its benefit. An association organized to carry on some business scheme for profit is for legal purposes subject to the law governing partnerships and cannot correctly be termed a voluntary association in the above sense. Consult N. L. Lindley, *Treatise on the Law of Partnership* (8th ed., London, 1912). See CORPORATION; PARTNERSHIP, and authorities there referred to.

VOLUNTARY CONVEYANCE (Lat. *voluntarius*, willing, from *voluntas*, will, from *velle*, to will, wish). In law, a conveyance made without valuable consideration therefor. No consideration is necessary to make a valid transfer of lands or chattels, and a person may legally make a gratuitous transfer of all his property provided his act does not prejudice his creditors. Fraudulent intent is implied from the fact that the creditors suffer loss as a result of the transfer. At common law a conveyance without consideration was held to vest the property in the grantee subject to a resulting trust (q.v.) in favor of the grantor. This rule does not now generally apply.

VOLUNTEER, MILITARY. A member of a military organization, serving of his own free will. He may belong to a trained reserve for national defense, as in England or the United States, or to an auxiliary force of the regular or standing army.

Volunteer System of England. The modern volunteer movement had its origin in England, the oldest organization of which there is any reliable knowledge being the Honorable Artillery Company of London. The volunteer movement proper may be said to have had its inception in the call for 40,000 Protestants of Ireland to repel the threatened invasion of that country by the French and Spaniards in 1779. The fear of an invasion of England by Napoleon brought about the volunteer legislation of 1805, resulting in the creation of a volunteer establishment closely approaching 450,000, of whom fully one-fifth were Irish. The militia were organized locally and in each county were under the command of a lord lieutenant (q.v.). With the advent of peace began the neglect of the system, an error which was heartily repented of during the periods of the Crimean War, the Indian Mutiny, the French hostility of 1857, and the difficulty with the United States over the San Juan boundary. The comparatively small regular army was used exclusively for the reënforcement of foreign and colonial garrisons, so that a volunteer force was an imperative necessity. The volunteer regiments of this period were made up of tradesmen, clerks, and farmers, officered by locally prominent professional men or employers of labor, each officer and man paying the entire expense of his service—uniform, equipment, drill hall, instruction, etc. Wealth was almost a necessity on the part of the officer, owing to the custom of enlisting employees to complete the strength of the command, the employer paying all the expenses. Prohibitive almost as such regulations were, the preference of a free people for a volunteer army rather than a huge regular army led to the assembling under arms of 100,000 men. The moment the war stimulus ceased, however, the organization again showed signs of decay, so much so that the government, in order to keep alive the system, finally placed it on a firm national basis by establishing it as a recognized form of national defense, defraying its expenses, and bringing it in actively close touch with the regular army. In 1872 was commenced the system of joint manœuvres, volunteer regiments taking an equal share of the work and training with the regulars. Under the Volunteer Act of 1900 new regulations were formulated as follows: (1) A member of a volunteer corps may contract to come out for actual military service at specified places in Great Britain whenever summoned by order of the Secretary of State for War, and to serve for a period not exceeding one month in the absence of a royal proclamation calling out the volunteers generally. (2) A member of a volunteer corps or regiment may contract to proceed upon active service to any part of the world in a unit or company formed of volunteers, on special conditions as defined by the terms of this contract. The Boer War of 1899–1902, in which large bodies of volunteers and yeomanry did valuable service, demonstrated the value of volunteers to the British Empire. In 1907 the volunteer and militia organizations of the United Kingdom were abolished and absorbed in the territorial army, which corresponds to the organized militia in the United States. The bulk of the territorial army was organized as 14 mounted brigades and 14 complete divisions. Service was purely voluntary and for home defense only. Many officers and men, however, volunteered for service abroad during the great war. See UNITED KINGDOM, *Army*.

The Volunteer System of the United States originally was formed along the same lines as in England. The Ancient and Honorable Artillery Company of Boston, like its British prototype, enjoys the distinction of seniority as a voluntary organization. In general terms the word "volunteer" applies to a man who voluntarily engages in the military service of the United States or of some particular State or Territory, and differentiates him from a man who is drafted compulsorily into the military service (a power which Congress has the right to exercise and did exercise during the Civil War). The term "volunteers," as applied technically to one of the three classes into which the United States land forces are divided, is used in a special or restricted sense and in-

cludes only the troops which have been raised and maintained for limited periods under authority of Congress as adjuncts to the regular army in times of actual or threatened war, or other emergency. So far as the constitutional authority for their creation is concerned, the regular and the so-called volunteer forces are upon an identical footing, but are differentiated by the fact that the former are permanent and the latter temporary.

As applied to military organizations, the term "volunteers" appears for the first time in the Act of May 28, 1798, which empowered the President to accept any company or companies of volunteers who might associate and offer themselves for the service. This act authorized the President to appoint the commissioned officers of such company or companies, and the Act of June 22, 1798, empowered him to organize the companies into legions, regiments, or battalions, and to appoint field officers for the same. It will be noted that as the States or Territories are not mentioned in the Act of May, 1798, the companies of volunteers to be raised under its provisions were not in any sense State organizations, but could be taken from the country at large.

In 1803, when difficulities arose with Spain, the President was authorized by the Act of March 3 of that year to require the executives of such of the States as he might deem expedient to organize, arm, equip, and hold in readiness to march at a moment's warning, detachments of militia, not exceeding in all 80,000 men; and the second section of this statute gave the President power to authorize the State executives to accept as part of such detachments any corps of volunteers, the officers of whom were to be appointed by the State authorities. The Acts of Feb. 24, 1807, and March 30, 1808, when trouble was anticipated with England, were practically repetitions of the Statute of 1803, except that the number of men to be called out was not to exceed 30,000 and 100,000, respectively, including corps of volunteers. The Act of Feb. 6, 1812, was largely a reënactment of the Statute of 1807, except that the number of volunteers was not to exceed 50,000 men; but the Act of July 6 of the same year repealed this statute so far as the appointment of officers was concerned, and empowered the President to appoint and commission them, by and with the advice and consent of the Senate. The Act of Feb. 24, 1814, reënacted the legislation of 1812, except that the President was authorized to receive such proportion of volunteers "as in his judgment the public service may require," who were to serve for five years, or during the war; and about a month later the Act of March 30, 1814, empowered the President, by and with the advice and consent of the Senate, to make all necessary appointments of officers and to fill all vacancies. In the War of 1812 the enrollment of volunteers was small compared with regulars and militia, the figures being: regulars, 38,186; militia, 458,463; rangers, 3049; volunteers, 10,110.

Passing now to the Florida War, the Act of May 23, 1836, authorized the President to accept the services of not exceeding 10,000 volunteers, the officers to be appointed in the manner prescribed by law in the several States and Territories to which such volunteers belonged; and practically the same legislation was reënacted on March 3, 1839, when 50,000 volunteers were authorized at the time of the dispute with Great Britain in regard to the Maine boundary line, and again on May 13, 1846, at the beginning of the Mexican War, 50,000 volunteers were likewise authorized. It is to be observed, however, that the Act of March 3, 1847, empowered the President to organize the volunteers who might reënlist into companies, battalions, and regiments, and to commission the officers of the same. The enrollment for the Mexican War was: regulars, 26,922; volunteers, 73,532; militia, none.

During the Civil War the first legislation in regard to volunteers, enacted on the 22d of July, 1861, made a radical departure from either of the previous methods of appointing volunteer officers, inasmuch as it provided that the company officers were to be elected by the men, and the field officers by the company officers; but the Act of the 6th of August following rescinded this and prescribed that the vacancies among the commissioned officers of volunteer regiments were to be filled by the State governors. Under the Act of July 17, 1862, colored troops were first organized in South Carolina and Louisiana, and later in many other places, to the number of nearly 100,000 men. While the officers in most instances were not named directly by the President, they were appointed, after passing careful examinations, by the Adjutant General and other officials under his authority.

On April 28, 1863, an invalid corps was organized for garrison duty, made up of officers and enlisted men who had been wounded or otherwise disabled for active field service, the officers, after passing satisfactory examinations, being appointed by the President, by and with the advice and consent of the Senate. About the same time six regiments and one company of United States volunteers were organized, the officers being all appointed by the Secretary of War, after passing examinations; and on the 20th of May, 1864, a regiment of veteran volunteer engineers was raised in the Army of the Cumberland, the officers being appointed by the President upon the recommendation of the commander of the Army of the Cumberland. The last act relating to volunteers during the Civil War was that of Nov. 28, 1864, which created a new volunteer army corps, consisting of not less than 20,000 men, and known as the United States Veteran Volunteers, the officers being appointed by the Secretary of War, after rigid examination. The enrollment in the North for the Civil War was: regulars, 46,679; volunteers and militia, 2,637,759. The Confederate States enrolled about 900,000 volunteers. A large majority of the Northern volunteers were American born; in the South practically all were Americans.

The first legislation in regard to volunteers passed during the Spanish War was that of April 22, 1898, which gave the appointment of all regimental and company officers to the governors of the States in which their respective organizations were raised, except that the President was authorized to organize not exceeding 3000 men possessing special qualifications, and to appoint the officers of the same. The Act of May 11 of that year provided for a volunteer brigade of engineers and a force of 10,000 immunes, all of the officers to be appointed by the President with the consent of the Senate. The enrollment in the war with Spain in 1898 shows regulars, 45,669; volunteers, 232,235. The Act of March 2, 1899, authorized the raising from

the country at large of a force not exceeding 35,000 men for service in the Philippine insurrection, and provided that the officers should be appointed by the President by and with the advice and consent of the Senate. It is admitted by all that the troops mustered into the service under the provisions of this act became the best-disciplined and best-instructed, and were, therefore, the most efficient and most economical body of volunteers that have ever formed a part of the national land forces.

The legislation of April 25, 1914, authorized the raising of volunteer forces in time of actual or threatened hostilities. The same act formally recognizes that the land forces of the United States consist of three classes: (1) the regular army; (2) the organized militia, when called into the service of the United States; (3) such volunteers as Congress might organize in time of war.

The War College Division, General Staff, in a *Statement of a Proper Military Policy for the United States*, published Sept. 11, 1915, commented as follows on the existing volunteer law: "In addition to any forces that may be maintained and trained in time of peace, provision must be made for vastly increasing such forces in time of war. These must come from the untrained body of citizens, and provisions for raising them is contained in the Act of Congress, approved April 25, 1914. This act meets the military needs for raising volunteer troops as far as concerns the enlisted personnel, except in two particulars, which are: (1) that under the existing laws certain organizations of the militia, with numbers far below the full strength, can enter the volunteer force in advance of other similar volunteer organizations from the same State; (2) no volunteers of any arm or branch can be raised until all the militia of that particular arm or branch have been called into the service of the United States." "It is evident that it cannot be known prior to the existence of the imminence of war what organizations, if any, of the organized militia will enter the volunteer service, and that no definite plans can be prepared providing for the use of such organizations, either as militia or as volunteers, until war is actually upon us. No legislation affecting the organized militia is recommended beyond the repeal of all provisions of laws now in effect whereby militia or militia organizations may or must be received into the Federal service in advance of any other forces."

It will be seen from the foregoing that there has been no uniform rule in the method of appointing officers of the volunteer forces, and that the legislation has often conferred this power wholly or in part upon the President, while at other times it has been vested in the governors of the States and Territories.

In all but two States of the Union militia officers below the rank of major are elected by the men and the field officers by the company officers. When the appointment of volunteer officers has been left to the State and Territorial executives, the usual practice has been—and particularly during the Spanish War—to make nearly all such appointments, and promotions as well, on analogous lines, the practical result being that the volunteer officers are elected by those whom they are to command. It is needless to point out that the appointment and promotion of officers on these lines is not only wholly wrong in principle but most pernicious in results, radically affecting, as it does, the discipline and efficiency of the troops and enormously increasing the expense to the government by making it necessary to employ at least twice as large a number in order to secure the same result. In defense of this bad system it is claimed that the men would come forward more readily and in greater numbers, but when we consider the vast population from which the volunteers can be drawn, it is believed that this argument has but little weight. Within three months after the declaration of war with Spain no fewer than 56,258 men had enlisted in the regular army. If in 1898 such a large number of men were willing to enlist in the regular army with its reputation for strict discipline, and where the men have no voice whatever in the selection of their officers, should another war occur it would seem reasonable to suppose (taking into consideration the large increase of the population) that the necessary men would be forthcoming for the volunteer regiments, even if the appointment of the officers were vested in the President. As a matter of fact, in 1899, although the climate was very hot and unhealthy and the seat of war was at the other end of the world, there was no difficulty whatever experienced in raising from the country at large 35,000 volunteers for service in the Philippines, the officers all being appointed by the President.

Even if the contention above referred to were true, it is the judgment of all military experts that volunteer troops in which the officers are elected by those under them would not be as efficient as a much lesser number organized under the system in which the President appoints the officers subject to existing legal restrictions and limitations, and this, too, with an immense diminution in the expense of the war. Consult *Organization of the Land Forces of the United States* (Washington, Government Printing Office, 1912).

In Germany, previous to the great European War, young men were allowed to serve as one-year volunteers provided they passed a scientific examination, or produced a certificate of maturity issued by one of the specially authorized educational institutions. Certificates of maturity certify the holder's qualification for one of the upper classes of a high school or college. After enlistment he has the option of serving in any corps open to such volunteers, or, if he so desires, with the pharmacists of the sanitary corps. If the volunteer is a medical student desiring to enter the sanitary corps, he is required to serve six months under arms, and after graduation six additional months as a noncommissioned officer or under-sergeant. Such volunteers are then elected military surgeons and pass into the reserve. Other volunteers, irrespective of their civil calling or profession, and so far as they are qualified by general education and military efficiency, are trained and destined for commissioned officers of the reserve or Landwehr. At the expiration of their term of service they undergo examinations in subjects both theoretical and practical, and are posted to the reserve, as reserve officers aspirants, and render active service in two exercises of eight weeks each. To secure such an appointment aspirants must have a civilian occupation or profession in no way derogatory to the rank of a commissioned officer. They must also be elected by their comrades. Although allowance is made for a few volunteers to be supported

at public expense, the great majority serve at their own charge, which is estimated as approximately 1500 marks in the infantry and 2000 in the mounted branches. See ARMIES; CONSCRIPTION; MILITIA; section on *Army* under UNITED STATES and UNITED KINGDOM. Consult especially Huidekoper, *The Military Unpreparedness of the United States* (New York, 1915).

VOLUNTEER FIRE DEPARTMENTS. See FIRE PROTECTION, MUNICIPAL.

VOLUNTEERS OF AMERICA. An organization formed for religious and philanthropic work in New York City in 1896. In that year the movement was incorporated under the laws of the State of New York and Gen. Ballington Booth, the founder, was elected president. The objects declared in the charter are as follows: "The Volunteers of America is to be a religious organization, military in its method, and having as its object the reaching and uplifting of the people of America who have not hitherto been reached or affected by the ministrations of any existing religious corporation." There are 11 directors, and the officers of the corporation are elected annually. The commander in chief is elected by members every five years. In 1915 the organization included six regiments or divisions, each under the direction of a regimental or sectional officer. These superintending officers had under their leadership 168 societies or stations and institutions, in which the following work was accomplished: The meetings of the Volunteer societies were attended by 783,279 persons, and 1,895,686 persons were addressed in open-air services. The number of families visited was 28,362. In the relief stations, homes, and institutions throughout the year the Volunteers furnished free beds to 241,297 persons, and lodged for pay and for work 247,855 persons. They furnished 875,119 free meals, and in addition there were paid for in work and nominal fees 303,201. The total number of families and individuals otherwise assisted was 105,915. In connection with the Volunteer prison work leagues have been formed in 40 States and Federal prisons embracing over 90,000 prisoners, 74 per cent of whom are leading reformed lives. The families of the prisoners are visited and if found needy are assisted by the Volunteer Prison League workers.

VOL'VOX. A genus of fresh-water algæ belonging to the group Chlorophyceæ. It forms spherical colonies, which are often composed of many thousands of cells, often have a diameter of 0.5 mm. or more, and are visible to the naked eye. They have a rotatory movement, produced by numerous cilia on the periphery. There is a marked protoplasmic continuity between all the cells of the colony. Propagation is both sexual and asexual. See ALGÆ; CHLOROPHYCEÆ; CŒNOBIA.

VOL'VULUS (Lat., from *volvere*, to roll). A form of intestinal obstruction due to twisting of the gut upon itself. This usually occurs in the vicinity of the cæcum and especially in cases where the bowel has a long mesenteric attachment. These knots and twists occur, as a rule, in individuals over the age of 30 and give rise to the same symptoms that characterize intestinal obstruction of whatever variety, viz., pain, vomiting, complete constipation, abdominal distention, and syncope. Vomiting occurs early and consists at first of the contents of the stomach, and later of the intestine. The only safe treatment is prompt operation.

VOLZ, fôlts, PAUL (1871–). A German evangelical theologian, born at Lichtenstern, Württemberg. Educated at the universities of Tübingen and Berlin, he held a pastorate at Leonberg in 1902–07, and thenceforth was connected with the University of Tübingen, where he was professor of Old Testament from 1914. Between 1905 and 1912 he also traveled and studied in Palestine. His publications include: *Die vorexilische Jahweprophetie und der Messias* (1897); *Jüdische Eschatologie von Daniel bis Akiba* (1903); *Mose* (1907); *Geist Gottes und verwandte Erscheinungen im Alttestament und Judentum* (1910); *Neujahrsfest Jahwes* (1912); *Die biblische Altertümer* (1914).

VO'MER (Lat., plowshare). In human anatomy, a bone which forms part of the middle partition of the nose, and the lower edge of which fits into grooves between the apposed surfaces of the palatine processes of the upper jaw and palate bones. Anteriorly it articulates with the triangular cartilage of the septum, above with the perpendicular plate of the ethmoid bone (q.v.); posteriorly with the sphenoid bone. The vomer develops in two laminæ, inclosing a plate of cartilage which is prolonged to form the rest of the septum of the nose; these laminæ unite into one bone, union being complete about the age of puberty. See SKELETON.

VOM'ITING (from *vomit*, from Lat. *vomitus*, p.p. of *vomere*, to vomit; connected with Gk. ἐμεῖν, *emein*, Skt. *vam*, to vomit). The emptying of the stomach by way of the mouth through its own spasmodic contractions. In a conscious person vomiting is preceded by nausea, increased flow of saliva in the mouth, and the breaking out of cool perspiration; the face is pale, weakness or prostration follows, the pulse becomes slower and feeble. The individual may faint. At first the stomach contents are vomited, consisting of food, mucus, and thin serous fluid. If persistent and violent, the vomiting causes the ejection of bile which has regurgitated from the duodenum into the stomach under the pressure of the diaphragm, and rarely of fæces from the intestine. This is a constant symptom of intestinal obstruction. In cirrhosis of the liver blood is vomited, as also in phosphorus poisoning, ulcer, and cancer of the stomach. The black vomit in yellow fever (q.v.) owes its color to blood which escapes into the stomach. In mild attacks of vomiting from an overloaded stomach the normal state soon returns. In young infants the act may be simply a regurgitation from an overfull stomach, and resembles an overflow, without systemic disturbance. In severe attacks deep inspiratory efforts are made, during which the diaphragm is thrust down low against the stomach, while the lower ribs are drawn in. A sudden, violent expiration and contraction of the abdominal wall succeed, adding to the pressure upon the stomach. Besides this, the longitudinal fibres of the œsophagus are shortened and the cardiac orifice of the stomach is somewhat dilated, and the contents are ejected. The vomiting centre in the medulla may be excited by reflex irritation due to peripheral causes, such as tickling the throat, or obstruction of the intestine; or to the presence of renal or biliary calculi. It may be excited by poisons, or by impulses from parts of the cerebrum, due to smells, tastes, and emotions, or by brain tumor, abscess, or other intracranial disease. Some emetics act directly on the vomiting centre, for they are efficient if the stomach be cut out

and replaced by a bladder filled with water, as in Claude Bernard's celebrated experiment. Others act reflexly by irritating the mucous lining of the stomach. Still others develop a nauseating taste, thus affecting a higher centre in the cerebrum.

Treatment must be conditioned upon the cause and the accompanying disease. In different conditions mustard applied to the epigastrium, darkness (when due to acute eye irritation), and the supine posture, or the administration of hot water, aromatic spirit of ammonia, nux vomica, small doses of ipecacuanha, arsenic, soda, ice, whisky, creosote, chloroform, or coffee will relieve. Calomel frequently is efficacious. Sudden and violent vomiting in a healthy person is cause for suspicion of a poisonous agency at work, either fermentation of improper food, or a drug.

VONDEL, vŏn'del, JOOST VAN DEN (1587–1679). A Dutch dramatist, born in Cologne. With his parents he early removed to Amsterdam, where he received a little schooling. He early turned to verse. In his twenty-fifth year he began the study of foreign languages. For a time he was in business, then he became a bookkeeper in the Public Loan Office. In 1640 he became a Catholic. His literary work begins with a drama, *The Pasha* (1612), and some lyrics, aided by study of the classical drama and the *Poetics* of Aristotle. Thereafter Vondel's dramas were classic in form; they observed the unities, employed the chorus, and tended generally to lyricism, though often didactic and sometimes controversial. Some of the lyrics from his dramas are among the finest in the Dutch language. His classical imitations or adaptations (*Hecuba*, 1625; *Hippolytus*, 1628; *Electra*, 1638; *King Œdipus*, 1660; *Hercules in Trachis*, 1663; *Iphigenia in Taurus*, 1666; *The Phœnician Iphigenia*, 1668, and others) were accompanied by a parallel series of original tragedies (*Jerusalem Laid Waste*, 1620; *Palamedes*, 1625; *Gijsbrecht van Amstel*, 1637; *Maria Stuart*, 1646; *Lucifer*, 1654; *Jephtha*, 1659; *Adam in Banishment*, 1664; *Zungchin*, 1666; *Noah in the Deluge*, 1667, and others). Of these *Lucifer* is famous as presenting parallels with *Paradise Lost*, supposed by some critics to be the result of imitation, but hardly more striking than the resemblance between Milton's work and the poem attributed to the Anglo-Saxon Cædmon. He also translated the *Metamorphoses* of Ovid. Vondel's *Works* were edited by Lennep (12 vols., Amsterdam, 1850–69; reprinted, 1888). There are *Lives* by Baumgartner (Freiburg, 1882), Haek (Hamburg, 1890), and Kalff (2d ed., Haarlem, 1902), and studies by Looten, *Etude littéraire sur Vondel* (Brussels, 1889), and Müller, *Ueber Miltons Abhängigkeit von Vondel* (Leipzig, 1891). See also the excellent *Bibliography* by Unger (Amsterdam, 1888).

VON EMMICH, fŏn ĕm'ĭĸ, OTTO (1848–1915). A German soldier, born at Minden in Westphalia. He entered the army in 1866, became a lieutenant in 1868, and as a battalion adjutant participated in the campaign of 1870–71. He was promoted through the various grades to colonel in 1897, and became commander of the 31st infantry brigade in 1901, and of the 10th division at Posen in 1905. Raised to the rank of general of infantry in 1909, he was placed in command of the 10th Army Corps at Hanover. During the early days of the European War in 1914, as commander of the German army of the Meuse, he laid siege to Liége, which he entered August 7. Before the forts fell, a week later, he is said to have lost 20,000 men, and for some time it was believed he had committed suicide because of chagrin at this record. Afterward he distinguished himself in the Galician campaign and in the winter battle in East Prussia. In June, 1915, he was decorated with the Order Pour le Mérite. In 1913 he had been elevated to the nobility. He died of arteriosclerosis. See WAR IN EUROPE.

VON HOLST, fŏn hōlst, HERMANN EDUARD. See HOLST, HERMANN EDUARD VON.

VONNOH, BESSIE POTTER (1872–). An American sculptor, born in St. Louis. She studied at the Art Institute of Chicago under Lorado Taft (q.v.), whom she assisted in his work on the Agricultural Building at the World's Fair of 1893. Afterward she studied in Paris and in Italy. In 1899 she was married to Robert Vonnoh (q.v.). Her subjects are portrait and ideal statuette groups of children and young women. They are in modern dress, modeled with a sympathetic and sensitive appreciation, in a naturalistic style with little detail. Among her works, which have a wide popular appeal, are: "Mother and Child" (1905); "A Modern Madonna" (1905); "Beatrice" (1906); "The Young Mother" (Metropolitan Museum, New York); and several pieces in the Art Institute, Chicago, and the Brooklyn Museum. Mrs. Vonnoh was elected an associate of the National Academy of Design in 1906 and received medals at St. Louis (1904) and San Francisco (1915).

VONNOH, ROBERT WILLIAM (1858–). An American portrait, figure, and landscape painter. He was born in Hartford, Conn., and studied at the Massachusetts Normal Art School in Boston, and in Paris under Boulanger and Lefebvre; but he was more influenced by the prevailing realism. After his return to America he devoted himself, with much success, to portraiture, displaying skillful characterization, able technique, and warm agreeable color. Good examples include: "Miss Mildred Blair" (1900); "Little Louise" (1900); "Mrs. Vonnoh" (1904); "Portrait of the Artist" (Pennsylvania Academy, Philadelphia); "Dr. S. Weir Mitchell"; "John G. Milburn" (Buffalo); "Attorney General Griggs" and "Postmaster-General Charles E. Smith." Vonnoh was elected to the National Academy of Design in 1906, and was a teacher in the Boston Museum of Art School (1885–87) and at the Pennsylvania Academy, Philadelphia (1891–96). In 1915 he was awarded a gold medal at the Panama-Pacific Exposition, San Francisco. See also VONNOH, BESSIE POTTER..

VOODOO, vōō'doo, or **VAUDOUX,** vō'dōō' (perhaps a dialectic form of Fr. *Vaudois*, Waldensian, the Waldensians, as heretics, being suspected of sorcery). A term referring to certain beliefs and practices considered to be prevalent among the negroes of the West Indies and the southern United States. Research has made it certain, however, that there are no recognized beliefs and ceremonials which could be regarded as constituting a Voodoo religion. According to the formerly accepted view, the Voodoo cult came from West Africa, the term itself being the name of an all-powerful being, incarnate in the form of a snake, who communicates with his worshipers only through a priest and priestess, also known as king and queen, or papa and mamma, who are held in great veneration by the devotees. The worship is always at night, is

secret, and characterized by prayer to the snake, who is exhibited during the rite, by hysterical manifestations by the priest and priestess, by a dance for the initiation of novices said to be marked by wild debauchery and indecency, and by the sacrifice and eating of a human child. Careful examination of apparently circumstantial accounts of the Voodoo rites and orgies has eliminated the more shocking phases in practically every instance. If cannibalism has occurred, it has probably been merely sporadic. Other features are nothing more than shamanistic and magic practices common the world over.

VOORHEES, vo͝or'ĕz, DANIEL WOLSEY (1827–97). An American politician, born in Ohio. He graduated at Indiana Asbury (now De Pauw) University in 1849, studied law, and in 1851 began the practice of his profession in Covington, Ind. He became at once interested in politics, and gained a wide reputation as a Democratic campaign speaker. He was United States District Attorney for Indiana from 1858 to 1861, and was a member of Congress from 1861 to 1867 and again from 1869 to 1875. In 1877 he was appointed United States Senator to fill the unexpired term of Oliver P. Morton, and was regularly elected in 1879, 1885, and 1891.

VOORHEES, EDWARD BURNETT (1856–1911). An American agricultural chemist, born at Mine Brook, N. J. He graduated from Rutgers College in 1881. From 1882 he was identified with the New Jersey Agricultural Experiment Station, of which he became director in 1893, and from 1890 he was also professor of agriculture at Rutgers. He served as president of the New Jersey State Board of Agriculture after 1901, of the New Jersey State Forestry Commission after 1906, and of the New Jersey Conservation Commission after 1908, and was also president of the Association of Agricultural Chemists in 1894, and of the Association of Agricultural Colleges in 1904. Voorhees received the Nichols research medal in 1902 for a paper on dentrification contributed to the *Journal of the American Chemical Society*. He published: *First Principles of Agriculture* (1896); *Fertilizers* (1898; 9th ed., 1907); *Forage Crops* (1907; 2d ed., 1911).

VŌPADÉVA, vō'pâ-dā'vâ. A Sanskrit grammarian of India, who lived about the thirteenth century A.D. He wrote a grammar entitled *Mugdhabōdha*, or Enlightenment of the Ignorant, which is used mainly in Bengal. It is drawn up on different lines from the great work of Pānini (q.v.) and departs from it also in terminology. A commentary on the *Mugdhabōdha* was composed by Durgadasa. Besides several Calcutta and Bombay editions (e.g., 1826, 1861), there is a European edition by Böhtlingk (St. Petersburg, 1847).

VORA'GINE (or **VARAIGNE**), JACOBUS DE. See GOLDEN LEGEND.

VORARLBERG, fōr'ärl-bĕrk. The smallest and most westerly crownland of Austria (Map: Austria, A 3). Area, 1000 square miles. The Arlberg chain lies on the east of this mountainous territory. In the south, on the boundary, tower the Rhætian Alps, crowned by the Silvretta mass, the highest point in the crownland (about 11,300 feet). The Ill valley crosses the southwest portion. In the north part are the Bregenzerwald and Lechthal Alps, with the Bregenzer Ach valley in the extreme north. The Rhine valley from the Ill to Lake Constance is the feature on the west. A small section of Lake Constance belongs to Vorarlberg. About one-third of the area is in Alpine meadow and over one-fourth in productive forests, the tilled land being small. Some coal is mined and the manufacturing industries are conspicuous. There are shipbuilding plants, paper industries, cotton and weaving mills, and dye works. Embroideries are largely produced as the house industry. Vorarlberg has its own constitution (since 1861) and Landtag, but is administratively and judicially combined with the Tirol. The capital is Bregenz. Pop., 1910, 145,794, nearly all Germans and Roman Catholics.

VORONEZH, vō-rō'nyĕzh. A government in the southern part of central Russia. Area, 25,450 square miles. Its surface is mostly undulating and hilly in the west and the north (Map: Russia, E 4). It is watered principally by the Don and its tributaries. The climate is continental and comparatively mild, but the rainfall is scanty. Voronezh has a very fertile soil. The ordinary cereals, flax, hemp, and sugar beets are produced. The cultivation of fruit is widespread. Stock raising is extensively carried on. Horses of high breed are exported. The manufactures have an annual value of over $10,000,000 and consist principally of sugar, spirits, flour, tobacco, and various animal products. Pop., 1912, 3,491,200.

VORONEZH. The capital of the government of the same name, in Russia, on the right bank of the river Voronezh, five miles above its confluence with the Don, 332 miles south-southeast of Moscow (Map: Russia, E 4). It is a well-built town. Its industrial establishments include flour mills, oil presses, machine works, and railway shops. Pop. (including suburbs), 1913, 79,000.

VÖRÖSMARTY, vĕ'rĕsh-märt-y', MIHÁLY (1800–55). An Hungarian poet. He was born at Nyék, County of Stuhlweissenburg, and studied law in Pest, but devoted himself to letters, and became one of the most important of the authors who regenerated Hungarian literature. Of his epic poems, *Zalán Futása* ("The Flight of Zalán," 1825) and *Eger* (1827) are the best. His dramas were less successful. His national anthem, *Szózat*, was immensely popular in the Revolution of 1848. At the time of his death he was translating Shakespeare into Hungarian. Consult the second edition of his works in 12 volumes (Budapest, 1884), by Gyulai, who also wrote an excellent account of his life (4th ed., ib., 1896).

VORPARLAMENT, fôr'pär'lâ-mĕnt. A preliminary Parliament which met at Frankfort-on-the-Main from March 31 to April 4, 1848, to devise ways and means for calling a national German Parliament to deal with the widespread demand for reorganization of the Germanic political system on the basis of a closer national unity. The Vorparlament, which consisted of some 500 Liberal leaders, decided that a national assembly, elected by direct vote of the people without distinction of property, rank, or religious belief, and endowed with sovereign powers, should meet at Frankfort for the purpose of drawing up a constitution for the German nation. Great dissensions prevailed in the Vorparlament between the monarchical and republican factions. The latter, headed by Hecker and Struve (qq.v.), finding themselves outnumbered, seceded from the Parliament, and with the aid of Polish and French radicals stirred up an insurrection in southern Baden, which was

suppressed in a short time. After the dissolution of the Vorparlament its work was continued by a committee of 50 until the assembling of the National Parliament on May 18. See GERMANY, *History*.

VORSPIEL, fôr'shpēl. The German word for introduction or prelude (qq.v.). Beginning with *Lohengrin* Wagner, in order to obtain an elastic form for the unhampered expression of the dramatic ideas, abandoned the form of the overture for his dramatic works and designated the orchestral introductions, both to the entire drama and the separate acts, as Vorspiel. Several later operatic composers have also adopted this term. Bach wrote a series of preludes for organ which he called *Choral-Vorspiele*. These are intended as introductions to a chorale. Of course the chorale is made the basis of these Vorspiele, which treat certain phrases in canonic or fugal writing. The same treatment is found in the 11 posthumous Choral-Vorspiele of Brahms.

VORSTERMAN, fôr'ster-mȧn, LUCAS, the Elder (1595–1675). A Flemish engraver, born in Bommel (Gelderland). It is not known under whom he first studied, but he became a member of the Antwerp Guild in 1618, and was already trained as an engraver when he entered the studio of Rubens. Reforming his style, he became the greatest interpreter of that master's works, rendering in a wonderful manner the line, color, and spirit of the originals. Among his best plates are the "Adoration of the Magi"; "Descent from the Cross"; and "Susannah and the Elders." After quarreling with Rubens he went to England, where he worked for Charles I and the Earl of Arundel (1624–30). While there and after his return to Antwerp, Vorsterman executed numerous excellent plates after Van Dyck. His son LUCAS (1624–c.1667) was also an engraver, and practiced in Antwerp and in England.

VORTEX, VORTEX RING. A mass of fluid rotating about a closed curve as an axis; a motion similar to that of the particles of a rubber ring (such as a pneumatic tire) when it is so turned that the inside of the ring is becoming the outside, and vice versa. The most familiar form of vortex ring is that of a smoke-ring produced intentionally by a smoker, or accidentally by the discharge of a gun, or by the exhaust of an engine. Vortices are usually circular, but may be of other and complicated shapes, the essential condition being that the axis around which the whirl takes place must be either a closed curve, or a curve both ends of which rest upon a boundary surface of the fluid. Such rings are very persistent and have many interesting properties. They may be projected to considerable distances and exhibit mutual attraction and repulsion. See MATTER.

VOR'TICEL'LA (Neo-Lat., dim. of Lat. *vortex*, whirl, whirlpool). A genus of Infusoria (q.v.), notable for the highly contractile stalk by which they are ordinarily attached. They are inhabitants of both fresh and salt water and often occur in large numbers together, although those which form actual colonies are now separated from the true vorticellas, as other genera. These minute creatures are very graceful in all their movements and under normal conditions are constantly extending and contracting their stalks. Under unfavorable conditions, and occasionally at other times, they detach themselves, draw in the stalk, and swim freely. When fully expanded the body is somewhat bell-shaped, the flaring end forming the oral disk (surrounded with long cilia); at one side of this is the mouth. The opposite end of the body tapers into the stalk, which may be two or three times the length of the body. They contract with rapidity and force, when irritated, until they become a mere globule. The cilia surrounding the oral disk are in constant motion when the animal is expanded, and by their movements cause a miniature whirlpool, with vortex at the animal's mouth. Consult G. N. Calkins, *The Protozoa* (New York, 1901).

VOR'TIGERN AND ROWENA, rō-ē'nȧ. A drama by William Henry Ireland, who pretended that it with other forgeries was the work of Shakespeare. It was produced in 1796 and gave rise to considerable controversy.

VOS, vōs, CORNELIS DE (1585–1651). A Flemish portrait and historical painter. He was born in Hulst, studied with David Remeeus, and passed most of his life in Antwerp, where he became a master of the guild in 1608. Though influenced by Van Dyke and Rubens, he developed an independent style, good alike in line and color, and particularly excelled in depicting children. He is best represented in the Antwerp Gallery, which contains the "Meerbecker Epitaph" (once in the Cathedral); "St. Norbert with the Schnoeck Family," and the inimitable portrait of Abraham Grapheus, servant of the guild. Other fine works include the portrait of the artist with his family, at Brussels; "The Hutten Family" (Munich); and a portrait and group in the Metropolitan Museum, New York. His religious and historical paintings are of less value. A second CORNELIS DE VOS is known to have been a member of the guild in 1633.

VOS, GEERHARDUS (1862–). An American theologian, born at Heerenveen, Holland, and educated in Amsterdam, at the Seminary of the Holland Christian Reformed Church, at Princeton Theological Seminary, and at Berlin and Strassburg. He taught theology at the Holland Christian Reformed Seminary in Grand Rapids, Mich., in 1888–93, and then in Princeton Seminary. His works include: *The Mosaic Origin of the Pentateuchal Codes* (1886); *Die Kämpfe und Streitigkeiten zwischen den Banu Umajja und den Banu Haschim von Takijj addin al-Makrizijj* (1888); *The Doctrines of the Covenant in Reformed Theology* (1891); *The Teaching of Jesus Concerning the Kingdom of God and the Church* (1903).

VOSE, vōz, GEORGE LEONARD (1831–1910). An American engineer, born in Augusta, Me., and educated there, at Salem, Mass., and at the Lawrence Scientific School at Harvard. He was professor of civil engineering at Bowdoin College from 1872 to 1881, and at the Massachusetts Institute of Technology from 1881 to 1886. His works include: *Handbook of Railroad Construction* (1857); *Orographic Geology, or the Origin and Structure of Mountains* (1866); *Bridge Disasters in America; the Cause and the Remedy* (1887).

VOSGES, vōzh. A department of northeast France, bordering on Alsace, and forming part of the former Province of Lorraine (Map: France, N., M 4). Area, 2303 square miles. The eastern part belongs to the west slope of the Vosges Mountains, and rises to a height of over 4000 feet. The Moselle rises in this department, and the Meuse crosses its west end. The greater part of the improved land is pasture, and dairy-

ing is more important than tillage. The chief crops are oats and potatoes. The most important manufactures are of textiles. Pop., 1901, 421,104; 1911, 433,914. Capital, Epinal.

VOSGES MOUNTAINS (Ger. *Vogesen*, Fr. *Les Vosges*). A mountain range on the southwest frontier of Germany. It rises from the Belfort depression (*Trou de Belfort*), which separates it from the Jura Mountains, and extends in a north-northeast direction on the west side of the Rhine valley, parallel with the Black Forests (Map: Germany, B 4). In the south portion the main ridge forms the boundary between France and Alsace, but the north portion is wholly within German territory, partly within Alsace, partly on the boundary of Lorraine, while a northern continuation known as the Hardt Mountains extends through the Rhine Palatinate into Hesse. The Vosges and the Black Forests are remnants of an extensive mountain ridge, the crest of which has been depressed, forming the rift valley of the Rhine. Thus a steep escarpment, which the Germans in 1914–15 found practically impossible of capture, faces the Rhine valley, while the west-facing slope is much more gradual. North of the Rhine-Marne Canal the elevations are generally less than 2000 feet, the southern portion being much the higher and the more rugged. The highest point in the whole range, the Sulzer Belchen, with an altitude of 4668 feet, is one of a number of eastern spurs. Other high points are the Honeck, 4472 feet; the Kleinkopf, 4373 feet; and the Rheinkopf, 4327 feet. The range is composed mainly of crystalline schists and Paleozoic sedimentary rocks, chiefly Devonian and Carboniferous; mining has long been abandoned. The climate is rather mild, though snow remains for six months on the highest summits. Large forests exist on the mountains, but the valleys are very populous and contain many important industrial centres.

VOSS, vôs (Lat. *Vossius*), GERHARD JOHANNES (1577–1649). A Dutch classical scholar and author, born near Heidelberg, and educated at Dordrecht and Leyden. In 1600 he was called to be rector of the school at Dordrecht; in 1615 he was made director of the theological school at Leyden. In 1619, however, the opposition aroused by his work, *Historiæ Pelagianæ Libri IV* (1618), which was thought to favor the Arminians, cost him his place; but in 1622 he was appointed professor of oratory, an office he held for 11 years, until he was called from Leyden to be professor of history at the Athenæum in Amsterdam. There he remained until his death. In 1624 he had declined a call to Cambridge, England, but in 1629 he accepted a position from Archbishop Laud as prebendary in Canterbury Cathedral and visited England to be installed. He wrote: *Grammatica Latina* (1607); *Aristarchus, sive de Arte Grammatica* (1635); *De Vitiis Sermonis et Glossematis Latino-Barbaris* (1640). His other writings include his great work, *Commentariorum Rhetoricorum sive Oratoriarum Institutionum Libri VI* (1606); also his *Ars Rhetorica* (1623); *De Historicis Græcis* (1624); *De Historicis Latinis* (1627). His collected works were published in six volumes (Amsterdam, 1695–1701). The numerous valuable manuscripts which he gathered are now in the library at Leyden. Consult De Crane, *De Vossiorum Iuniorumque Familia* (Franeker, 1820); J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

VOSS, ISAAC (1618–89). The youngest son of Gerhard Johannes Voss (q.v.), born at Leyden. In 1648 he accepted the invitation of Queen Christine to Stockholm, but ten years later, owing to differences with Salmasius, he returned to Holland. In 1670 he went to England, and in 1673 was made a canon of Windsor by Charles II. This office he held until his death. He edited the works of the geographers Scylax and Mela; also Justin, Catullus, etc. His other important writings were: *De Septuaginta Interpretibus* (1661); *De Poematum Cantu et Viribus Rhythmi* (1673); *Variæ Observationes* (1685). Consult De Crane, *De Vossiorum Iuniorumque Familia* (Franeker, 1820), and J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

VOSS, fôs, JOHANN HEINRICH (1751–1826). A German poet, translator, and classical philologist, born in Sommersdorf, Mecklenburg. He studied under Heyne at Göttingen, was a prominent member of the *Göttinger Hain*, and after editing for a time the *Göttinger Musenalmanach*, was made rector of the Gymnasium at Ottendorf (1778). He translated the *Odyssey*, was promoted in 1782 to the rectorship of the Gymnasium at Eutin, and here in 1789 published a translation of Vergil's *Eclogues* and *Georgics*, his classical version of the Homeric poems (4 vols., 1793), and two volumes of controversial letters addressed to Heyne (*Mythologische Briefe*, 1794). In 1802 he moved to Jena, and in 1805 was made professor of classical literature at Heidelberg. Here he translated Horace, Hesiod, Theocritus, Bion, Moschus, and Tibullus, and attempted Shakespeare, Ovid, and Aristophanes with less success. Of his original poems in four volumes (1825) the idyl *Luise* (1795; new ed., 1912), in hexameters, is alone noteworthy. His later works, *Wie ward Fritz Stolberg ein Unfreier?* (1819) and *Antisymbolik* (1824–26), are painstaking and dignified, but dreary. Voss's *Letters* are in three volumes (Halberstadt, 1829–33). Consult the *Lives* by Paulus (Heidelberg, 1826) and Herbst (Leipzig, 1872–76); also Prutz, *Der Göttinger Dichterbund* (Leipzig, 1841).

VOSS, RICHARD (1851–). A German author born at Neugrape, in Pomerania. He studied at Jena and Munich, traveled in Italy, and in 1884 became librarian of the Wartburg. His works are very numerous. His best-known dramas, many with a psychological-pathological bent, are: *Pater Modestus* (1882), dealing with religion; *Alexandra* (1886); *Brigitta* (1887); *Eva* (1889), patterned after Ibsen's "Nora"; *Schuldig* (1890); *Zwischen zwei Herzen* (1896); *Die Patrizierin*, a classical drama, which in 1896 won a Schiller prize offered by the Mannheim theatre to commemorate the first presentation of Schiller's *Räuber;* and *Jürg Jenatsch*, written in 1893, produced in 1906. His women are usually of abnormal disposition. His novels include: *Die Sabinerin* (1890), remarkable for its beautiful descriptions of Italian country; *Villa Falconieri* (1896); *Amata* (1901); *Römisches Fieber* (1902); *Die Leute von Valdaré* (1903); *Die Schuldige* (1906); *Narcissuszauber* (1909); *Zwei Menschen* (1911).

VOSSLER, fôs'lĕr, KARL (1872–). A German critic and philologist, born at Hohenheim. He studied at Tübingen, Geneva, Strassburg, Rome, and Heidelberg, was professor at Innsbruck and Würzburg, and after 1910 held the chair of Romance philology at Munich. In German literature Vossler studied particularly

the German madrigal (*Das deutsches Madrigal*, 1898), but his activity was mainly in Italian literature and philology, where he figured as follower and critic of the esthetics of Benedetto Croce (q.v.). His principal works deal with Benvenuto Cellini (*Benvenuto Cellini's Stil in seiner Vita*, 1899), the Divine Comedy (*Die Göttliche Komödie*, 1907–10; Ital. trans., 1909), and the history of Italian literature (*Italienische Litteraturgeschichte*, 1900; *Italienische Literatur der Gegenwart von der Romantik zum Futurismus*, 1914). His theories of applied esthetics in philology appear in *Positivismus und Idealismus in der Sprachwissenschaft* (1904; Ital. trans., 1909) and in *Sprache als Schöpfung und Entwickelung* (1905).

VOSTOKOV, vŏs-tō'kŏf, ALEXANDER CHRISTOFOROVITCH (1781–1864). A Russian philologist. He was born in the island of Osel, in the Gulf of Riga, studied architecture, and later devoted himself to philology and paleography. In 1815 he became assistant in the department of manuscripts in the Imperial Library and five years later was chosen member of the Russian Academy of Sciences. Vostokov's works include a comparative study of the Slavic languages, *Razsuždenie o slavyanskom Yazykě;* a descriptive catalogue of Slavic manuscripts (1842); a lexicon (1861) and grammar (1863) of the Old Church Slavic; and a *Russian Grammar* which appeared first in 1831, and reached a twelfth edition in 1874. Vostokov contributed to the great lexicon of the Russian Academy (1847). His minor works were edited by Sresnevsky in 1865.

VOTE (from Lat. *votum*, wish, engagement, vow, from *vovere*, to wish, promise, dedicate, vow). A formal declaration or expression of the will or preference of a person in regard to a question or issue submitted to him together with others for action. The term is perhaps most commonly applied to the means whereby an elector or citizen expresses his choice of candidates for public offices and to the expressions of assent or dissent of legislators to the enactment of proposed measures, but is also correctly employed to describe the voice of a member of a corporation or any association of individuals in declaring his will as to any question submitted. The word is also used collectively to include the combined action of a number of individuals upon a given question. Various methods of voting have been devised, but practically only two are in use: by ballot (q.v.), and *viva voce*, by voice. Where the voting is by ballot one or more judges must be appointed to canvass or count the ballots which have been deposited in some receptacle by the voters. Where the more simple method of having each voter announce his will orally is adopted, a secretary is usually appointed to note the name and choice of every one entitled to vote.

In all political elections and legislative bodies in the United States every person entitled to vote must do so personally. However, in corporations and associations voting by proxy is usually permitted.

In order to secure a fair election and freedom of choice on the part of the voters, various means of voting have been devised. The Australian system, which practically insures absolute secrecy, is the most in favor. This system prohibits any marking of ballots for indentification, and as all the tickets which may be voted are printed upon one sheet of paper and marked and folded in a closed booth, there is perhaps no method of determining absolutely how a person votes. See BALLOT; CORPORATION; ELECTORAL REFORM; PROXY; VOTING MACHINE.

VOTER. One entitled to a vote or voice in the determination of a question before a number of individuals. The term implies some qualification. For example, to entitle a person to vote for candidates for public office he must be a citizen of the jurisdiction in which the election is held, and, of course, no one can vote on any question before a private corporation or association unless he is a member.

The character of the qualifications required of voters in political elections varies somewhat in the different States. However, there are certain general requirements in all States, which may be summarized as follows: (1) Citizenship; (2) residence for a certain time in the State, county, and election district; (3) that the voter shall have attained his majority (21 years); (4) that the voter shall be of sound mind; (5) that he shall not be a convicted felon under sentence. Registration is also required in many States. Some of the States have established either property or educational qualifications. This has been done in most of the southern States in order to exclude the negro vote. (See SUFFRAGE, *Grandfather Clause.*) Several States permit women to vote. See WOMAN SUFFRAGE.

The election laws of most States contain provisions under which a person who suspects that another is illegally attempting to vote may challenge the latter's right to do so. Under such circumstances the person challenged is generally permitted to "swear in" his vote, i.e., state under oath that he possesses the qualification which the challenger denies, and his vote is counted subject to rejection later if the courts subsequently decide that he had no right to vote. See ELECTORAL REFORM; VOTE.

VOTING MACHINE. A mechanical device which automatically records and counts votes. Besides preventing repeating and other fraud, an ideal voting machine has the additional advantages over the paper ballot system of greater secrecy, simplicity, rapidity, and cheapness.

The first State law authorizing the use of automatic machines was passed by New York in 1892, allowing towns to use the Myers automatic ballot cabinet at elections of town officers. Twenty-two States have since authorized the use of voting machines. They are: New York, 1892; Massachusetts and Michigan, 1893; Connecticut, 1895; Minnesota, 1897; Ohio, 1898; Idaho, Indiana, and Nebraska, 1899; Rhode Island, 1900; Kansas and Maine, 1901; California and Illinois, 1903; Colorado, Utah, and New Jersey, 1905; Montana, 1907; Maryland, 1912–14; New Hampshire, Washington, and Oregon in 1913. The first permanent State Voting Machine Commission to examine machines and make rules for their use was established in New York in 1897. Such commissions are almost invariably found in States using voting machines. The attitude of the courts has been generally favorable to the use of this device. The Massachusetts courts, however, held their use unconstitutional (196 Mass. 410, 1907). In 1911 a constitutional amendment reëstablished their validity.

During the presidential election of 1900, 78 United States voting machines were in use, and they had been used at five preceding annual

elections. This machine has the party lines arranged in horizontal rows, the candidates in each row being numbered consecutively. To vote the straight ticket a key is pulled out, but the vote is not registered until the voter swings the gate on the voting machine. Before he swings his gate he can rearrange his ballot to any extent he desires.

The Bardwell votometer consists of a series of sections of interchangeable form, except in the sections designed for the questions Yes and No, or for the selective or multiple votes, which differ only as to the interlocking or safety devices. The voter finds before him the complete ballot, and he is at liberty to make any selection of names he sees fit. If he desires to cast a vote for all the nominees of any one party at a single motion, he makes his selection in the straight-ticket column, and, inserting the key in the hole in the centre of the card bearing the party name, he gives it a turn to the right. This actuates a register at the back. Simultaneously with the turning of the key a blank disk, or indicator, located at the right of and 1 inch from the keyhole, changes and a cross or × appears, indicating his vote. It is now impossible to turn the key in any other hole in that column—i.e., to vote for an additional straight ticket—and it is likewise impossible to vote for any individual on the chosen ticket or any other ticket. But the optional column remains open, and in it the voter is free to make any choice he may desire. The affirmative and the negative of a question have corresponding keyholes.

After having voted the straight ticket and on the questions, all one can now do is to correct any mistakes that become evident upon inspection. If the voter finds that he has turned the key in the wrong hole, he can reinsert the key and by turning it back cancel his vote. He may now make a new choice with the same limitations as before. The voter leaves the machine at the opposite end to which he entered. In passing out he raises a bar, which resets the machine and at the same time locks it. The bar at the entrance end of the machine cannot be raised till the exit bar has been operated, so that it is impossible for two to have access to the machine at the same time.

The Standard voting machine is about 4 feet square and 10 inches deep, and is supported by legs. The top is a little over 6 feet from the floor. A semicircular bar projects from the upper corners, on which is hung a curtain which forms a booth. An operating lever extends from the centre of the top of the machine, the outer end of which is attached to the curtain. When the voter advances to vote he throws the lever by a dependent handle to the opposite side of the machine, thus carrying the curtain behind him and inclosing himself in a booth.

The voter first selects his party ticket, and by pulling the straight-ticket knob over the party emblem down to the right, moves all the pointers for that ticket. If he desires to split his ticket, he can move the pointer back from over the name that does not suit him, and in the same office line move the pointer over the name he wishes to vote for. He now registers his vote by throwing the curtain open by means of the operating lever with which he closed it, thus casting and counting his vote in perfect secrecy.

The Standard machine had its first trial April 12, 1898, in a town election. During the presidential election of 1900 it was used in a large number of cities and towns in New York State, including Buffalo, Rochester, Utica, Ithaca, and Poughkeepsie. Consult: "The Voting Machine," in *Municipal Journal and Engineer* (New York, December, 1900); A. C. Ludington, *American Ballot Laws, 1888–1910* (Albany, 1911); National Municipal League, *Conference for Good City Government* (New York, 1910); F. A. Cleveland, *Organized Democracy* (ib., 1913).

VOTKINSKY ZAVOD, vô-tyĭn'ski zȧ-vôt'. An industrial settlement in the Government of Viatka, East Russia, 380 miles southeast of Viatka. It has extensive iron works and machine shops. There are also manufactures of agricultural machinery and other iron and steel products, and a mining school. Pop., 1910, 27,637.

VO'TYAKS. A Finno-Ugrian tribe, neighbors of the Permiaks, living between the Vetluga and Kama, tributaries of the Volga, in northeastern Russia. Other groups are found in the governments of Ufa, Kazan, and Samara. They number about 360,000, and are skillful husbandmen, stock breeders, and apiarists. Their height is 1.619 meters and their cephalic index 82.0. They have high cheek bones, straight nose, small lips, blue or gray eyes, blond or red hair, and a slender physique. They are mentally undeveloped. Polygamy is practiced, and, though nominal Christians, they secretly continue their Pagan cult. Their speech is allied to that of the Zyrians (q.v.), and they have some little Russian admixture. Consult: Wiedemann, *Grammatik der wotjakischen Sprache* (Reval, 1851); Buch, *Die Wotjaken* (Helsingfors, 1882); De Baye, *Notes sur les Votiaks* (Paris, 1897); Wichmann, *Wotjakische Chrestomathie* (Helsingfors, 1901); Bonmariage, *La Russie d'Europe* (Brussels, 1903).

VOUCH'ER (from *vouch*, from OF. *voucher*, *vocher*, from Lat. *vocare*, to call, from *vox*, voice). In law, a written or printed instrument which records the particulars of a payment of money, or which entitles a person to receive a sum of money. It is something more than a receipt, as it sets forth more fully the essential facts of the transaction, and may operate as an order as well as an acknowledgment. The term was also formerly employed to describe a person who was called into court by a tenant to defend the latter's title on a general warranty. In some instances, as in common recoveries, the person called upon to defend the title was called the vouchee.

VOUET, vo͞o'ȧ', SIMON (1590–1649). A French decorative and historical painter, born in Paris. He early established himself in Rome, where he was appointed prince of the Academy of St. Luke. In 1627 he was called to Paris by Louis XIII, who made him first painter to the crown, and commissioned him to decorate the royal palaces of the Louvre, the Luxembourg, Fontainebleau, and Versailles. He also painted decorations in the Palais Royal and the Château of Reuil for Cardinal Richelieu. Vouet was a facile, skillful, and brilliant painter. He ushered in the great French school of the seventeenth century, and strongly influenced his pupils, among whom were the King himself, Lebrun, Lesueur, and Mignard. His "Susanna and the Elders" and eight other canvases are in the Louvre, and he is represented in all French provincial museums.

VOUSSOIRS, vo͞o'swärz'. The individual stones or bricks forming an arch, of which the

central one is called the keystone. They are generally of a truncated wedge form. See ARCH.

VOW (OF. *vou, vo, veu*, Fr. *vœu*, from Lat. *votum*, wish, engagement, vow). In religion, a promise of a future gift to a god, or of some action supposed to be pleasing to the god. In primitive religion, gifts or worship of any kind could commonly be made to the god only by the entire tribe; between the times of sacrifice, the favor of the god could be secured by promising a gift on the next proper occasion. The promise was often conditioned on the bestowal of a benefit by the gods, as in the case of Jacob (Gen. xxviii. 20 ff.) and Jephthah (Judg. ix. 30 ff.). Gradually the use of the vow widened. It might accompany a gift to a god, and pledge the giver to some future line of action. Survivals of this are found in the monastic vows of chastity, poverty, and obedience, and in the marriage vow, where a ceremony takes the place of the gift to the god. It might present the god, instead of a gift, with some action or abstention from action (taboo), such as the Nazarite's vows not to cut the hair (Num. vi. 18). It might impose duties upon another, with the threat of a curse if the vow were broken (1 Sam. xiv. 24). Every religion has used vows, but they are most prominent in religions with forms of sacrifice, or with a strong sense of personal relation between God and man. Confucianism, e.g., makes little of vows; Hebraism made much of them. The frequency of vows in Israel is indicated by their careful regulation in the law. Deuteronomy calls attention to the voluntary character of the vow, but also to the obligation of fulfilling it when taken (xxii. 21 ff.). The priestly law provides for the nullification of vows by women (Num. xxx), and for the redemption of an object vowed which could not be offered (Lev. xxvii. 1–25). The Jewish custom of vows was inherited by the early Church (Acts xviii. 18). With the growth of monasticism, vows became of more importance, and began to receive more attention. Catholic theology discriminated between real and personal vows, dealing respectively with property and personal life; and between simple and solemn vows. The last are irrevocable and absolute, when accepted by competent authority. Vows of abstinence, pilgrimages, and individual acts of charity or piety are simple. So are the first vows of monastic orders. At present only the vow of chastity, and under certain conditions vows of poverty and obedience, taken by religious profession in an order is regarded as solemn. What constitutes a solemn vow was long discussed by moralists, with no final unanimity. Vows may be annulled by those in authority over the person making the vow, as a father over a minor, for good reason. Vows can only be dispensed by ecclesiastical authority. Certain vows, including the vows of chastity, are reserved for the Pope; other vows may be dispensed by a bishop or prelate. Protestantism, laying aside authority of the Church over individual Christian life, denied the perpetual binding power of vows, and left promises to God and the methods of their fulfillment with the individual conscience.

VOWEL. See ALPHABET; LETTERS.

VOWEL GRADATION. See ABLAUT.

VOWELS AND CONSONANTS. See PHONETICS.

VOX CLAMAN'TIS (Lat., voice of one crying). A Latin poem by John Gower, completed in 1384, but never printed. It describes allegorically the rising under Wat Tyler in 1381.

VOYAGE AUTOUR DE MA CHAMBRE, vwä'yäzh' ō'tōōr' de mȧ shän'br' (Fr., journey around my room). A prose work by Xavier de Maistre (1794) written during an enforced confinement to the barracks.

VOYER, vwä'yȧ', RENÉ LOUIS DE, and MARC RENÉ DE. See ARGENSON, MARQUIS D'.

VOYNICH, ETHEL LILIAN (1864–). An English novelist, daughter of George Boole (q.v.). She passed several years on the Continent, and married Wilfrid Michael Voynich, a native of Lithuania, who, after participating in the Polish national movement, escaped to England. She began her literary work by translating from the Russian, tales and plays, published under the title of *The Humour of Russia* (preface by Stepniak, 1895). Her first novel, *The Gadfly* (1897), met with instant success, and was followed by other books—*Jack Raymond* (1901); *Olive Latham* (1904); *An Interrupted Friendship* (1910); *Six Lyrics from Schevchenko* (1911).

VOYSEY, voi'zĭ, CHARLES (1828–1912). An English clergyman, founder of the Theistic church. He was born in London, graduated at Oxford (1851), and was curate of Hessle, Yorkshire (1852–59); of Craighton, Jamaica (1860–61); and of St. Mark's, Whitechapel, London (1861–63). From this last charge he was removed on account of a sermon against endless punishment. He was vicar of Healaugh, Yorkshire (1864–71). In 1866 he published, in *The Sling and the Stone*, sermons preached at Healaugh, which were deemed at variance with the Bible and the Thirty-nine Articles. The secretary of the Archbishop of York prosecuted him in the Chancery Court of the diocese. From the sentence of condemnation he appealed to the judicial committee of the Privy Council, which confirmed the sentence (1871). He afterward preached and lectured in St. George's Hall, London, a fund having been raised called the Voysey establishment fund, the outcome of which was the Theistic church (1885). He published *Religion for All Mankind* (1903) and *Testimony of the Four Gospels Concerning Jesus Christ* (1907).

VOZNESENSK, vŏz'nyĕ-syĕnsk'. A district town in the Government of Kherson, south Russia, situated on the Bug, 100 miles northwest of Kherson (Map: Russia, D 5). It has extensive warehouses for the storage of grain and salt and manufactures brick and iron products. Pop., 1910, 19,300.

VRANIA, vrän'yȧ, or **VRANJA.** The capital of a department in Servia, 37 miles east by south of Prishtina, Turkey, on the Morava River (Map: Balkan Peninsula, C 3). It is an important railway and commercial centre, and is noted for the manufacture of rope. Hemp and flax are the principal products of the vicinity. There are numerous sulphur springs. Vrania was captured by the Bulgarians in 1915. See WAR IN EUROPE. Pop., 1900, 11,921; 1910, 11,439.

VRATZA, vrät'sȧ. The capital of a department in Bulgaria, 59 miles north by east of Sofia (Map: Balkan Peninsula, D 3). It manufactures leather, wine, and jewelry and carries on an important trade. There is a school of sericulture. Pop., 1900, 13,749; 1905, 14,832.

VRAZ, vräs, STANKO (1810–51). A Serbo-Croatian poet, born at Zerovec, in Lower Styria.

He was educated at Gratz and, as editor of the periodical *Kolo* (1842–50), joined the movement to fuse the Slovene and Serbo-Croatian languages under the name of Illyrian. This attempt was not successful; but Vraz (who is also known as Jacob Fraz) wrote many graceful lyrics and made collections of national songs which are of great value. His work has a strong Oriental coloring and he ranks as one of the most important Serbo-Croatian poets. His collected works, *Djela*, were published at Agram in four volumes (1863–64), and a fifth volume containing his letters was added in 1877.

VRCHLICKY, JAROSLAV. See FRIDA, EMIL BOHUSCH.

VREELAND, EDWARD BUTTERFIELD (1857–). An American legislator. He was born at Cuba, N. Y., received an academic education and served as superintendent of schools at Salamanca, N. Y., in 1877–82. Admitted to the bar in 1881, he practiced law at Salamanca, and after 1891 was president of the Salamanca National Bank. As a Republican he represented the 37th New York district in the 56th to the 62d Congress (1899–1913). As chairman of the House Committee on Banking and Currency, which had investigated the panic of 1907, Vreeland, in 1908, was part author, with Nelson W. Aldrich (q.v.), of the Aldrich-Vreeland Currency Law (expired 1915), which sought to prevent panics by the creation of an emergency currency, which national banks might circulate upon certain securities, the issue of all banks not to exceed $500,000,000. He became vice chairman of the National Monetary Commission, and endorsed the Aldrich plan of reform (see CURRENCY; RESERVE BANK, FEDERAL).

VRIBERG, HEINRICH VON. See HEINRICH VON FREIBERG.

VRIES, vrēs (or **FRIES**), ADRIAEN DE (1560–1603). A Dutch sculptor, born at The Hague. In his boyhood he went to Florence and there studied under Giovanni da Bologna. Many of his original works were done for the Emperor Rudolph II, who invited the sculptor to Prague. They include busts and reliefs of the Emperor (Vienna Museum); bronze statues and groups, such as "Mercury and Psyche" (Louvre), and reliefs in wax. From Prague De Vries went to Augsburg, where his greatest works were made and remain, the most famous being the Mercury Fountain (1599) and the Hercules Fountain (1602). Both are beautiful examples of the Italian Renaissance, with much profusion of figure and fine detail. Numerous later statues, executed for Wallenstein, are now in Drottningholm Park, near Stockholm, Sweden. A "Triton" is in the Metropolitan Museum, New York (Altman collection). Consult the monograph of Buchwald (Leipzig, 1899).

VRIES, MATTHIAS DE (1820–92). A Dutch philologist, born in Haarlem, and educated at Leyden, where in 1853 he became professor of Dutch language and literature. His most important publication was *Woordenboek der Nederlandsche taal* (1864 et seq.), which he began with Te Winkel and continued with the assistance of Cosijn and Verwijs, but was unable to complete. Another great lexicographical labor, also uncompleted, was the *Middelnederlandsch Woordenboek* (1864–65). It was in Middle Low German that his most typical work was done, mainly editions of Van Hooft's *Warenar* (1843), of Boendale's *Lekenspieghel* (1844–48), and of Von Maerlant's *Spieghel historiœl* (with Verwijs, 1863, concluded by Utenbroeke, 1879). Mention should be made as well of his orthographical work, *De grondbeginselen der Nederlandsche spelling* (with Te Winkel, 1865), which introduced the modern method, and of his many pamphlets on linguistic problems in general, of which *De Nederlandschetaalkunde* (1849) and *De heerschappij der taal, het beginsel der welsprekendheid* (1850) are most important. Consult Kluyver in *Vragen van den Dag* (The Hague, 1892), and Verdam in the *Jaarboek der Kon Akademie* (ib., 1893).

VRIES ISLAND. See OSHIMA.

VRIESLAND. See FRIESLAND.

VUL'CAN (Lat. *Vulcanus, Volcanus;* connected with Skt. *ulkā,* firebrand), or HEPHÆSTUS. In classical mythology, the god of fire. In Greek legend Hephæstus was the son of Zeus and Hera. Deformed at birth, he was hurled by his mother from Olympus. He fell into the sea, and was cared for by Thetis and Eurynome. Another story represents him as hurled from heaven by Zeus for interfering in behalf of Hera. He fell on Lemnos and was cared for by the Sintians. In the *Iliad* his wife is Charis (Grace), but later legend united him with Aphrodite, apparently for the contrast between the lame, awkward, and grimy smith and the goddess of beauty. His detection of her infidelity with Ares is told in the *Odyssey,* book viii. In spite of his prominence in legend the cult of Hephæstus was very limited. At Lemnos and in Sicily (both volcanic regions) he enjoyed honor, but in Greece proper his cult is scarcely known outside of Attica. Here he was the god of artisans, especially workers in metal, and was joined in worship with Athena Ergane, in a temple in the Ceramicus, identified by some with the so-called Theseum. In the suburb of the Academy (q.v.) in the sacred precinct of Athena was a common shrine of Hephæstus and Prometheus (q.v.), a very similar personage. The god seems to have developed from the conception of divinity in fire conjoined with local demons or gnomes honored or feared by smiths and potters. In Rome we find among the early Roman gods Volcanus, with a festival on August 23, and a sacred place, the Volcanal, not far from the Comitium. He seems to have been a god of the destructive fire, who was appeased by the offering of living fishes, and in whose honor captured weapons were burned. He certainly was especially invoked against danger from conflagration, and his worship became more prominent under Augustus, who had redistricted the city and provided special protection against fires. The poets of course identified him with Hephæstus, and we find him paired with Vesta and otherwise honored by the Greek ritual as early as the third century B.C. This did not, however, penetrate deeply into the common cult, and he does not seem to have been held in special honor by Roman artificers. Consult: W. W. Fowler, *Roman Festivals* (London, 1899); Otto Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1906); W. W. Fowler, *The Religious Experience of the Roman People* (London, 1911); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

VULCAN. A hypothetical planet once supposed to be revolving around the sun within the orbit of Mercury. In 1859 Leverrier found cer-

tain perturbations in the motions of Mercury which indicated the existence of another body in the vicinity. Such a body could be no other than another planet. Soon afterward a certain Lescarbault announced that he had witnessed its transit across the sun's disk. It was thought that his observation was correct; but astronomers agree that he mistook some small sun spots for the supposed planet. Vulcan is not now believed to exist.

VULCANITE. See DENTISTRY.

VUL'CANIZING. See RUBBER.

VULCANO, vụl-kā'nō, or **VOLCANO.** The southernmost island of the Lipari group, in the Mediterranean Sea, 12 miles north of the coast of Sicily (Map: Italy, E 5). It is 7 miles long, 3 miles wide, and contains the crater of a volcano 1200 feet high, from which issue sulphurous gases. The soil is fertile, producing grain, fruit, and grapes. Vulcanello, lying off the northern coast, containing two craters, is connected with it by a neck of land.

VUL'CAN POWDER. See EXPLOSIVES.

VULGATE. See BIBLE.

VULLUM, vụl'lụm, ERIK V. (1850–). A Norwegian political leader and author. He traveled for years in Denmark, Germany, Austria, and Italy, studying politics, economy, history, literature, and art. Returning in 1877, he contributed largely to the press, was editor of *Dagbladet* (1880), and throughout the country served as orator of the Liberal party. Among his works are: *Kristrian Magnus Falsen, Grundlovens Fader* (1881); *Henrik Wergeland i Digt og Liv* (1881); *Leon Gambetta* (1881); *Følgerne af 9 Juni* (1883); *Unionen og dens Fremtid* (1894); *Hvorledes Norge blev Frit* (1913); *Norge og Begivenhederne i 1814* (1914).

VULNED, vŭlnd (from *vuln*, from Lat. *vulnerare*, to wound, from *vulnus*, wound). A term in heraldry, used to describe an animal or part of an animal, blazoned as wounded, with dropping blood. The pelican, when shown plucking at her breast, is described as vulning herself.

VULPEC'ULA (Lat., dim. of *vulpes*, fox). A small northern constellation, situated directly south of Cygnus. It was first described by Hevelius in 1690. Its chief objects of interest are the variable star, T Vulpeculæ, with a period of 4.4 days, and the well-known Dumb-bell nebula, M 27. In 1670 a nova was discovered in this constellation by Anthelmus, a Carthusian monk of Dijon.

VULPIUS, vụl'pē-ụs, CHRISTIAN AUGUST (1762–1827). A German novelist and dramatist, born at Weimar. He studied at Jena and Erlangen, and, probably through Goethe's influence, obtained a post in the Weimar Library in 1797. In Weimar he published the typical penny dreadful of the period, *Rinaldo Rinaldini, the Robber Captain*, often translated and imitated, but unrivaled on its bad eminence. He published a number of romantic operas, dramas, and tales, and was active as editor. He died at Weimar. His sister, CHRISTIANE (1765–1816), became the wife of Goethe. See GOETHE.

VULTURE (Lat. *vultur*, *voltur*, vulture, from *vellere*, to pluck). A representative of a group of carrion-eating rapacious birds classified in two distinct families. The vultures proper constitute the Old World family Vulturidæ; the other family, Cathartidæ, comprises the condors, turkey buzzards, etc. The true vultures have a long straight beak, slightly or not at all hooked at the tip, the head and neck bare or downy, a ruff or collar of soft feathers at the lower part of the neck, into which most of the head can be withdrawn for warmth. The legs and feet are large, but the claws are not nearly so large and strong as in the falcons. They have long wings, great powers of flight, and soar out of human sight. Their plumage is dense, usually black and white, often with the naked parts of the head red. They are mostly found in warm climates, and many are inhabitants of mountainous regions. Their food is carrion. They seldom attack a living animal, but may put to death the wounded or sick; some of them regularly seek food in and about eastern towns, where they are suffered as scavengers. Vast numbers have been seen upon battlefields. They gorge themselves when prey is abundant, till their crop forms a projection, and sit, sleepy or half torpid, to digest their food. They do not carry food to their young in their claws, but disgorge it from the crop. The bareness of their heads and neck adapts them for feeding on putrid flesh, by which feathers would be defiled; they are very careful to wash and cleanse their plumage. The question has been much discussed whether vultures discern dead animals by the eye or are attracted by the smell. They possess great powers of vision, but the reasonable conclusion appears to be that the sense of smell is also of service in finding prey. The rapidity with which they congregate about a carcass has been remarked. It is explained by their practice of soaring to a great height. Each one observes any signs of excitement on the part of others, and so numbers are lured, following one another towards the feast.

Among notable species are the tawny vulture or griffon (*Gyps fulvus*), found in southern Europe, northern Africa, and western Asia. It nests on inaccessible rocks of high mountains, as in the Alps and Pyrenees, and sometimes in tall forest trees. It is more than 4 feet in length, with yellowish-brown plumage, quills and tail feathers blackish-brown, the down of the head and neck white, the ruff white. The same parts of Europe, northern Africa, and most of Asia, are also inhabited by the cinerous vulture (*Vultur monachus*), another large species, which departs from the typical vultures in having the greater part of the neck feathered, and comparatively large and powerful claws. Various species are known in Africa and eastern Asia, of which a familiar one in India is the rather small Pondicherry vulture (*Otogyps calvus*), which is black, and noted for its enormous nest.

The American vultures of the family Cathartidæ differ from those of the Old World technically rather than in appearance or habits. This family includes the huge condors, the California vulture and the king vulture of the genus *Sarcorhamphus* (see CONDOR), and several other species, among them the smaller carrion crow (q.v.) of the tropics, and the more familiar turkey buzzard (*Cathartes aura*) of the southern part of the United States; this bird is occasionally seen, however, in all parts of the United States, and occasionally beyond the Canadian line. It is about 30 inches in length, with wing spread of about 75 inches; in color dingy brown; the tail is long, the wing is bent at a salient angle, and the tips of the longest quills spread apart and bend upward. No birds are better flyers or more expert in soaring.

Their only utterance is a sort of hiss. They breed sometimes in communities and sometimes in separate pairs, depositing the eggs on the ground, on rocks, or in hollow logs and stumps, usually in thick woods. Where a rookery is established the place becomes very foul. The eggs are one or two in number, roundish, about 2¾ inches in longest diameter, and yellowish-white blotched with brown and purplish tints. These birds are of great service as scavengers, especially in hot regions. Consult general works cited under BIRD. See EAGLE VULTURE, and Plate of VULTURES.

VYĀSA, vyä'sȧ (Skt., distribution, arrangement). A legendary Hindu sage to whom is ascribed the authorship, or compilation, of a large body of ancient Sanskrit literature. The redaction of the Vedic hymns and the authorship of the *Mahābhārata* (q.v.) are attributed to him, while his name is attached to the *Purāṇas* (q.v.), to a *Brahmasūtra* (see VEDANTA), and to several other works. According to tradition his father was Parasara (q.v.), and his sons were Pandu and Dhritarashtra, the kings of the *Mahābhārata.* His full name is given as Krishna Dvaipayana Vyāsa, and legend accounts for the title *Kṛiṣṇa,* black, by his dark complexion, and for the attribute *dvāipāyana* by his birth on an island in the Yamuna or River Jumna. The immense mass of literature ascribed to him is so varied in character and so different in point of age, that Vyāsa is not regarded as an individual but is understood to typify the literary activity which brought order into the heterogeneous mass of Sanscrit literature.

VYATKA, vyät'kȧ. A government of northeast Russia. Area, nearly 59,400 square miles. It is largely a plateau, somewhat elevated in the northeast, with hills reaching an altitude of 1400 feet. The chief rivers are the Kama and its tributary the Vyatka (Map: Russia, H 3). Agriculture is the principal occupation and is favored by a fertile soil, but is carried on by primitive methods. Stock raising is also an important industry. About one-half of the area of the government is under forests, but they are unequally distributed. Over 300,000 persons are engaged in household industries. The mineral and smelting industries employ about 45,000 persons and produce chiefly iron and steel. The manufacturing industries are gradually developing and the annual value of their products approximates $15,000,000. The chief manufactures are leather, flour, spirits, hardware, and machinery. There is an extensive gun factory owned by the government. Pop., 1912, 3,869,100. The Russians form about 80 per cent and the remainder is composed of Votiaks, Tcheremisses, and Tatars.

VYATKA. The capital of the government of the same name, in Russia, situated on the river Vyatka, 660 miles northeast of Moscow (Map: Russia, G 3). The trade in grain and animal products with St. Petersburg, Moscow, Archangel, and Siberia is extensive. Pop., 1911, 44,114. Vyatka, formerly Khlynov, dates probably from the twelfth century (1174). It was an important commercial city practically independent in its administration, and differing from Novgorod (q.v.) in that it had no princes. It was annexed to Moscow in the fifteenth century.

VYERNY, vyĕr'nĭ. The capital of the Territory of Semiryetchensk, Russian Turkestan, situated at an altitude of 2430 feet, 2690 miles southeast of Moscow. Pop., 1910, 36,382. The town was founded on the site of a Kirghiz settlement in 1854. It has suffered greatly from earthquakes, that of 1887 having almost entirely ruined the place and killed over 330 persons.

VYSHNY-VOLOTCHEK, vĭsh'nyĕ vŏ'lŏ-chĕk'. The capital of a district in the Government of Tver, Russia, situated near the Tsna River, 224 miles southeast of St. Petersburg (Map: Russia, D 3). It has considerable commercial importance. The chief manufactures are cotton goods. Pop., 1910, 17,592.

W

W The twenty-third letter, and eighteenth consonant in the English alphabet. As its name in English indicates, the character is formed by a doubling of single *v*'s or *u*'s into a ligature. This composite letter was first employed to transliterate the Latin semivocalic *v* (*w*) and the earliest recorded instance of its occurrence is in a diploma of Clovis III at the end of the seventh century. It appeared in English usage in the eleventh century, although *uu* or *vv* (without ligature) had already occasionally been employed.

Sound and Philological Value. As a phonetic character *w* is a voiced labial spirant, corresponding very nearly to *u* in the position of its formation. The sound is produced by contracting the tongue in the back of the mouth and allowing the breath to escape between the slightly rounded lips. In words beginning with *wh*, like *white, what, wheel*, where the more original Anglo-Saxon had *hw*, the *w* is pronounced voicelessly, and with the aspiration preceding. The older spelling *hw* (Anglo-Saxon *hwīt, hwæt, hwēol*) was transposed after the twelfth century and *wh* became the generally accepted orthography. In some words now beginning with *wh*, the *w* is not original, but has been adopted since the fifteenth century, thus *whole* (Anglo-Saxon *hāl*), *whoop* (Middle English *houpen*). The silencing of *w* before *r*, as in *wrath, wrestle*, and also in *sword, answer*, is a later development since the Norman Conquest. The representation of the intermediate *w* sound in *quell, queen*, where *qu* stands for an older *cw* (Anglo-Saxon *cwellan, Cwēn*), is likewise of later date. (See Q.) The labialized *w* in the form *ow* at the end of *sorrow, arrow*, and similar words is evolved from an earlier guttural *g* or *h* (Anglo-Saxon *sorg, earh*, etc.). In *cow, now, how* (Anglo-Saxon *cū, nū, hū*) the *w* is graphic. The labio-guttural character of the letter is also evinced in such interchanges as French *Guillaume, guerre*, English *William, war*, which gives rise also to such doublets in English as *guard* and *ward, warranty* and *guarantee*. The strongly marked labial character of *w* tends furthermore to color adjacent vowels, as in English *two* (*tu*), Anglo-Saxon *twā;* English *who*, Anglo-Saxon *hwā*.

In regard to its philological value, the English *w* may represent (1) Indo-Germanic *v* (*u̯*), as English *new*, German *neu*, Latin *novus*, Sanskrit *navas*, Indo-Germanic **neu̯os;* (2) Indo-Germanic *gh*, as in English *warm*, Latin *formus*, Greek *θερμός*, Sanskrit *gharmas*, Indo-Germanic **ghuarmas;* (3) English *wh* stands for Germanic *hw* (Indo-Germanic *ku̯*), as Sanskrit *kas*, Anglo-Saxon *hwā*, English *who*.

As a symbol in chemistry W stands for *tungsten* (from the Latinized German designation *Wolframium*). Consult: Henry Sweet, *The Sounds of English* (Oxford, 1908); P. Passy, *Petite phonétique comparée des principales langues européennes* (2d ed., Paris, 1912); Daniel Jones, *Outlines of English Phonetics* (Leipzig, 1913); Laura Soames, *Introduction to English, French, and German Phonetics* (3d ed., London, 1913).

WAAGEN, vä'gen, GUSTAV FRIEDRICH (1794–1868). A German art-historian. He was born at Hamburg, studied at the universities of Breslau and Heidelberg, and took part in the War of Liberation in 1813–14. He became at once favorably known through his work *Ueber Hubert und Johann van Eyck* (1822), one of the landmarks in modern art history, which led to his being called to the Berlin Museum. From 1830 until his death he was director of the picture gallery, and in 1844 he was appointed professor at the University of Berlin. In 1862 he published his *Handbuch der deutschen und niederländischen Malerschulen*. Other important works are *Kunstwerke und Künstler in England und Paris* (1837–39), afterward revised and extended under the title *The Treasures of Art in Great Britain* (1854), and supplemented by *Galleries and Cabinets of Art in Great Britain* (1857); and *Kunstwerke und Künstler in Deutschland* (1843–45). His *Kleine Schriften* were collected and edited with a biography of Woltmann (Stuttgart, 1875). His work was scholarly and thoroughly critical for its day.

WAAHOO, wä-hōō'. See SPINDLE TREE.

WAAL, väl. The southernmost and largest arm of the Rhine delta. It flows westward through the Dutch Province of Gelderland, and is joined by the Meuse or Maas (q.v.) near Gorinchem (Map: Netherlands, D 3).

WAALS, wäls, JOHANNES DIDERIK VAN DER (1837–). A Dutch physicist. He was born at Leyden, took the degree of Ph.D. in 1873, taught in secondary schools at Deventer and The Hague, and after 1877 was professor of physics at the University of Amsterdam. In 1910 he was awarded the Nobel Prize in physics. His publications deal with the continuity of state of liquids and gases, electrolytic dissociation, thermodynamic theory of capillarity, and similar subjects, one of the most important being *Die Continuität des gasförmigen und flussigen Zu-*

standes (2 vols., 2d ed., 1899–1900). He originated a formula known by his name.

WABASH, wą'băsh. A city and the county seat of Wabash Co., Ind., 42 miles southwest of Fort Wayne, on the Wabash River, and on the Cleveland, Cincinnati, Chicago, and St. Louis and the Wabash railroads (Map: Indiana, F 3). It has public and high school libraries and the Wabash City Library, and the Wabash County Hospital. Other features include Memorial Hall, and the Masonic Temple, City Park, and Charley Falls and Park. The principal industrial establishments are railroad shops of the Big Four, engine works, a foundry, a canning factory, and manufactories of paper, motor trucks, cabinets, hats, church and school furniture, etc. Pop., 1900, 8618; 1910, 8687; 1915 (U. S. est.), 8723.

WABASHA, wą'bà-shâ. A city and the county seat of Wabasha Co., Minn., 70 miles southeast of St. Paul, on the Mississippi River, and on the Chicago, Milwaukee, and St. Paul Railroad (Map: Minnesota, E 6). It is a residential place and summer resort. There are some industrial establishments, including marine boat yards and flour mills. Pop., 1900, 2528; 1910, 2622.

WABASH COLLEGE. A college for young men at Crawfordsville, Ind., founded in 1832. It has no organic connection with any ecclesiastical body, but is closely affiliated with the Presbyterian church. Students are admitted on examination or by certificate from accredited schools. All undergraduate courses lead to the degree of B.A. The master's degree is given on completion of one year's graduate work at the college. The college grounds consist of 40 acres in the heart of the city, valued, with the buildings, at $243,800. In 1915 the total attendance was 335, the faculty numbered 23, and the library contained 50,000 volumes. The endowment was $750,000. The president in 1916 was G. L. Mackintosh, A.M.

WABASH (wą'băsh) **RIVER.** The chief river in Indiana and the largest north tributary of the Ohio (Map: Indiana, C 4). It rises in the southwestern part of Mercer Co., Ohio, flows northwest, then southwest to Covington, where it takes a more southerly direction, finally forming for 120 miles the boundary between Indiana and Illinois until it enters the Ohio River at the extreme southwestern corner of Indiana. Its length is about 410 miles, and it is navigable for steamers 300 miles to Covington at high water as far as Lafayette. Its middle course, from Terre Haute to Huntington, is followed by the Wabash and Erie Canal, which connects the river with Lake Erie. The chief tributary of the Wabash is the White River (q.v.).

WACE (c.1100–c.1175). An Anglo-Norman poet. He was born on the island of Jersey, about 1100. When a boy he was taken to Caen, in Normandy, where he learned Latin in preparation for the Church. He then studied "a long time" at Paris, returning between 1130 and 1135 to Caen, where he became "a clerc lisant" in the royal chapel. Henry the Second made him a prebendary at Bayeux (apparently in 1169). As there is no trace of him after 1174, it may be inferred that he died in that or the next year. Wace was the author of two great poems. The first, the *Geste des Bretons,* or the *Roman de Brut,* was completed in 1155, and presented with a dedication to Queen Eleanor some time before 1160. It comprises over 15,000 lines, in the prevailing octosyllabic couplet. The narrative begins with the settlement of Britain by Brut, or Brutus, the great-grandson of Æneas, and closes with Cadwalader, the last of the shadowy kings of Britain. The poem is based mainly on the Latin *History of the British Kings* by Geoffrey of Monmouth (q.v.), but Wace drew on other Kymric traditions. He describes the round table, which was unknown to Geoffrey. The *Brut* was translated into English with changes and additions by Layamon (q.v.). Wace's second poem is the *Roman de Rou,* composed between 1160 and 1174. It is partly in Alexandrine verse and partly in octosyllabic couplets. After summarizing the history of the Norman kings and dukes from Henry the Second back to Rolf, Wace reverses the order in more detail. Of most interest to an English reader is a description of the Norman Conquest, which seems based upon the best traditions. But he never completed his chronicle, for old age was approaching and he became discouraged on hearing that his patron had asked Benoît de Sainte-More to write on the same theme. Belonging to Wace's middle life are three minor poems: the *Vie de St. Nicolas* (edited by Delius, Bonn, 1850); the *Vie de la Vierge Marie* (edited by Luzarche, Tours, 1859); and the *Vie de Ste. Marguerite* (edited by Joly, Paris, 1879). The *Brut* has been edited by Le Roux de Lincy (Rouen, 1836–38), and the *Roman de Rou* by Andresen (Heilbronn, 1877–79). For the life and work of Wace, consult Gaston Paris, *Littérature française au moyen âge* (Paris, 1888).

WACE, HENRY (1836–). An English clergyman and Church historian, born in London. After graduating at Oxford in 1860, he was a curate in London (1861–72), chaplain (1872–80) and preacher (1880–96) of Lincoln's Inn, and rector of St. Michael's, Cornhill (1896–1903). He also served as professor of ecclesiastical history in King's College, London (1875–83), and as its principal (1883–97). In 1881 he became a prebendary of St. Paul's; in 1896 examining chaplain to the Archbishop of Canterbury; in 1900 dean of the East City, and in 1903 dean of Canterbury. He became an honorary royal chaplain in 1884, and chaplain in ordinary in 1889. In addition, he delivered Boyle and Bampton lectures and preached much at Oxford and Cambridge. His chief literary work is his *Dictionary of Christian Biography, Literature, Sects, and Doctrines from the Time of the Apostles to the Age of Charlemagne* (4 vols., 1877–87), prepared in coöperation with William Smith. He was author of *Sermons on the Sacrifice of Christ* (1898); *The Bible and Modern Investigations* (1903); *The Principles of the Reformation* (1910); *Prophecy: Jewish and Christian* (1911); *Some Questions of the Day* (1912; new ed., 1914).

WA CHAGA. See CHAGA.

WACHENHUSEN, vä'gen-hōō'zen, HANS (1823–98). A German author, born at Treves. During the Crimean War he was a war correspondent of several prominent papers, embodying his observations afterward in such books as *Von Widdin nach Stambul* (1855), *Ein Besuch im türkischen Lager* (1855), and those of later campaigns in *Tagebuch vom italienischen Kriegsschauplatze* (1859), *Halbmond und Doppeladler* (1860), *Freischaren und Royalisten* (3d ed., 1867), *Vor den Düppeler Schanzen* (1864), *Tagebuch vom österreichischen Kriegsschauplatz* (6th ed., 1867), and *Tagebuch vom französischen*

Kriegsschauplatz (1871), all of which form a faithful and spirited history of these modern campaigns. In the meanwhile he had lived repeatedly in Paris, where he wrote *Das neue Paris* (1855), *Die Frauen des Kaiserreichs* (7th ed., 1872), and a trip through Spain to Africa he described in *Reisebilder aus Spanien* (1857). He also published several novels and tales, notably *Rom und Sahara* (3d ed., 1867), *Unter dem weissen Adler* (2d ed., 1885), based upon the Polish insurrection of 1863, *Die bleiche Gräfin* (6th ed., 1894), but his most interesting works are his memoirs, which appeared under the title *Aus bewegtem Leben* (2d ed., 1895). His works appeared in 17 vols. (1865–68).

WACHSMUTH, väks-mo͝ot, CHARLES (1829–1896). An American paleontologist, born in Hanover, Germany. He was educated for the law but abandoned it because of ill health and went to the United States, where he settled in 1854 in Burlington, Ia. Here he became interested in the crinoids of the Burlington limestones, of which he made extensive collections. With Frank Springer he published the important papers: "Discovery of the Ventral Structure of Taxocrinus and Haplocrinus" (1889); "The Perisomic Plates of the Crinoids" (1891); "The North American Crinoidea Camerata" (posthumous, 1897).

WACHSMUTH, väks'mu̯t, GOTTLIEB (1784–1866). A German historian, born at Hildesheim. After studying philology and theology at Halle, he taught in various positions at Magdeburg, Zerbst, and Halle until 1820, when he was called as professor of history to Kiel. Thence he went to Leipzig in 1825, and there published his most important works: *Historische Darstellungen aus der Geschichte der neuern Zeit* (3 vols., 1831–35) and *Hellenische Altertumskunde* (2 vols., 2d ed., 1843–46); *Europäische Sittengeschichte* (5 vols., 1831–39); *Geschichte Frankreichs im Revolutionszeitalter* (1840–44); *Allgemeine Kulturgeschichte* (1850–52); *Geschichte deutscher Nationalität* (1860–62), and many others.

WACHT AM RHEIN, väkt äm rīn, DIE (Ger., The Watch on the Rhine). A famous German patriotic song, the words by Max Schneckenburger (1819–49) and the music by Karl Wilhelm (1815–73). The poem was written in 1840, when the left bank of the Rhine seemed threatened by France. The music, which is a part song for men's voices, was composed and first sung in 1854, but did not become a national song until the Franco-Prussian War. In 1871 the composer was granted a pension of 3000 marks.

WACHUSETT, wą-chū'sĕt, MOUNT. An isolated monadnock in the central part of Massachusetts, 7 miles southwest of Fitchburg (Map: Massachusetts, D 3). Its altitude is 2108 feet, and its summit affords a fine view.

WACKENRODER, väk'en-rō'dĕr, WILHELM HEINRICH (1773–98). A German author of the Romantic school. He was born at Berlin, and was educated in law at the universities of Erlangen and Göttingen. While a schoolboy he became the friend of Ludwig Tieck (q.v.), and was closely associated with him till his death. Tieck contributed an introduction and one or two sketches to his friend's *Herzensergiessungen eines kunstliebenden Klosterbruders* (1797; new ed., 1904), and after his death published two works which were the fruit of their joint authorship: *Franz Sternbalds Wanderungen*, largely Tieck's work (1798), and *Phantasien über die Kunst* (1799). In these books the two young men expressed for the first time the principles of æsthetics which were to govern the Romanticists. Consult "Tieck und Wackenroder," edited by J. Minor in Kürschner's *Deutsche Nationallitteratur*, vol. cxliv (Berlin, 1882–99), and Koldewey, *Wackenroder und sein Einfluss auf Tieck* (Leipzig, 1904).

WACKERNAGEL, väk'er-nä'gel, JACOB (1853–). A Swiss-German Hellenist and comparative philologist, son of Wilhelm Wackernagel, born in Basel, and educated there, in Göttingen, and in Leipzig. He became professor of Greek at Basel in 1881 and in 1902 was called to Göttingen. Wackernagel's publications include: *Der Ursprung des Brahmanismus* (1877); *Das Dehnungsgesetz der griechischen Komposita* (1889); *Das Studium des klassischen Altertums in der Schweiz* (1891), an historical sketch of humanistic study in Switzerland; the important *Altindische Grammatik*, vols. i, ii, part 1 (1896–1905); *Vermischte Beiträge zur griechischen Sprachkunde* (1897).

WACKERNAGEL, WILHELM (1806–68). A German scholar, born and educated at Berlin. In 1833 he was called to the University of Basel and in 1835 was made professor of German language and literature there. He was primarily a student of Germanics, though he wrote much on other subjects. His works include: *Deutsches Lesebuch* (1835–36); an edition of the *Schwabenspiegel* (1840); *Altfranzösische Lieder und Leiche* (1846); *Geschichte der deutschen Litteratur* (1848–56), completed by Martin; *Walther von der Vogelweide* (ed., with Rieges, 1862). In 1873 appeared *Poetik, Rhetorik und Stilistik*, and in 1876 his *Altdeutsche Predigten und Gebete*, both edited by associates of Wackernagel.

WACO, or **HUECO,** wā'kō. A small tribe of Caddoan stock (q.v.), one of the divisions of the Tawakoni, formerly residing on the middle Brazos River, about the present town of Waco, Texas, which takes its name from them. Like all the other tribes of the stock, they were agricultural and sedentary, living in conical houses of grass laid over a framework of poles. They cultivated an abundance of corn and pumpkins, in addition to which they obtained a supply of meat from the buffalo. In 1855, with several other small tribes, they were gathered upon a reservation near Fort Belknap, but were driven off by the Texans, and in 1859 were removed to a new reservation established north of the Washita, where they became incorporated with the Wichita (q.v.). During the Civil War they fled to Kansas, where they suffered greatly from disease and famine. They are still resident with the Wichita upon the same reservation, but had been reduced by disease and removals from an estimated 400 in 1804 to five individuals in 1910.

WACO. A city and the county seat of McLennan Co., Tex., 97 miles southwest of Dallas; on both sides of the Brazos River, connected by two suspension bridges, and on the St. Louis Southwestern, the Missouri, Kansas, and Texas, the San Antonio and Aransas Pass, the Gulf, Colorado, and Sante Fe, the Houston and Texas Central, and the International and Great Northern railroads (Map: Texas, D 4). The city is laid out parallel with the river, the residential portion occupying the more elevated regions on either side. There are numerous

artesian wells with medicinal properties. The educational institutions include Baylor University (q.v.), Academy of the Sacred Heart, and Paul Quinn College (African M. E.), opened in 1881. Other important features are the natatorium, Federal building, auditorium, public library, Texas Cotton Palace, Amicable Building, Provident Sanitarium, and the Methodist Orphanage. Waco carries on an enormous jobbing business; and has grain elevators, cottonseed oil mills, flour mills, and manufactories of mattresses, saddlery, sashes and doors, etc. The city has adopted the commission form of government. Pop., 1900, 20,686; 1910, 26,425; 1915 (U. S. est.), 32,756.

WAD. A manganese oxide of doubtful composition, black in color and earthy in texture. It occurs with other ores of manganese (q.v.).

WADAI, wä-dī. Formerly one of the most powerful native states of the Sudan, and now part of French Equatorial Africa, situated east of Lake Chad (Map: Africa, F 3). Its area with dependencies is given as 170,000 square miles. It is a long, narrow, semicivilized state, stretching from north to south. It largely possesses the character of a region of steppes, with here and there naked mountain groups. In the southwest lies a wild, broken, thick-forested region, where the Guere Mountains reach over 3000 feet. In the east is the Tir range, 2000 feet high. The watercourses dry up during the year except the Aukadebbe in the south, an important tributary of the Shari. The most important oases are the Bahr-es-Salamat and the Batha. From the last the Fitri Lake, east of the mouth of the Shari, gathers its waters. Wadai is especially arid in the north. The flora and fauna are similar to those of Bornu. The region, where the Guere Mountains reach over are rice and wheat. The leading occupation is pastoral. Cattle, horses, and camels are raised of a superior kind. Ostrich feathers, ivory, and slaves are the prominent items in the trade. The population is estimated by the French at about 1,000,000. The Mabas are the foremost race and form about one-seventh of the population—a negro people of the Mohammedan faith and belonging to the Senussi sect. Arabs are numerous. Market communities take the place of cities. Vassal states are Fitri, East Kanem, and Runga. Abeshe is now the Sultan's capital.

The Wadai kingdom was founded in 1635, and paid tribute to both Bornu and Darfur. The country has had powerful rulers. The Sultan Ali conquered, after about 1860, the territory of Runga, the east half of Kanem, and also Borku. The Sudanese Rabaj conquered Wadai during 1892–93, and extended his rule to surrounding states. The present native conditions of political rule are not definitely known. In 1901 a revolution occurred owing to local political feuds, and a new sultan was enthroned. Eduard Vogel was the first European to enter the land, about the middle of the nineteenth century. Nachtigal explored it in 1873 and Matteuci and Massari in 1879. By the Anglo-French agreement of 1898–99 the region passed definitely to the French, who extended their colonial system to it in 1903.

WADDELL, wŏd-dĕl′, James Iredell (1824–86). An American naval officer, born in Pittsboro, N. C. He became a midshipman in the United States navy in 1841, and a second lieutenant in September, 1855. In 1859 he was assistant professor of navigation at the Naval Academy, and in 1860 was at the China station. In November, 1861, he resigned from the navy, and in March, 1862, was commissioned lieutenant in the Confederate navy. He commanded the ram *Louisiana* at New Orleans, and blew her up to prevent capture. In October, 1864, he took command, in England, of the *Shenandoah*, with which he made his way to the northern Pacific and Arctic oceans by way of Australia, and almost destroyed the United States whaling fleet. Thirty-eight vessels were captured, and the amount of damage done was estimated at only $400,000 less than that done by the *Alabama*. (See Alabama Claims.) Most of this was done after the collapse of the Confederate government, as Waddell did not hear of the end of the war until Aug. 2, 1865. He at once made his way to Liverpool and surrendered his ship to the British government, which afterward turned it over to the United States. In 1875 he became commander of the *San Francisco* of the Pacific Mail line.

WADDING, wŏd′ĭng, Luke (1588–1657). An Irish Franciscan friar and historian of the order. He was born at Waterford, educated at the Irish Jesuit College at Lisbon, and entered the Franciscan Order there. He pursued his studies at the University of Coimbra and was ordained priest in 1613. He taught theology at Salamanca for a while, and went to Rome, where the rest of his life was to be passed, in 1618, in the suite of the Bishop of Cartagena, sent by Philip III to request the Pope to define the dogma of the immaculate conception. His account of this mission (1624) is his first important work. He founded the College of St. Isidore and another at Capranica, for the members of his order, and was influential in founding the Irish College at Rome. He was procurator of the Franciscans, and a member of the important Roman congregations; the revision of the breviary under Urban VIII is largely the result of his work in the Congregation of Rites. His fame rests principally, however, on his historical studies: *Annales Ordinis Minorum* (1625–54; new ed., in 24 folio vols., 1731–1860); *Scriptores Ordinis Minorum* (1650; new ed. 1806).

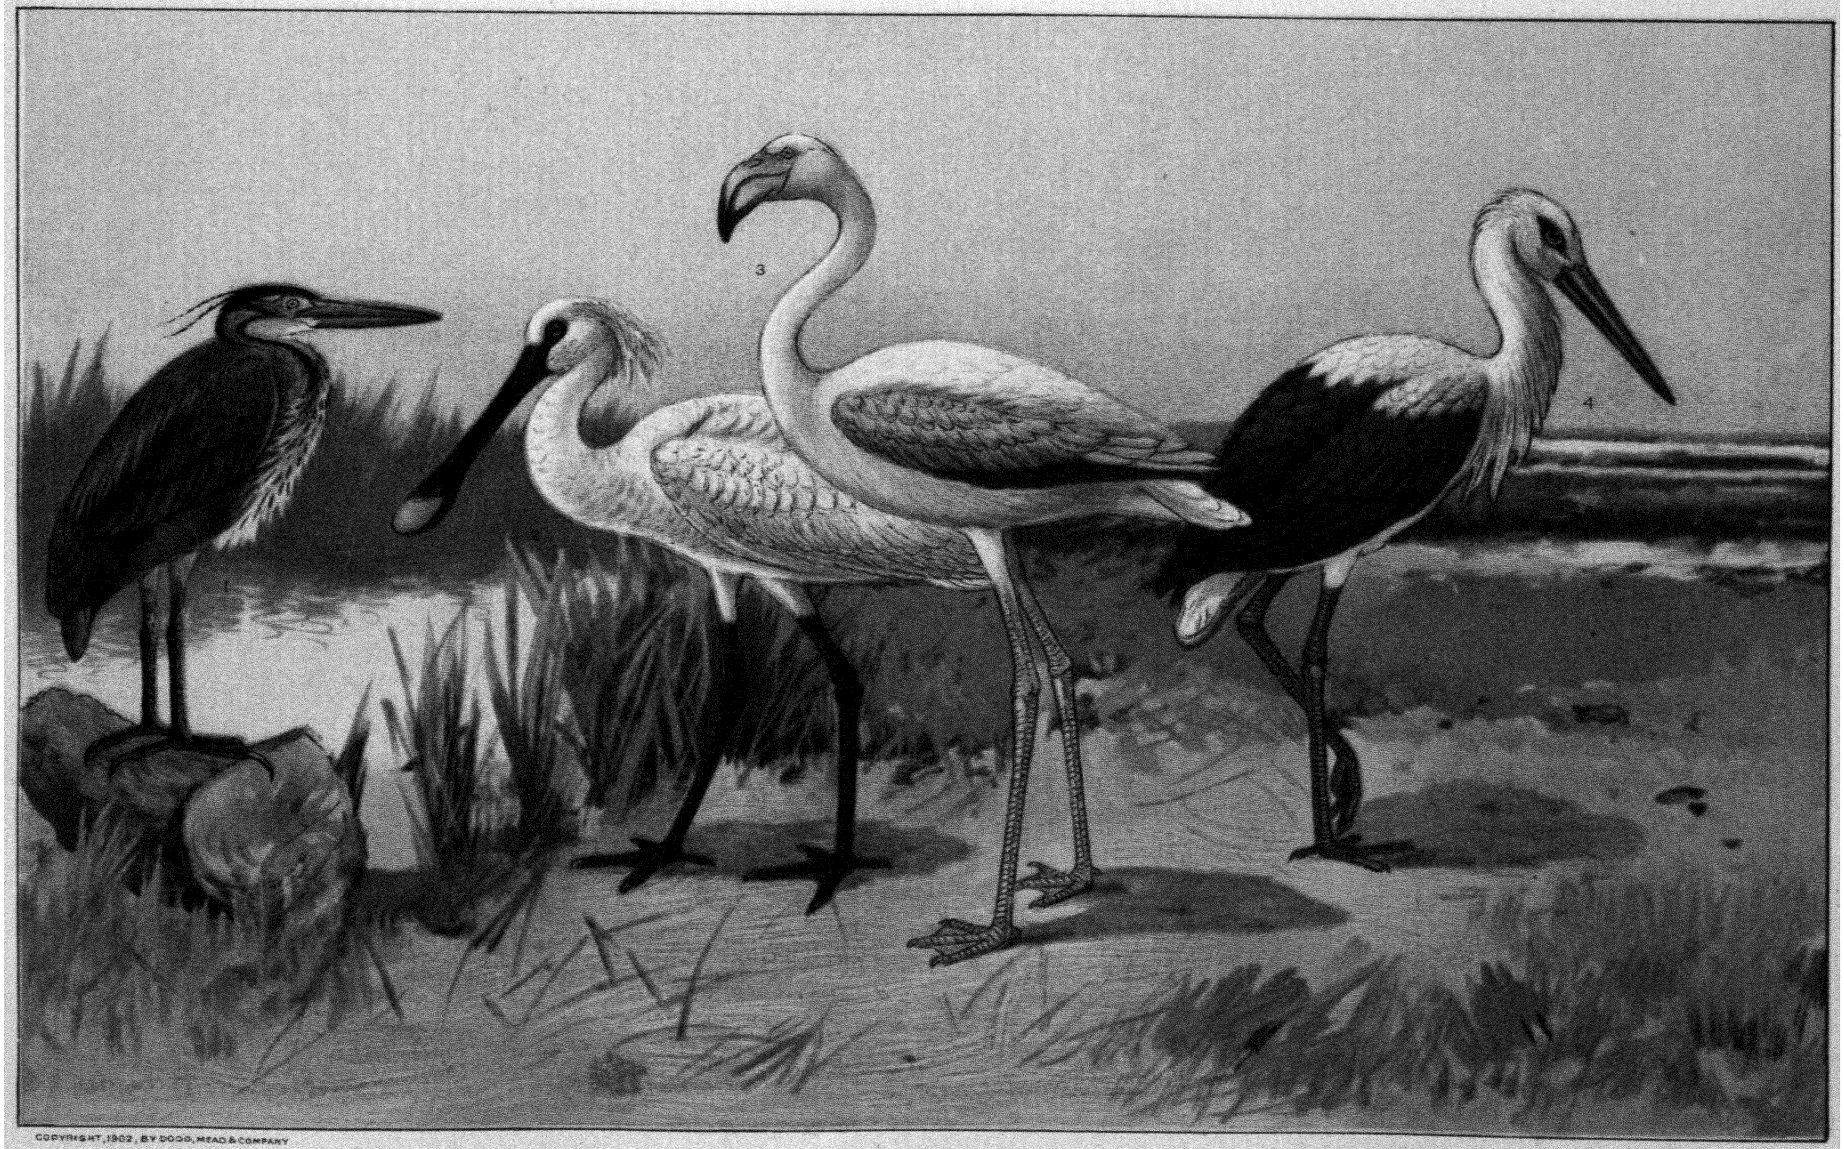
WADDINGTON, wŏd′ĭng-tŭn, Charles (1819–1914). A French philosopher, cousin of Richard and William H. Waddington. He was born at Milan, of a Protestant family of English origin. Graduating from the Ecole Normale Supérieure at 19, he taught at various institutions, including the Protestant Seminary of Strassburg, the Lycée Louis le Grand, and the Sorbonne, where in 1879 he was appointed professor of ancient philosophy. In 1888 he became a member of the Academy of Moral and Political Sciences. His works, notable for clearness and penetration, include: *Essai de logique* (1858); *De l'idée de Dieu dans l'athéisme contemporain* (1859); *De l'âme humaine, études de psychologie* (1863); *Dieu et la conscience* (1870); *De la science du bien* (1875); *L'Athéisme en France à la fin du XVIIIième siècle* (1892); *La philosophie ancienne et la critique historique* (1904).

WADDINGTON, Richard (1838–). A French legislator and historian, brother of William Henry Waddington and cousin of Charles Waddington (qq.v.). He was born at Rouen. In 1870–71 he served as a captain of artillery. Elected a deputy in 1876, he sat with the Left Centre until 1891, when he was elected senator

for Seine-Inférieure. He was reëlected to the Senate in 1900. Waddington wrote *Louis XV et le renversement des alliances* (1896), and *La guerre de sept ans: histoire diplomatique et militaire* (4 vols., 1899–1908).

WADDINGTON, WILLIAM HENRY (1826–94). A French statesman and archæologist, brother of Richard and cousin of Charles Waddington. He was born of English parentage at St. Rémy-sur-l'Avre, France, and was educated at the University of Cambridge, England, but on his return to France in 1849 became a naturalized citizen of that country. He engaged in important archæological expeditions in Asia Minor and Palestine, the results of which were published in his works, *Voyage en Asie Mineure au point de vue numismatique* (1852); *Mélanges de numismatique et de philologie* (1861). The work of Le Bas, *Voyage archéologique en Grèce et en Asie Mineure* (Paris, 1868–77), was also continued by him. With these should be named his other important publications within the same field, *Inscriptions grecques et latines de Syrie* (1870), and his *Edit de Dioclétien* (1864). His services to classical scholarship were recognized in 1865 by his election to the Académie des Inscriptions.

Waddington became prominent in political life in 1871, when he entered the National Assembly; in 1873 he was Minister of Public Instruction under Thiers, but for six days only; and in 1876 he was chosen Senator. On Dec. 13, 1877, he became Minister of Foreign Affairs in Dufaure's Cabinet, and as such took part in the Berlin Congress (1878). In February, 1879, he was appointed by President Grévy to the presidency of the Council. He resigned in December of that year. From 1883 to 1893 he was the French Ambassador at the Court of St. James's. Consult: Mme. Waddington, *Letters of a Diplomat's Wife, 1883–1900* (London, 1903); id., *Italian Letters of a Diplomat's Wife* (ib., 1905); J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).



WADE, BENJAMIN FRANKLIN (1800–78). An American political leader, born of humble parentage, near West Springfield, Mass. He removed to Ohio in 1821; was admitted to the bar in 1827, and in 1831 became the partner of Joshua R. Giddings (q.v.). He was elected prosecuting attorney of Ashtabula County in 1835, and State Senator in 1837 and 1841; and was chosen presiding judge of the third judicial district of the State in 1847. From 1851 until 1869 he was a member of the United States Senate. He was a Whig, and a strong opponent of slavery; voted for the repeal of the Fugitive Slave Law in 1852; and opposed the Kansas-Nebraska Bill (q.v.) of 1854, the purchase of Cuba, and the admission of Kansas under the Lecompton Constitution (q.v.). After the election of Lincoln in 1860 he opposed all compromise between the North and the South; was chairman of the Committee on the Conduct of the War in 1861–62, and advocated a more vigorous policy, urging a law to confiscate the property of the leading secessionists and to emancipate the slaves. With Henry W. Davis and other Republicans he caused, in the summer of 1864, an open breach with the President upon the proper method and policy of Reconstruction (q.v.), and issued the Wade-Davis Manifesto, condemning in strong language the policy of the President. As chairman of the Committee on Territories, he reported in 1862 a bill to abolish slavery in all the Territories, and prohibit it in all future Territories. He was elected president of the Senate in 1867, and was sent in 1871 as one of the commission to Santo Domingo to report in regard to its annexation to the United States. Senator Wade was popularly known as Ben or Old Ben, and was greatly admired by his associates for his rugged, fearless manner, his honesty of purpose, and independence of thought. Consult Riddle, *Life of Benjamin F. Wade* (Cleveland, 1888).

WADE, JAMES FRANKLIN (1843–). An American soldier, born at Jefferson, Ohio. He was appointed first lieutenant in the 6th United States Cavalry in 1861; was breveted captain and major for services respectively at Beverly Ford, Va., and Marion, Tenn.; and was mustered out of the volunteer service with the brevet rank of brigadier general in 1865. Entering the regular army as captain in 1866, he was promoted through the grades to brigadier general in 1897. During the Spanish-American War he served as major general of volunteers, and in 1898 was head of the Cuban Evacuation Commission. Sent to the Philippines in 1901, he was promoted major general U. S. A., in 1903, and in 1903–04 commanded the Division of the Philippines. Thereafter he was in command of the Atlantic Division until 1907, when he was retired.

WADE, THOMAS (1805–75). An English poet, born at Woodbridge, in Suffolk. He went to London at an early age with a competence, and began to publish remarkable verse under the inspiration of Shelley and Keats. He met with some success in the acting drama; but he eventually turned to journalism, becoming editor and part proprietor of *Bell's Weekly Messenger*. After losing much by this undertaking, he retired to the Isle of Jersey, where he edited the *British Press*, and continued to write verse until his death. Wade's first volume of poems, *Tasso* (1825), displaying rare imaginative qualities, especially in the piece called "The Nuptials of Juno," was followed by a collection strangely called *Mundi et Cordis, de Rebus Sempiternis et Temporariis, Carmina* (1835), and by remarkable verse pamphlets: *The Contention of Death and Love* (1837), *Helena* (1837), *The Shadow Seeker* (1837), and *Prothanasia and Other Poems* (1839). In the meantime, he had written for the stage *Woman's Love* (Covent Garden Theatre, 1828), a romantic drama; *The Phrenologists*, a farce (Covent Garden, 1830); and *The Jew of Arragon* (Covent Garden, 1830), a tragedy. The play last named failed because of its exaltation of the Jew. Of two other dramas written at this period, *Elfrida* is lost, and *King Henry II* exists only in manuscript, as does his translation (made in 1845–46) of Dante's *Inferno* in the original metre. Some of a series of sonnets inspired by his wife have been published. Consult: A. H. Miles (ed.), *Poets and Poetry of the Nineteenth Century*, vol. iii (London, 1896), which contains an estimate by Forman; Nicoll and Wise (ed.), *Literary Anecdotes of the Nineteenth Century*, vol. i (ib., 1895), which contains a specimen of the Dante, 50 sonnets, and the first two verse pamphlets cited above.

WADE, SIR THOMAS FRANCIS (1818–95). A British diplomat, born in London. He was educated at Harrow, spent a year at Trinity College, Cambridge, and entered the army (1838). Promoted lieutenant, he went to Hongkong,

and took part in the attack on Chinkiang, and in the operations near Nanking during the Opium War. In 1853 he became chief of the commission that established the customs administration which developed into the Imperial Maritime Customs Service. He was attached to Lord Elgin's mission in 1857, and negotiated the treaty of Tien-tsin (1858). He assisted in establishing the legation at Peking (1861), where, after experience as chargé d'affaires, in which capacity he conducted the difficult negotiations arising from the Tien-tsin massacre of 1870, he became Minister in 1871. Largely through his effort, audience to Ministers was granted by the Emperor T'ungchih in 1873. As a result of the murder of A. R. Margary in Yun-nan, he negotiated with Li Hung Chang the Chifu convention of 1876. Wade was made K.C.B. in 1883, and retired. In 1888 he was appointed first professor of Chinese at Cambridge. Among his publications, which include several valuable books for the study of Chinese, are: *The Hsin Ching Lu*, or *Book of Experiments* (1859); *Wenchien Tzu-erh Chi* (1867), dealing with documentary Chinese; and *Yü-yen Tzu-erh Chi* (1867; enlarged 1886), a progressive course in the colloquial Peking variety of the Mandarin dialect. Wade bequeathed his large Chinese library to Cambridge University.

WADHAM (wŏd'am) **COLLEGE.** A college at Oxford, England. It was founded by Nicholas Wadham, of Merifield, Sussex, and Dorothy, his wife, daughter of Sir William Petre, the great benefactor of Exeter College. Sir Nicholas dying in 1609, his plan was carried out by his wife. The site and ruins of the old priory of the Austin Friars were purchased, and the building of the college was begun in 1610, the society being founded by letters patent from James I, in 1612. The original foundation was for a warden, 15 fellows, 15 scholars, two chaplains, and two clerks. In 1882 there was a change in the statutes, which provided for a warden, eight fellows, several honorary fellows, two chaplains, college officers, a number of lecturers, 18 scholars, and some 100 undergraduates in all. The buildings (seventeenth century) are attractive, though not remarkable. The garden is one of the most pleasant in Oxford. The college presents to 10 livings. Among distinguished men of Wadham have been Admiral Blake, Sir Christopher Wren, Bishop Ward, Dr. Kennicott, and Frederic Harrison. Consult J. Wills, *Wadham College* (London, 1898).

WADI, wä'dē, or **WADY** (Ar. *wādi*, from *wadaya*, to flow). Properly, a river or water course, more generally a valley or ravine; sometimes also an oasis. These various meanings are due to climatic and physical conditions in Arabia and Palestine, where fertility is dependent upon the presence of water, and the streams are usually during most of the year mere beds with low streams, though in the rainy season they may become raging torrents.

WADI HALFA, wä'dē hăl'fā (valley of grass), or HALFA. The chief town of the district of Wadi Halfa, Egyptian Sudan, on the right bank of the Nile 1 mile below the second cataract (Map: Africa, G 2). Here the Sudan military railway branches, one line going to Kerma and the other to Khartum. There are mosques and a primary government school. Pop. with Dabrosa, 1912, 4653.

WADING BIRDS. A popularly named group of birds, within the order Ciconiiformes, prominently characterized by having very long, naked legs, the feet partly webbed, the neck long and capacious, and the beak long, pointed, and strong. The group includes the herons and bitterns (suborder Ardeæ); storks, ibises, and spoonbills (Ciconiæ); and flamingoes (Phœnicopteri). Their associates in the order are the totipalmate sea birds (suborder Steganopodes). They haunt swamps and marshes, and walk in the shallows, never swimming or diving, where they catch fish, frogs, crayfish, etc., by a dart of the bill. Some are nearly terrestrial and live largely on insects; while the flamingoes (q.v.) are otherwise exceptional. Most of these birds are of large size and have white, gray, or brownish plumage, some developing ornamental plumes (see AIGRETTE); the character and distribution of powder-down patches are an important tribal feature. They are mainly migratory and gregarious; most of them nest in companies on trees. All are precocial and lay unspotted eggs. See HERON; STORK; ETC.; and Colored Plate of WADERS.

WADLIN, wŏd'lĭn, HORACE GREELEY (1851–). An American librarian and statistician, born at Wakefield, Mass. In 1875 he began practice as an architect, and from 1888 to 1903 was chief of the Massachusetts Bureau of Statistics and Labor. Thenceforth he was librarian of the Boston Public Library. He also served as a member of the Massachusetts House of Representatives (1884–88), and as a supervisor of the United States Census (1899–1900). Besides editing *The Decennial Census of Massachusetts for 1895* (7 vols.) and other statistical works, he published *Carroll Davidson Wright, a Memorial* (1911), and *The Public Library of the City of Boston: A History* (1911).

WADMAN, wŏd'man, WIDOW. A designing, middle-aged woman in Sterne's *Tristram Shandy*, who seeks to captivate Uncle Toby.

WADSWORTH, wŏdz'wŭrth. A village in Medina Co., Ohio, 14 miles southwest of Akron, on the Erie and the Northern Ohio Traction and Light Company railroads (Map: Ohio, G 3). Salt, injectors, and matches are the principal manufactured products. Pop., 1900, 1764; 1910, 3073.

WADSWORTH, JAMES SAMUEL (1807–64). An American soldier, born at Geneseo, N. Y. He was educated at Hamilton College, at Harvard, and at Yale, though he did not graduate at any of these institutions; studied law under Daniel Webster in Boston and under McKeon and Deniston in Albany, and in 1833 was admitted to the bar, but never practiced his profession. He took an active interest in agricultural affairs, and in 1842 was president of the New York State Agricultural Society. In 1861 he was a member of the Peace Convention (q.v.), in which he opposed the granting of extreme concessions to the South, and in June, 1861, soon after the outbreak of the Civil War, he became a volunteer aide, with the rank of major, on the staff of General McDowell. He participated in the first battle of Bull Run; was promoted to the rank of brigadier general of volunteers in August, 1861; and from March to December, 1862, was Military Governor of Washington, D. C. In 1862 he was defeated by his Democratic opponent, Horatio Seymour, for the governorship of New York. He led a division with great gallantry at Fredericksburg and Chancellorsville, and at Gettysburg took a

conspicuous part in the first day's fighting and then occupied Culp's Hill, where he helped to repel the Confederate assaults on the second and third days of the battle. Early in 1864 he made a tour of inspection through the Western and Southwestern States; and subsequently, while commanding a division in the battle of the Wilderness (q.v.), May 6, was mortally wounded, dying two days later. He received the brevet of major general of volunteers to date from May 6, 1864.

WADSWORTH, wŏdz'wûrth, JAMES WOLCOTT, JR. (1877–). An American legislator, born at Geneseo, N. Y., grandson of Gen. James S. Wadsworth. He graduated from Yale University in 1898, and immediately entered the live-stock and farming business in which his father was interested both in New York and Texas. He became active early in Republican politics, being elected to the State Assembly in 1905 (when 28 years old) and serving continuously until 1910. As Speaker of the Assembly from 1906 to 1910 he was regarded as perhaps the most able young leader in his party. His conservative views led him to oppose Governor Hughes's progressive programme, especially the direct primary election bill. In 1914 Wadsworth was elected to the United States Senate as successor of Elihu Root. He served as a delegate to the Republican national conventions of 1908 and 1912 and to the New York State Constitutional Convention in 1915, and in 1916 was permanent chairman of the Republican State Convention. He married a daughter of John Hay (q.v.).

WAECHTER, vâk'tĕr, ALFRED VON KIDERLEN-. See KIDERLEN-WAECHTER, ALFRED VON.

WAECHTER, KARL GEORG VON (1797–1880). A German jurist, born at Marbach-on-the-Neckar, and educated at Tübingen and Heidelberg. In 1819 he left the university for legal practice, but was recalled in the same year to Tübingen as professor of law. There he stayed until 1833, and in 1836 returned thither after three years in Leipzig to become professor and chancellor of the university, which he represented in the Estates. From 1839 to 1851 he was president of the Chambers. In 1852 he was called to Leipzig to become professor of the law of the Pandects. He was made a member of the Saxon Council of State in 1855 and privy councilor in 1872. As a jurist Waechter showed great range of knowledge, lecturing and writing on almost every branch of law with an equally remarkable grasp of theory and practice. His more important works are: *Lehrbuch des römisch-deutschen Strafrechts* (2 vols., 1825–26); *Gemeines Recht Deutschlands* (1844); *Beiträge zur deutschen Geschichte* (1845); *Pandekten* (2 vols., 1880–81); *Deutsches Strafrecht* (1881). Consult his *Life* by his son Oscar (Leipzig, 1881).

WAFA, wä-fä', or **WEFA,** we-fä', ABUL. See MOHAMMED BEN MOHAMMED BEN YAHAYA.

WAFER ASH. See HOP TREE.

WAGE EARNERS, HOUSING OF. See TOWN PLANNING AND HOUSING.

WAGEL, wăg'el. See GULL.

WAGER (from OF. *wager, gager,* Fr. *gager,* to pledge, wager, from ML. *wadiare,* to pledge, Ger. *Wette,* AS. *wedd,* obsolete Eng. *wed,* pledge). A promise or agreement to pay money or transfer property to another upon the happening or determination of an uncertain event. The promise is given in consideration of the payment of money or transfer of property by the other party to the wager, or a promise on his part to pay money or transfer property if the event fails to happen or if it happens in a particular manner specified by the agreement. The uncertainty of the event may arise either because it has not happened or because it is not known to the parties to the wager. Thus a wager may be made as to the outcome of a race which has not taken place, or a wager may be made as to the weight or size of an existing object, the only uncertainty being in the knowledge of the parties to the wager. It will thus be seen that many common forms of commercial contracts are technically wagers. Thus contracts of insurance, contracts dealing in futures in stocks or any commodity, are strictly speaking wagers. At early common law wagering contracts were held to be valid unless they involved some element in addition to the wager which rendered them contrary to public policy and therefore illegal. Generally speaking, however, wagering contracts are illegal and void, and hence no action at law may be predicated upon such an agreement.

There have been numerous statutes also affecting wagers in the form of commercial contracts. The Act of 7 Geo. II c. 8 made illegal all wagers upon the price of stocks by agreements to pay differences, i.e., to settle a contract for the sale of stocks for future delivery by paying the difference between the contract and market prices on the date of delivery. This statute was subsequently repealed.

For further consideration of the subject, see the titles BETTING; GAMBLING; ETC.

WAGER OF BATTLE. See BATTLE, TRIAL BY, OR WAGER OF.

WAGER POLICY. In insurance law, a policy covering a risk on a person in whom, or property in which, the insured has no financial interest of dependency, technically known as an insurable interest. Such policies are void by the old English common law, and also by virtue of statutes in England, and in the United States where similar statutes have not been enacted, the English law is held to be a part of their common law and applied to such cases. The English insurance companies insure the life of the sovereign for the benefit of tradesmen on the theory that the sovereign's death would cause depression in trade and consequent loss to trade; this is near the border line of speculative insurance. See INSURANCE, and authorities there cited.

WAGES. The reward of economic labor, i.e., exertion systematically directed towards the creation of goods or utilities. Popular usage tends to limit the application of the term to the earnings of hired labor, and frequently the meaning of the term is still further restricted so as to exclude the earnings of professional labor, such earnings being known as fees, honoraria, salaries, etc. Economic writers make no distinction between the rewards for the different classes of services, a prima donna's income being regarded as wages just as the income of the day laborer. Furthermore, economists treat as wages a part of the income of a man who works with his own instruments of production, as, e.g., a small farmer. The same thing is true of a part of the profit of the *entrepreneur* who performs the routine work of management. In this sense of the term wages are contrasted with interest (q.v.), rent (q.v.), and profit (q.v.).

The four incomes, taken together, make up the whole of the social dividend.

Nominal and Real Wages. Wages are most frequently paid in money; but sometimes they are paid partially in goods, privileges, and advantages which possess a definite money value. In domestic service, e.g., the money value of board, lodging, etc., must be added to actual money payments to give the true wage. Wages thus expressed in terms of money are called nominal wages. To estimate the true welfare of the laborer, given the rate of nominal wages, it is necessary to take into account the purchasing power of money. Nominal wages, reduced to terms of purchasing power, are termed real wages. The importance of the distinction becomes apparent when one attempts to compare the position of labor in different countries. Differences in money wages signify nothing, unless we are able to estimate differences in the purchasing power of money. The distinction is even more important in historical study. The nominal annual wages of a hind in the thirteenth century, according to Thorold Rogers, amounted to 35s. 8d., less than one-twentieth of the nominal wages of agricultural labor in modern England (£39 in 1891, according to the British Labor Commission). It is certain that real wages have not increased in anything like the same proportion.

Theory of Wages. The earliest school of scientific economists, the Physiocrats (q.v.), taught that wages naturally afford the laborer no more than a bare subsistence. The competition of laborers and the strategic advantage of the employer, it was believed, made this result inevitable. Adam Smith advanced a similar view, admitting, however, that in societies in which wealth is increasing wages may exceed the minimum of subsistence. The effect of Malthus's *Essay on Population* was to confirm the view that wages are naturally limited to mere subsistence. The alleged tendency of population to outrun subsistence appeared to demonstrate conclusively that any temporary rise in wages above the necessary minimum would soon be overcome by increase in population. Ricardo held in the main a similar view, but he admitted that the comforts to which a laboring class had become accustomed could not be withdrawn without a slackening in increase of population. The natural price of labor Ricardo defines as "that price which is necessary to enable the laborers, one with another, to subsist, and to perpetuate their race, without either increase or diminution." This theory was adopted by the Socialists as a correct explanation of wages under a capitalistic régime, and has served as one of the chief arguments against the continuance of the present order.

James Mill, McCulloch, Senior, and John Stuart Mill, the followers of Ricardo and Malthus, developed a theory of wages which is known as the wages-fund theory. It emphasizes the dependence of labor upon capital. Assuming that present wages are paid out of past accumulations, these writers argued that total wages must be limited by capital, or (in the completed theory) by that part of capital which is devoted to the subsistence of labor. Given the magnitude of the wages fund, the average rate of wages may be found by an arithmetical division, the number of laborers being the divisor. In order to increase wages, it was held to be necessary either to increase the wages fund or to decrease the number of laborers. According to this theory, attempts of the laborers to raise wages through combination would necessarily be unavailing, since such combination could affect neither dividend nor divisor. If some laborers succeeded in raising their wages, it would necessarily be at the expense of other laborers.

From about 1820 to 1870 the wages-fund theory was generally accepted by English economists. In 1869 the theory was abandoned by John Stuart Mill as a result of Thornton's attacks upon it. The idea that a definite portion of capital is set apart for the support of labor was seen to be fallacious. To a considerable extent modern economists have adopted the so-called productivity theory, the ablest of the earlier exponents of which was Francis A. Walker. Wages are not paid out of capital at all; the product of labor is the natural reward of labor, and the money wage represents not an advance, but a price paid for a product already created. The same idea was ably defended by Henry George. Recent discussions of the wages question have largely turned upon the significance of the term "productivity of labor." Von Thünen demonstrated that it is the product of the laborer who is in the least advantageous situation that really determines wages. This theory has been still further developed by Prof. J. B. Clark, whose work makes it clear that under free competition it is possible to discover units of labor which are virtually unaided by capital or land, and that the pure product of such units sets the standard for all units of labor.

Adherents of the productivity theory are under no necessity of believing that the wages of labor are incapable of substantial and indefinite rise. An increase in wages naturally increases the efficiency of labor, and hence its natural reward. High wages may thus be more economical from every point of view than low.

A revival of the old idea that wages depend on the cost of subsistence of the laborer appears in the modern theory of the dependence of wages upon the standard of living. As expounded by Gunton, this theory teaches that wages tend towards a standard which just covers the needs of labor; to raise wages, it is essential that needs should be increased. Labor of women and children is regarded as having a depressing influence on the wages of men, since the needs of the husband and father are reduced through the possibility of an income earned by other members of the family. Savings of laborers, resulting in an income through interest, result in a proportional decline of wages. If laborers eschew comforts and luxuries, with the hope of having a surplus of income above needs, the only result in the long run will be a fall in wages until they cover necessaries only. Critics of this theory point out that it would be true only if the Malthusian doctrine that population tends to outrun subsistence were correct; and at present no one would hold to that doctrine in its unqualified form. Employment of women and children may, indeed, depress wages of men; but that fact is due partly to the decline in efficiency of the population, and partly to the fact that an increase in labor supply renders necessary the resort to poorer opportunities of employment, and a consequent lowered standard of wages.

Causes Determining the Rate of Wages.

The wage level depends, not on the minimum for subsistence nor mainly on the standard of living, but chiefly on the specific productivity of each group. An increase in the quantity of land available for cultivation through improvements in transportation will make it possible for labor to abandon employments which produce little, and devote itself to the cultivation of new lands of unimpaired fertility. The product of the laborer in the least advantageous position rises, and with it wages. On the other hand, an increase in population, attended by no other change, must force labor to poorer and poorer positions, with a universal lowering of wages. An increase in capital, again, will give each laborer a more complete outfit of tools, etc., and thus increase his productivity, raising wages. Labor-saving inventions, it is generally believed, while they lower wages of certain classes of labor, increase in the long run the productivity of labor. But while productivity determines what the laborer will, in the long run, secure, it is far from true that the laborer is always able to secure his whole product. The laborer may be able to sell his labor to only one employer, who thereby is enabled to fix his own price. Only if competition among employers were active or if capital and labor could meet on equal terms would the laborer be sure of getting exactly what he produces.

Trade Unions and Wages. A trade union, by preventing an employer from taking advantage of the weakness in bargaining of the individual workman, may raise the rate of wages to the level of productivity. Where wages fail to keep up with productivity of labor, strikes can secure the amount withheld, but strikes cannot permanently hold wages ahead of productivity. By excluding labor from a certain occupation, a union may artificially raise productivity therein, and so gain at the expense of the public. On the other hand, by putting pressure on the employer to increase efficiency, a union has power, not only to raise wages, but to benefit the public. For a general discussion of the effect of trade unions upon wages, see TRADE UNIONS.

Trusts and Wages. In respect to wage rate, as in certain other particulars, there seems to be an improvement in the status of labor through concentration of industry. This is a normal corollary of the productivity theory. See TRUSTS.

Restriction of Output and Wages. Many laborers believe that wages would be increased if the hours of labor could be reduced in number, or if laborers would systematically endeavor to produce as little as possible. Prices, they believe, would rise, and with them wages. The view is fallacious, since it fails to take into account the fact that rise in prices would force the laborer to pay more for everything which he buys, so that the apparent rise in wages would represent no net gain. Restriction of output in some one industry, however, may raise wages there, if other labor can be excluded from the industry. Such a raising of wages is largely at the expense of the excluded labor, the disadvantage to laborers as a class exceeding the advantages to special groups.

Time and Piece Wages. Time wages represent the price for a certain number of hours of the workers' time; piece wages, a payment for a task accomplished. When labor consists in a series of definite operations, as in the making of certain portions of shoes, etc., the efficiency of labor can be accurately tested by quantity of product. Payment in proportion to product is likely to stimulate the workers to greater effort than payment in proportion to time. The plan is, however, unpopular with most laborers, because they believe that it results in a degree of strain which is injurious to the physical health of the worker; and, moreover, because of a tendency of employers to reduce wages whenever the increased energy of the workers affords them much more than the average rate of pay. From the point of view of society, it is probable that every increase in the efficiency of labor increases the sum of wealth obtained by the working class as a whole; and, therefore, so far as the piece-wage system increases time efficiency, it is advantageous to labor.

Custom, Inertia, and Wages. In so far as the theory of wages rests upon the assumption of free and decisive competition, it is subject at every point to qualifications made necessary by failures to realize the competitive norm. Labor is not completely fluid. Inertia, poverty, and ignorance prevent free movement from place to place and from trade to trade, and nullifies the theoretical bargaining power of labor; so that the custom of the locality or of the industry plays a larger part in fixing wage levels than pure theory supposes.

Women's Wages. In most countries the average wages of women are much lower than those of men. An inquiry made in 1884 showed that in Great Britain the average earnings of women were 41 per cent of those of men; in Massachusetts, 51 per cent. In manufacturing in the United States, women get but little more than half what men receive. Of persons 16 years of age and over in a wide range of industries (Census of Manufactures, 1905) the following was the wage classification:

NUMBER COUNTED	PER CENT RECEIVING YEARLY WAGE RATE LESS THAN			
	$250	$500	$750	$1000
Men: 2,124,069..	8	47	79	94
Women: 488,832..	34	92	99	..

See WOMEN'S WORK.

Wages in the United States. In his *Industrial Evolution of the United States* (1895) Carroll D. Wright, United States Commissioner of Labor, traces the course of wages in American industry during the progress of a century, but the data are of relatively small value apart from reliable price figures, which are not at hand for the earlier years. He reaches the conclusion, however, that for the 30 years preceding 1860, wages advanced to a much greater degree than prices.

The best figures available for wages (as distinguished from salaries) are those of W. I. King, *Wealth and Income of the People of the United States* (New York, 1915). The index numbers which he gives are contained in the tables on the following page.

The two tables are calculated on slightly different plans, but it is improbable that the difference in weighting systems would materially change the indexes.

Wage studies make it clear that the wage worker receives a smaller share of the total

INDEXES OF REAL WAGES FOR MEN IN ALL INDUSTRIES—BASE, 1890-99

YEAR	Hour wages	Day wages	YEAR	Hour wages	Day wages
1850	46.8	54.5	1870	58.2	61.9

WAGES FUND. See WAGES.

WAGNER, väg'nĕr, ADOLPH (1835–). A German economist, brother of Hermann Wagner (q.v.). He was born at Erlangen. He studied jurisprudence and political science at Göttingen and Heidelberg and was professor successively in the Commercial Academy at Vienna, and at the universities of Dorpat, Freiburg (from 1870), and Berlin. He was also made a member of the Royal Statistical Bureau of Prussia. From 1882 to 1885 he was a member of the Prussian Lower House. He was one of the founders of the Verein für Social-politik. Wagner's doctor's dissertation was a monograph on the science of banking (*Beiträge zur Lehre von den Banken*, 1857). Beginning in 1862 he published numerous works on banking, taxation, and social reform. His work in economics proper began with a revision of Rau's *Lehrbuch der politischen Oekonomie* (1875–76). In later editions, the work, which came to bear no direct relation to the original work of Rau, was published under the title *Lehr- und Handbuch der politischen Oekonomie*, of which the *Grundlegung* was Wagner's own work (1892–94), as well as the *Finanzwissenschaft* (in four parts, 1877–1901). The *Grundlegung* and the *Finanzwissenschaft* are his best-known and most ambitious works. In addition, he published many books and articles, chiefly on practical problems of economics and social science. Wagner approaches economics from the point of view of jurisprudence and statistics. His method is mainly inductive, although in his *Grundlegung* he shows a marked tendency towards the deductive methods of the theoretical branch of economics. Although sometimes classed with the Historical school (see POLITICAL ECONOMY), he was vigorously opposed to the view that historical and inductive studies make up the whole of fruitful economic science. In his work on finance he manifests a decided predilection for the extension of State functions, and has therefore not infrequently been regarded as a Socialist; he recognizes, however, the weaknesses of the pure Socialistic theory, and seeks to establish the proper limits of individualism and Socialism.

WAGNER, ALEXANDER (1838–). An Hungarian historical and genre painter, born at Budapest. He studied at the Vienna Academy and then under Piloty in Munich, and first won success with "Isabella Zápolya Taking Farewell of Transylvania," and two historical mural paintings, in the National Museum in Munich. These were followed by a series of frescoes in the Redoutengebäude at Budapest,

including the "Banquet of Attila," and by numerous paintings with motives from Hungarian history, such as the "Death of Titus Dagovich," National Museum, Budapest. In 1866 he became professor at the Munich Academy. As an historical painter he was one of the chief representatives of the school of Piloty, but his best works are the scenes of Hungarian peasant life, with a special view to the spirited action of the horse, such as "Csikós Race" (1876). A journey to Spain resulted in numerous Spanish scenes, including "Post Near Toledo" (1879), and his versatility was further shown in a fine panorama of ancient Rome. Wagner excels in the grouping of gorgeously colored animated masses of men and horses.

WAGNER, vág'nâr', CHARLES (1852–). A French moral essayist and Protestant clergyman, born at Wiberswiller, Meurthe. After studying at Paris, Strassburg, and Göttingen he served in several Protestant missions in the provinces, went to Paris in 1882, and aroused general interest by his effective protest against the degenerating tendencies of Parisian literature and life in *La jeunesse* (4th ed., 1892; Eng. trans., 1893); *Le courage* (1894; Eng. trans., 1894); and *La vie simple* (1895), translated as *The Simple Life* (1901; 13th ed., 1903), which had a great vogue in the United States, partly because it received the enthusiastic endorsement of Theodore Roosevelt. The author visited the United States in 1905, and recorded his observations in *My Impressions of America* (1906). He wrote also: *Pour les petits et les grands* (1907; 5th ed., 1915); *Par la loi vers la liberté* (1908); *A travers les choses et les hommes* (1909); *Ce qu'il faudra toujours* (1911); *A travers le prisme du temps* (1912).

WAGNER, vág'nĕr, HEINRICH LEOPOLD (1747–79). A German poet, born at Strassburg. He studied law in his native city, and in 1774 settled at Frankfort. At Strassburg he made the acquaintance of Goethe, while both were students. The friendship was continued at Frankfort. Wagner published two tragedies, *Die Reue nach der That* (1775) and, his best work, *Die Kindesmörderin* (1776), both of which discuss social problems with revolting crudity. His talent is seen to better advantage in *Prometheus, Deukalion, und seine Rezensenten* (against Goethe's critics) and *Voltaire am Abend seiner Apotheose*, dramatic satires. Wagner was among the oldest of Goethe's followers, and a typical poet of the so-called storm and stress period. He had a lively fancy, but lacked taste and the sense of literary form. Consult Schmidt, *Heinrich Leopold Wagner, Goethes Jugendgenosse* (2d ed., Jena, 1879).

WAGNER, HERMANN (1840–). A German geographer and statistician, a brother of Adolph Wagner (q.v.), born at Erlangen. He studied at Erlangen and Göttingen, and in 1864 received an appointment in the gymnasium at Gotha. He became connected with the Justus Perthes Geographical Institute, edited from 1868 to 1876 the statistical section of the *Gothaer Almanach*, and in 1872 founded *Die Bevölkerung der Erde*, a periodical devoted to the statistics of area and population. In 1880 he became professor of geography at Göttingen. After 1879 he was editor of the *Geographisches Jahrbuch*. He published *Lehrbuch der Geographie* (1894; 9th ed., 1913) and *Methodischer Schulatlas* (12th ed., 1907).

WAGNER, JOHANNA (1828–94). A German dramatic soprano, niece of Richard Wagner, born at Hanover. Her talent showed itself very early, and she virtually grew up on the stage. At 17 (in 1845) she created the rôle of Elisabeth in *Tannhäuser*, but after that studied for two years with Viardot-Garcia (q.v.). From 1850 to 1861 she was one of the chief artists at the Royal Opera in Berlin. The sudden loss of her voice necessitated her retirement from the operatic stage, and thereafter she appeared with great success as a tragedienne in the spoken drama until her final retirement in 1872. Upon her uncle's special request she participated in the first Bayreuth Festival as Schwertleite and the First Norn.

WAGNER, JOHANN MARTIN VON (1777–1858). A German sculptor, born at Würzburg. He was a pupil of his father, J. P. A. Wagner, a sculptor, and studied painting in Vienna under Füger. He then went to Rome where he turned to sculpture, and in 1840 Louis I made him director of the gallery at Munich. The bas-relief "An Eleusinian Festival" (1819), the great frieze in the Valhalla (1827–37) at Regensburg, and the classic reliefs and "Triumphal Chariot" on the Siegesthor at Munich are among his best works. Consult Ulrichs, *Johann Martin von Wagner* (Würzburg, 1866).

WAGNER, MORITZ (1813–87). A German traveler and naturalist, born at Bayreuth. He studied at Erlangen and Munich, after which he traveled in Algeria, and upon his return published *Reisen in der Regentschaft Algier* (3 vols., 1841). In 1842–45 he explored the Caucasus, Armenia, and Kurdistan. The results of these explorations appeared in *Der Kaukasus und das Land der Kosaken* (2 vols., 1848); *Reise nach dem Ararat und dem Hochlande Armenien* (1848); *Reise nach Persien und dem Lande der Kurden* (2 vols., 1852). Later he spent three years in North America and Central America with Karl Scherzer, and they jointly published *Reisen in Nordamerika* (3 vols., 1854) and *Die Republik Costa-Rica* (1856). From 1857 till 1860 Wagner was engaged in exploring the region of Panama and of the northern Andes. On his return he became professor of geography and ethnology in the University of Munich. His later publications include *Die Darwinsche Theorie und das Migrationsgesetz der Organismen* (1868) and *Naturwissenschaftliche Reisen im tropischen Amerika* (1870). See MIGRATION, WAGNER'S LAW OF.

WAGNER, OTTO (1841–). An Austrian architect, born at Prentzling near Vienna. He was educated in the Vienna Polytechnic, the Berlin Academy of Architecture, and the Vienna Academy of Art, and had his office training under Van der Nüll (see NÜLL) and Siccardsburg. His first independently executed work was the Kur-Salon in the City Park, Vienna—a prize design (1862); after which date he was in continuous active practice. In 1894 he was made professor of achitecture in the Imperial Academy of Fine Arts; he also was appointed imperial surveyor in chief of buildings. Wagner became the acknowledged leader of his profession in the Austrian Empire, designing a great number of important public and private buildings. His later works were in a very free style, sometimes of a decided secessionist sort, but always controlled by refined taste and marked by monumental qualities. He published several brochures, e.g., *Modern Architecture* (Eng. trans. by N. C. Ricker, Boston,

1902) and "The Development of a Great City" (Eng. trans. by M. L. Hamlin, in *Architectural Record*, New York, May, 1912).

WAGNER, RICHARD (1813–83). The originator of the music drama, and one of the greatest of musical geniuses. He was born at Leipzig, May 22, 1813, the ninth child of Karl Friedrich Wilhelm Wagner and Johanna Rosina Pätz. The father, who was a clerk in the police court, and during the French occupation of Leipzig was chief of police, died five months after Richard's birth. His widow, in straitened circumstances, married in 1814 Ludwig Geyer, an actor, playwright, and portrait painter in Dresden, whither the family removed.

Wagner's father had been fond of poetry and the drama, and devoted to amateur acting. From him Richard inherited, and in his stepfather's home absorbed, that love of the theatre which later directed his musical gifts towards the stage. At the Kreuzschule he wrote, in competition with his classmates, verses on the death of a schoolmate, which attained the distinction of print. He aimed at the colossal even as a boy; his admiration for Shakespeare led him at 14 years to begin a tragedy, *Leubald*, which he described as a jumble of *Hamlet* and *Lear*. So many people died in the course of four acts that their ghosts had to return to keep the fifth act going. He was deeply impressed by Weber's music, and so moved by Beethoven, several of whose symphonies and whose *Egmont* music he heard at the Gewandhaus, in Leipzig—the family having returned there after Geyer's death in 1820—that he decided to write music for his tragedy. First he tried to teach himself; then he took lessons of Gottlieb Müller, who was too pedantic, however, for Wagner's assertive individuality. An overture in B flat composed by him at this time was played between the acts at the theatre where his eldest sister had an engagement. Every four bars a loud beat was required of the drum player. At first the listeners were puzzled, then they became impatient, finally they laughed. In 1830 he entered the University of Leipzig, and also began studying music with Theodor Weinlig, to whom as late as 1877 he paid a high tribute. A sonata and a polonaise (piano duet), without Wagnerian characteristics, date from this period, and a *C Major Symphony*, which was performed at Leipzig in January, 1833, has an interesting history. Wagner gave it to Mendelssohn, hoping for another performance. Nothing came of it. We know it was Mendelssohn who played the *Tannhäuser* overture at the Gewandhaus "as a warning example." After Mendelssohn's death, search for the manuscript failed. But in 1872, in an old trunk which Wagner had left in Dresden when he fled during the Revolution of 1849, an almost complete set of the parts was found. From these Anton Seidl reconstructed a new score, and Christmas Eve, 1882, nearly half a century after its composition and within a few weeks of his death, Wagner conducted this early work at a private performance in Venice. Since then it has had several public performances in Germany, and in 1911 was heard in New York.

In 1833, at the age of 20, he became a professional musician, accepting the post of chorus master at Würzburg, where his brother Albert was a tenor, actor, and chorus master. He became successively for brief periods conductor at Magdeburg, Königsberg, and Riga, composed the operas *Die Hochzeit* (fragment), *Die Feen*, and *Das Liebesverbot* (based on Shakespeare's *Measure for Measure*); the overtures *König Enzio*, *Polonia*, *Columbus*, and *Rule Britannia;* seven compositions to Goethe's *Faust;* and an unfinished *Symphony* in E. He also wrote a libretto sketch *Die hohe Braut*, which he sent to Scribe, who took no notice of it; and added to his financial burdens, already critically heavy, by marrying, in 1836, Minna Planer, an actress in Königsberg.

As Kapellmeister at Riga (1837–39) Wagner completed the libretto and the first two acts of *Rienzi*. With his wife he sailed from Pillau to London, and during the tempestuous voyage gained his first inspiration for *Der fliegende Holländer*. After eight days in London and four weeks in Boulogne, he arrived in September, 1839, at Paris, where he remained until April, 1842, passing through bitter experiences. At one time he was so impoverished that he offered himself as a chorus singer at a small Boulevard theatre, but was refused for his lack of voice. The first version of *A Faust Overture* was finished in 1840 (remodeled in 1855), and, through Meyerbeer's influence, he sold to Pillet, director of the Opéra, his *Flying Dutchman* sketches, for which, however, Foucher and Revoil were commissioned to write the libretto and Pierre Louis Philippe Dietsche the music. The result, the *Vaisseau fantôme*, soon disappeared from the stage, but Dietsche conducted nearly 20 years later the *Tannhäuser* performances which made such a colossal and famous fiasco at the Opéra.

After selling his *Flying Dutchman* sketches Wagner set to work on his own version. He had sent the score of *Rienzi* to Dresden, where it aroused the enthusiasm of the chorus master, Wilhelm Fischer, and of the tenor, Tichatschek. It was accepted and produced Oct. 20, 1842. Schroeder-Devrient was the Adriano, and Tichatschek the Rienzi. *Rienzi's* success led to the production of *Der fliegende Holländer*, Jan. 2, 1843, which was received with moderate favor. This sombre, but beautiful work, was ahead of the times. Spohr, who produced it at Cassel the following June, was the only eminent musician who then approached Wagner with cordiality. Had Wagner not been as true as steel in all matters relating to art, he would have taken his cue from the ill success of the *Dutchman* and reverted to the brilliant style of *Rienzi*. But *Tannhauser* was his answer to the public that had failed to appreciate the *Flying Dutchman*.

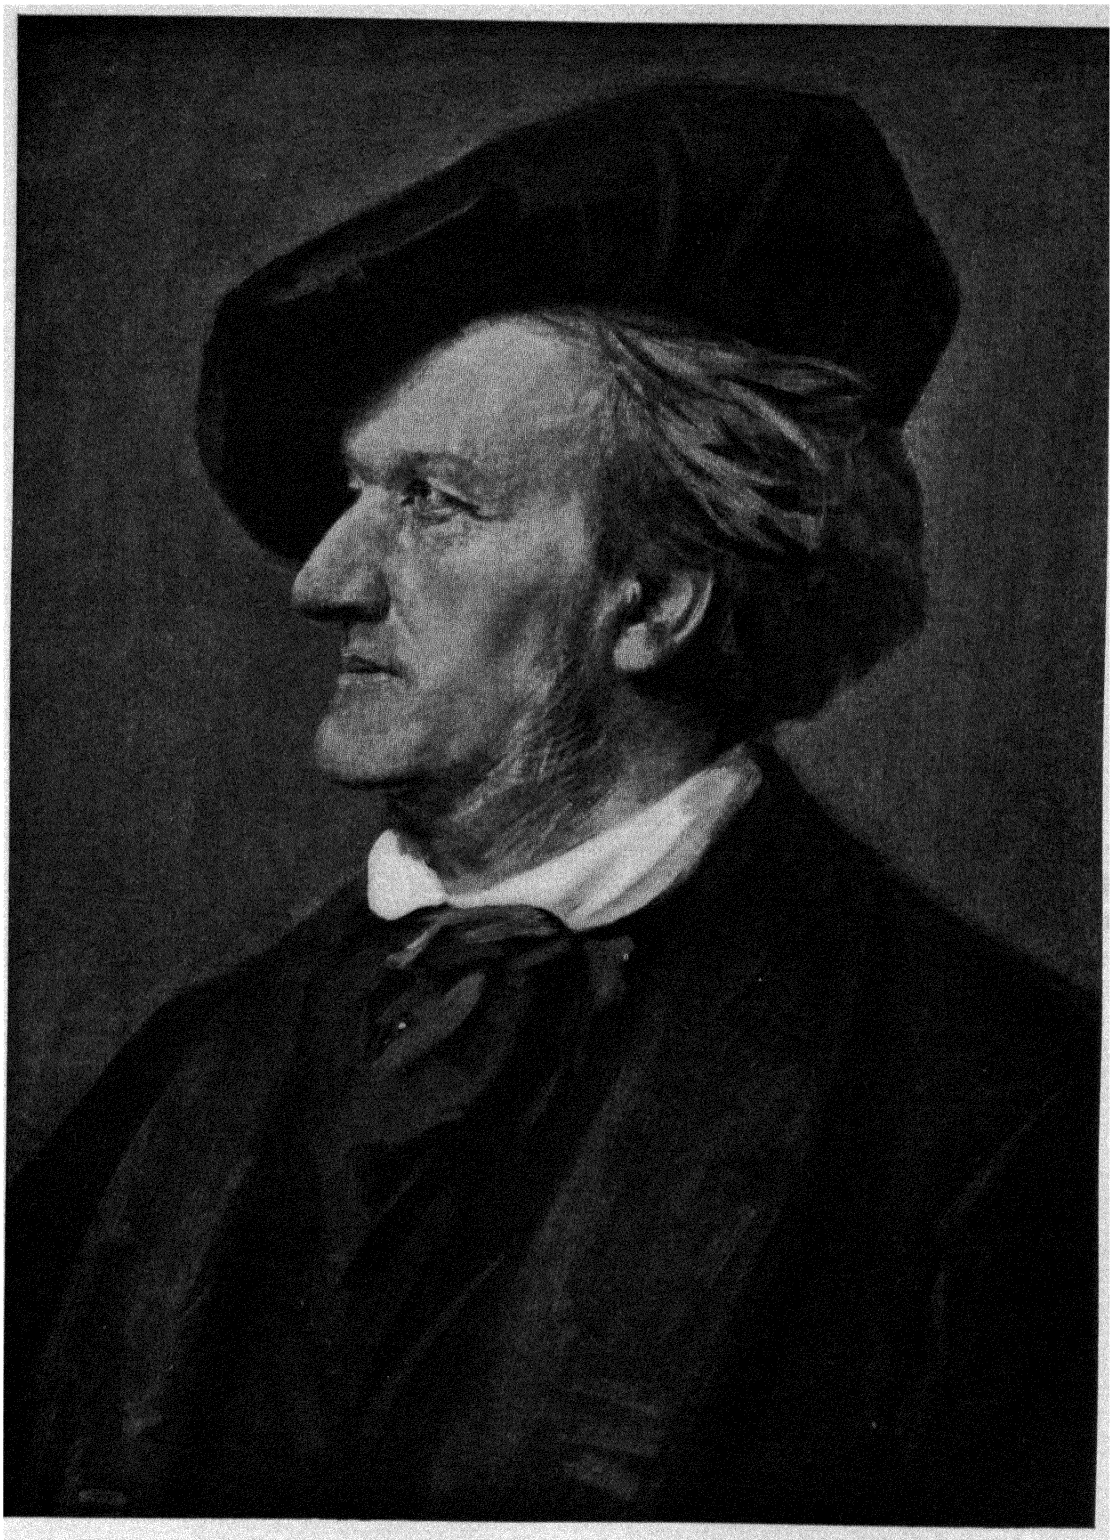
Meanwhile, in January, 1843, he had become one of the conductors of the Dresden opera. His revival and revision of Gluck's *Iphigenia in Aulis* attracted much attention, as did also his performance of the *Ninth Symphony*, with new and striking readings of the score. In fact, his extraordinary ability as conductor was quickly recognized. In the same year he produced with the *Liedertafel* his only oratorio, *Das Liebesmahl der Apostel*. In his official capacity of court conductor he was obliged to write a *Gelegenheits Kantate* (1843) and *Gruss an den König* (1844), both for chorus and orchestra, and on the removal of Weber's remains from London to Dresden (1844) he composed a funeral march on themes from *Euryanthe*.

Tannhäuser was produced at Dresden, Oct. 19, 1845, and proved even a greater puzzle to the public than the *Flying Dutchman*. Liszt, however, brought it out at Weimar late in 1848,

an achievement which led to the now historic Wagner-Liszt friendship, in which Liszt played one of the noblest and most self-sacrificing rôles ever taken by genius. "I once more have courage to suffer," wrote Wagner after hearing of the Weimar performance; while Liszt replied: "So much do I owe to your bold and high genius, to the fiery and magnificent pages of your *Tannhäuser*, that I feel quite awkward in accepting the gratitude you are good enough to express."

Lohengrin was finished in 1848, but Dresden was afraid to produce it. Wagner took up other subjects. Sketches for an opera on the Saviour are interesting in view of his allegorical treatment of this 30 years later in *Parsifal*. The story of Barbarossa also was considered, but abandoned for the Nibelung myth. The drama *Siegfrieds Tod*, in alliterative verse, which formed the basis of the *Götterdämmerung*, was written in the autumn of 1848. More than a quarter of a century and much heart-breaking storm and stress were to intervene before Wagner's ambitions regarding the work into which this drama developed were realized.

A venture in publishing his scores resulted in great pecuniary embarrassment. Believing that political changes might lead to more advanced ideas in art, he joined in the revolutionary agitation of 1848–49. When the revolution failed he fled first to Paris and then to Zurich. He was so impoverished that Liszt was obliged to furnish Frau Wagner with the means of joining her husband, and in spite of the moral stamina which came to Wagner through his passionate devotion and loyalty to his art, it is questionable if he could have stood the strain without the aid of his brother artist. An even greater satisfaction was the first production of *Lohengrin* at Weimar (Aug. 28, 1850) by Liszt. It acted as a tonic on Wagner. He became all activity. Although at a distance, he directed the production as well as he could through numerous written instructions. This performance was one of the most important events in Wagner's career. It opened the now historic "Wagner question," a controversy fought out in a fierce war of words, with vituperation previously unheard of in art matters. The Wagner cause forged steadily ahead and finally became triumphant. A letter from Wagner to Liszt, Nov. 20, 1851, shows that the texts of the *Nibelung* dramas were written in reverse order. Finding that certain narrative episodes in *Götterdämmerung* needed to be set forth on the stage, he wrote *Siegfried*. Finding that even this did not wholly clear up matters, he wrote *Die Walküre*, and as a further explanatory prelude to these three, *Das Rheingold*. The same letter proves that he also appreciated the impossibility of producing the work except "at a great festival, to be arranged perhaps especially for the purpose of this performance."



Wagner began the composition of *Rheingold* in November, 1853, and finished it in May, 1854. By the end of December of the same year *Die Walküre* was completed. In 1855 he was somewhat relieved financially by an engagement to conduct the London Philharmonic concerts. For that conservative body he was far too progressive. "The directors continually referred me to what they chose to call the Mendelssohn traditions." After this short interruption the composition of the *Ring* continued, but not without times of depression. By the summer of 1857 the work had proceeded as far as the forest scene in the second act of *Siegfried*. Circumstances then combined to cause the master to cease work on this task for 11 years.

In 1852 Wagner made the acquaintance of Otto and Mathilde Wesendonk, who both showed a deep understanding of the composer's works and ambitions. The friendship between Wagner and Mathilde soon ripened into love; and the published correspondence between the two shows the growth of this absorbing passion, which, after heroic struggles on the part of both, ended in noble renunciation. This intense personal experience led to the creation of *Tristan und Isolde*.

Besides personal inclination, two external circumstances supervened which determined Wagner to lay aside, temporarily, his great tetralogy. Negotiations with Breitkopf and Härtel for publication of the work were broken off, because the publishers did not believe actual production possible. However, they expressed their willingness to undertake publication of a less ambitious work which could be performed on one night. At the same time Dom Pedro, the Emperor of Brazil, an enthusiastic admirer of *Tannhäuser* and *Lohengrin*, urged Wagner to write an opera for Rio de Janeiro. Thus the text of *Tristan und Isolde* was written in August and September of 1857, and two years later the orchestral score was finished. *Tristan* was intended to be a thoroughly practicable work—short and comparatively easy to perform. As a fact it is the most difficult of Wagner's music-dramas. In Vienna, in 1861, it was pronounced impossible after 54 rehearsals; and its production could not be secured until June 10, 1865, at Munich, after King Ludwig of Bavaria had become Wagner's patron.

The famous Paris fiasco of *Tannhäuser* occurred in March, 1861. The hostile demonstrations which resulted in its withdrawal after three performances were instigated by the Jockey Club, partly because Wagner refused to introduce a ballet, partly to show disrespect towards the Emperor, who, at the urging of Princess Metternich, had commanded the production. This treatment made a hero of Wagner in Germany and the ban of exile was lifted, except in Saxony, where it came later. On May 15, 1861, in Vienna, he heard *Lohengrin* for the first time. He had been obliged to wait 13 years after its composition for this privilege.

Wagner now took up *Die Meistersinger*. As early as 1845 he had sketched the story as a humorous sequel to *Tannhäuser*. He worked on the score at Biebrich and also at Penzing, near Vienna, where in 1863 he published his *Nibelung* dramas, expressing the hope that the bounty of some German ruler would make the production of his work possible. But in the spring of 1864, worn out by his struggle with poverty and broken in spirit, he was obliged to flee from his creditors, and found shelter with a friend in Switzerland. On a détour to Stuttgart he was found there by a messenger from King Ludwig of Bavaria, and thus, at a most critical moment of his life, he received promise of the aid which was to enable him to realize his artistic hopes. *Tristan* was produced in Munich in June, 1865, after exacting rehearsals under Von Bülow. Intrigues at court and in musical circles forced Wagner to leave Munich, and he took up his residence near Lucerne. The King continued his steadfast patron, and *Die Meistersinger von Nürnberg* was produced June 21, 1868, at the Bavarian capital, where in 1869 and 1870 *Rhein-*

RICHARD WAGNER
FROM A PAINTING BY FRANZ LENBACH

gold and *Die Walküre* also were given by command of the King and against Wagner's wishes.

Immediately after the production of *Die Meistersinger* Wagner resumed work on *Siegfried*, completing it in February, 1871. While still engaged upon its orchestration he began the composition of *Götterdämmerung*. When, in the spring of 1872, the master took possession of his villa Wahnfried at Bayreuth the actual composition of the last part of *Der Ring des Nibelungen* was finished. The completion of the orchestration was delayed by many details connected with the realization of the plans and personal superintendence of the festival theatre erected at Bayreuth, the corner stone of which was ceremoniously laid May 22, 1872. In November, 1874, the orchestral score of *Götterdämmerung* was finished. The next summer rehearsals began, and on Aug. 13, 14, 15, and 17, 1876, the first performance of the gigantic tetralogy, under the direction of Hans Richter (q.v.), took place. Wagner's indomitable energy and iron will had made the impossible possible. The importance of this victory is admirably characterized by Max Koch: "The controversy about Wagner, lasting more than half a century, is by no means concerned with a purely musical question. So unprecedented an event as the Bayreuth Festivals is a landmark also in the history of literature; for the issue at stake was not a series of musical productions, but the creation of a national drama through the cooperation of music and poetry, such as Lessing, Mozart, Schiller, Jean Paul had longed for."

The artistic success of the first festival was so complete that many bitter enemies became converted; but there was a deficit of 150,000 marks. In order to reduce this sum Wagner visited London, where, in May, 1877, he conducted alternately with Richter a famous series of six subscription and two extra concerts, performing excerpts from all his works.

Scarcely had Wagner returned to Bayreuth, before he completed the text of *Parsifal*, which was begun early in that year, before his departure for London. The musical composition occupied him from March, 1878, to August, 1879, but owing to various interruptions, chiefly concerning plans for the resumption of the Festivals, the orchestral score was not finished until January, 1882. Under the direction of Herman Levi (q.v.) the last of Wagner's creations was heard for the first time at Bayreuth, July 16, 1882. The material success was such that the original guarantee fund of 140,000 marks not only remained intact, but could even be increased to 200,000 marks. This sum was set aside as a fund for the perpetuation of the Bayreuth Festivals, which since then have been held, at first every other summer, and later, annually. Until the expiration of the copyright, Dec. 31, 1913, *Parsifal* was the exclusive property of Bayreuth. However, in spite of legal proceedings instituted by the heirs of Wagner, the Metropolitan Opera House of New York produced the work on Christmas Eve, 1903. Since then it has been regularly in the repertory, but has always occupied a position of distinction, being given only on special occasions outside the regular subscription nights.

After the Revolution Wagner's life is practically the story of his works. After his flight from Dresden he never occupied a post of any kind. His first marriage with Minna Planer was unfortunate. Minna was an estimable woman, who dutifully looked after her husband's physical needs. The suffering in Paris she bore without complaint, even with fortitude, for she believed in Wagner's future and success. But the brilliant external success of *Rienzi* was all she could understand. Wagner's art, his ideals and artistic convictions, always remained to her a sealed book. She died Jan. 25, 1866. On Aug. 25, 1870, Wagner married Cosima von Bülow, a daughter of Liszt, a woman of rare character and gifts. He found true happiness in the constant sympathy and companionship of a real helpmate. So profoundly had she penetrated into and assimilated Wagner's ideals, that after his death she became the leading spirit of Bayreuth and the keeper of his precious heritage to mankind.

After 1879 Wagner's health compelled him to spend the winter months in a warmer climate, and the beautiful Palazzo Vendramin on the Grand Canal in Venice became his regular winter residence. Even then, his active spirit knew no rest. On the afternoon of Feb. 13, 1883, death came to him suddenly in the midst of his work. On the 18th, with solemnities worthy of the illustrious dead, his body was placed in the mausoleum in the garden of Wahnfried.

Wagner's Art. In order to appreciate Wagner's position in the world of art—not alone the art of music—it is necessary to understand the nature of what the master himself termed the *Kunstwerk* (Art-work). His own creations, *Tristan und Isolde*, *Die Meistersinger*, *Der Ring des Nibelungen*, *Parsifal*, are the full realization of that wonderful ideal which he first proclaimed to an incredulous and scoffing world in three of his most important books, *Das Kunstwerk der Zukunft* (1849), *Oper und Drama* (1851), *Eine Mitteilung an meine Freunde* (1851).

The Greek drama was a combination of the arts of poetry, music, and dancing. Its effect however, depended primarily upon the spoken word addressed to the intellect. The mask hiding the features of the actor eliminated one of the most potent factors of dramatic expression, facial play, without which even gesture and pantomime lose most of their meaning. That music without harmony (such as the Greek was) can express virtually nothing—at least, as we to-day understand musical expression—is an axiom. Therefore the whole expression must have been concentrated in the beauty of the language and its distinct declamation. The Shakespearean drama, while demanding the same beauty of language and distinctness of declamation, adds the all-important factors of facial expression and pantomime. Thus it addresses itself not only to the intellect, but also to the eye. Even music is intuitively assigned its proper rôle, that of assisting in the delineation of moods (blare of trumpets, dead marches, and the innumerable lyrics interspersed). Nowhere does the all-embracing genius of the great dramatist give more palpable proof of correct intuition than in *Hamlet* (iv. 5), when Ophelia sings her answers. Instinctively Shakespeare felt that only music could adequately express the inner soul of the distraught maiden.

With the same unerring instinct Wagner, even in his earliest works, felt and, as yet unconsciously, employed this power of musical expression. He chose the form of the opera, because at that time he believed that this offered him the proper medium for the conveyance of his

thoughts. His practical experience as conductor, however, soon revealed to him to what a low level opera had sunk; that, in spite of Gluck's reform, it had entirely lost sight of the drama, and had become a superficial amusement addressing itself merely to the eye and ear, without offering any stimulus to the intellect. All the while, that is, up to the Revolution of 1848, and through the composition of *Lohengrin*, Wagner was concerned with the problem of making the operatic form a medium for adequate expression, both musical and dramatic. These two elements were always inseparable in his mind. His reflections at Zurich brought to him a clear understanding of the problem and, at the same time, its final solution. Each of his own works meant a notable advance over its predecessor, and in *Lohengrin* the cherished ideal was almost realized. But not quite, for in many portions the music preponderates over the drama, thus disturbing the perfect balance of the component elements. Wagner discovered that he had misstated the whole question by putting it: "How is it possible to attain perfect expression in opera?" He had to become convinced that it was not possible. And now he he was able to state the question correctly as follows: "What dramatic subjects imperatively demand the cooperation of music for their full expression?" It was not a question of *how?* but of *what?* In this investigation he was helped by a comparison of two of his own dramatic sketches, *Siegfried's Tod* and *Friedrich der Rotbart*, both dating from the year 1848. To his surprise he found that the former imperatively demanded the coöperation of music, whereas the latter was absolutely complete as a spoken drama. Thus he arrived at the conclusion that "the subject to be treated by the *Worttondichter* (word-tone-poet) is the purely human, freed from all convention and everything historically formal." Now that the all-important problem of *what* had been solved, a close analysis of the score of *Lohengrin* disclosed the fact that the secondary problem of *how* had been solved intuitively through the employment of the leading motive. See LEITMOTIV; MUSICAL DRAMA.

Before 1848 Wagner had created intuitively, his inborn genius leading him unconsciously in the right direction. After that date he concentrated all his powers upon the conscious attainment of an ideal he had clearly set before his mind. That this full consciousness of purpose reacted in no manner as a check upon the spontaneity of Wagner's creative faculty is attested—aside from the great music dramas themselves—by the master's own explicit statement. In his essay *Zukunftsmusik*, written in 1860 as an introduction to a French translation of his earlier works, Wagner says: "I am willing to submit this work [*Tristan*] to the severest test that can be devised from the application of my theoretical assertions; not because I created it according to my system, for all theory was completely forgotten by me; but because here at last I proceeded with the utmost disregard of all theoretic reflection, in such a manner that during the execution of the work I myself realized how far I was transcending my system." Wagner is generally regarded as the great reformer of opera. According to his own statement he began his career as a composer of operas. But when he began the composition of his *Nibelungen* dramas he had forever renounced opera and the operatic public. He was creating an entirely new form, and for its appreciation he was obliged to create also a new public.

The spoken drama of Shakespeare and Schiller reaches the highest point in the power of depicting soul states through appeal to the intellect (the word) and the eye (pantomime). In Wagner's drama a new factor is added, the ear, i.e., the inner, musical ear. If one grants that music is preëminently the language of the soul, it becomes the most important medium for the portrayal of soul states. Where the spoken word ends, music begins. The true development of the Wagnerian music drama, then, is from the Greek drama through Shakespeare and Schiller: not through the Florentines, Monteverde and Gluck. Even on the purely musical side the development is in the direct line leading from Bach through Beethoven, inasmuch as the fundamental principle of the music drama is the leading motive, i.e., continuous thematic development; whereas the opera with its set numbers, each formally complete in itself, precludes the employment of this very principle. That opera has actually been reformed is not due to any direct effort on the part of Wagner; it is merely one of the results of the tremendous influence exerted by Wagner's art upon every form of music. The most notable improvements in the modern opera are the vastly better libretti (a poor text being rather the exception), the employment of the orchestra as a means of expression, and a striving after musical characterization and expressiveness. The stereotyped forms of the aria, recitative, finale, duets, quartets, etc., have been swept away; senseless repetition of words and meaningless coloratura are no longer tolerated. Many composers have even adopted the title music drama and consciously imitated Wagner's form, but without the least success; for the very nature of Wagner's art work demands a combination of several talents, each in an extraordinary degree.

The tremendous influence of the new art work upon instrumental music is merely the reflex of the demonic force inherent in its specifically musical element, and this irresistible quality is due, above all, to the plasticity and expressive power of the thematic material, quite apart from its masterly development and the gorgeous orchestral coloring in which it is presented. These, naturally, greatly enhance the total effect, in the attainment of which orchestration, even as superb as Wagner's, is of secondary importance in comparison with thematic invention. Nothing proves so conclusively the inherent power and lasting quality of this music as performance on the piano, where only the essential elements of melody, harmony, and rhythm are preserved. The means by which Wagner produces his overwhelming effects—his innovations in harmony, rhythm, and orchestration—have become common property of all modern composers; and if by the employment of the same means they cannot produce the same effect, the chief reason is that they are not gifted with Wagner's power of thematic invention.

The history of music furnishes no second example of a composer whose development shows such extraordinary advance as that of Wagner from *Die Feen* to *Parsifal*. This development may be represented by a rapidly ascending line up to the master's fortieth year. After that it runs perfectly level, without the slightest declension even towards the end. *Tristan und Isolde, Die Meistersinger, Der Ring des Nibelun-*

gen, Parsifal differ widely in their subject matter and the character of the music, and it would be impossible to find a basis for establishing the superiority of one of these works over the others. A preference can only be a question of personal taste. Each work produces the impression that it is the perfect, full, and only possible expression of that particular subject. Each exhibits those marked characteristics recognized as typically Wagnerian; yet each has its pronounced style, imparting to it an individuality quite distinct from that of every other work. The emotions expressed range through all gradations from the heights of the sublime to the grotesque-comical, thus exhibiting the universality of Wagner's genius; while in respect to his powers of musical characterization he stands without a peer even among the greatest masters.

The bitter opposition encountered by Wagner's later works was due to absolute inability to understand the master's ideals. Neither musicians nor public could see in the new works anything else than operas presenting insuperable difficulties. Not until Wagner had been amnestied and could superintend the rehearsals personally was the first of the music dramas, *Tristan und Isolde*, produced. But before this result was achieved the master was obliged to train each of the artists in the new style of interpretation, and this process was repeated in the case of every succeeding work. Thus Wagner became the founder of the new school of interpretative conducting and dramatic singing. His personal superintendence, however, extended also to the minutest details of the mechanical departments, and perhaps his most important innovation in this respect is the invisible orchestra. After he had educated a body of enthusiastic artists capable of interpreting his works according to his intentions, the compelling power of his music, in a comparatively short time, finally forced the public, at least the more seriously inclined, under its spell. Nothing attests more convincingly the firm hold of Wagner's music—considered purely as music—on the general public than its constant performance by the largest symphony orchestras throughout the world. In their repertory the overtures, preludes, and certain excerpts occupy the same position as the symphonies of Beethoven. Incidentally, this very fact conclusively refutes the often-made assertion that Wagner's music, abstracted from the actual scenic representation, fails to impress the hearer.

As the years pass, the figure of Wagner seems to assume greater and greater proportions. Even now his influence, like that of Shakespeare and Goethe and Beethoven, is felt and recognized as one of the living and moving forces of civilization.

Bibliography. Besides the music dramas and other works mentioned in the above sketch Wagner wrote for piano a *Sonata* in B♭, a *Polonaise* in D, a *Fantasie* in F♯ minor (all in 1831), an *Albumblatt* in C (1861) and one in E (1875). During his first residence in Paris he set to music three French romances: *Dors, mon enfant, Mignonne, Attente,* and two German lieder, *Die beiden Grenadiere* and *Der Tannenbaum* (1839–40). Five poems of Mathilde Wesendonk, *Der Engel, Stehe still, Im Treibhaus, Schmerzen, Träume,* were composed 1857–58. For orchestra he wrote *Huldigungsmarsch* (1864), dedicated to King Ludwig; *Siegfried Idyll* (1870); *Kaisermarsch* (1871), dedicated to Emperor William I; *Grosser Festmarsch* (1876), for the Centennial Exhibition at Philadelphia.

Rienzi, Der fliegende Holländer, Tannhäuser were published by Wagner at his own expense; *Lohengrin, Tristan und Isolde*, by Breitkopf and Härtel; the *Ring* dramas, *Die Meistersinger, Parsifal*, by B. Schott's Söhne. In 1914 Breitkopf and Härtel issued a monumental folio edition in 18 volumes, edited by Michael Balling, which contains, besides the full orchestral scores of all the famous works, all the earlier works not published before. Wagner's literary works were published by E. W. Fritzsch (9 vols., Leipzig, 1871–73). A tenth volume was added in 1883. In 1911 Breitkopf and Härtel issued an octavo edition in 12 volumes. An English translation of the prose works by W. A. Ellis was brought out in London (8 vols., 1892–99).

Probably more has been written about the Bayreuth master than about any figure in the history of art or literature, not excepting Shakespeare and Goethe. The following list, therefore, contains only a few of the most important works embodying the results of original investigation.

Biography: R. Wagner, *Mein Leben* (2 vols., Munich, 1911), which appeared simultaneously in five languages, extends only to 1864; C. F. Glasenapp, *Das Leben Richard Wagners* (6 vols., Leipzig, 1876–1911); A. Jullien, *Richard Wagner: sa vie et ses œuvres* (Paris, 1886); H. T. Finck, *Wagner and his Works* (New York, 1893); H. S. Chamberlain, *Richard Wagner* (2 vols., Munich, 1896); W. E. Ashton, *Life of Richard Wagner* (London, 1902 et seq.), was begun as a translation of Glasenapp, but after vol. 3 continued as an original work; M. Koch, *Richard Wagner* (3 vols., Berlin, 1907 et seq.).

Criticism and appreciation: H. S. Chamberlain, *Das Drama Wagners* (Leipzig, 1892; Eng. trans., London, 1915); E. Schuré, *Le drame musical* (2 vols., Paris, 1875; 9th ed., 1912); L. Torchi, *Riccardo Wagner: studio critico* (Bologna, 1890; new ed., 1913); M. Berendt, *Schiller bis Wagner* (Berlin, 1901); A. Seidl, *Wagneriana; Erlebte, angewandte, und kritische Aesthetik* (3 vols., Berlin, 1901–02); W. Golther, *Richard Wagner als Dichter* (ib., 1904; Eng. trans., London, 1905); L. Dauriac, *Le musicien-poète Richard Wagner* (Paris, 1908); M. Seiling, *Richard Wagner, der Künstler und Mensch, der Denker und Kulturträger* (Leipzig, 1911; 2d ed., 1914); H. S. Chamberlain, *The Wagnerian Drama* (New York, 1915).

Correspondence: *Briefwechsel zwischen Wagner und Liszt* (2 vols., Leipzig, 1887; 3d enlarged ed., 1910; Eng. trans., London, 1888); *Richard Wagners Briefe an Dresdener Freunde* (Leipzig, 1889; Eng. trans., London, 1890); *Richard Wagner an Mathilde Wesendonk* (Berlin, 1904; Eng. trans., London, 1905); *Bayreuther Briefe von Richard Wagner* (ib., 1907); *Richard Wagner an Minna* (2 vols., ib., 1908; Eng. trans., London, 1909)); *Wagners Briefwechsel mit seinen Verlegern* (2 vols., Leipzig, 1911); Kapp and Kastner, *Gesammelte Briefe von Richard Wagner* (ib., 1914 et seq.), which contains all known letters (nearly 5000), arranged in chronological order.

Catalogues, etc.: E. Kastner, *Chronologisch-systematischer Wagner Katalog* (Offenbach, 1878); N. Oesterlein, *Katalog einer Wagner Bibliothek* (4 vols., Leipzig, 1882–95), which lists 10,180 titles, covering only the period up to Wagner's death; H. Silège, *Bibliographie wag-*

nérienne française (Paris, 1902); L. Frankenstein, *Richard Wagner Jahrbuch* (Leipzig, 1907 et seq.).

WAGNER, RUDOLF (1805–64). A German physiologist, born at Bayreuth. He studied medicine at Erlangen and Würzburg (M.D., 1826), and comparative anatomy under Cuvier at Paris. After traveling in Normandy and along the Mediterranean coast of France and Italy, making geological observations, he went to Erlangen (1829), where he became professor of zoölogy in 1833. From 1840 till his death he occupied a chair at Göttingen. Wagner discovered the germinal spot in the human ovum. In his later years he became a defender of Christianity and an opponent of materialism, his writings in this field leading to a controversy with Karl Vogt (q.v.). Wagner was also known as an anthropologist and archæologist. Among his writings are: *Lehrbuch der vergleichenden Anatomie* (1834–35), republished under the title *Lehrbuch der Zoötomie* (1843–47); *Lehrbuch der Physiologie* (1839); *Handwörterbuch der Physiologie* (1842–55); *Neurologische Untersuchungen* (1854).

WAGNER, SIEGFRIED (1869–). A German musical conductor, son of Richard Wagner, born at Triebschen, near Lucerne. Although intended for the career of an architect, he early determined to follow his father's profession, and accordingly left the Polytechnic School, in which he was studying, to commence his musical training under Kniese and Humperdinck (q.v.). Outside of Germany he is better known as a conductor than as a composer. In 1893 he entered upon his career as a musical conductor, and toured through Germany, Austria, Italy, and England, meeting with marked success. In 1896 and 1899 he won general favor by his work as conductor of *Der Ring des Nibelungen* at Bayreuth. His published works include the operas *Der Bärenhäuter* (1899), *Herzog Wildfang* (1901), *Der Kobold* (1904), *Bruder Lustig* (1905), *Das Sternengebot* (1908), *Banadietrich* (1910), *Schwarzschwanenreich*, *Der Haidenkönig* (the last two not produced up to 1916). Other compositions are a symphonic poem *Sehnsucht*, *Fahnenschwur*, for male chorus and orchestra, a concerto for violin and orchestra. Consult C. Glasenapp, *Siegfried Wagner und seine Kunst* (Berlin, 1911).

WAGON. See CARRIAGE.

WAGON, AMMUNITION. See AMMUNITION WAGON.

WAGONER. A city and the county seat of Wagoner Co., Okla., 16 miles north of Muskogee, on the Missouri, Kansas and Texas, the St. Louis, Iron Mountain and Southern, and the Missouri, Oklahoma, and Gulf railroads (Map: Oklahoma, F 3). It has a Carnegie library. The leading industrial establishments are cotton gins, a cotton-oil mill, grain elevators, roller flour mills, foundry and machine shops, railroad yards, and a wagon wood factory. Wagoner adopted the commission form of government in 1911. Pop., 1900, 2950; 1910, 4018.

WAGONER, THE. See AURIGA.

WAGONETTE. A four-wheeled horse-drawn carriage having a capacity for six or more passengers. It has a transverse seat for the driver and two longitudinal seats behind, which are usually entered by a step at the rear. Wagonettes are ordinarily supplied with a canopy, and prior to the introduction of motor vehicles were extensively used in the country on account of their large capacity.

WAGRAM, vä'grȧm, or DEUTSCH-WAGRAM. A village of Lower Austria, on the left bank of the Russbach, about 20 miles northeast of Vienna, notable as the scene of one of Napoleon's most celebrated victories, gained over the Austrians under the Archduke Charles, July 6, 1809. After the French defeat at Aspern (q.v.) in May of that year, Napoleon had retired to the island of Lobau in the Danube, whence, with his forces increased by the arrival of Eugène Beauharnais, he prepared to set out for a decisive struggle with the Austrians. On the night of July 4 the French began to cross the Danube, and early in the morning of the following day their forces, 181,700 in number with nearly 450 guns, were drawn up on the left bank of the river. The Austrians numbered about 128,600 men with 410 guns. The battle began early with an assault by Masséna on the Austrian right, which was driven from the villages of Aspern and Essling. Davout's attempt, however, to encircle the Austrian left failed, and the night closed with the advantage on the side of the Austrians, who had sustained by desperate fighting repeated charges against their right and centre by Oudinot, Bernadotte, and Beauharnais. The Archduke Charles had dispatched orders to the forces under the Archduke John to advance from Pressburg and take the enemy in the rear, while the main army, confident of success, prepared to assume the offensive. John, however, could not arrive in time, and when the Austrians advanced to the attack on the morning of the 6th they met determined resistance from the French. Towards noon Davout with excellent support succeeded in turning the Austrian left, and, though the Austrian right and centre had held fast, the Archduke Charles was compelled to retreat. The Austrian loss is estimated at nearly 35,000 in killed and wounded, and the French loss was nearly 30,000. The battle of Wagram was followed by the treaty of Schönbrunn (October 14), in which Austria was forced to cede to the conqueror. See NAPOLEON I. Consult Bleibtreu, *Aspern und Wagram* (Vienna, 1902); Binder von Krieglstein, *Aspern und Wagram* (Berlin, 1906).

WAGTAIL. A small bird of the European family Motacillidæ, characterized by slenderness of form and a long narrow tail, which the bird incessantly wags up and down, with a jerking motion. The wagtails run with great speed, and frequent the margins of rivers and lakes, inundated fields, and other moist grounds, feeding almost entirely upon insects and worms. They make their nests on the ground, among moist herbage, or in stony places. One species, the yellow wagtail (*Budytes flavus alascensis*), occurs abundantly in Alaska in summer, migrating to and from Asia; and the American titlark (q.v.) is a member of the family. The name wagtail is often given in the United States, however, to the similarly appearing American warblers (q.v.) of the genus *Seiurus*, especially to the two water thrushes *Seiurus noveboracensis* and *Seiurus motacilla*. Like their congener the oven bird (*Seiurus aurocapillus*), they are among the largest of warblers, and are olive

above and buffy-white below, streaked with black. See OVEN BIRD; WATER THRUSH.

WAH, wä. A mammal. See PAÑDA.

WAHABIS, wä-hä'bēz, or **WAHABITES.** A Moslem sect, named after its founder, Mohammed Abd al Wahhab. He seems to have been born in 1704 (1116 A.H.), probably at Ayane in the District of Arid, Nejd, Central Arabia, and died at Deriye in 1792 (1206 A.H.). He was the son of Suleiman, a poor shepherd of the tribe of the Beni Tamim. He studied at Basra, Bagdad, and Damascus, and came under the influence of Hanbalite teaching through perusal of the works of Ibn Taymiyya (died 1327; 728 A.H.) and his disciple Ibn Kayyim al Jauziyya, which he copied with his own hand, as is known from two Leyden manuscripts. Like these followers of Ahmed ibn Hanbal, he became a stanch supporter of Koran and Sunna, and an opponent of the Ijma', or consensus of opinion, and the Bida', or novelty. On his pilgrimage to Mecca and Medina he must have been shocked at the formalism, laxity of morals, cult of the saints, and pagan survivals at these shrines. His stern preaching and ascetic life were not calculated to win for him a ready adherence in Nejd where people cared little for religion, and he was forced to leave both Ayane and Horeimle. In Deriye, however, he made a convert of the ruler, Mohammed ibn Sa'ud, in 1746. Before his death in 1765 this Emir of Deriye had extended his power and the influence of Abd al Wahhab through the neighboring towns. But Riad was not finally captured until 1772 by his successor Abd al Aziz (1765–1803). Mohammed Abd al Wahhab himself never sought political power; he remained to the end a warner and a spiritual guide, faithful to Koran and tradition as interpreted by the Hanbalite school, and fighting all innovations, such as the mention of Mohammed and other men in prayer, and the veneration of local saints, as well as all luxury, the use of tobacco, music, dancing, and gambling. He had in the course of his life 20 wives, by whom he had 18 children; but he followed in this respect the law which he recognized, and his life was free from many of the blemishes attaching to that of the prophet Mohammed. His followers did not call themselves Wahabis, a name given them by their enemies, but Muslimin and Muwahhidin, because they insisted upon the unity and transcendence of Allah. Like the Almohades (q.v.) they regarded all other Mohammedans as Kuffar (unbelievers) and Mushrikin (polytheists).

Abd al Aziz spread the power of the Wahabite state beyond the boundaries of Nejd. In 1801 he sent his son Sa'ud to Kerbelah, the greatest shrine of the Shiites, and he destroyed the sanctuary, killed the priests, and brought back enormous booty. Mecca was plundered in 1803; but in that year Abd al Aziz was murdered at Deriye by a Shiite in revenge for the destruction of Husain's shrine. Sa'ud (1803–14) captured Medina in 1804 and in 1810 opened Mohammed's grave and carried away its treasures; at Mecca he cut the black stone of the Ka'bah to pieces. In 1811 Damascus was held for ransom, and the territory east of Jordan paid tribute. Then Mahmud II directed Mehemet Ali (q.v.), Viceroy of Egypt, to restore Turkish authority in Arabia. He first sent his son Tusun who after an initial defeat captured Jidda, Mecca, and Medina in 1812; then Mehemet Ali came himself and defeated the Wahabis at Bessel in 1815; finally Ibrahim Pasha was sent who destroyed Deriye after a long siege in 1818. The brave defender, Abdallah ibn Sa'ud, was put to death in Constantinople. About 1820 the Egyptian governor was overthrown, and Turki made himself independent Emir at Riad. He was succeeded by his son Faizal (1830–36), and he by his brother Abdallah (c.1866–92). The recent history of the Sa'udian dynasty is not known.

In 1830 Abdallah ibn Rashid, of the tribe of Abde, in Jebel Shammar, was made governor of Hail as a reward for services to Faizal. Gradually he made himself ruler of northern Nejd, though recognizing the Wahabite Emir at Riad. His son, Talal (1845–68), was an excellent ruler who extended the power of this Wahabite state, and was a capable administrator. His brother Met'ab was murdered by two of Talal's sons; and one of these, Bender, by his uncle, Mohammed ibn Abdallah. In 1892 he gained a victory at Anciza which forced the southern oases to recognize his suzerainty. European visitors speak highly of his ability, justice, and power. The recent history of the Rashidian dynasty is unknown. The first information concerning the Wahabites came to Europe through Niebuhr who obtained it in Arabia in 1763–65. Derije was visited by Reinaud in 1799, and G. F. Sadlier in 1819; Riad by G. W. Palgrave in 1862, and Lewis Pelly in 1865; Eduard Nolde went to Bereida in 1893. Wallin lived at Hail for two months and at Jof four months in 1845, and visited Hail again in 1848; this capital has since been visited by Palgrave in 1862, Guarmani in 1864, Doughty and Huber in 1875, Lady Anne Blunt and her husband in 1879, and Euting in 1883. From Arabia the Wahabi movement spread into Africa, where it influenced the founder of the Senussi brotherhood (see SENUSSI), into India where Sa'id Ahmed, a reputed descendant of Mohammed, declared a religious war against the Sikhs, but was defeated and slain in 1831, and elsewhere in the Moslem world. Among the works that set forth the doctrines of the Wahabis may be mentioned the Sirat al Mustakin and the Tawiyet al Iman, and among Wahabite theologians especially Abdallah ibn Abd al Rahman al Sindi.

WAHL, väl, ADALBERT EMIL AUGUST (1871–). A German historian, born at Mannheim. He was educated at Oxford, Bonn, Vienna, and Berlin, and was assistant professor at Freiburg (1905–08), and then professor of history at Hamburg till 1910, when he was called to Tübingen. His writings include: *Komposition und Succession Verhandlungen unter Kaiser Matthias* (1895); *Notabelnversammlung von 1787* (1899); *Studien zu Vorgeschichte der französischen Revolution* (1901); *Politische Ansichte der offiziellen Frankreich in 18. Jahrhundert* (2 vols., 1905–07); *Beiträge zu deutsche Parteigeschichte* (1910); *Robespierre* (1910); *Geschichte der europäischen Staatensystems* (1912); *Die Ideen von 1813* (1913); *Beiträge zur Geschichte der Konfliktszeit* (1914).

WAHLSTADT, väl'shtät, PRINCE OF. See BLÜCHER, G. L. VON.

WAHLSTATT, väl'shtät. A battlefield near Liegnitz (q.v.), Silesia.

WAHLVERWANDTSCHAFTEN, väl'fĕr-vänt'shäft-en (Ger., Elective Affinities). A fatalistic romance by Goethe (1809).

WAHNFRIED, vän'frēt. The residence of Richard Wagner at Bayreuth, built in 1873 by Wölfle.

WAHOO. See ELM; SPINDLE TREE.

WAHRMUND, vär'mụnt, ADOLF (1827–1913). An Austrian Oriental scholar. He was born at Wiesbaden, studied at Göttingen and Vienna, and was connected with the Imperial library in the latter city from 1853 to 1861. In 1871 he became teacher of Arabic in the Oriental Academy, and was its head from 1885 till 1897. He published grammars of modern Arabic, Persian, and Turkish, and a modern Arabic-German dictionary; *Die christliche Schule und das Judenthum* (1885); *Das Gesetz des Nomadenthums* (1887; 2d ed., 1892); *Der Kulturkampf zwischen Asien und Europa* (1887); *Das Reich der Zwecke* (1895).

WAIFS (OF. *waif, gaif,* from Icel. *veif,* flapping or moving thing, from *veifa,* to vibrate). In English law, stolen goods which are thrown away or abandoned by a thief on being pursued. Such goods belong to the crown, but this prerogative is usually waived if the true owner diligently endeavors to prosecute the thief. This doctrine does not prevail in the United States where the owner may reclaim stolen goods under such circumstances. See CRIMINAL LAW and authorities there referred to.

WAIGATZ. See VAIGATCH.

WAILATPUAN, wī'ĕ-lăt-pōō'an. A linguistic family composed of the Cayuse (q.v.) and Molala tribe, occupying the headwaters of the Walla Walla River in Oregon. Of the Molala but 31 survived in 1910.

WAIKATO, wī'kâ-tō. The most important river in the North Island of New Zealand. It rises near Lake Taupo and flows out of the lake, and for 170 miles north, past towns like Cambridge, Hamilton, and Mercer, and reaches the Pacific Ocean on the west coast of the island. It is navigable for small steamers for 100 miles (Map: New Zealand, N. I., B 5).

WAILAKI, wī-lä'kī. A small Athapascan tribe in Round valley, on Eel River in northern California. Their culture was like that of their neighbors. They numbered 227 in 1910.

WAILING PLACE OF THE JEWS. See PLACE OF WAILING.

WAINFLEET, WILLIAM. See WAYNFLEET.

WAINSCOT. A wooden lining or covering of an interior wall usually paneled. The term originally was applied in Great Britain to oak of superior quality imported and used for panels. Eventually any wooden covering or facing of a wall of an apartment, especially when of elaborate workmanship, came to be known as a wainscot or wainscoting. See DADO.

WAIN'WRIGHT, JONATHAN MAYHEW (1793–1854). An American Protestant Episcopal bishop, born in Liverpool, England, of American parentage. He graduated at Harvard (1812), and became rector at Hartford, Conn. (1816), assistant minister of Trinity Church, New York (1819), rector of Grace Church (1821), and of Trinity Church, Boston (1834). He took charge of St. John's Chapel, Trinity Parish, New York (1838); and was elected provisional Bishop of the diocese of New York, and consecrated in 1852. Among his published writings are: *There Cannot be a Church Without a Bishop* (1844); *The Pathways and Abiding Places of Our Lord* (1851); *The Land of Bondage* (1852). Consult his memoirs by J. N. Norton (New York, 1858).

WAINWRIGHT, RICHARD (1849–). An American naval officer, born in Washington, D. C. He graduated at the United States Naval Academy in 1868, became a lieutenant in 1873, commanded the coast-survey vessel *Arago* for a time, was successively flag lieutenant to Admiral Patterson, and secretary to Admiral Jouett, and was promoted to the rank of lieutenant commander in 1894. In February, 1898, he was executive officer of the battleship *Maine,* when that vessel was destroyed in Havana Harbor, and during the Spanish-American War he commanded the converted yacht *Gloucester,* taking a distinguished part in the naval battle of Santiago and being largely responsible for the destruction of Cervera's topedo-boat destroyers, the *Pluton* and the *Furor.* He became a commander in 1899, a captain in 1903, and a rear admiral in 1908. He commanded the cruiser *Newark* in 1902–04; was a member of the General Board, 1904–07; commanded the battleship *Louisiana,* 1907–08; and the second and third divisions of the Atlantic fleet, 1908–10. He became Aid for Operations in 1910 and continued as such until his retirement in December, 1911.

WAITE, MORRISON REMICK (1816–88). An American jurist, Chief Justice of the Supreme Court of the United States from 1874 to 1888. He was born at Lyme, Conn., and graduated at Yale in 1837. He was admitted to the bar at Maumee City, Ohio, in 1839. In 1849 he was elected to the Ohio Legislature as a Whig, of which party he was a member until the organization of the Republican party. He first attracted national attention when in 1871 he was appointed with Caleb Cushing and William M. Evarts to represent the United States before the tribunal for the arbitration of the *Alabama* and other claims at Geneva, Switzerland. In 1873 he was president of the Ohio Constitutional Convention. In January, 1874, President Grant nominated Waite to succeed Salmon P. Chase as Chief Justice of the United States, and he was at once unanimously confirmed. This position he held until his death. As Chief Justice he was dignified and impartial, and absolutely unbiased by political considerations. In the numerous constitutional questions growing out of the interpretation of the amendments following the Civil War, he maintained a balance between the rights of the States and

the extended powers of the Federal government, and many of the most important opinions of this period were written by him.

WAITS (OF. *waite, gaite*, Fr. *guet*, watch, guard, from Ger. *Wacht*, watchman, from Ger. *wachen*, Eng. *watch;* connected with Lat. *vigil*, wakeful, watchful). A name which has, at successive periods of English history, been given to different classes of musical watchmen. In the time of Edward IV the waits appear to have formed a class distinct from both watch and minstrels. They were not confined to the court; there were musical watchmen very early in many provincial towns. In Exeter a company existed in 1400. The word in the provinces was afterward sometimes applied to the town musicians, who may have represented the old waits, but with no duties as watchmen. The name was also given to the town band, or to private musicians when employed as serenaders. At present in England, the waits are musicians who play or sing during the night or early in the morning for two or three weeks before Christmas.

WAITZ, vĭts, GEORG (1813–86). A German historian, born at Flensburg, in Schleswig. He was educated in the schools of his native town and at the universities of Kiel and Berlin. In 1842 he was called to the chair of history at Kiel, where he remained for five years. In 1849 he became professor of history at Göttingen. He remained there until 1875, when he was called to Berlin as chief editor of the *Monumenta Germaniæ Historica*. He was actively engaged on this work till his death. Waitz was turned from the study of law at the university by the influence of Ranke, and he is usually regarded as one of that historian's principal disciples. In his own field of mediæval history he was the foremost German scholar of his day. His important publications include: *Jahrbücher des deutschen Reichs unter Heinrich I.* (1837); *Ueber das Leben und die Lehre des Ulfila* (1840); *Deutsche Verfassungsgeschichte* (1844–84; rev. ed., 1893–96); *Lübeck unter Jürgen Wullenweber und die europäische Politik* (1855–56); *Grundzüge der Politik* (1862); and *Deutsche Kaiser von Karl dem Grossen bis Maximilian* (1872), besides a great number of contributions to the *Monumenta*. Consult Steindorff, *Bibliographische Uebersicht über Georg Waitz's Werke* (Göttingen, 1886).

WAITZ, THEODOR (1821–64). A German psychologist and anthropologist, born at Gotha. He studied at Leipzig and Jena, and in 1848 was appointed professor of philosophy in the University of Marburg. He attempted to point out the weakness of the philosophy of Fichte, Schelling, and Hegel, and made an Herbartian psychology the basis of all philosophy. He also studied anthropology and ethnology extensively. His works include: *Grundlegung der Psychologie* (1846; 2d ed., 1878); *Lehrbuch der Psychologie als Naturwissenschaft* (1849); *Allgemeine Pädagogik* (1852; new ed., 1910); *Die Anthropologie der Naturvölker* (1859–72; vols. v and vi edited by Gerland).

WAITZEN, vī'tsen (Hung. *Vácz*). A town of Hungary, at the base of the Waizenberg, on the left bank of the Danube, 22 miles north of Budapest (Map: Hungary, F 3). It is the seat of a bishop and has a fine cathedral. Pop., 1900, 16,808; 1910, 19,057.

WAIVER (from OF. *weyver, guever*, to waive, refuse, surrender, resign, probably from Icel. *veifa*, to vibrate, waiver). A voluntary abandonment or renunciation of a known legal right. A contractual right can usually only be waived for a consideration, but where a person possessing a certain right acts inequitably to the detriment of the person against whom the right exists, he may be deemed to have waived it upon the principle of estoppel. The doctrine of waiver is, perhaps, most frequently applied to the renunciation of statutory rights and privileges, such as: statutory and common law liens; the right to notice of protest and dishonor of commercial paper; also, conditions of forfeiture in contracts, as in insurance policies; and many technical irregularities in pleading and practice which are not necessarily fatal to the cause of action. Consult CONTRACT; ESTOPPEL.

WAIVER OF TORT. See QUASI CONTRACT.

WAI-WU-PU, wī'wōō-pōō'. The Foreign Office of China (q.v.), formerly known as the Tsung-li Yamen, and later as the Waichiaopu.

WAKAMATSU, wä'kä-mät'sụ. A town in the Prefecture of Fukushima, Japan, situated in the northern part of the island of Hondo, 79 miles east-southeast of Niigata (Map: Japan, F 5). The castle of the Prince of Aidzu has been completely demolished. The chief manufacture is lacquer ware. Pop., 1903, 32,534; 1908, 39,265.

WAKAN or **WAHKAN,** wä-kän'. See WAKONDA.

WAKASHAN (wä-kăsh'an) **STOCK** (Nootka *wakash*, good). A well-marked Indian linguistic group occupying the west coast of British Columbia from about 50½° N. to Gardner Channel, the west and northwest coast of Vancouver Island, and a narrow strip of territory about Cape Flattery, Wash. The stock consists of a large number of small tribes, each speaking a separate dialect, all of which may be grouped into three languages, Hailtzuk (q.v.), Kwakiutl (q.v.), and Nootka (q.v.), the last including the Makaw of Cape Flattery. All the tribes of this stock are maritime in habit, daring sailors, fierce fighters, and strongly conservative. They build large communal houses of cedar planks, are organized upon the clan system, and have slavery and the potlatch (q.v.) as recognized institutions. The population of the various tribes in 1910 was about 5000 of whom 388 reside in the State of Washington.

WAKAYAMA, wä'kä-yä'mä. The capital of the Prefecture of Wakayama, in Japan, situated on the south coast of the island of Hondo, 39 miles by rail southwest of Osaka (Map: Japan, D 6). It is the former castle town of the princes of Kishu, one of the three august families. The castle rises on a wooded hill and is one of the most perfect examples of the old architecture of Japan. It dates from 1850. A short distance from Wakayama stands the temple of Kiimiidera, celebrated for its beautiful situation. Tradition gives the date of its founding as 770 A.D. The principal manufacture is cotton flannel. Pop., 1903, 68,527; 1908, 77,303.

WAKE (AS. *wacu*, watch, from *wacian, wæccan*, to watch). The English equivalent of the ecclesiastical vigil (q.v.); a name for English festival celebrations, preceded by a night vigil. The saint's-day festivals are still kept in many English parishes under the name of country wakes. A lykewake or lichwake is a watching of a dead body all night by the friends and neighbors of the deceased. This watching,

called simply a wake, still persists as a common custom among the humbler Irish. It no doubt originated in superstitious fear either of passing the night alone with a dead body, or of its being interfered with by evil spirits. Consult Brand, *Popular Antiquities*, in Bohn's Antiquarian Library (London, 1849). See MORTUARY CUSTOMS.

WAKE, WILLIAM (1657–1737). Archbishop of Canterbury. He was born at Blandford, Dorsetshire, England, graduated at Oxford in 1676, and accompanied Viscount Preston as chaplain to the English Embassy to France in 1682; returning in 1685, he was elected preacher to Gray's Inn (1688). He became canon of Christ Church (1689), rector of St. James's, Westminster (1693), Dean of Exeter (1703), Bishop of Lincoln (1705), and Archbishop of Canterbury (1716). In 1717–20 a union was proposed between certain members of the Gallican church and the Church of England, to which he showed himself favorably inclined. He published many works, including *The State of the Church and Clergy of England in Their Councils, Synods, Conventions, and Their Other Assemblies, Historically Deduced* (1703), and a translation of *The Apostolic Fathers* (1693). Consult J. H. Lupton, *Archbishop Wake and the Project of Union between the Gallican and the Anglican Churches* (London, 1896).

WAKEFELD, ROBERT (?1480–1537). An English Oriental scholar. He was born probably at Pontefract, Yorkshire. After graduating from Cambridge in 1513–14 he went abroad for study and remained to teach at Louvain and at Tübingen. Being summoned home in 1523, he was appointed chaplain to Henry VIII, and lecturer on Hebrew in Cambridge. He was among the advisers of the King on the subject of his divorce. In 1530 he went to Oxford as teacher of Hebrew, and in 1532 was appointed canon of King's College or Christ Church, newly refounded by Wolsey. He is remembered for his efforts to prevent the destruction of books during the dissolution of the lesser monasteries. Among his works printed by Wynkyn de Worde was one reputed to be the first book printed in England with Hebrew and Arabic characters, *Oratio de Laudibus et Utilitate Trium Linguarum Arabicæ, Chaldaicæ, et Hebraicæ* (1524).

WAKE'FIELD. An episcopal city, market town, and municipal and parliamentary borough, the capital of the West Riding of Yorkshire, England, on the Calder, 9 miles south of Leeds (Map: England, E 3). Among the chief buildings are the cathedral, formerly the parish church, founded in 1329; the grammar school (1591), a wealthy institution; a library, corn exchange, etc. The town has long been famous for its manufactures of woolen yarn and cloths. It dates from the Wackefield of Domesday, and was the scene of a Yorkist defeat in 1460. Pop., 1901, 41,544; 1911, 51,511.

WAKEFIELD. A town, including several villages, in Middlesex Co., Mass., 10 miles north of Boston, on the Boston and Maine Railroad (Map: Massachusetts, E 2). It has the Beebe Town Library and the Wakefield Home for Aged Women. The town hall was the gift of Cyrus Wakefield 1st, a public-spirited citizen. Wakefield is mainly engaged in manufacturing. The most important products are rattan goods, knit goods, pianos, stoves, pipe, and shoes. The town owns and operates the electric light and gas plants and the water works. Originally a part of Reading, Wakefield was settled about 1639, and was incorporated as South Reading in 1812. It received its present name in 1868. Pop., 1900, 9290; 1910, 11,404; 1915 (State census), 12,781.

WAKEFIELD, EDWARD GIBBON (1796–1862). An Anglo-Australian colonist and statesman. He was born in London, and was educated in Westminster and in Edinburgh. In 1814 he received a minor appointment in the diplomatic service at Turin and later at Paris. He subsequently resided in Australia, in Canada, where he was elected member of Parliament (1843), and in New Zealand; introduced the Wakefield colonization system, resembling the preëmption plan of the United States; took part in abolishing penal transportation; and edited and wrote various treatises on social and political questions, of which the most important is *A View of the Art of Colonization* (1849). He was a member both of the Provincial Council of the Province of Wellington and of the Colonial House of Representatives (1853). Consult Richard Garnett, *Edward Gibbon Wakefield* (London, 1898).

WAKEFIELD, GILBERT (1756–1801). An English classical scholar, born at Nottingham. At the age of 20 he graduated from Jesus College, Cambridge. In 1778 he was ordained a deacon in the Church of England, but after holding for a brief time two curacies, he gave up his profession owing to his inability to subscribe to the doctrine of the Trinity. He turned to teaching for support, becoming classical tutor in Warrington Academy (1779–83) and in the dissenting college at Hackney (1790–91). Resigning this position on account of his objection to public worship (elaborated in *An Enquiry into the Expediency and Propriety of Public or Social Worship*, 1791), he devoted the rest of his life to study and controversy. He wrote a reply to Paine's *Age of Reason* (1795), and was imprisoned for two years (1799–1801) in Dorchester jail for seditious libel contained in a violent *Reply* to Bishop Watson's *Address to the People of Great Britain*. Wakefield's scholarship is well represented by a critical edition of *Lucretius* (3 vols., 1796–99), and *Silva Critica* (1789–95), an attempt to illustrate the Scriptures "by light borrowed from the philology of Greece and Rome." Among other works are a translation of the New Testament (1792), a group of Greek tragedies edited under the title of *Tragadiarum Delectus* (1794), editions of Vergil's *Georgica* (1788), of Horace (1794), Moschus (1795), and a treatise on Greek metres called *Noctes Carcerariæ* (1801).

WAKEFIELD, THE VICAR OF. See VICAR OF WAKEFIELD.

WAKE FOREST COLLEGE. An educational institution under Baptist control at Wake Forest, N. C., founded in 1834 as Wake Forest Institute and reorganized as a college in 1838. It is organized in schools of Latin, Greek, English, modern languages, pure mathematics, applied mathematics and astronomy, chemistry, biology, physics, moral philosophy, political science, law, the Bible, education, and medicine (first two years), and confers the degrees of B.A., B.S., LL.B., and M.A. There is no preparatory department, but subcollegiate classes are maintained in Latin, Greek, mathematics, and English for students not fully prepared for collegiate work. In 1915–16 the students numbered 503, the faculty 40, and the library contained 20,000 volumes. The endowment was $508,139, with a total income of about $60,000. The value of the college property in buildings,

grounds, and equipment was about $235,000. The president in 1916 was W. L. Poteat, LL.D.

WAKE ISLAND. A small island in the Pacific Ocean belonging to the United States, 1505 miles east-northeast of Guam (Map: Guam, B 9). It is only about 1 square mile in area, and is uninhabited. It was acquired for the United States by the second Philippines expedition in 1898.

WAKE'LEY, JOSEPH BEAUMONT (1804–76). An American Methodist Episcopal minister. He was born at Danbury, Conn., and entered the New York Conference in 1828. He filled various appointments in the neighborhood of New York and won renown as an ecclesiastical antiquary. As the result of his researches he published *Heroes of Methodism* (1856); *Lost Chapters Recovered from the Early History of Methodism* (1858); *Anecdotes of the Wesleys* (1869); *Portraiture of Rev. William Cravens* (1869); *A Prince of Pulpit Orators—Whitefield* (1871); *Temperance Cyclopædia* (1875); *The Wesleyan Demosthenes: Comprising Select Sermons of Joseph Beaumont* (1875).

WAKE'MAN, HENRY OFFLEY (1852–99). An English historical writer, educated at Eton and at Christ Church, Oxford, graduating B.A. in 1873, with first honors in modern history. His life was passed at Oxford. He became a tutor in Keble College, and afterward fellow and bursar of All Souls. His *Introduction to the History of the Church of England* (1896; 5th ed., 1898) is regarded as the standard work from the Anglican point of view. Next to this comes *The Church and the Puritans, 1570–1660* (1887; 3d ed., 1892). Among his other works are *History of Religion in England* (1885); *Europe, 1598–1715* (1894); and *Life of Charles James Fox* (1890).

WAKE ROBIN. See ARUM; TRILLIUM.

WAKIDI, wä-kē'dē (Ar. *Abū 'Abd Allāh Muḥammad ibn 'Umar al Wāḳidā*) (747–823). One of the first biographers of Mohammed. He was born in Medina, the centre of the traditions concerning the Prophet. Unsuccessful as a merchant, he finally gained patronage in Bagdad, and found opportunity for his literary labors. His chief work is the *Kitāb al maghāzi*, or Book of the Campaigns of Mohammed. He was a close student of the traditions concerning the Prophet, and excelled in chronology. The book has been translated by Kremer, *History of Muhammed's Campaigns* (Calcutta, 1856), and it has been condensed into German by Wellhausen in *Muhammed in Medina* (Berlin, 1882). A number of later works have been erroneously ascribed to this historian. Consult: Carl Brockelmann, *Geschichte der arabischen Litteratur*, vol. i (Weimar, 1898); R. A. Nicholson, *A Literary History of the Arabs* (New York, 1907); C. I. Huart, *Histoire des Arabes* (Paris, 1912).

WAKLEY, wāk'lĭ, THOMAS (1795–1862). An English surgeon and reformer, born at Membury, Devonshire. In 1823 he founded the *Lancet*, a weekly medical journal which became famous, and through which he made many bitter enemies, but accomplished much good. He attacked abuses in his profession and especially in the College of Surgeons. From 1835 till 1852, while a member of the House of Commons, he carried through many humanitarian reforms. In 1851 he began in the *Lancet* a crusade against adulterated foods which resulted in legislation to correct the evil.

WAKONDA, wä-kŏn'dȧ. A Sioux Indian term now found in general literature and expressing a native religious concept of the essential supernatural element in the universe. It appears in various forms, as wakonda, wakanda, wakan, etc., according to the dialects of the various Siouan tribes. Such a concept is not peculiar to the Sioux, for we have the almost parallel terms, orenda (Iroquois), manitou (q.v.) (Algonquian), tirawa (Pawnee), natosiwa (Blackfoot), etc. Consult Clark Wissler, "North American Indians of the Plains," in American Museum of Natural History, *Handbook Series*, No. 1 (New York, 1912).

WALAFRID (vä'lȧ-frēt) **STRA'BO** (c.808–849). A mediæval German monk and scholar. At an early age he went to the famous cloister of Reichenau for his education, and entered the Benedictine Order at the age of 15. He spent about three years at Fulda under Rabanus Maurus (q.v.) and then returned to the Imperial court as instructor of the young son of Louis the Pious. As a reward, the Emperor bestowed on him the Abbey of Reichenau (838). In the contest that followed the death of Louis, Walafrid, like Rabanus, took the side of German unity as represented by Lothair; he was obliged to leave his abbey, but recovered it in 842. Little is known of his life after this. He was of a poetical nature, and left some notable verse, distinguished by elevation of thought. Conspicuous is the *Visio Wettini*, a description of the experiences of his teacher Wettin in the other world, and the first of that class of mediæval poems which reached its highest point in the *Divina Commedia*. His name is even better known for his *Glossa Ordinaria*, partly a compilation, but the most popular commentary on Scripture throughout the Middle Ages. His works are in Migne, *Patrologia Latina*, cxiii and cxiv. Consult J. C. F. Bähr, *Geschichte der römischen Literatur in Karolingischen Zeitalter* (Karlsruhe, 1840).

WALAPI, wä'lȧ-pī, or **HUALAPAI** (Pine People). A tribe of Yuman stock (q.v.) originally residing about the Great Bend of the Colorado and extending eastward into Arizona. They are now gathered upon a reservation in the same country. They numbered 501 in 1910. Consult G. A. Dorsey, *Indians of the Southwest* (Chicago, 1903).

WALCH, välk, CHRISTIAN WILHELM FRANZ (1726–84). A German theologian, born at Jena, where he studied theology. He traveled in Holland, France, Switzerland, and Italy; became professor of philosophy at Jena in 1750, and three years afterward at Göttingen; and in 1754 was made professor of theology at that institution. His writings include: *Entwurf einer vollständigen Historie der römischen Päpste* (1756; 2d ed., 1758); *Entwurf einer vollständigen Historie der Kirchenversammlungen* (1759); *Entwurf einer vollständigen Historie der Ketzereien* (11 vols., 1762–85); *Neueste Religionsgeschichte* (9 vols., 1771–83).

WALCHEREN, väl'кĕr-en. An island belonging to the Province of Zealand, Netherlands, at the mouth of the Scheldt (Map: Netherlands, B 3). The Sloe, now bridged, passes between it and the island of South Beveland on the east. Length, 12 miles; area, 80 square miles. The island is protected from the sea by dunes and dikes, and is very fertile. It contains Middelburg and Flushing. Walcheren was the scene of a British military disaster during the Na-

poleonic wars. In July, 1809, a British fleet comprising nearly 250 vessels of war and 400 transports carrying some 40,000 men set sail for Holland with the intention of seizing Antwerp and obtaining command of the Scheldt. Criminal negligence was displayed in the preparations for the expedition, and both Sir Richard Strachan, the naval commander, and the Earl of Chatham, who was placed at the head of the land forces, were markedly incapable. Valuable time was wasted in the reduction of Flushing, and not until late in August was Chatham prepared to march on Antwerp. By that time, however, the French forces in Holland had been greatly strengthened, and the British commander deemed it inexpedient to pursue the campaign. The French assumed the aggressive and in the first days of September the British abandoned Flushing. Chatham with part of the forces returned to England, leaving 15,000 men on the island of Walcheren. There the swamp fever played havoc with the men, and the medical authorities were utterly incompetent to combat the ravages of the disease. The island was finally abandoned in the latter part of December, the results of the expedition being a loss of 7000 dead and the permanent disablement of half of the remainder.

WALCKENAER, vål'ke-nâr', CHARLES ATHANASE, BARON (1771–1852). A French scientist and writer, born in Paris. He became general secretary of the prefecture of the Seine in 1816, and prefect of Nièvre in 1826. He retired to Paris in 1838, and in 1840 was chosen life secretary of the Academy of Inscriptions. He published *Essai sur l'histoire de l'espèce humaine* (1798); *Histoire naturelle des aranéides* (1805); *Le monde maritime* (4 vols., 1818; 2d ed., 12 vols., 1819); *Histoire de la vie et des ouvrages de Lafontaine* (1820; 4th ed., 1858); *Histoire naturelle des insectes* (3 vols., 1836–44); *Histoire de la vie et de poésies d'Horace* (2 vols., 1840; 2d ed., 1858); *Mémoires touchants la vie et les écrits de la marquise de Sévigné* (5 vols., 1842–52; 6th vol. by Aubenas, 1865).

WALCOTT, wôl'kŏt, CHARLES DOOLITTLE (1850–). An American geologist and paleontologist, born at New York Mills, N. Y. He early showed a decided bent towards the study of natural history. In 1876 he became one of the assistants of the Geological Survey of the State of New York, and three years afterward entered the service of the United States Geological Survey, of which he was the director from 1894 to 1907. In 1897–98 he was at the head of the National Museum, and in 1905–07 served also as director of the United States Reclamation Service. He was secretary of the Carnegie Institution in 1902–05, and secretary of the Smithsonian Institution after 1907. Walcott served as president of the Geological Society of America (1901) and as vice president of the National Academy of Sciences (for the term 1913–19). He was the author of many important geological memoirs and reports.

WALD, vält. A town of the Rhine Province of Prussia, 10 miles southeast of Düsseldorf. There are important manufactures of steelware, cutlery, wire, and pottery. Pop., 1910, 25,274.

WALD, wäld, LILLIAN D. (1866–). An American social worker, born in Ohio. She studied at the New York Hospital Training School for Nurses and the Women's Medical College. In 1893 she became president and head worker of the Henry Street Settlement, New York (also known as the Nurses' Settlement). The position of school nurse in New York was originated by Miss Wald, who is also to be credited with the idea of a Federal Children's Bureau, which has been realized. She became president of the Social Halls Association, served on the New York State Commission of Immigration in 1909, and lectured at Teachers College (Columbia), the New York School of Philanthropy, and the Boston School for Social Workers. Mount Holyoke College gave her the degree of LL.D. in 1912 and the National Institute of Social Sciences awarded her its gold medal. She published *The House on Henry Street* (1915), a history of the settlement.

WALDAU, väl'dou, MAX. See HAUENSCHILD, R. G. S. VON.

WALDECK, väl'dĕk, or WALDECK-PYRMONT. A principality of the German Empire, composed of two separate parts: the one, the former county of Waldeck, containing 408 square miles; the other, the former principality of Pyrmont, containing 25 square miles (Map: Germany, C 3). The main division is a country of low mountains, with no great fertility. Its western portion, containing slate formations, is highest, reaching an elevation of 2775 feet. The streams belong to the Weser basin. The climate is somewhat raw. Siderite is mined. The town of Bad Pyrmont is a well-known spa, attracting some 25,000 visitors annually. Agriculture and stock raising are the main occupations. Forests occupy over one-third the total area. The manufactures and commerce are small. After the Austro-Prussian War of 1866 the reigning prince assigned his main rights as sovereign to the King of Prussia, which arrangement can be terminated on two years' notice. The Prussian King names all public officials and Prussia controls the finances. There is a Landtag of 15 members. The principality is represented by one member in the Bundesrat and by one in the Reichstag. Arolsen (pop., 1910, 2793) is the capital. Pop., 1900, 57,918; 1910, 61,723, almost all Protestants.

The Waldeck house sprang from the mediæval counts of Schwalenberg. The affiliated Pyrmont lines became extinct in 1494. Waldeck joined the Confederation of the Rhine in 1807 against its will. It was an ally of Prussia in the war of 1866 and became a member of the North German Confederation in 1867 and of the German Empire in 1871.

WALDECK, GEORG FRIEDRICH, COUNT (later PRINCE) (1620–92). A German soldier and statesman. He was born at Arolsen, and was the second son of Wolrad IV of the Wildungen line. It was his ambition to form a league of Protestant countries about Brandenburg, and in 1656 he was active in bringing about the League of Marienburg with Sweden against Poland. In 1664, as a field marshal, he distinguished himself at St. Gotthard against the Turks; in 1682 for services against the French he received the title of Prince; and in 1683 he helped to drive the Turkish army from before Vienna. In 1689 he was put in command of the allied forces in the Netherlands. In the same year he gained a success at Walcourt over the French under Marshal d'Humières, but in 1690 he was badly defeated by Marshal Luxembourg at Fleurus. For his life, consult Rauchbar (Arolsen, 2 vols., 1867–72) and Erdmannsdörfer (Berlin, 1869).

WALDECK-ROUSSEAU, väl'dĕk'-rōō'sō', PIERRE MARIE RENÉ (1846–1904). A French statesman, born at Nantes. He studied law; in 1879 was elected Deputy for Rennes; and was Minister of the Interior in Gambetta's *grand ministère* of 1881, and in the Cabinet of Jules Ferry of 1883–85. In 1894 he was elected to the Senate for the Department of the Loire, and in the following January he was supported by the Right for the Presidency of France against MM. Faure and Brisson. In the confused politics of the years that followed he was regarded as a leader of the Moderate Republicans. After the fall of the Dupuy Cabinet in June, 1899, he organized the famous radical *bloc* consisting of all stripes of republicans, as at one extreme was M. Millerand, the socialist leader, and at the other was General Galliffet, notable for his severity in suppressing the Commune of 1871. All, however, were united upon the platform of sustaining the Republic against the royalists and clericals. The Premier himself took the portfolio of the Interior, and set himself vigorously to the work of establishing order throughout the Republic. He permitted the Dreyfus case to be reopened, and in December, 1900, carried through a general amnesty law for all connected with the case. The most important law passed during his Premiership was, however, the Association Bill of 1901. (See FRANCE, section on *Religion.*) Throughout his incumbency the Premier showed great ability in gaining support of his measures. When the general election of 1902 came, he entered the contest with great vigor; and, thanks to his admirable personality, and despite the bitterest opposition, he gained a great victory for Republican principles. Feeling his task completed, he resigned in June, 1902, with the prestige of having held office longer than any other Premier since the establishment of the Third Republic. His publications include: *Discours parlementaires* (1889); *Discours prononcés dans la Loire* (1896); *Questions sociales* (1900); *Associations et congrégations* (1901); *La défense républicaine* (1902); *Politique française et étrangère* (1903); *Action républicaine et sociale* (1903). His collected speeches were published as *Pour la République* (1905), and *L'Etat et la liberté* (2 vols., 1906). Consult J. Ernest-Charles, *Waldeck-Rousseau* (Paris, 1902).

WALDEN, wŏl'den. A village in Orange Co., N. Y., 12 miles west-northwest of Newburgh; on both sides of the Wallkill River, and on the West Shore Railroad (Map: New York, A 1). Almost half of the country's supply of pocket knives are said to be made here. Hot-air engines, table cutlery, paper bags, overalls, and shirts are also manufactured. An electric car line connects with Newburgh. Pop., 1900, 3147; 1910, 4004; 1915 (State census), 5036.

WALDEN, wŏl'den. See THOREAU, HENRY DAVID.

WALDEN. See NETTER, THOMAS.

WALDEN, wŏl'den, JOHN MORGAN (1831–1914). An American Methodist Episcopal bishop. He was born at Lebanon, Ohio, and graduated at Farmers' (now Belmont) College, near Cincinnati, in 1852. He began his career as a journalist, first in Illinois and then in Kansas, and was a member of the Kansas Legislature (1857), and of the Leavenworth Constitutional Convention (1858). He entered the Cincinnati Conference in 1858, and was one of the publishing agents of the Methodist Book Concern, at Cincinnati, Ohio (1868–84). He was elected Bishop in 1884. He was a member of the Ecumenical Methodist Conference in 1881, in 1891, and in 1911. Consult the biography by D. H. Moore (New York, 1915).

WALDEN, väl'dĕn, PAUL (1863–). A Russian chemist. He was born in Livland, and was educated at the Polytechnic School in Riga and at the universities of Leipzig (Ph.D., 1891), Odessa, and St. Petersburg (Dr.Chem., 1899). He taught at Riga and at Odessa, in 1902 returning to the former city as business director of the higher schools, and becoming a professor and dean in the Riga Polytechnic in 1906. In 1908 he was called to succeed Mendeléev (q.v.) in the chair of chemistry in the University of St. Petersburg, and in 1910 was appointed successor to Beilstein (q.v.) as professor and director of the chemical laboratory of the Royal Academy of Sciences. Walden was chosen president of the Ninth International Congress of Applied Chemistry. He devoted much time to the study of optical rotary power and inversion; a form of the latter which he discovered has become known to chemists throughout the world as the "Walden Inversion." He also investigated surface tension, the electrical conductivity of aqueous solutions, and the dissociation constants of liquids. In addition, he became well known as a popular lecturer on natural science. His principal works are: *Die Affinitätsgrossen einiger organische Säuren* (1891); *Versuch zur Untersuchung der osmotischen Erscheinungen* (1891); *Louis Pasteur* (1896); *Material zur Studie der optischen Isomerie* (1898); *Wilhelm Ostwald* (1903); *D. Mendeléef* (1909); *Lösungstheorien* (1910). He also made translations into Russian of Ostwald's *Wissenschaftliche Grundlagen der Analytischen Chemie* (1896), Fischer's *Anleitung zur Darstellung organische Präparaten*, and other German works.

WALDENBURG, väl'den-bōōrK. A town of Silesia, Prussia, 42 miles southwest of Breslau (Map: Germany, G 3). It has porcelain, pottery, and glass works, and coal mines. Pop., 1910, 19,681.

WALDENSES, wŏl-dĕn'sēz. The origin of the Waldenses has been a cause of much disputation. According to many, they are a branch of the primitive Church which has always been independent of the Roman Catholic church since the third century; according to others, and especially their enemies, they date from the twelfth century and took their name and doctrines from Pierre Valdo, the merchant of Lyons. The later historians, however, such as Comba (1903), Yalla and Gay, discard both these opinions and show that the Waldensian movement, which later became identified with the Waldensian people and church, is the result of the blending together or the fusion of four distinct reform movements, brought about by four men: Pierre de Bruys at Toulouse (1100), Henry de Cluny at Maus (1116), Arnaldo at Brescia (1135), Pierre Valdo at Lyons (1173).

The teachings of these four men were very much alike. However, Pierre de Bruys insisted especially on simplicity and purity in the worship of God, Henry of Cluny or Lausanne on purity of life, Arnaldo on the independence of the church from the state and its spiritual mission, Pierre Valdo on poverty. The followers of these four men were respectively called Petrobusiani, Henriciani, Arnalisti, Leonisti or "Poor Men of Lyons."

The name Vallenses occurs for the first time in 1180 and the name Valdenses, later, to indicate all heretics, after the four movements had been blended together. The life and work of Pierre Valdo are most remarkable. He was a wealthy merchant of Lyons, France, in the latter half of the twelfth century. Moved, according to one story, by the death of a friend in 1170, he determined to lead a life of poverty and to devote himself to the cause of religion. He divided his property with his wife, placed his two daughters in the monastery of Fontévrault, and gave all his money to the poor. Followers soon flocked to him, and were known sometimes by his name, sometimes as the "Poor Men of Lyons." Waldo and his followers had no intention of separating from the Church, but their fundamental principles, that, first, all Christians, lay or clerical, ought freely to interpret the Scriptures, and, second, that laymen had a right to teach, brought them under the condemnation of the Church. The Archbishop of Lyons forbade them to teach, and they appealed to the Pope. They were convicted of error at the Lateran Council in 1179. Then they appealed for permission to found an order, but this was denied. As they continued their preaching, they were anathematized by the Council of Verona in 1184, and again at Narbonne in 1190. Many fled from Lyons into Dauphiné and Piedmont. Their missionaries traveled far and wide making converts. Gradually the community took form. It consisted really of two parts: the "fraternity" proper, made up of men and women who had taken the three monastic vows of poverty, chastity, and obedience, and for whom it was not lawful to lie, to take an oath, or to shed blood; and, second, "the faithful," who followed the teachings of Waldo, but were not obliged to take the vows. It is impossible now to determine exactly their organization, as it differed from place to place; but they had bishops, priests, and deacons. In the beginning their beliefs were nearly the same as those held by the orthodox Christians of the time. The councils and inquisitors frequently distinguished between heretics and the followers of Waldo. Nevertheless they suffered with the Albigenses, from whom they differed widely in doctrine, in the Albigensian crusade. (See ALBIGENSES.) As a result few were left in France. Their headquarters in the thirteenth century were in the upper valleys of Piedmont. There they were known as the "Poor of Piedmont," "the Leonisti," from their origin at Lyons, or as the "Insabates," from the shoes fashioned like sandals which they wore. Many other names were given to them at different times and in different places, of which the most familiar is the French name Vaudois.

In Piedmont they suffered persecution in 1220. In 1231 Pope Gregory IX excommunicated them, but they increased steadily in numbers. They suffered much from the Inquisition in many parts of Europe. In the fourteenth and fifteenth centuries many went to Calabria under the protection of the Neapolitan ruler and established several colonies.

In going about the country the Barbes adopted disguises, usually as merchants, which made them inconspicuous. In the first stage of the movement learned Inquisitors bore almost uniform testimony to their excellent moral lives; but in 1487 attention was again directed especially to them by Innocent VIII, who preached a crusade against them as heretics. The Waldenses in Piedmont made a heroic resistance, but in vain. The excessive cruelty of the Inquisitors led Louis XII of France, the ruler of part of Piedmont, to interpose, and he obtained from Pope Alexander VI a bull absolving the Waldenses. In 1532 and 1533 they joined the reform party. This brought on them a fresh persecution by the Inquisition. In 1545 the Parliament of Aix ordered lords of lands on which the Waldenses lived to oblige their vassals to conform to the Established church or to leave their lands. As they refused to conform, frightful massacres took place at Cabrières and Mérindol. These horrors brought about a reaction, and one of the chief persecutors was condemned to death in 1557. For some time pacific means were employed to convert them, but without success. Later they were forbidden to open schools, condemned to exile and violence, and massacres followed. In 1655 the Waldenses in Piedmont were ordered to conform to the Catholic faith within 20 days under penalty of death and confiscation of their property. As they remained firm, persistent attacks were made upon them, and these attacks were met by a valiant but useless defense. This persecution aroused the indignation of England, and led Cromwell to send an embassy of protest to Turin, and Milton to write his well-known sonnet on the Waldenses. The trial fortunately lasted for only a short time, as within a few months the Duke of Savoy by the Treaty of Pignerol allowed them to follow their religious beliefs in the upper valleys of his dominions. These enjoyed relative religious immunity until the revocation of the Edict of Nantes in 1685. After that the decree went forth that their churches should be destroyed and that their ministers should be banished. At about the same period persecutions began again in Piedmont. The Waldenses made a stubborn resistance, but 12,000 men, women, and children were taken prisoners. These were released within a few months, largely through the intervention of the Swiss cantons, and were exiled. Many of them went to Switzerland as a land of refuge. In 1689 they resolved to make an attempt to reconquer their own valley homes in Piedmont. At first they were successful, but a great force was sent against them and their position seemed desperate. The political issues of Europe led to a coalition against Louis XIV in 1690, and their aid was sought to defend the frontiers of Piedmont against his troops. They received in compensation official permission to return to their villages in 1694. The peace of 1697 was disastrous to them, as in 1698 they were ordered to go into exile. In 1740 they secured some indulgence, but there was little change in their position, although there was also little persecution, up to the time of the French Revolution. In 1799 liberty of conscience was proclaimed. After the fall of Napoleon in 1814 there was a reaction under Victor Emmanuel I. Finally, in 1848, under Charles Albert, the Waldenses acquired civil and religious liberty. In 1855 they founded a school of theology in Torre Pellice, which was removed to Florence in 1860.

In 1916 the Waldenses had 60 organized churches throughout Italy and 156 stations with 98 pastors. The Central Board, administering the affairs of the church, called the Venerabile Tavola Valdese, is composed of nine members, whose president is called moderator, elected for one year. The General Synod, which is the supreme authority, meets every year. The head-

quarters of the church are at Torre Pellice (Waldensian valleys).

Besides the churches in Italy, the Waldenses had missionaries in Abyssinia, Madagascar, Basutoland, and Barotseland, also flourishing agricultural settlements in Uruguay and Argentina with 8 organized churches and 20 scattered groups, with a total population of 7000 people. In North America they had one church in New York City and agricultural settlements at Wolf Ridge, Tex.; Valdese, N. C.; Monett, Mo.; Provo City, Utah; and Santa Ana, Cal. The headquarters of the Waldensian church in the United States are in New York City.

Much has been written about their literature. There are extant versions of the Scriptures, the *Sentences*, as the extracts from the Fathers were called, various forms of services, and especially a considerable number of poems. The best known of these poems is *La Nobla Leicon*, whose date has now been fixed at the middle of the fourteenth century. The best editions of their poems are by Apfelstedt, in the *Zeitschrift für romanische Philologie*, vol. iv (Halle, 1880), and in the *Archiv für das Studium der neueren Sprachen*, vol. lxiii (Brunswick, 1880). For their history, consult: Léger, *Histoire générale des églises évangéliques des vallées de Piémont, ou Vaudoises* (Leyden, 1669); Dieckhoff, *Die Waldenser im Mittelalter* (Göttingen, 1851); Herzog, *Die romanischen Waldenser* (Halle, 1853); Montet, *Histoire littéraire des Vaudois du Piémont* (Paris, 1885); Muston, *Israel of the Alps: History of the Waldenses of Piedmont* (Eng. trans., London, 1863); Melia, *Origin, Persecution, and Doctrines of the Waldenses* (ib., 1870); Preger, *Die Verfassung der französischen Waldenser in der älteren Zeit* (Munich, 1890); S. WALDENSIS. See Netter, Thomas.

WALDERSEE, väl'dĕr-zā, Alfred, Count von (1832–1904). A German soldier, born at Potsdam. He entered the army in 1850, served in the war of 1866, and at the beginning of the Franco-Prussian War was an aid-de-camp to the King of Prussia. He was at the battle of Gravelotte, and became chief of staff to the Grand Duke of Mecklenburg. For services in the war he was made a colonel. When peace came he was appointed chargé d'affaires at Paris; in 1882 became quartermaster-general of the Prussian staff; and in 1888 succeeded Moltke as chief of staff. In 1900 he became field marshal. In August of that year he took command of the German forces in China, and was made commander in chief of the allied forces.

WALDEYER, väl'dī-ĕr, Wilhelm (1836–1906). A German anatomist, born at Hehlen, in Brunswick. He studied at Göttingen, Greifswald, and Berlin, taught at Breslau, in 1872 became professor and director of anatomy at Strassburg, and in 1883 went to Berlin as professor and director of the anatomical institute of the university. Here he remained till his death. His specialties were histology, embryology, and comparative anatomy. Best known are his studies on cancer and his monographs on the construction of teeth, cornea, sclera, and conjunctiva. His works include: *Eierstock und Ei* (1870); *Atlas der Haare* (1884); *Das Gorilla-Rückenmark* (1889); *Lage der weiblichen Beckenorgane* (1892); *Das Becken* (1899); "Die Geschlechtszellen," in Hartwig's *Handbuch der Entwickelungsgeschichte* (1903).

WALDIS, väl'dĭs, Burkard (c.1490–c.1557). A German fabulist, born at Allendorf, in Hesse. He became a monk, but afterward turned Protestant, and suffered persecution. After many vicissitudes he became pastor in Abterode (1544). His first important literary production, the drama *Die Parabel vom verlornen Sohn*, was performed at Riga in 1527. He is remembered for his *Esopus ganz neu gemacht und in Reimen gefasst* (1548, and many later editions; a complete one by Von Tittmann, 1882). Among other works was a paraphrase of the Psalter in verse, composed in prison, and published in 1553. Consult Milchsack, *Burkard Waldis* (Halle, 1881).

WALDMÜLLER, vält'mŭl-lĕr, Ferdinand Georg (1793–1865). An Austrian landscape, portrait, and genre painter. He was born in Vienna, studied at the Academy there under Maurer and Lampi, and after traveling in Italy and Germany settled in his native city, where he became professor at the Academy. He owed his popularity during his lifetime to his genre scenes of peasant life in Nether Austria, such as "Soup Day at the Convent" (Vienna Museum) and "After School" (Berlin Gallery). To-day, however, he is better known as an ironically truthful portraitist and as a pioneer of modern landscape painting. His "Ruins at Schönbrunn" is in the Vienna Gallery, which also contains fine examples of his portraiture.

WALDMÜLLER, Robert. See Duboc, Eduard.

WAL'DO, Peter. See Waldenses.

WALDO, Samuel Lovett (1783–1861). An American portrait painter. He was born at Windham, Conn., and after painting portraits in Charleston, S. C., went to London in 1806 to become a pupil of Benjamin West. On his return in 1809 he opened a studio in New York, and rapidly acquired popularity as a portrait painter. His sitters included Peter Remsen and David Grim (both in New York Historical Society), and Andrew Jackson (Metropolitan Museum, New York). He painted thinly, but with some skill and technical ability. About 1812 he formed a partnership with his pupil William Jewett, which lasted 18 years. Among the numerous portraits which they painted jointly is that of Rev. Dr. Gardner Spring (Metropolitan Museum).

WALDOBORO, wŏl'dō-bŭr-ō. A town in Lincoln Co., Me., 69 miles northeast of Portland, on the Medomak River and on the Maine Central Railroad (Map: Maine, C 4). Cutting paving stone and poultry raising are the chief industries. Pop., 1900, 3145; 1910, 2656.

WALDRON, wąl'dron, George. See Barrington, George.

WALDSCHMIDT, vält'shmĭt, Maximilian. See Schmidt, Maximilian.

WALDSEEMÜLLER, or **WALTZEMÜLLER,** vält'zā-mül'lĕr, MARTIN (c.1470–c.1521). A German geographer and the most distinguished cartographer of his time, born at Freiburg. For several years after 1505 he was professor of geography in the College of Saint-Dié in Lorraine. In 1506 he and some compatriots matured a plan for a new edition of the work of Ptolemy, revised and amended so as to include the results of recent discovery. In the following year Waldseemüller published a large map of the world in 12 sheets and finished a small treatise which he intended as an introduction to the more elaborate work; and this treatise, together with a Latin translation of the famous second letter from Americus Vespucius (q.v.) to Soderini, and some verses in praise of Vespucius, was published under the title of *Cosmographiæ Introductio* on the college press in the same year. The work is famous because in it Waldseemüller said: "But now the parts have been more extensively explored and another fourth part has been discovered by Americus Vespucius (as will appear from what follows); wherefore I do not see what is rightly to hinder us from calling it Amerige or America, i.e., the land of Americus, after its discoverer Americus." However, the new edition of Ptolemy was finally published in 1513. It contained a map called Tabula Terræ Novæ, which had been made under the supervision of Waldseemüller prior to 1508. On this map the "Fourth Part" is not called America, but Terra Incognita; while to the left, referring to the Pearl Coast and perhaps to Honduras, is the inscription: "This land with the adjacent islands was discovered by Columbus of Genoa by order of the King of Castile." Of the first edition of the *Cosmographiæ Introductio* but one copy is known to be in existence, and it is in the New York Public Library. Of the three other editions published the same year about 20 copies are preserved. It was published in facsimile, edited by Wieser (Strassburg, 1908). Consult John Fiske, *The Discovery of America* (2 vols., Boston, 1902).

WALDSTEIN, wäld'stīn, SIR CHARLES (1856–). A British archæologist. Born in New York City, he studied at Columbia University in 1871–73, and in 1875 received the degree of Ph.D. at Heidelberg. In 1876 he studied at Leipzig and in the British Museum, where he lectured in 1878. He then traveled in Italy and Greece. From 1880 he was identified with Cambridge University, being reader in classical archæology from 1883 to 1907, director of the Fitzwilliam Museum (1883–89), Slade professor of fine art (1895–1901; 1904–11), and lecturer at King's College. In addition he served as director of the American School of Classical Studies at Athens (1889–93). While in this office he discovered that the so-called "Apollos" are simply statues of athletes. In 1883 he lectured before the Royal Institution and in 1886 at Columbia University. In 1912 he was knighted. Among his works are: *The Balance of Emotion and Intellect* (1878); *Essays on the Art of Phidias* (1885); *Excavations at the Heraion of Argos* (1892); *The Work of John Ruskin* (1893); *The Argive Heræum* (1902); *Herculaneum, Past, Present, and Future* (1908), with L. Shoobridge; *Greek Sculpture and Modern Art* (1914).

WALDTEUFEL, vält'toi'fel, EMILE (1837–1915). A French composer, born at Strassburg. At the Paris Conservatoire he studied for some time under Marmontel and Laurent, but left before completing the regular course. His first published waltzes, *Joies et Peines* and *Manola,* met with such success that he devoted himself entirely to the cultivation of the dance forms, in which he produced several hundred works. In 1865 he was appointed chamber pianist to the Empress Eugénie and musical director of the Imperial court balls.

WALES. An Alaskan village at Cape Prince of Wales, Bering Strait. Pop., 1910, 337, practically all Eskimo (Map: Alaska, D 3). It has a government school, a coöperative store, and a Congregationalist central mission. On Shisharef Inlet near by is a village containing a native school and some herds of reindeer. The herds of reindeer at and near Wales number 3100 head, the largest aggregation of animals in Alaska except at Bethel.

WALES (AS. *Walas, Wealas,* foreigners; connected with OHG. *walh,* foreign, Celtic *Volcæ,* a tribe of Gaul). An historical division of the United Kingdom of Great Britain and Ireland, administratively a part of England. It is a large peninsula projecting westward on the island of Great Britain. Wales extends 136 miles from north to south and has a breadth varying from 36 to 96 miles. Area, 7446 square miles. The northwestern corner is cut off by Menai Strait to form the island of Anglesey (q.v.). In Wales the proportion of hilly and mountainous country is much greater than in England, and the area of arable land is less than three-fifths. The ranges are, however, short and there are many openings allowing an easy passage for railroads. Snowdon, the highest point of Wales and of the British Isles, is 3590 feet. Wales is geologically more ancient than the greater part of England, consisting almost exclusively of the older Paleozoic rocks with igneous intrusions. The mineral deposits are extensive and valuable, including coal, iron, copper, zinc, tin, lead, and gold. Of these by far the most important is coal, amounting in value to about 85 per cent of the mineral output of Wales and in quantity to about 20 per cent of the coal supply of the United Kingdom. There are two coal fields, the north, in Denbigh and Flint, and the south, more than half in Glamorgan and the rest in Carmarthen, Pembroke, Brecknock, and the English county Monmouth. The north fields were worked as early as the sixteenth century and the development of the south fields began about the middle of the eighteenth. The thickness of the coal measures is estimated at about 7000 feet. Cardiff (q.v.) has become the largest coal-exporting port in the world, its export in 1913 being 20,095,051 tons. In 1913 Wales yielded mineral products to the value of $112,182,220, or about one-fifth of the total amount produced by Great Britain and Ireland.

For agriculture, manufactures (the most important of which is iron), and other topics concerning Wales not treated here, see UNITED KINGDOM.

The increase in population between 1901 and 1911 was 18.8 as against 11.3 per cent for the United Kingdom. The county of Glamorgan contains all the cities of Wales that exceeded a population of 50,000 in 1911; Cardiff, with 182,280, having increased 10.92 per cent in the decade ending with that year; Swansea, with 114,673; and Merthyr Tydfil, with 80,999. This is due to the great mining in-

dustry. Wales is divided into 12 administrative counties, as shown in the following table.

The greater portion of the population belong to the Calvinistic, Methodist, or other free Protestant bodies. In 1914 an act was passed by which the Protestant Episcopal church in Wales was disestablished, but the actual enforcement was postponed till the end of the European War.

COUNTY	Area, square miles	Pop. in 1901	Pop. in 1911

Wales has the same educational system as England (q.v.). (See also GREAT BRITAIN.) Elected school boards have charge of elementary education in districts not adequately provided for by voluntary schools, the necessitous voluntary schools receiving public aid. Attendance is compulsory. Non-sectarian religious instruction is offered but is not compulsory in board schools. Sectarian instruction may be given in the voluntary schools. Secondary education is controlled by the county councils, and in towns of over 10,000 by the municipality. The University of Wales, consisting of the three colleges at Aberystwith, Bangor, and Cardiff, was established in 1903.

The Welsh are a Celtic people. Their average height is 1.695 metres; the cephalic index, 78.0. The Welsh are brunettes, with black hair and hazel eyes. The earliest inhabitants of Wales, as of the rest of Britain, are supposed to have been of non-Caucasic origin. These were succeeded by Celts, possibly first of the Gaelic division, although in the earliest historic times Wales, like Britain, was occupied by Cymric or Brythonic Celts. After the Saxon invasion Wales was, as it still remains, the ethnic centre of this race, although later admixtures of both Irish and English have probably modified the type.

History. At the time of the coming of the Romans, 55 B.C., the tribes of Wales, representing a mixture of the primitive Iberians with the later invading Celts, were the Decongi (Decangi) in the north, the Ordovices in the centre, the Silures in the southeast, and the Demetæ (Dimetæ) in the southwest, all bearing the general name of Cymry. After a long struggle the subjugation of these tribes was accomplished under Vespasian. The Celtic inhabitants of Britain, fleeing before the wave of Anglo-Saxon invasion, took refuge in the Welsh mountains, where, in time, they were merged with their native kinsmen and maintained their independence against the Teuton conquerors. The country was divided into several states, of which Gwynedd, Gwent, Dyved, and Powys were the most important. Of these the first two, because of their situation on the eastern frontier of Wales, were engaged in constant hostilities with the Anglo-Saxon kingdoms, especially Northumbria and Mercia. Constant warfare, too, prevailed among the Welsh principalities themselves. In 1062–64 Harold, the son of Godwin, overran Wales with an English army after a struggle with Llewellyn ap Griffith, King of Gwynedd. William the Conqueror succeeded in forcing the recognition of his sovereignty from the Welsh princes, but this did not prevent them from raiding the English border, for protection of which the early Norman kings erected a number of feudal lordships with very extensive powers, the so-called lords of the marches. The marchers were a turbulent class and a source of trouble to the kings, but they served their purpose in holding the Welsh back. In 1136 the Welsh won a great victory over Henry I, but were again reduced to homage by Henry II. Llewellyn, Prince of North Wales, sided with Simon de Montfort against Henry III, but later submitted to the King. In 1273, however, he refused to pay homage to the new King, Edward I, who in 1276 invaded Wales and at Rhuddian compelled Llewellyn to submit to humiliating terms, including the surrender of the eastern portion of his lands and the annual acknowledgment of fealty. Llewellyn rose in rebellion in 1282, but perished, and his brother David, who carried on the struggle, was captured in the following year and beheaded. By 1284 the English conquest of the country was complete, and the process of introducing English law and administration was begun. In 1301 Edward I conferred on his second son, Edward, born at Carnarvon, in Wales, the title of Prince of Wales (see WALES, PRINCE OF), and this sufficiently satisfied the pride of the Welsh to keep them loyal for a hundred years. The national spirit did not die out, however, and was nourished by the songs of the bards, whom the English government regarded with great disfavor. Upon the seizure of the English throne by Henry IV a revolt broke out in Wales, which, under the leadership of Owen Glendower (q.v.), assumed, in 1402, formidable proportions. Henry IV repeatedly invaded the country, but the revolt was not suppressed till the death of Glendower, about 1415. The Welsh submitted to Henry IV, whom they regarded as their countryman. Glendower's was the last national uprising. In 1536 Wales was incorporated with England, its inhabitants receiving all the rights and privileges of English subjects. A national revival of recent years has taken the form of a patriotic cultivation of the ancient Cymric tongue and literature. See WELSH LANGUAGE AND LITERATURE.

Edwards, *Wales* (ib., 1902), a history; A. G. Bradley, *In the March and Borderland of Wales* (Boston, 1905); T. F. Bumpus, *Cathedrals of England and Wales* (3 vols., New York, 1905–06); J. E. Lloyd, *History of Wales from the Earliest Times to the Edwardian Conquest* (2 vols., ib., 1911); H. T. Evans, *Wales and the Wars of the Roses* (ib., 1915); Gilbert Stone, *Wales: Her Origins, Struggles, and Later History, Institutions, and Manners* (London, 1915).

WALES, PHILIP SKINNER (1837–1906). An American naval surgeon. He was born at Annapolis, and educated for his profession in the universities of Maryland and Pennsylvania. He was commissioned full surgeon in the navy in

1861 and served through the Civil War at the Naval Hospital and on board the United States ship *Fort Jackson* of the North Atlantic and Western Gulf squadrons. He became chief of the Bureau of Medicine and Surgery in 1880, and Surgeon-General and Medical Director in 1881. He was one of the first in attendance on President Garfield when he was shot by Guiteau. His career was interrupted in 1887 by the discovery of frauds in his department, and although acquitted of actual responsibility, he was suspended from office for five years, and afterward resided abroad.

WALES, PRINCE OF. The title borne by the eldest son of the sovereign of Great Britain and Ireland. It was first conferred on Prince Edward, afterward Edward II, in 1301. The idea of making Wales an appanage for the heir apparent seems due to Edward III, who in 1343 invested his son, the Black Prince, with the principality, and from that time the title has been borne by the eldest son of the reigning King. The Principality of Wales has usually been bestowed by patent investiture, though in a few instances the heir to the throne has become Prince of Wales simply by being so declared. The Earldom of Chester was made a principality for the King's eldest son in 1393, and has since the accession of Henry IV been annexed to the Principality of Wales. On the death of a Prince of Wales in his father's lifetime, the title has been conferred on the heir apparent. As heir of the crown of Scotland, the eldest son of the sovereign is Prince and High Steward of Scotland, Duke of Rothesay, Earl of Carrick, Baron of Renfrew, and Lord of the Isles. As heir to the crown of Ireland the Prince of Wales bears the title of Earl of Dublin, created in 1849.

WALES, UNIVERSITY OF. An institution of higher education, established in 1893 by the union of the three colleges of Aberystwyth, Bangor, and Cardiff. These colleges had been founded, originally, in 1872, 1883, and 1885, and previous to their unification gave no degrees, though their work was accepted as partially equivalent for the degrees in English, Scotch, and Irish universities. Aberystwyth was founded and is largely patronized by the dissenting churches. The two others are free and give no theological work. Instruction for women is provided. The administration of the university is in the hands of a council composed of representatives from various county political and educational boards of Wales, and of a senate consisting of members of the instructing staff. The senate recommends to the council, with whom the chief control lies. There was a combined faculty in 1914–15, a war year, of 180 and an attendance of 1080. The normal attendance is about 1400. Consult Davies and Jones, *The University of Wales and its Constituent Colleges* (London, 1905).

WALEWSKI, vä'lĕf'skē', ALEXANDRE FLORIAN JOSEPH COLONNA, Count and Duke (1810–68). A French statesman. He was the son of Napoleon I and the Polish Countess Walewska, and was born at Walewice, Poland. When the revolt of 1830 broke out in Poland he joined the Polish army, and after the capitulation of Warsaw (September, 1831) he went to France. He held a captaincy in the French army, but soon gave it up for literature and politics. He went to Egypt on a diplomatic mission; held appointments under the Guizot Ministry; was chargé d'affaires in Argentina in 1848; then was envoy at Florence and at Naples, and in 1854 at London. He became Minister of Foreign Affairs in 1855, and as French plenipotentiary presided over the Congress of Paris in the following year. He was appointed Minister of State in 1860, and retired in 1863. He was made a duke in 1866 and was president of the Legislative Assembly in 1866–67. His published writings include *Un mot sur la question d'Afrique* (1837), *L'Alliance anglaise* (1838), and a drama, *L'Ecole du monde* (1840).

WALFISH (wôl'fĭsh) **BAY.** A possession of Great Britain on the west coast of Africa, forming a part of the Cape Province of South Africa, but situated as an enclave in German Southwest Africa, 400 miles north of the mouth of the Orange River. It is named from the bay on which it borders (Map: Cape of Good Hope, A 4). It consists of a small peninsula, and a sandy stretch of territory on the mainland. Area, 430 square miles. It has a harbor, which is a free port, and is the best on the coast of Damaraland and Namaqualand. Pop., 1911, 3076, of which 1638 were whites. The chief settlements are Sandfontein and Scheppmansdorf. The territory was acquired by Great Britain in 1878.

WALFORD, wąl'fẽrd, MRS. LUCY BETHIA (1845–1915). A British novelist, the youngest daughter of John Colquhoun, born at Portobello, near Edinburgh, Scotland. In 1869 she married Alfred Saunder Walford of Cranbrooke Hall, in Essex. She began her long series of novels with *Mr. Smith* (1874). Among others are *A Stiffnecked Generation* (1888); *The Mischief of Monica* (1891); *The Matchmaker* (1893); *Iva Kildare* (1897); *The Archdeacon* (1899); *One of Ourselves* (1900); and *Charlotte* (1901); *The Enlightenment of Olivia* (1907); *Leonore Stubbs* (1908); *David and Jonathan on the Riviera* (1914). Her *Memories of Victorian London* appeared in 1912. Consult her *Recollections of a Scottish Novelist* (New York, 1910).

WALHALLA. See VALHALLA.

WALIE, wä'lĭ. See IBEX.

WALKE, wąk, HENRY (1808-96). An American naval officer, born in Princess Anne Co., Va. He entered the navy as a midshipman in 1827, was commissioned lieutenant in 1839, and served in the bomb-brig *Vesuvius* in the Mexican War. In November, 1861, he commanded the gunboats *Taylor* and *Lexington*, at the battle of Belmont, Missouri; and later commanded the *Carondelet* at the bombardment of Fort Henry and Fort Donelson. With the same vessel he took part in the bombardment above Island No. 10 on March 17, 1862; on April 4th ran past the batteries (see ISLAND NUMBER TEN); captured a battery opposite Point Pleasant two days later; in command of the *Carondelet* and *Pittsburg* captured three batteries below New Madrid; and on April 7th covered the crossing of Pope's army. In the following May he participated in the battle of Fort Pillow, a Confederate victory; and in June in the battle of Memphis, in which the Federal fleet was successful. In the following month he was commissioned captain. He participated in command of the *Lafayette* in the operations against Vicksburg and Grand Gulf, and accompanied Porter's first expedition up the Red River. In 1864 he was sent with the *Sacramento* to Europe, relieved the *Kearsarge*, and blockaded the *Rappahannock* in the port of

Calais. He was commissioned commodore in 1866 and rear admiral in 1870, and retired in 1871. He published *Naval Scenes in the Civil War* (1877).

WALKEM, wâk'em, GEORGE ANTHONY (1834–1908). A Canadian political leader and jurist. He was born at Newry, Ireland, came to Canada in his youth, and was educated at McGill University. He was called to the bar of Lower Canada in 1859, of Upper Canada in 1861, and of British Columbia in 1864. He was a member of the Legislative Council in 1864–70, took an active part in effecting the entrance of British Columbia into the Dominion of Canada as a province in 1870, and was elected a member of the Provincial Legislature. Later he was a member of the Cabinet (1872–74), Premier (1874–76), leader of the opposition (1876–78), again Premier (1878–82), and in the latter year was appointed a puisne judge of the Supreme Court. During his second premiership he did much to further the construction of the Canadian Pacific Railway in British Columbia.

WALKER, wą'kẽr, AMASA (1799–1875). An American economist, born at Woodstock, Conn. From 1820 to 1840 he was engaged in business, retiring in 1840 from commercial life. In 1842–48 he lectured on political economy at Oberlin College; in 1853–60 was examiner on political economy at Harvard; and in 1859–69 lecturer on political economy at Amherst. In 1843 he was delegate to the First International Peace Congress at London, and in 1849 delegate to the Peace Congress at Paris. He was elected to several political offices, among them that of Secretary of State of Massachusetts (1851–53), and Representative in Congress (1862–63). He was a frequent contributor to periodical literature, especially on financial subjects, on which his authority was regarded as of the highest. His principal work was *Science of Wealth* (1866), a manual of political economy which became very popular. For his son, see WALKER, FRANCIS AMASA.

WALKER, SIR BYRON EDMUND (1848–). A Canadian financier. He was born in Haldimand Co., Ontario. Entering the Canadian Bank of Commerce in 1868, he was appointed general manager in 1886, a director in 1906, and president in 1907. He was elected president of the Canadian Bankers' Association, president of the Canadian Institute (1898–99), and chairman of the board of governors of Toronto University in 1910, in which year he was knighted. He published: *The Canadian System of Banking* (1890); *Banking in Canada* (1893); *A Canadian View of the Financial Situation in the United States* (1895); *Why Canada is Against Bi-metallism* (1897); *Canadian Surveys and Museums* (1900).

WALKER, CHARLES HOWARD (1857–). An American architect, born in Boston. He studied in the Massachusetts Institute of Technology, and was a member of the Archæological Institute of America expedition to Assos in Asia Minor in 1881. After two years of travel in Europe he established himself in the practice of architecture in Boston and from 1889 to 1900 was a member of the firm of Walker and Kimball, to which firm was committed the chief work of design of the Omaha Exhibition in 1898. Walker also served on the board of architects of the Louisiana Purchase Exhibition (q.v.) in 1902–04. From 1902 to 1913 he was director of the department of design in the Museum of Fine Arts, Boston; he served on the National Fine Arts Commission appointed by President Roosevelt in 1909; was president of Metropolitan Improvement League of Boston (1909–13); and from 1887 was instructor and professor of the history of ornament in the Massachusetts Institute of Technology. He became editor of the (Boston) *Architectural Review*, and published *Parish Churches of England* (1915).

WALKER, FRANCIS AMASA (1840–97). An American economist, born in Boston, the son of Amasa Walker (q.v.). He graduated at Amherst in 1860 and began to study law. In the Civil War he rose to be lieutenant colonel and brevet brigadier general. From 1865 to 1868 he taught Latin and Greek at Williston Seminary; in 1868 he was on the staff of the Springfield *Republican*. In 1869 he was placed in charge of the Bureau of Statistics of the Treasury Department, in 1870 became superintendent of the Ninth Census, and in 1872 was appointed Commissioner of Indian Affairs. In 1873–81 he occupied the chair of political economy and history at the Sheffield Scientific School of Yale, and in 1877–79 he was lecturer at Johns Hopkins University. In 1878 he represented the United States at the Monetary Conference in Paris. He was appointed superintendent of the Tenth United States Census in 1880, and from 1881 till his death was president of the Massachusetts Institute of Technology. The Walker Memorial, a students' clubhouse and one of the new Technology buildings on the Charles, was dedicated in 1916. From 1882 to 1897 he served as president of the American Statistical Association, and in 1885–92 as president of the American Economic Association. A prolific writer, especially on economic topics, Walker was one of the foremost advocates of international bimetallism. In economic theory he is regarded as an original and powerful thinker, and his treatment of wages and profits has had a profound influence upon economic theory. Indeed, the development of interest in economics in America is in a large measure the result of his work. His principal writings are *The Indian Question* (1874); *The Wages Question* (1876); *Money* (1878); *Money in its Relation to Trade and Industry* (1879); *Political Economy* (1883); *Land and its Rent* (1883); *History of the Second Army Corps* (1886); *Political Economy* (3d ed., 1888); *Life of General Hancock* (1894); *The Making of the Nation* (1895); and *International Bimetallism* (1896). Consult C. D. Wright, *Francis Amasa Walker*, with bibliography (Boston, 1897); G. F. Hoar and C. D. Wright, *Francis Amasa Walker* (Washington, 1898).

WALKER, FREDERICK (1840–75). An English figure and landscape painter and illustrator. He was born in Marylebone, London, and his earliest studies consisted in drawing the Elgin marbles in the British Museum, the influence of which may be seen in all of his works. In 1858 he joined the Royal Academy schools and later was employed by Whymper, a line engraver, with whom he remained two years. He soon became well known as an illustrator, especially for the works of Thackeray, whose friendship he formed at this time, but he finally relinquished engraving in 1865. His few oil paintings include: "The Wayfarers" (1866); "Vagrants" (1868, National Gallery); and "Harbor of Refuge" (1872, Tate Gallery). But it is in his water-colors, few in number and highly

prized, that the full charm of his painting appears—the sureness and delicacy of drawing, bloom of color, and poetic grace of form and movement. "Philip in Church" (1863), "A Rainy Day at Bisham," "The Violet Field," and a version of "The Harbor of Refuge," are good examples. Walker was an associate of the Royal Academy (1871), and received a gold medal at Paris in 1863. He is supposed to be the prototype of Little Billee in Du Maurier's *Trilby*.

WALKER, GEORGE (?1618–90). An Irish clergyman, distinguished for the part he took in the heroic defense of Londonderry against the army of James II in 1689. He was born in the county of Tyrone, of English parents, was educated at the University of Glasgow, and, entering the Church, became rector of Donaghmore. When the army of James II entered Ulster and took possession of Kilmore and Coleraine, Walker sought refuge in Londonderry. The town was not fortified sufficiently to oppose regular troops, and Lundy, the governor, prepared to surrender to the enemy. Some of his officers protested against this course, and the citizens determined not to yield, Walker encouraging them to fight to the last. The siege began in April and lasted till the end of July. The inhabitants were reduced to the greatest extremities by hunger, but they were sustained to the last by the inspiring sermons preached to them by Walker in the cathedral, and the example he and Captain Campbell set in heading sallying parties. After the raising of the siege Walker was made Bishop of Derry by the King. Walker was present at the crossing of the river at the battle of the Boyne, and was killed. He published *A True Account of the Siege of Londonderry* (1689; new ed. by Philip Dwyer, 1893).

WALKER, HENRY OLIVER (1843–). An American figure and mural painter. He was born in Boston and studied in Paris under Bonnat. Upon his return to America he settled in New York, exhibiting ideal figure compositions of poetic beauty and refined feeling. Good examples are "Eros et Musa" and "Musa Regina" (National Gallery, Washington); "Morning Vision" (Metropolitan Museum, New York). But he is chiefly known for mural decorations, the most important including a series of lunettes in the Library of Congress, Washington; "Wisdom Attended by Learning" (Appellate Court, New York); and panels in the Massachusetts State House, Boston, and the Essex County Courthouse, Newark, N. J. He was elected a member of the National Academy of Design in 1902 and of the National Institute of Arts and Letters, and received a gold medal at Charleston in 1902.

WALKER, HORATIO (1858–). A Canadian animal, figure, and landscape painter, chiefly identified with the American school. He was born in Listowel, Ontario, and after studying miniature painting with J. A. Fraser in Toronto he went to New York in 1885. Although influenced by the Barbizon painters, he was practically self-taught. His favorite subjects are taken from the lives of the descendants of the Canadian-French colonists, who retain in an uncommon degree the characteristics and habits of their fathers. His work is characterized by a largeness of composition, a solidity of treatment, and a powerfulness that are responsible for comparison with Troyon (q.v.), while the sentiment with which he portrays his peasants has something of the elemental feeling of Millet. His technique is brilliant, the color rich and glowing, with fine tonal and atmospheric effects. Good examples are: "The Harrower" (two paintings), (Metropolitan Museum, New York); "Oxen Drinking," "Ave Maria" (Corcoran Gallery, Washington); "Sheepyard, Moonlight" (National Gallery, Washington); "Sheepshearing" (Albright Art Gallery, Buffalo); "The Woodcutter" and "Milking" (St. Louis Museum). Walker was elected to the National Academy of Design in 1891, to the National Institute of Arts and Letters, and to the Royal Institute of Painters in Water Color, England. His numerous awards include gold medals at New York (1887), Chicago (1893), Buffalo (1901), Charleston (1902), St. Louis (1904), Pennsylvania Academy of Fine Arts, Philadelphia (1906), and the Panama-Pacific Exposition, San Francisco (1915).

WALKER, SIR HOVENDEN (c.1656–1728). A British naval officer, born in Queen's County, Ireland. He seems to have entered the royal navy at an early age. In 1702, as acting commodore, he commanded a squadron that sailed to the West Indies and took part in the attack on Guadeloupe. In 1706 in the *Cumberland* he assisted Sir John Leake in the relief of Barcelona. In 1707–08 he was captain-resident at Plymouth. In 1710 he was promoted to be rear admiral of the white and was knighted, and in April was appointed to command the "secret" expedition against Quebec, which proved a failure. In 1711 Walker was appointed commander in chief in Jamaica. After the accession of George I Walker's name was removed from the list of admirals, ostensibly because of the failure of the Quebec expedition, but probably because of suspected Jacobitism. He subsequently spent several years in South Carolina as a planter, but before his death returned to his family estates in Ireland. He published *A Journal, or Full Account of the Late Expedition to Canada* (1720).

WALKER, JAMES (1794–1874). An American educator. He was born at Burlington, Mass., graduated at Harvard College in 1814, studied divinity, and was settled over the Unitarian church in Charlestown (1818–39). He was professor of moral and intellectual philosophy in Harvard College (1839–53), and its president (1853–60). In 1831–39 he served as editor of the *Christian Examiner*. He published for undergraduate use editions of Stewart's *Philosophy of the Active and Moral Powers* (1849) and Reid *On the Intellectual Powers* (1850); *Sermons* (1861); *Memoir of Daniel Appleton White* (1863); and *Memoir of Josiah Quincy* (1867). A *Memorial* appeared at Cambridge in 1875.

WALKER, JAMES BARR (1805–87). An American religious writer. He was born in Philadelphia; studied law at Ravenna, Ohio; and graduated at Western Reserve College, Hudson, Ohio, in 1831. After being editor of several religious papers he studied theology and was licensed as a Congregational preacher in 1841. He established a private orphan asylum at Mansfield, Ohio, and was lecturer at Oberlin College and Chicago Theological Seminary on harmony between science and revealed religion. He published *Philosophy of Skepticism and Ultraism* (1857); *Philosophy of the Divine Operations in Human Redemption* (1862); *Poems* (1862); *The Living Questions of the Age* (1869); *Doctrine of the Holy Spirit* (1870).

WALKER, JOHN (1732–1807). An English lexicographer and actor, born at Colney Hatch, Middlesex. He played at first in provincial companies and afterward under the management of Garrick at Drury Lane. In 1758 he joined the company of Barry and Woodward to open the Crow Street Theatre, Dublin. His chief rôles were tragic, especially noteworthy being his Cato and Brutus. In 1762 he again appeared in London at the Covent Garden Theatre, but five years later he returned to Dublin. In 1768 he left the stage, and the following year he opened a school at Kensington Gravel-pits in partnership with James Usher, through whose influence he left the Presbyterian for the Roman Catholic church. The school failed after two years, however, and Walker then began to lecture on elocution, and made several tours. His most permanent work was his *Critical Pronouncing Dictionary and Expositor of the English Language* (1791, of which more than 40 editions have been issued). This long remained the standard and is still of interest as giving the pronunciations in vogue at the beginning of the nineteenth century. His other works include *Rhyming Dictionary of the English Language* (1775; revised by J. Longmuir, 1890 and 1904); *Elements of Elocution* (2 vols., 1781; 8th ed., 1838); *Hints for Improvement in the Art of Reading* (1783); *Rhetorical Grammar* (1785; 7th ed., 1823); *Melody of Speaking Delineated* (1789); *Key to the Classical Pronunciation of Greek and Latin Proper Names* (1798; 9th ed., 1833); *Teacher's Assistant in English Composition* (1801–02), reprinted as *English Themes and Essays* (11th ed., 1853); and *Outlines of English Grammar* (1805; 2d ed., 1810).

WALKER, JOHN GRIMES (1835–1907). A United States naval officer, born in Hillsboro, N. H. He graduated at Annapolis in 1856, was promoted lieutenant in 1858, and was instructor in mathematics in the Naval Academy in 1859-60. He served on the *Winona* in Farragut's expedition against New Orleans, was promoted lieutenant commander in July, 1862, and in command of the iron-clad river steamer *Baron de Kalb* participated in the operations against Vicksburg. After the fall of that city he led the expedition up the Yazoo River, and while engaging Confederate batteries his vessel was sunk by a torpedo. He was then transferred to the Atlantic coast, and as commander of the *Shawmut* assisted in the capture of Wilmington in 1865. He was promoted commander in 1866, captain in 1877, and in 1873–78 was secretary of the Lighthouse Board. He became chief of the Bureau of Navigation in 1881 and in 1889 became a commodore. From 1889 till 1893 he commanded the White Squadron, in 1894 was put in command of the Pacific Squadron and was sent to protect American interests in the Sandwich Islands, in the same year was commissioned rear admiral, and in 1897 was retired. In the latter year he was appointed president of the Nicaragua Canal Commission and in 1899 president of the Isthmian Canal Commission.

WALKER, LEROY POPE (1817–84). A Confederate Secretary of War, born at Huntsville, Ala., and educated at the universities of Alabama and Virginia. He was admitted to the bar, was several times a member of the State Legislature, being Speaker of the House in 1847–50, and was judge of the Fourth Circuit Court in 1850–53. In February, 1861, he was made Secretary of War in the Confederate cabinet, but resigned in September. After the fall of Fort Sumter he made a speech in which he is said to have declared that before the war closed the Confederate flag would be flying in triumph over Independence Hall, Philadelphia, and over Faneuil Hall, Boston. This reported official utterance, whether true or not, was taken as a note of defiance and did much to rouse the North. After he resigned he was made a brigadier general, and was for a time in command of Mobile, but in 1862 he retired from the army, and during the remainder of the war served as judge of a military court.

WALKER, MARY E(DWARDS) (1832–). An American physician and dress reformer, born at Oswego, N. Y. She graduated at the Syracuse Medical College in 1855, and practiced at Columbus, Ohio, and later at Rome, N. Y. When the Civil War broke out she became an assistant army surgeon, being the first woman to hold such a commission; for her bravery and services on the field a medal of honor, which she always wore, was awarded to her by Congress. An enthusiastic advocate of woman suffrage, she did much to advance the cause in the United States and in England and claimed to have been the first woman to attempt to vote at the polls. Dr. Walker zealously urged dress reform for women, and during her later life wore male attire habitually. She finally retired to her estate near Oswego, where she founded a hospital for consumptives.

WALKER, ROBERT JAMES (1801–69). An American political leader and financier, born at Northumberland, Pa. He graduated at the University of Pennsylvania in 1819, and began the practice of law at Pittsburg in 1822. In 1826 he removed to Mississippi and became prominent as a lawyer and land speculator. He was active in his opposition to nullification and secession in 1832–33, and through his influence the Legislature passed an act declaring nullification treasonable. In 1835 he was elected United States Senator as a Unionist Democrat, and at once became known as one of the foremost anti-slavery advocates in his party. He is said to have secured great influence over President Tyler, and is credited by some with having been largely instrumental in causing his return to the Democratic party. While in the Senate he opposed the Bank of the United States and the distribution of the surplus, advocated gradual emancipation, and introduced the resolution for Texan independence. From 1845 to 1849 he was Secretary of the Treasury. The tariff bill of 1846, providing for a strictly revenue basis, was adopted almost as it came from his hands, and is known as the "Walker Tariff." In 1853 he declined the post of commissioner to China, and in 1857, against his will, was appointed Governor of Kansas Territory. He resigned in 1858, declaring that he would not help to force slavery upon the Territory. At the beginning of the Civil War he took strong ground in favor of the Union, negotiated a loan in Europe for the United States in 1863–64, and was instrumental in preventing the success of the second Confederate loan. On his return he published a number of articles opposing the impeachment of President Johnson, advocating the Alaska treaty, and favoring the construction of the Pacific Railroad.

WALKER, SEARS COOK (1805–53). An

American astronomer, born in Wilmington, Mass. He graduated at Harvard College (1825), and for some time taught school near Boston. In 1828 he removed to Philadelphia, where he taught till 1835, and afterward became actuary of an insurance company. In 1837 he prepared a plan for an observatory in connection with the Philadelphia high school. In 1845 he was appointed to the Naval Observatory, took charge of the longitude work of the United States Coast Survey (1847), and remained in this department of the United States government. He improved the electric chronograph (q.v.) and made an investigation of the orbit of Neptune.

WALKER, THOMAS LEONARD (1867–). A Canadian geologist. He was born in Peel County, Ontario, and graduated at Queen's University, Kingston, in 1890, and at Leipzig (Ph.D.) in 1895. He was an assistant on the staff of the Canadian geological survey (1890–93); assistant superintendent of the geological survey of India (1897–1902); lecturer in geology at the Presidency College, Calcutta (1898); and in 1902 was appointed professor of mineralogy in Toronto University. While in India he made a scientific expedition across the Himalaya into Tibet. He contributed frequently to scientific periodicals.

WALKER, TIMOTHY (1806–56). An American lawyer, born at Wilmington, Mass. He graduated from Harvard in 1826; taught mathematics for three years; studied in the Harvard Law School (1829–30); and three years later, in association with Judge John C. Wright, he established the Cincinnati Law School, in which he was a professor of law until 1844. He was presiding judge of the Hamilton County Court of Common Pleas (1842–43). He edited the *Western Law Journal* for several years. His lectures on law and his chief work, *An Introduction to American Law*, have always been popular with law students. He died at Cincinnati in 1856.

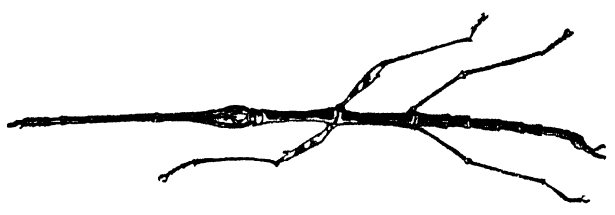
WALKER, WILLIAM (1824–60). An American adventurer and filibuster, born in Nashville, Tenn. He graduated at the University of Nashville in 1838 and was admitted to the bar, after which he studied medicine at Edinburgh and Heidelberg, and later engaged in newspaper work in New Orleans and San Francisco. In the summer of 1853 he organized an expedition for the conquest of the Mexican State of Sonora. He eluded the United States authorities, landed with an armed force at La Paz, in Lower California, in November, captured several towns, proclaimed himself President, and began a march inland. His provisions and ammunition ran short, and to escape falling into the hands of a Mexican force sent against him he crossed into the United States, and surrendered to United States officials at San Diego. He was tried at San Francisco for violation of neutrality, but was acquitted. He next planned an expedition to Nicaragua, then in a state of civil war. He landed at Realejo June 11, 1855, and succeeded in capturing Granada and making an arrangement with General Corral, the President, by which Walker was appointed Secretary of War and commander in chief. The two leaders soon quarreled and Walker had Corral tried for conspiracy and shot. Walker was then in complete control of Nicaragua, of which, after a short and successful war with Costa Rica, he had himself proclaimed President. His rule soon became arbitrary, however, and provoked an insurrection, resulting in his expulsion from Granada. To save himself he surrendered, May 1, 1857, to Commander C. H. Davis of the United States sloop *St. Mary's*, by whom he was conveyed to New Orleans, and put under bonds there to keep the peace. In November, 1857, he was again in Nicaragua with a strong force of Americans and natives, but was again driven from the country. Late in 1858 he started with a force of adventurers for Honduras, but a shipwreck caused him to abandon the expedition. In June, 1860, he made a second attempt, landed at Ruatan on August 15, and captured Truxillo (Trujillo), but was compelled to flee, and subsequently surrendered himself to the captain of the British sloop of war *Icarus*, by whom he was handed over to the Honduran government. He was condemned by court-martial at Truxillo and shot there on Sept. 12, 1860. He wrote *The War in Nicaragua* (1860). Consult also Doubleday, *Reminiscences of the Filibuster War in Nicaragua* (1886), and W. O. Scroggs, *Filibusters and Financiers* (1916).

WALKER, WILLIAM DAVID (1839–). An American Protestant Episcopal bishop, born in New York City. He graduated from Columbia in 1859, and from the General Theological Seminary in 1862, and was vicar of Calvary Chapel, New York City, in 1862–83. Thenceforth he served as Missionary Bishop of North Dakota until 1896, when he was appointed Bishop of Western New York. While in North Dakota he originated the cathedral car, by means of which it was possible to conduct the services of the church at places that could not otherwise be reached. In 1887 he was appointed by the President a member of the United States Board of Indian Commissioners. He served as select preacher to the University of Cambridge and received honorary degrees from Oxford and Columbia universities.

WALKER, WILLIAM HULTZ (1869–). An American chemist. He was born in Pittsburgh, Pa., and graduated in 1890 at Pennsylvania State College and took his Ph.D. at Göttingen (1892). In 1894 he accepted the chair of industrial chemistry at the Massachusetts Institute of Technology, where from 1908 he was also director of the research laboratory of applied chemistry. Walker was a vice president of the International Congress of Applied Chemistry in 1893 and president of the American Electrochemical Society in 1910. The New York Section of the American Chemical Society conferred on him its Nichols medal in 1908. As an authority on industrial chemistry he takes high rank; indeed, he contributed largely to the development of that science in the United States.

WALKER, WILLIAM SIDNEY (1795–1846). A British Shakespearean critic, born at Pembroke, Wales. He graduated at Trinity College, Cambridge, in 1819, and was a fellow of Trinity in 1820–29. During his later years he was at times insane. He published numerous poems and other literary productions, but his great work consisted in his studies of Shakespeare's plays. Part of the results of these studies were published posthumously under the title *Shakespeare's Versification* (1854; 3d ed., 1859). There followed *A Critical Examination of the Text of Shakespeare* (3 vols., 1860). The works are poorly arranged, but they have been invaluable to later commentators, especially as regards points of prosody and syntax.

WALKER, WILLISTON (1860–). An American Church historian, born at Portland, Me. He graduated at Amherst in 1883, and at the Hartford Theological Seminary in 1886; then studied at Leipzig (Ph.D., 1888); and was professor of Church history at Hartford Seminary from 1889 to 1901, when he accepted a similar chair at Yale University. Walker became a contributor to the NEW INTERNATIONAL ENCYCLOPÆDIA. His publications include: *On the Increase of Royal Power under Philip Augustus* (1888); *The Creeds and Platforms of Congregationalism* (1893); *A History of the Congregational Churches in the United States* (1894); *The Reformation* (1900); *Ten New England Leaders* (1901); *John Calvin* (1906); *Great Men of the Christian Church* (1908); *French Trans-Geneva* (1909).



WALKERVILLE. A town in Essex County, Ontario, Canada, on Detroit River, opposite Detroit, Mich., and on the Grand Trunk, Michigan Central, and Canadian Pacific railways (Map: Detroit, F 8). It has important industries, including large distilling plants. Pop., 1901, 1579; 1911, 3302.

WALKING FERN. A small evergreen fern (*Camptosorus rhizophyllus*) which grows in tufts and whose heart-shaped and very tapering leaves often take root at the apex and thus form new plants, hence the popular name. It is a native of eastern North America, but is rather rare. See Colored Plate of FERNS.

WALKING FISH. One of the curious eel-like fishes of the snake-head family (Ophiocephalidæ), numerously represented in the fresh waters of the East Indies and China. They are elongated, reaching in some cases a length of 4 feet, and have a snakelike head covered with shieldlike scales. Their respiratory apparatus is double, as they must be able to breathe air direct, and their habit of occasionally going out upon land has given them the name "walking fish" in India. They are common in tanks and ponds, where they lie at the margin with the head out of water. They breed twice a year, preparing a nest for the eggs, which the male guards, and survive droughts by burying themselves in the mud. Consult Day, *Fauna of India: Fishes* (London, 1889).

WALKING LEAF. See LEAF INSECT; WALKING STICK.

WALKING STICK. An insect of the orthopterous family Phasmidæ, especially one of those forms destitute of wings, in which the body is long, slender, and cylindrical like a small stick, the legs being slender and delicate, and resembling little twigs. Some of the walking

WALKING-STICK INSECT.

sticks proper, which are more abundant in the tropics than elsewhere, reach a length of 9 inches or more. From their resemblance to twigs and leaves, the terms walking leaf and leaf insect (q.v.) are often applied to them. Some slender species look like stems of grass; others resemble bark covered with lichens; others appear mossy. Protective resemblance, in fact, is carried to an extreme—the legs and antennæ, and even their attitudes, enhance the resemblance to vegetable structures. The eggs are strangely shaped and resemble plant seeds, each being surrounded by a capsule. They are dropped loosely on the ground, remaining during winter. The adults are voracious, and are plant feeders throughout their entire growth. A North American species (*Diapheromera femorata*) feeds on the leaves of several trees (especially upon walnuts), and when numerous may cause defoliation. If a leg be cut off beyond the femur and trochanter joint, the parts remaining outside the joint are dropped before the next molt and are afterward renewed either as a straight, short stump or as a miniature leg nearly resembling the normal one. A leg cut off nearer the body is not replaced. Phasmidæ have been found in the fossilized amber, in the Tertiary strata in North America, and in the Carboniferous rocks there occur remains of gigantic insects possibly connected with this group.

WALKLEY, wąk'lĭ, ARTHUR BINGHAM (1855–). An English dramatic critic, born in Bristol, and educated at Balliol and Corpus Christi colleges, Oxford. He held important positions in the British postal service, but it was by his dramatic criticism that he became known over the English-speaking world to all interested in contemporary British dramatic and theatrical activities. He proved himself a sound and scholarly critic in his notices for the London *Times* and in contributions to various journals and reviews. In book form appeared *Playhouse Impressions* (1892); *Frames of Mind* (1894); *Dramatic Criticism* (1903); *Drama and Life* (1907).

WALKÜRE, väl'kų-re, DIE. The second division of Richard Wagner's music drama *Der Ring des Nibelungen* (see RING OF THE NIBELUNGEN). It was first produced in Munich, June 26, 1870; in the United States, April 2, 1877 (New York).

WALKYRIES, väl-kīr'ĭz. See VALKYRIES.

WALL. A vertical structure forming a partition, inclosure or dividing member, or a solid barrier for defense; especially and more generally such a structure built of masonry of stone, brick, or concrete; but the term is also applied, irrespective of material, to the vertical inclosing structure of a wooden house, to its internal partitions of studding, lath and plaster, which form the walls of its rooms; and in anatomy and biology to the partitions and inclosing membranes of the organs of animals and human beings.

In architecture the term connotes either the structure itself or one of its surfaces. Thus the inner face of the outer wall of a building may be the east wall of the drawing room, or south wall of the front chamber, etc. The inclosing wall of a building is its exterior wall; the interior dividing walls are called partitions. The wall dividing two houses in a city block and thus common to both is a party wall, the wall at right angles to the ridge or pitch of the roof is in some cities called a gable wall irrespective of the form of the roof. Retaining walls are massive walls of masonry erected to hold back the earth of an embankment or terrace. A bearing wall is one which supports the beams of a floor or roof. In former times, i.e., previous to 1889, the walls of a building were depended upon to carry the floors and roof, and were built from the foundations up. In modern steel-skeleton construction (q.v.) the

walls of each story are separately supported on steel lintels carried by the posts of the skeleton, and are thus mere screens of brick or stone, about 12 inches thick.

Walls for defense, with gates and towers at intervals, were in ancient days the chief reliance of cities for protection against invasion. Such walls were high and massive, sometimes forming a double or triple circuit with an exterior moat. Those of Troy, Thebes, and Babylon were the most famous in classical antiquity; those of Constantinople, of Avignon, Carcassonne, and Aigues Mortes in France, of Gothenburg in Germany, and of Lucerne in Switzerland, are the finest of mediæval examples now extant. The most colossal of all such walls is the Great Wall of China. See BRICKWORK; BUILDING; CHINESE WALL; MASONRY; MILITARY ARCHITECTURE.

WALLABY, wŏl'ă-bĭ (Australian name). A local name for the small kangaroos of Australia, especially of the genus *Petrogale* (rock kangaroos) and the genus *Macropus* (formerly *Halmaturus*). Some are of large size, but the true wallabies are small. One of the most striking is the black-gloved wallaby (*Macropus irma*), of which Gould said that if its fore feet and the tips of its ears had been carefully dipped in ink they could not be any blacker. The name is not restricted to these genera, however; there are the nail-tailed wallaby, genus *Onythogala*, the hare wallabies (*Lagoschestes*), the banded wallaby (*Lagostrophus*), etc. See Plate of KANGAROOS.

WAL'LACE. A city and the county seat of Shoshone Co., Idaho, 130 miles (direct) east of Spokane, Wash., on the Northern Pacific and the Oregon-Washington Railroad and Navigation Company lines (Map: Idaho, C 2). It is the centre of the Cour d'Alene mining district. Wallace was incorporated in 1892. Pop., 1900, 2265; 1910, 3000.

WALLACE, ALFRED RUSSEL (1823–1913). An English naturalist and philosopher. He was born at Usk, Monmouthshire, and fitted himself for work as a surveyor and engineer. He then became English master in the Collegiate School at Leicester. Interested in botany and insects, he was greatly aroused by Darwin's *Journal*, and other books. Early in 1848 he sailed with H. W. Bates (q.v.) for Pará. In 1850 Bates and Wallace parted company, finding it more convenient to explore separate districts and collect independently. Wallace took the tributaries of the Amazon. He returned to England in 1852, but his collection and notes were lost by shipwreck. *Travels on the Amazon and Rio Negro* (1853; new ed., 1911) is a popular account of these experiences. In 1854 Wallace went to the Malayan Archipelago, where he traveled and collected for eight years from Malacca to New Guinea. He studied the ethnological relations, collected the vocabularies of 75 native dialects, and made numerous measurements of the aboriginal crania, besides studying the habits of the orang-utan and the birds of paradise.

Wallace during his residence at Sarawak wrote in February, 1855, an essay *On the Law Which Has Regulated the Introduction of New Species*, which was published in September, 1855, though he remarks that 10 years previous the idea of such a law suggested itself to him. But beyond vaguely stating that in the method of peopling of the earth the process was gradual, and that no new creation was formed widely differing from anything before existing, the essay only shows that its author was keenly alive to a search for the causes of evolution. But light was shed upon the subject by Malthus's *Essay on Population;* and it was by reading this suggestion that Wallace, like Darwin, hit upon the doctrine of natural selection (q.v.). In February, 1858, while at Ternate, he wrote his famous essay *On the Tendency of Varieties to Depart Indefinitely from the Original Type.* It led to the publication of Darwin's preliminary essay, and the two papers were published in the *Proceedings* of the Linnean Society of London for August, 1858. In this Wallace discusses the nature of varieties, the struggle for existence, perpetuation of species, useful and useless variations, and the partial reversion of domesticated varieties, although he does not use the term "natural selection," which we owe to Darwin. Wallace did no work in the anatomy, embryology, and morphology of animals, but his contributions to bionomics, or the relations of animal life to the world around it, were important.

To Wallace we are indebted for a comprehensive and epoch-making work in zoögeography. Strongly inclined to speculation, he gave in his *Tropical Nature* (1878) and *Island Life* (1880; 3d ed., rev., 1911) many valuable suggestions regarding the effect of geological and climatic changes on animal life. He was apparently for a while a believer in miracles and spirit manifestations. This tendency led him to deny that man's moral and spiritual nature has, like his physical being, been evolved by a natural process. His reputation will mainly rest on his discovery of natural selection. His native amiability and high mindedness of character were shown by his rare self-abnegation of any claim for the discovery of natural selection, and by his uninterrupted friendship with Darwin. Darwin and he differed, however, on the subject of psychic phenomena, which greatly interested Wallace. During the latter part of his life Wallace lived in a rural part of England enjoying a moderate pension from the government, bestowed in recognition of his work in natural history. He died on Nov. 7, 1913.

Wallace's most important works, are, besides the 1858 essay, his epoch-making paper "On the Phenomenon of Variation and Geographical Distribution as Illustrated by the Papilionidæ of the Malayan Region," published in the *Transactions of the Linnean Society of London* (1865); *Contributions to the Theory of Natural Selection* (1870); *The Malay Archipelago* (2 vols., 1869); *The Geographical Distribution of Animals* (2 vols., 1876); *Tropical Nature* (1878); *Darwinism* (1889). Other works are: *Miracles and Modern Spiritualism* (1875); *Land Nationalization: Its Necessity and Its Aims* (1882; 3d ed., 1902); *Australia and New Zealand* (1893); *Studies, Scientific and Social* (1900); *Man's Place in the Universe* (1903; 4th ed., 1904); *My Life: A Record of Events and Opinions* (2 vols., 1905; new ed., 1 vol., 1908); *Is Mars Habitable?* (1907); *The World of Life* (1911); *Social Environment and Moral Progress* (1913); *The Revolt of Democracy* (1914). Consult James Marchant, *Alfred Russel Wallace: Letters and Reminiscences* (2 vols., London, 1916).

WALLACE, CHARLES WILLIAM (1865–). An American Shakespearean scholar, born at Hopkins, Mo. He taught in normal schools in Iowa and Nebraska and graduated in 1898 from

the University of Nebraska, in connection with which a year earlier he had founded a preparatory school. Of the latter he was principal and director until 1900, and thereafter was a member of the English department of the University, becoming associate professor in 1907. He studied at several German universities (Freiburg, Ph.D., 1906) and carried on extensive researches in European archives. Important documents relating to theatrical conditions in Shakespeare's time, discovered by him especially in the Public Record Office in London, aroused great interest among scholars. These documents formed the basis of Wallace's books: *The Children of the Chapel at Blackfriars, 1579–1603* (1908); *Three London Theatres of Shakespeare's Time* (1909); *Shakespeare and his London Associates as Revealed in Recently Discovered Documents* (1910); *The Evolution of the English Drama up to Shakespeare* (1912); *The First London Theatre, Materials for a History* (1913).

WALLACE, Sir Donald Mackenzie (1841–). A British journalist and author, born at Boghead, Dumbartonshire, Scotland, and educated at the universities of Berlin and Heidelberg, and at the Ecole de Droit, Paris. After long residence and much travel abroad (1863–84), especially in France, Germany, Russia, and Turkey, he served as private secretary to two viceroys of India—the Marquis of Dufferin and then to the Marquis of Lansdowne. On his return to London, the direction of the foreign department of the *Times* was in his hands from 1891 to 1899. Wallace edited the tenth edition of the *Encyclopædia Britannica*. He was made K.C.I.E. in 1887, and K.C.V.O. in 1901, and became a member of the Institut de Droit International. From his pen came: *Russia* (1877; revised and enlarged eds., 1905 and 1912); *Egypt and the Egyptian Question* (1883); *The Web of Empire* (1902).

WALLACE, Horace Binney (1817–51). An American jurist. He was born in Philadelphia, was educated at the University of Pennsylvania and at Princeton, where he graduated in 1835; studied both medicine and law, but never engaged in active practice. With Judge Hare he edited *American Leading Cases; Smith's Leading Cases; White and Tudor's Leading Cases in Equity; British Crown Cases Reserved;* he published a novel, *Stanley, or Recollections of a Man of the World,* and several works of travel. In 1851 he became afflicted with a brain disease and committed suicide.

WALLACE, John Findley (1852–). An American civil engineer, born at Fall River, Mass. He graduated C.E. from the University of Wooster in 1882, but had earlier been employed in government improvements on the Mississippi River and in railroad work. From 1891 he served with the Illinois Central, of which he was general manager in 1901–04. Wallace was the first American chief engineer of the Panama Canal (1904), and served as Isthmian Canal commissioner, and as vice president and general manager of the Panama Railroad and Steamship Company (1905). After 1906 he was identified with important corporations. He designed and constructed the World's Fair terminals at Chicago in 1892, and the new passenger terminal in the same city for the Chicago and Northwestern Railroad. He served as president of the American Society of Civil Engineers (1900) and of the American Railway Engineering Association.

WALLACE, John William (1815–84). An American lawyer, law reporter, and author, the son of John Bradford Wallace, a prominent lawyer of Philadelphia. He was born in Philadelphia, Pa., graduated at the University of Pennsylvania in 1833, and studied law in his father's office and at the Inner Temple in London. In 1844 he became standing master in chancery in the Pennsylvania Supreme Court, was reporter of the Third Circuit of the United States Circuit Court from 1842 to 1853, and from 1863 to 1876 was reporter of the United States Supreme Court. From 1860 to 1884 he was president of the Pennsylvania Historical Society. He published: *Reporters, Chronologically Arranged, with Occasional Remarks upon Their Respective Merits* (1843); *Cases, Argued and Abridged, in the United States Supreme Court* (23 vols., 1864–76); and *An Old Philadelphian, Colonel William Bradford of 1776* (1884); and edited *British Crown Cases Reserved* (1839–53).

WALLACE, Lewis (1827–1905). An American soldier and novelist, known as Lew Wallace. He was born in Brookville, Ind. He studied law in Indiana, served in the Mexican War, and then practiced law until the Civil War. He served as colonel of a regiment of Indiana volunteers in West Virginia in 1861, and on Sept. 3, 1861, was promoted to the rank of brigadier general of volunteers. He distinguished himself at Shiloh and at Corinth, and in 1863 superintended the construction of defenses at Cincinnati, saving the city from capture by Gen. E. K. Smith. Subsequently he commanded the Middle Department and the Eighth Army Corps, and in 1864, although defeated by a superior force, delayed the advance of Gen. Jubal A. Early (q.v.) at Monocacy. He was president of two courts of inquiry (see Buell, D. C.; Andersonville, Ga.) and was a member of the court which tried the Lincoln conspirators. On retiring from the army in 1865 General Wallace resumed the practice of law in Indiana, and was Governor of New Mexico (1878–81) and United States Minister to Turkey (1881–85). Among his novels *The Fair God* (1873) and *The Prince of India* (1893) were fairly successful, while *Ben Hur* (1880), a story of Palestine and Rome in the time of Christ, achieved a remarkable success and was dramatized (1899). His autobiography was published in 1906.

WALLACE, Sir Richard (1818–90). An English art collector and philanthropist. He was born in London, and was probably the natural son of Maria, Marchioness of Hertford, though during his lifetime he was reputed to be her grandson. He was educated chiefly in Paris, where the greater part of his life was passed. He was known as an art connoisseur and was much beloved on account of his many benefactions during the Franco-Prussian War. In 1870 he inherited the property and the priceless art collection of the fourth Marquis of Hertford, and on the death of Sir Richard's wife in 1897, this collection was bequeathed to the British nation, and housed in Hertford House, London, as the Wallace collection.

WALLACE, Robert (1853–). A Scottish agriculturist, born in Glencairn, Dumfriesshire, and educated at Edinburgh University. He was professor of agriculture at the Royal Agricultural College, Cirencester, from 1882 to 1885, and thereafter professor of agriculture and rural economy in the University of Edinburgh,

serving also from 1900 as Garton lecturer on colonial and Indian agriculture. He traveled extensively, frequently in an official or advisory capacity, and studying the agriculture of various countries. The results of these studies are embodied in reports and in volumes of travels. Wallace, who came to be recognized as an expert in his field, was active in promoting agricultural education in Scotland. His principal writings are: *Farm Live Stock of Great Britain* (1885; 4th ed., 1907); *Indian Agriculture* (1888); *The Agriculture and Rural Economy of Australia and New Zealand* (1891); *Farming Industries of Cape Colony* (1896); *British Breeds of Live Stock* (1910; 1913).

WALLACE, Sir William (c.1270–1305). A Scottish patriot. He was the second son of Sir Malcolm Wallace, a small landed proprietor. His biographer, Blind Harry, who lived 200 years later, had access to sources now lost and gives a very full account of the hero; but unfortunately his statements are in some cases self-contradictory, and in many cases improbable. According to this writer Wallace in his youth performed prodigious feats of valor in killing Englishmen. His first authentic appearance was in May, 1297. John de Warenne was then ruling Scotland, as the representative of Edward I of England, and English sheriffs were placed over many of the shires. At the head of a band of about 30 men Wallace burned Lanark and killed the English sheriff. Many of the Scotch joined his band, which he quickly formed into a well-disciplined army. He plundered Scone, drove out English priests and friars who held Scottish benefices, and after ravaging much of the country laid siege to Dundee. An English army of over 50,000 was sent against him. At Stirling Bridge, Sept. 11, 1297, Wallace, who had a considerably smaller army, won a great victory. Edinburgh and Stirling soon fell into his power; Roxburgh, Haddington, and other towns were burned. His success was so complete that before October 18 he was invading England. He harried Northumberland, Westmoreland, and Cumberland and returned to Scotland about the end of the year. For a few months he was generally recognized as guardian of the realm. In the meantime Edward I was preparing to reconquer Scotland. On July 22, 1298, he inflicted a crushing defeat upon Wallace at the battle of Falkirk (q.v.). At least 10,000 Scots were killed and Wallace was forced to retreat. From this time we have little knowledge of his actions. He resigned the office of guardian, went to France to seek aid, and may have gone to Rome, but the last is uncertain, as his movements from 1299 to 1303 cannot be traced. In the summer of 1304 it is certain that he was again fighting against Edward; he was especially excluded from the general amnesty offered to the other leaders, and was outlawed. After many attempts to capture him had failed, he was taken by Sir John de Menteith in 1305. On August 23 he was placed on trial in Westminster Hall. He was convicted the same day and condemned to be hanged, drawn, beheaded, and quartered. The sentence was executed on the following day. Blind Harry's *Life of Wallace* has been edited frequently. The best editions are by Jameson (Edinburgh, 1820) and Moir (Scottish Text Society, Edinburgh, 1885–89). Consult: P. F. Tytler, *History of Scotland*, vol. i (Edinburgh, 1866); James Moir, *Sir William Wallace* (Aberdeen, 1886); A. W. Murison, *Sir William Wallace* (Edinburgh, 1898). G. R. Pauli, in his *Geschichte Englands* (Hamburg, 1853), gives a good account of Wallace's services to Scotland.

WALLACE, William (1844–97). A British philosopher, born at Cupar-Fife, Scotland. Educated at the University of St. Andrews and at Balliol College, Oxford, he became a fellow of Merton College in 1867. Appointed tutor at Merton in 1868 and Whyte professor of moral philosophy at Oxford in 1882, he held both offices until his death. His works include: *The Logic of Hegel* (1874; 2d ed., 1894), a translation from Hegel's *Encyclopædia of Philosophical Sciences; Epicureanism* (1880); *Kant* (1882; reprint, 1899); *The Life of Arthur Schopenhauer* (1890); *Lectures and Essays on Natural Theology and Ethics* (1898).

WALLACE, William (1860–). A British composer, born at Greenock, Scotland. He studied ophthalmic surgery in Vienna and Glasgow, but later in 1889 entered the Royal Academy of Music in London, where he spent two terms. From the very beginning his compositions, almost exclusively in the larger forms, attracted attention. His principal works include six symphonic poems, *The Passing of Beatrice* (1892), *Amboss oder Hammer* (1896), *Sister Helen* (1899), *Greeting to the New Century* (1901), *Sir William Wallace* (1905), *François Villon* (1909); a symphony, *The Creation* (1899); a choral symphony, *Koheleth* (MS.); an orchestral suite, *Pelléas et Mélisande* (1900); several cantatas, chamber music, and two song cycles. He wrote *The Musical Faculty, its Origins and Processes* (1914).

WALLACE, William Vincent (1813–65). An Irish musician and operatic composer, born at Waterford. After being for some years leader of the orchestra of a Dublin theatre, he emigrated to Australia, and subsequently gave successful concerts there, as also in New Zealand, India, and America. In 1845 he went to England, and wrote his first opera, *Maritana*, which was an immediate success both in London and Vienna. *Matilda of Hungary* followed in 1847. During a sojourn of some years in Germany Wallace continued his musical studies; and after again visiting North and South America composed *Lurline*, which was brought out in London in 1860, with even greater success than *Maritana*. In 1861 he produced *The Amber Witch;* in 1862, *Love's Triumph;* and in 1863, the *Desert Flower*. Wallace died at the Château de Bages, in the south of France, leaving another opera, *Estrella*, nearly completed. Consult W. H. Grattan-Flood, *William Vincent Wallace* (London, 1912).

WALLACEBURG. A town in Kent Co., Ontario, Canada, on the Sydenham River and on the Pere Marquette, Grand Trunk, and Canadian Pacific railways (Map: Ontario, C 8). It has a variety of manufactures. Pop., 1901, 2763; 1911, 3438.

WALLACH, väl'ăḫ, Otto (1847–). A German chemist. He was born in Königsberg, Prussia, and studied chemistry at the universities of Göttingen and Berlin (Ph.D., 1869). He was professor of chemistry at Bonn from 1876 to 1889, and thereafter professor in and director of the Chemical Institute at the University of Göttingen. Wallach became a member of the Royal Academy of Sciences and a Privy Councilor, and in 1910 received the Nobel prize in chemistry for his researches on the constitu-

tion of organic compounds, especially of the camphors and related substances. His studies on the constitution of ethereal oils and perfumes have resulted in important advances in the industries concerned with their artificial production. In addition to his many scientific papers he is the author of *Hülfstafeln für den chemisch-analytischen Unterricht* (1889); *Tabellen zur chemischen Analyse* (3d ed., 1898); *Forschung und Lehre in der Chemie* (1899); *Terpene und Camphor* (1909).

WALLACHIA, wŏl-lā'kĭ-ȧ. A former principality of Europe, now forming the southwestern part of Rumania (q.v.). It is bounded by the Transylvanian Alps, Moldavia (on the northeast), and the Danube, and is divided by the Aluta, a tributary of the Danube, into Great Wallachia on the east and Little Wallachia on the west (Map: Balkan Peninsula, E 2). Total area, 29,915 square miles. Pop., 1912, 4,712,291. The principal city is Bucharest. See RUMANIA.

WALLACHS, wŏl'lăks. See RUMANIA; RUMANIAN LANGUAGE; RUMANIAN LITERATURE.

WALLACK, JAMES WILLIAM (?1794–1864). A well-known actor and manager, born in London. He was of a theatrical family, and when quite young became a member of the company at Drury Lane, supporting Elliston, Edmund Kean, and others. In 1818 he made his first appearance in the United States as Macbeth at the Park Theatre, New York, and for a number of years he divided his time between England and America. During several years he was stage manager at Drury Lane. In 1852, having finally settled in the United States, he took control of the first theatre known as Wallack's, at Broadway and Broome Street, New York. In 1861 he built the second Wallack's Theatre, at Broadway and Thirteenth Street, of which his son John Lester Wallack became the manager. As an actor Wallack was at his best in comedy and in romantic parts, such as Rolla in *Pizarro* and Don Cæsar de Bazan. Consult: *A Sketch of the Life of James William Wallack, Late Actor and Manager* (New York, 1865); Lester Wallack, *Memories of Fifty Years* (ib., 1889); William Winter, *The Wallet of Time*, vol. i (ib., 1913).

WALLACK, (JOHN) LESTER (1820–88). An American actor, the son of James William Wallack. His real name was John Johnstone Wallack. He was educated in England for the British army. After having left the army for the theatre he came to America in 1847, making his first appearance as Sir Charles Coldstream in *Used Up*. In 1852 he became stage manager at his father's theatre. In 1882 he opened the third and last Wallack's Theatre, at Broadway and Thirtieth Street, New York, which he conducted with great liberality and much artistic success, many famous stars appearing there. This theatre passed in 1887 under the management of Henry E. Abbey, and from 1888 to 1896 it was known as Palmer's Theatre (owned by A. M. Palmer, q.v.). Afterward, till it was torn down in 1915, it was again called Wallack's. Lester Wallack himself was a very popular actor, especially in comedy. His Charles Surface and his Benedick were admirable, and in several melodramatic rôles he was extremely successful. He was the author of several plays, of which *Rosedale* is best known. He died at Stamford, Conn. Consult his *Memories of Fifty Years* (New York, 1889) and M. J. Moses, *Famous Actor-Families in America* (ib., 1906).

WAL'LAROO' (Australian name). A well-known kangaroo (*Macropus robustus*) of Queensland and southward, which is of large size and robust form, and has long, thick, smoky gray fur. See Plate of KANGAROOS.

WALLAS, wŏl'ȧs, GRAHAM (1858–). An English economist, born at Sunderland. He attended Corpus Christi College, Oxford, in 1877–81, was a classical schoolmaster in 1881–90, and thereafter was an extension lecturer of the university, and after 1896 lectured also at the London School of Economics. He was a member of the London School Board from 1894 to 1904, and in 1904–07 a member of the London County Council, on whose education committee he served in 1908–10. After 1912 he was a member of the Royal Commission on Civil Service. In 1914 he held the chair of political science at London University, and in that year was also Lowell Lecturer in Boston. A member of the Fabian Society from 1886 to 1904, he published one of the *Fabian Essays* in 1889. His writings include also: *Life of Francis Place* (1898); *Human Nature in Politics* (1909; Ger. trans., 1911); *The Great Society* (1914).

WALLASCHEK, väl'läs-chĕk, RICHARD (1860–). An Austrian musical scholar, born at Brünn, Moravia. He studied jurisprudence and philosophy at Vienna, Heidelberg, and Tübingen, became privatdocent at Freiburg in 1886, and the same year published his *Aesthetik der Tonkunst*. The results of his study (1890–95) of the manuscripts in the British Museum he published in his books, *On the Origin of Music* (1891) and *Primitive Music* (1893; enlarged as *Anfänge der Tonkunst*, 1903). In 1896 he was appointed instructor in musicology at the University of Vienna and subsequently became professor. In 1900–02 he lectured on æsthetics at the Vienna Conservatory. Important works other than those mentioned are: *Anfänge unseres Musiksystems* (1897), *Urgeschichte der Saiteninstrumente* (1898), *Geschichte der Wiener Hofoper* (1907–08).

WALLASEY, wŏl'lȧ-sȧ. A manufacturing town in Cheshire, England, on the west bank of the Mersey estuary, 4 miles west of Liverpool. It is practically a suburb of Birkenhead (q.v.), and its chief feature is its immense dock formed from a former marsh called Wallasey Pool. Another notable feature is the Wallasey embankment, which prevents the inroads of the sea on the peninsula. Pop., 1901, 53,580; 1911, 78,514.

WALLAWALLA, wŏl'lȧ-wŏl'lȧ (rushing water, or many waters). A tribe of Shahaptian stock (q.v.) formerly occupying the territory about the river of the same name and the adjacent banks of the Columbia, in Washington and Oregon, and since 1855 associated with the Cayuse and Umatilla upon the Umatilla Reservation, Oregon. They were visited by Lewis and Clark in 1804 and were Christianized by Jesuit missionaries about 40 years later. They lived originally by fish, roots, and game, but are now fairly prosperous farmers and stock raisers, with a population of 397.

WAL'LA WAL'LA. A city and the county seat of Walla Walla Co., Wash., about 200 miles south by west of Spokane; on Mill Creek and on the Northern Pacific, the Walla Walla Valley, and the Oregon-Washington Railroad and Navigation Company lines (Map: Washington, G 4). It is an educational centre, having Whitman and Walla Walla colleges, St. Paul's School,

St. Vincent's Academy, De La Salle Institute, and the Empire Business College. The manufactures are agricultural implements, beer, cigars, flour, leather, saddletrees, ice, threshing machines, artificial stone, brick, candy, sashes, doors, and blinds. A United States land office, United States District and Circuit Courts, Fort Walla Walla, a four-troop cavalry post, and the State penitentiary are situated here. Other prominent features are, a modern opera house, a Carnegie library, a fine Y. M. C. A. building, two modern hospitals, the State Odd Fellows' Home, and the Stubblefield Home for Widows and Orphans. A military post was established here in 1856 and the settlement which grew up about it was at first called Steptoe City. In 1868 it was chartered under the present name. Walla Walla has adopted the commission form of government. Pop., 1900, 10,049; 1910, 19,364; 1915 (U. S. est.), 24,205.

WALL CREEPER. The Alpine wall creeper (*Tichodroma muraria*) is a beautiful little bird of the creeper family (Certhiidæ), which is found from the European Alps along the mountain ranges to the Himalaya. During the summer months it makes its home among precipitous rocks, fluttering about the faces of cliffs with queer butterfly movements, and darting hither and thither like a humming bird. Its resemblance to the latter is enhanced by the very long, straight, slender bill, with which it probes the crevices and cracks of the rocks in search of the spiders and flies upon which it lives. Its colors are gay, but its song is insignificant. See illustration on Plate of CREEPERS.

WALLENSTEIN, wŏl'*e*n-stīn; *Ger. pron.* väl'*e*n-shtīn (originally WALD- and WALDENSTEIN), ALBERT EUSEBIUS WENZEL VON, Duke of Friedland, Sagan, and Mecklenburg (1583–1634). An Imperialist general in the Thirty Years' War. He was the third son of a noble though not wealthy Bohemian family, and was born at Hermanic, in Bohemia, Sept. 24, 1583. His parents, who were Protestants, intrusted his education to the Moravian Brotherhood of Koschumberg, who made little of their stubborn and passionate pupil. On his parents' death his uncle, Albert Slavata, a Catholic, took charge of him, and, having won him to his own creed, sent him to the Jesuit convictorium at Olmütz, and to the universities of Altdorf, Bologna, and Padua, where his education was completed. He traveled in Germany, France, and Holland, took service in the Imperial army, fought against the Turks in Hungary, and, returning in 1606, married a widow of noble rank, who at her death in 1614 left him all her wealth. This, with his uncle's estates, made him one of the richest and most influential noblemen of Bohemia. In 1617 he raised a volunteer corps with which he fought for the Hapsburg cause against Venice, and he was made a count of the Empire and colonel in the Imperial army. Upon the outbreak of the Bohemian Revolution in 1618 he sent a regiment to the aid of the Emperor, and after the battle of the White Hill near Prague (1620) acquired possession at slight values of 60 confiscated lordships in Bohemia. In 1623 he married a daughter of Count Harrach, of great influence at the Imperial court, and was created Duke of Friedland. Two years after, when the King of Denmark, Christian IV, took up arms for the Protestants against the Emperor, Wallenstein offered to raise, equip, and maintain 20,000 men, provided he were intrusted with absolute command, and might appoint his own officers, a proposal accepted by the Emperor. Wallenstein brought to Bohemia adventurers from all quarters, men who knew his service meant ample booty, and soon his army far exceeded the 20,000. With this array he marched into north Germany, and, acting with Tilly (q.v.), routed Mansfeld at Dessau (April 25, 1626), pursued him through Silesia and Moravia, and on his junction with the army of Bethlen Gábor in Hungary, compelled, by strategy, the combined forces to remain on the defensive. Released by a truce with the Transylvanian Prince and the death of Mansfeld, he returned by way of Silesia, recovered the fortresses which Thurn had captured, forced the Elector of Brandenburg to submit to the Emperor, and joined Tilly in annihilating the military power of Denmark.

The value of Wallenstein's services caused the Emperor to overlook the complaints of the princes whose possessions suffered greatly from the rapacity and license which his soldiers were allowed to exercise. Wallenstein was rewarded with the Mecklenburg duchies, the rank of generalissimo on land, and admiral of the Baltic. He made himself master of his new territory; fitted out a fleet, and captured Usedom and Rügen, with various Baltic ports, and laid siege to Stralsund, but failed before the heroic resistance of its inhabitants. His arrogance grew with his success and aroused the enmity of a powerful party at court. The Catholic League, headed by the Duke of Bavaria, became his adversary, and, backed by the intrigues of France, induced the Emperor to dismiss Wallenstein in 1630. Wallenstein obeyed and went into retirement, waiting for the day when he would be again needed. He lived in magnificent state at Prague, but spent much time scheming for revenge All the while he kept a watch over affairs in Vienna. The death of Tilly (April, 1631) and the advance of Gustavus Adolphus towards the hereditary Austrian dominions made it necessary for him to be recalled, and after pretense of indifference he consented to take the field on condition that he be given absolute command over the Imperial forces with power of negotiating and, at need, of concluding peace. With the Swedes on the Danube, the Saxons in Bohemia, and the army of the League almost annihilated, the Emperor had no choice: Wallenstein within three months was at the head of 40,000 men, well armed and disciplined. Commands and entreaties were in vain employed to induce him to save Bavaria from the Swedes; but in July, 1632, he moved against Gustavus Adolphus, who was intrenched in Nuremberg. There Wallenstein fortified himself, and for more than two months the armies confronted each other, an attack by the Swedes on Wallenstein's lines (September 3) being repulsed with heavy loss. At last Gustavus retreated to the Danube, whence his skillful opponent soon drew him by marching on Saxony. They confronted each other at Lützen (q.v.), where a great battle was fought in which the Swedes gained the advantage, though at the price of the death of their King (Nov. 16, 1632).

Wallenstein now set out upon a course of action entirely independent of the Emperor, and early in 1633 entered into negotiations with Sweden, Saxony, and France, whether with treasonable designs against the Emperor (his

enemies charged him with aspiring after the Bohemian crown) or for the purpose of deceiving the enemy, has not been definitely determined. Suddenly breaking off negotiations, he renewed the struggle against Saxony and Brandenburg; but this did not prevent his opponents from spurring on the Emperor to remove him. In winter quarters at Bohemia Wallenstein was aware of the progress of the intrigues, and he sought to attach the officers of his army to himself by causing them to pledge absolute obedience to him. His enemies finally carried the day, and in February an Imperial edict removed him from his command on the ground of conspiracy. A number of his officers had been gained over to the Imperial side, chief among whom were Piccolomini and Gallas (qq.v.), to the latter of whom the command of the army was transferred. Wallenstein now removed from his headquarters at Pilsen to Eger, for the purpose of establishing communication with the Swedish army under Bernhard of Weimar. On the way to Eger he was joined by Colonel Butler, commander of a regiment of dragoons, to whom had been intrusted the task of seizing the person of Wallenstein. No opportunity offered for the execution of the plan until the arrival at Eger, where, with two other Scottish officers, Gordon and Leslie, Butler determined upon the assassination of the great general. On the night of February 25 an Irish officer named Devereux with a number of soldiers broke into the house where Wallenstein had his quarters and slew him with a pike thrust in the breast. His estates were confiscated by the Emperor. Wallenstein had much of the ability of the statesman as well as the soldier. He was more liberal than his age and tolerant in religious matters, having no convictions of his own. He was unscrupulous, and his ability was curiously affected by a superstitious faith in astrology, which he had studied deeply in Italy.

Bibliography. There is a large amount of literature, both history and fiction, relating to Wallenstein. Much of it is controversial. Schmid, "Die Wallensteinlitteratur," in *Mitteilungen des Vereins für Geschichte der Deutschen in Böhmen* (Prague, 1879, 1883, 1885, 1896, 1902), mentions 1865 titles. Consult: Ranke, *Geschichte Wallensteins* (Leipzig, 1880), the classic biography; Förster, *Briefe Wallensteins* (Berlin, 1828–29); id., *Albrecht von Wallenstein* (Potsdam, 1834); id., *Wallensteins Prozess* (ib., 1844); Sarasin, *La conspiration de Waldstein* (Paris, 1853); T. Baaster, *Wallenstein als Student* (Nuremberg, 1860); Hallwich, *Wallensteins Ende, ungedruckte Briefe und Akten* (ib., 1879); Gindely, *Waldstein während seines ersten Generalats, 1625–30* (Prague, 1886); and a reply to Hallwich, *Zur Beurtheilung des k. Generals A. von Waldstein* (ib., 1887); Bilek, *Beiträge zur Geschichte Wallensteins* (ib., 1886); Wittich, "Zur Geschichte Wallensteins," in Sybel's *Historische Zeitschrift* (1892–93); Vetter, *Wallenstein in der dramatischen Dichtung* (Frauenfeld, 1894); F. Stieve, *Wallensteins Uebertritt zum Katholizismus* (Munich, 1897); P. Schreiser, *Die Wallenstein-Fraze* (Zurich, 1899). See THIRTY YEARS' WAR.

WALLENSTEIN TRILOGY. A name applied to three famous plays by Schiller based on the career of the Austrian General Wallenstein. The newly built theatre at Weimar was opened with *Wallensteins Lager* (Wallenstein's Camp) on Oct. 12, 1798; *Die Piccolomini* (q.v.) was presented on Jan. 30, 1799, and *Wallensteins Tod* (Wallenstein's Death) on April 20, 1799.

WALLER, wŏl'lẽr, EDMUND (1606–87). An English poet, born at Coleshill, in Buckinghamshire. He was sent to Eton, and thence to King's College, Cambridge (1620), but seems to have left the university without a degree. In 1622 he was a student of Lincoln's Inn. It appears that at the age of 18 (perhaps earlier) he obtained a seat in Parliament for Amersham. After the death (1634) of his first wife, Anne Banks, Waller courted Dorothy Sidney, eldest daughter of the second Earl of Leicester, whom he commemorated in verse under the name of Sacharissa. In the Long Parliament Waller joined the party of his cousin Hampden, but when the attack was made on Strafford and the episcopacy (1641) he began to move towards the Royalist side and was soon won over. In 1643 he was appointed by Parliament one of the commissioners to negotiate with King Charles, then at Oxford. On this occasion he was drawn into a plot to secure the city of London for the King. He seems to have turned informer to save his own life, and some of his colleagues were hanged, he himself escaping with a fine of £10,000 and banishment from the kingdom (1644). After an exile of seven years, spent mostly in France, Waller was pardoned. Returning to England, he now gave his support to the Commonwealth, and was subsequently appointed a commissioner of trade (1655). After the Restoration he was elected to Parliament for Hastings (1661), and continued a member down to his death. The last volume of his verse to appear in his lifetime was *Divine Poems* (1685). He died at Beaconsfield, Buckinghamshire. Three editions of his collected poems appeared in 1645, and new editions with added poems were frequent after the Restoration. The heroic couplet he reduced to an art, and used extensively. Waller's poetry as a whole has long since ceased to interest a wide public, but he lives by a few perfect little poems, such as the song beginning "Go, lovely rose," and the lines "On a Girdle." Consult his *Poems*, edited by J. T. Drury (Muses' Library, London, 1893); E. A. Gosse, *Seventeenth Century Studies* (new ed., ib., 1897); Samuel Johnson, *Lives of the British Poets*, edited by G. B. Hill, vol. i (ib., 1905).

WALLER, FRANK (1842–). An American architect and artist. He was born in New York City and in 1870 went to Rome, studying under John Chapman for a year. The year following he traveled in Egypt, making many studies and sketches. He was one of the incorporators of the Art Students' League and was its first president (1875). From 1888 he devoted himself to architecture in New York. He wrote *Report on Art Schools* (1879) for the Art Students' League, and the first report of the League (1886).

WALLER, LEWIS (1860–1915). English actor-manager, born at Bilbao, Spain. He was educated for a commercial career and for five years was employed in his uncle's London office. His first appearance on the professional stage was at Toole's Theatre, London, in 1883, but prior to this he had acted frequently as an amateur. During the next 10 years he played a wide range of parts, both in the London theatres and in the provinces, and by hard work forged his way to the front rank of his

profession. In 1895 he was associated with Sir Charles Wyndham (q.v.) in the production of *The Home Secretary*, and under Sir Herbert Beerbohm Tree's (q.v.) management played in *The Three Musketeers*. In the same year he assumed the management of the Shaftesbury Theatre. During the next decade he managed the Lyceum, the Comedy, the Lyric, the Imperial and other theatres for short periods, producing and appearing in many of the most successful plays of the time. His best-known rôle was Monsieur Beaucaire in Booth Tarkington's play of that name, which at the first production ran for over 400 nights and afterward was revived innumerable times. Waller visited America for the first time in 1911, appearing at the Century Theatre in *The Garden of Allah* and later at Daly's, of which he had assumed the management, in a revival of *Monsieur Beaucaire*. One of his notable impersonations was that of the Shakespearean Richard III, presented in New York in 1913. His wife (died 1912), who before her marriage was Florence West, was an actress of high abilities.

WALLER, SIR WILLIAM (c.1597–1668). A parliamentary general, son of Sir Thomas Waller, lieutenant of Dover. He studied at Magdalen Hall, Oxford, and became a soldier of fortune. In 1640 he was elected to the Long Parliament as a member of the popular party. When the English Civil War began he entered the parliamentary army as colonel of a regiment of horse and gained numerous successes, but was defeated at Roundway Down in July, 1643. He was given another army and gained several successes, but in June, 1644, was defeated by King Charles at Cropredy Bridge. In the early part of 1645 he led the expedition for the relief of Taunton. The Self-Denying Ordinance (q.v.), which forbade members of Parliament to hold a command in the army, put an end to his military career, and he then became one of the Presbyterian leaders in Parliament, gained the enmity of the army, and in 1647 fled to France. Returning to England, he supported the proposed treaty with the King, and in December, 1648, was imprisoned on a charge of having instigated the Scots to invade England. He was later active in negotiating for the return of Charles II; in February, 1660, sat in the Long Parliament; was a member of the last council of state; promoted the calling of a free Parliament; and sat in the Convention. A *Vindication of the Character and Conduct of Sir William Waller*, written by himself, was published posthumously in 1797.

WALL-EYED PIKE. See PIKE PERCH; and Plate of PERCHES OF NORTH AMERICA.

WALL-EYED POLLACK. See POLLACK.

WALLFLOWER (*Cheiranthus*). A genus of herbs or shrubby biennials and perennials of the family Cruciferæ, characterized by racemes of rather large yellow or purple flowers. The common wallflower (*Cheiranthus cheiri*), a native of Europe, which occurs in rocky places and on old walls, is frequently grown for ornamenting such places. In the wild state its flowers are always yellow, but the numerous cultivated varieties are diversely colored. In the north, where it is not hardy, it is grown as a house plant. The double varieties are especially ornamental. *Cheiranthus semperflorens* is a north African perennial producing yellow and white flowers at different periods of the year. It requires a dry, sheltered place in winter. Wallflowers thrive best in a rather dry gravelly soil. They are propagated by seeds and cuttings. The plants flower the second season at the north.

WALLFLOWER (*Cheiranthus cheiri*).

WALLICH, väl'lĭk, NATHANIEL (1786–1854). A British naturalist, born at Copenhagen, Denmark. He studied medicine in his native city, and in 1807 became surgeon to the Danish settlement of Serampore, in India. When the English captured that settlement in 1813, he entered the service of the East India Company, and in 1815 became superintendent of the Calcutta botanical garden. He explored Nepal, the forests of western Hindustan and those of Ava and Lower Burma; in 1828 took to England more than 8000 specimens of plants; and after returning to India explored Assam and other places. His published works include: *Testamen Floræ Nepalensis Illustratæ* (1824–26); *A Numerical List of Dried Specimens of Plants in the East India Company's Museum* (1828); and *Plantæ Asiaticæ Rariores* (3 vols., 1830–32).

WALLIN, väl-lēn', JOHAN OLOF (1779–1839). A Swedish poet and archbishop, born in Dalarna. He entered the ministry, and in 1837 he was made Archbishop of Upsala. Early in life he began to write poetry, and first obtained general recognition in 1815 through the didactic poem *Uppfostraren* (the educator), which was awarded the highest prize by the Academy. On account of his great success in writing hymns he was called by Tegnér "David's Harp of the North." His *Psalmbok*, of which 128 hymns were his own, was authorized as the hymn book of the country in 1819 and is still in use. His other poems include: "George Washington," "Gustavus III," "Hemsjukan," and "Dödens ängel." A collection of his poetical works was published at Stockholm in 1848.

WALLING, wąl'ĭng, WILLIAM ENGLISH (1877–). An American Socialist writer, born at Louisville, Ky. He graduated from the University of Chicago in 1897, was a factory inspector in Illinois in 1900–01, and resided at the University Settlement, New York, in 1902–05. He became a director of the National Association for the Advancement of the Colored

People, and a member of the executive committee of the Intercollegiate Socialist Society, was a director of the *New Review* and a contributing editor to the *Masses*. Besides contributing to the *Independent*, the *Outlook*, *Collier's*, and other periodicals he wrote: *Russia's Message* (1908); *Socialism as It Is* (1912); *The Larger Aspects of Socialism* (1913); *Progressivism and After* (1914); and edited *The Socialists and the War* (1915) and *The Socialism of To-Day* 1916). His wife, ANNA STRUNSKY WALLING, also became identified with Socialistic work. She wrote *Violette of Père Lachaise* (1915).

WALLINGFORD, wŏl'ĭng-fērd. A borough in a town of the same name in New Haven Co., Conn., 12 miles north by east of New Haven, on the Quinnipiac River and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, D 4). It has a public library, a sanitarium, fine high-school and post-office buildings, and a Masonic Home. The most important manufactured products are sterling silver goods, plated ware, insulated wire, brassware, celluloid novelties, hardware, and iron and brass bedsteads. In 1670 Wallingford was incorporated by Connecticut and settled by 100 planters from New Haven. The Wallingford Community was organized in 1851, near the town, on the model of Oneida Community (q.v.). Pop., 1900, 6737; 1910, 8690; 1915 (U. S. est.), 9719. Consult Davis, *History of Wallingford* (Meriden, 1870).

WALLINGTON. A borough in Bergen Co., N. J., 9 miles north of Newark. The chief industries are represented by chemical works, a handkerchief factory, and a fur and robe factory. Pop., 1900, 1812; 1910, 3448.

WALLIS, wŏl'ĭs, JOHN (1616–1703). An English theologian and mathematician, born at Ashford. He was educated for the ministry at Cambridge. He took the degree of B.A. at Emmanuel College in 1637, received the M.A., and was ordained in 1640, and soon after became a fellow of Queens' College (1644). He sided with the Parliament in the Civil War and was of great service in deciphering intercepted messages of the Royalists. He became an adept in cryptology and was for a long time in the employ of the state. In 1649 he was chosen Savilian professor of geometry at Oxford, holding this position until his death. Wallis was a student of polemics, language, mechanics, and theology, but his genius for mathematics eclipsed his ability in other lines. He systematized and extended the new geometry, extended the application of Kepler's law of continuity (see CONTINUITY), first made popular the present meaning of fractional and negative exponents, and introduced the symbol ∞ for infinity. His work on quadratures was original and included a discussion of such curves as represent $y = x^n$, $y = x^0 + x^1 + x^2 + \ldots$. His attempt at interpolation was the beginning of a more general method employed by mathematicians of the seventeenth century, which later enabled Newton to generalize the binomial formula. He increased the power of algebra by the systematic use of formulas, gave the law for forming the successive convergents of a continued fraction, and suggested (1685) a modern graphic interpretation of imaginaries. His chief works are: *Arithmetica Infinitorum* (1655); *Tractatus de Sectionibus Conicis Nova Methodo Expositis* (1655); *De Angulo Contactus et Semicirculi Tractatus* (1656); *De Cycloide* (1659); *Commercium Epistolicum* (1658); *Mathesis Universalis* (1657); *Mechanica, sive de Motu Tractatus Geometricus* (1669–70–71); *De Gravitate et Gravitatione Disquisitio Geometrica* (1662 and 1674); *Treatise on Algebra* (1685; Latin trans., 1693); *Institutio Logicæ* (1687); *Grammatica Linguæ Anglicanæ* (1652). His complete works were published in Oxford (1693–99).

WALLIS, SEVERN TEACKLE (1816–94). An American lawyer, born at Baltimore, Md. He graduated at St. Mary's College, Baltimore, in 1832, and was admitted to the bar in 1837. Early in life he became interested in Spanish history and literature and in 1849 was sent to Spain by the United States government to investigate the title to certain public lands in Florida. In 1861 he was elected to the Maryland Legislature, where, as leader of the faction opposed to the Civil War, he incurred the displeasure of the Federal authorities and was arrested and imprisoned. Upon his release, in November, 1862, he returned to his law practice and in 1870 was chosen provost of the University of Maryland. Wallis contributed to various periodicals and also wrote *Glimpses of Spain* (1849); *Spain: Her Institutions, Politics, and Public Men* (1853); *Discourse on the Life and Character of George Peabody* (1870).

WALL OF ANTONIUS. See ROMAN WALL.

WALL OF AURELIAN. See AURELIAN, WALL OF.

WALLON, vȧ'lôN', HENRI ALEXANDRE (1812–1904). A French politician and historian. He was educated at the Paris Normal School, and in 1840 was appointed Guizot's substitute in history and modern geography at the Sorbonne. Elected to the Legislative Assembly as a Conservative in 1849, he resigned in the following year because of the restriction of universal suffrage, and participated no further in politics during the Empire. In 1871 he was elected to the National Assembly as a Moderate Conservative; in 1875 proposed the clause by which the Republic was constitutionally established; and in the same year became Minister of Public Instruction. In 1876 he resigned and was elected life Senator. His works include *La vie de Jésus et son nouvel historien* (1864), answering Renan; *La terreur* (1873); *Histoire du tribunal révolutionnaire de Paris* (1880–82); *Les représentants du peuple en l'an II (1793–1794)* (1888–90).

WALLOON (wŏl-lōōn') **CHURCH.** A church in the Netherlands, the members of which are descendants of refugees of the Reformed faith, who entered Holland from France and Flanders in 1581 and subsequent years. Their services are still conducted in the French language and they use the Geneva Catechism instead of that of the Synod of Dort. In 1916 they had some 25,000 adherents.

WALLOONS. The name given to those among the Belgians whose mother tongue is French or a French dialect, in contrast to the Flemings, who speak Dutch or Dutch dialects. The name has been given to them by the neighboring Teutons. It is the same as Welsh to designate the Celts of Great Britain, or Wallach as applied to the Rumanians. Like the German Welsch, it simply means Roman or Celtic. It comes from Old High German Walah, an adulteration of Volca, the name of a Celtic tribe in northern Italy, the first one that the Teutons found on their way to the south. The Walloons

are the remnants of the romanized Celts of northern Gaul, the so-called Belgæ of Julius Cæsar. (See CELTIC LANGUAGES; CELTIC PEOPLES.) After having offered a stubborn resistance to the Romans, they were finally conquered by them and like the other tribes of Gaul gradually abandoned their Celtic speech for Latin, which is therefore the source of all present Wallonian dialects. The north of Belgium was barren and unprotected. It was soon raided by Teutonic tribes. Among these, the Toxanders settled in the heaths and marshes of the Campinian plain, with the consent of the Romans. Flanders, the land of the Menopii, was also devastated and the whole north of Belgium was first invaded by the Franks. The south remained for some time under the protection of the Roman legions in Tournay, but at the end of the fifth century the Franks took possession of the greater part of Gaul. This, however, was a mere conquest and did not result in any Teutonization of the country. The Teutonic settlements extended only as far south as the Carbonaria silva in the centre of Belgium, for the Teutons, being agriculturalists, were able to cultivate the more barren soil. In the wooded region of Hainault and the Ardennes, they simply appropriated large estates that were being cultivated by the Gallo-Romans. This explains why the language has remained Romance, while a great many place names are Teutonic: Hagina, the wooded river (La Haine); Hees-apa-gau, the land of the bushy brook (La Hesbaye); Leudico, town of Leudo (Liége); Namuco, town of Namo (Namur). Village names like Robechies, Obrechies, Gelbressée, Gonrieux, though Latin in form, preserve the names of Frankish lords: Robert, Odbert, Gilbert, Gunther.

In the Middle Ages the Wallonian provinces did not play so conspicuous a part as Flanders and Brabant. The communes of Liége and Dinant, however, were famous for their prosperity and their independence. The severe treatment inflicted upon Dinant by Charles of Burgundy has remained memorable. Liége was an episcopal principality notorious for the contests between bishops and citizens. In the sixteenth century, during the religious wars, the Walloons (the "Malcontents") sided principally with Spain and helped in the reconquest of the Flemish country. Only in Tournay, Valenciennes, and Artois were there Protestant communities, whose members later emigrated to the Dutch Republic, where they founded the so-called Eglises wallones. Some also went to America, among them Jean de Forest, from Avesnes, one of the founders of the city of New York (consult Emily De Forest, *A Walloon Family in America* (Boston, 2 vols., 1914), while Guido de Bray or Bres from Mons is supposed to have been the author of the "Belgic Confession" (q.v.). The Walloons in the Spanish Low Countries provided good mercenaries for Spain, especially the so-called Walloon Guard, a bodyguard.

In 1916 the Walloons in Belgium numbered about 3,000,000, as compared with 4,000,000 Flemings. They occupy the provinces of Hainault, Namur, Liége, Luxemburg, and a part of Brabant, or all the regions south of a line drawn from Aix-la-Chapelle to the environs of Lille. The linguistic frontier is clearly drawn and has not materially changed for centuries. There are a great many Wallonian dialects, belonging to two main groups: the Wallonian, properly called, found in the old diocese of Liége, and the Picardish, found in the old diocese of Cambrai. The French words château, poisson, chien, e.g., appear as tchastyâ, pehon, tchin, in the former, as kastyo, pishon, kyé in the latter. Though the Flemings and Walloons have been politically united for centuries, their physical and moral characteristics are still easily distinguishable. The Walloons, like the French, are mostly of the brunette type, and are more nervous and vivacious than the Flemings. They are more industrious and thrifty than their neighbors, but less consistent in feeling. The lower classes are somewhat careless personally, in contrast with the proverbial Flemish and Dutch cleanliness, but they have more natural distinction than their Teutonic neighbors.

The Walloons are not so conspicuous as the Flemings for their artistic achievements, although they had some good painters in the fourteenth century and in modern times have produced the musician Grétry (q.v.). By Wallonian literature is sometimes meant songs, plays, and satires written in the dialects of Liége or Mons. It has a merely local interest. The real Wallonian literature, written in French, claims such names as Clesse, Mockel, Séverin, Des Ombiaux, Nothomb. The activity of the authors mentioned is inseparable from the general evolution of the Belgian literature in French, practiced both by Walloons and by French-speaking Flemings. As early as the Middle Ages Belgium produced French writers such as the historians Froissart (q.v.) and Commines (q.v.), while Adenet Leroy wrote long romances in verse and Jean Lemaire des Belges was a court poet. From 1500 to 1850, however, very few valuable works in French were published in Belgium. The period from 1850 till 1880 was not very brilliant either, but, at least, it was marked by some isolated names such as A. van Hasselt (q.v.), the Romanticist; Charles Decoster (q.v.); Octave Pirmez, a moralist, author of valuable essays of a pessimistic tendency; Antoine Clesse, "the Walloon Béranger," who composed cheerful songs expressive of the Hainault temperament. The first years of the eighties witnessed an important literary movement. The *Jeune Belgique*, a magazine edited by a group of Louvain students, became the medium of expression for many young writers of talent and vigor, among them Max Waller, G. Eekhoud (q.v.), Camille Lemonnier (q.v.), E. Verhaeren (q.v.), T. Gilkin, A. Giraud. They had a long war to wage against the prejudices and the indifference of the public, but finally forced attention by their works. Beside the *Jeune Belgique*, the Belgian renaissance was furthered by Edouard Picard's *L'Art Social*, a review with Socialistic tendencies, and by Albert Mockel's *La Wallonie*. Mockel became the theorist of symbolism and the head of the Franco-Belgian school of Symbolist poets, a group comprising Maeterlinck (q.v.), Van Lerbergh, Le Roy, Fontainos, and Séverin among the Belgians, Mallarmé (q.v.), Héredia (q.v.), Rotté, Moréas (q.v.), and Louys (q.v.) among the French. The Belgian writers illustrate two main artistic tendencies: realism and symbolism. The most conspicuous among the realists are G. Eekhoud and Camille Lemonnier (qq.v.), whose verse and more important novels show remarkable power of description and an almost truculent naturalism, while Gaston Virrès is the

painter of the life of the middle class in the small towns. Emile Verhaeren (q.v.), in his first works (*Les Flamandes, Les Moines, etc.*), was also a violent realist. His method underwent an evolution towards social art. In *Les débacles, Les campagnes hallucinées, Les villes tentaculaires,* and *Les spectacles* he is sorely grieved by the triviality and gloominess of large cities and extols the simple vocations of the country. Later works, however, showing him deeply impressed by the grandeur of human effort in modern industry and science, have a Socialistic and atheistic tendency.

Belgium has produced several dreamy and mystical poets who all, to a greater or less degree, identified themselves with the Symbolistic school, among them being Max Elskamp, who delights to portray the piety of the Flemings; George Rodenbach, the painter of peaceful old Bruges; the mystic Ch. Van Lerberghe; Grégoire Le Roy; Albert Mockel, a graceful and lyric Symbolist, and F. Séverin, whose delicate soul is expressed in refined and simple verse—two poets who, like Verlaine (q.v.), came from the Ardennes; and above all, Maurice Maeterlinck (q.v.), who constantly associates man's life and activity with nature and manifests a pantheistic tendency. It should be remembered that the Belgian literature in French is not exclusively of Wallonian inspiration. Features of the Flemish character, such as an exuberant realism and a mystical symbolism, are discoverable in many a Belgian writer, and notably in Verhaeren, Maeterlinck, and Rodenbach.

Grandgagnage, *Dictionnaire etymologique de la langue wallone* (3 vols., Liége, 1845–80); id., "De l'origine des Wallons," in Institut Archéologique liégeois, *Bulletin,* vol. i (ib., 1852); Paul Marchot, *Phonologie détaillée d'un patois Wallon: contribution à l'étude du wallon moderne* (Paris, 1892), containing a bibliography; Oscar Colson, *Table générale systematique des publications de la Société liégeoise de littérature wallonne, 1856–1906* (Brussels, 1908); Maurice Wilmotte, *La culture française en Belgique* (Paris, 1912).

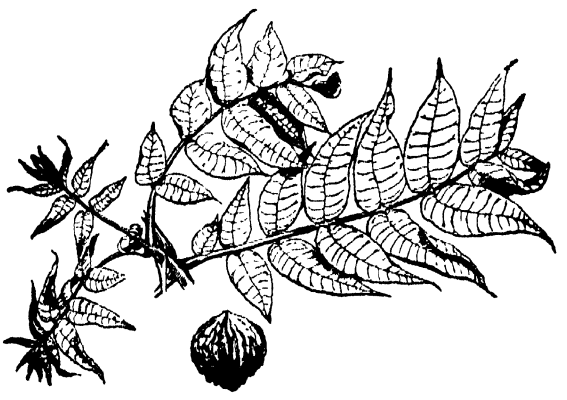
WALL PAPER. Paper made to decorate walls. It usually carries colored patterns or designs produced by painting, stenciling, or printing. The equivalent term in French is papier peint, painted paper; in German, Tapete, formerly tapestry, and still used in that sense in Austria, but usually with a qualifying word like Flemish to distinguish the woven from the paper hangings. The use of wall paper in the present fashion to cover all or most of the side walls of a room did not become common until the eighteenth century. Isaac Ware in his *Classic Architecture,* published in 1756, laments that: "Paper has taken the place of sculpture," by paper meaning wall paper, and by sculpture relief ornament in wood or plaster.

However, wall paper painted in China had been used in Europe as early as the middle of the sixteenth century, although it did not become fashionable until over a century later. Macky about 1720 speaks of Sir Richard Child's residence as having: "a parlour finely adorned with China paper, the figures of men and women, birds and flowers, the liveliest I ever saw come from that country." A paper representing the trade and occupations of China was put about 1780 into the drawing room of Brasted in Kent, by Dr. Turton, favorite of George III, who is reported to have received it as a present from the Emperor of China. Such papers were at this period customary gifts from ambassadors and merchants in China to their friends at home. A number of boxes of Chinese wall paper, each box generally containing 12 lengths, have been discovered in recent years unused in the attics and lumber rooms of English country houses. Also many eighteenth-century wall papers in Chinese design, some made in China for the European trade and others made in England, are still on the walls where they were first hung, notably the one in the bedroom at Badminton; and the one in the Baroness' room at Coutts' Bank on the Strand, brought to England by Lord Macartney, the British Envoy to China, who immortalized himself by refusing to "kow-tow" to the Chinese Emperor. Of course these papers were backed with canvas and mounted on wooden frames with an air space between them and the walls. If they had been pasted fast to the plaster as now they would not have lasted much longer than do our modern papers. The painted Chinese paper on the Cadwalader room in the Metropolitan Museum of Art, New York, hung on the walls of a house in England for over 200 years, before it was safely removed and brought across the Atlantic. Of the fidelity with which these Chinese papers pictured Chinese life, Sir Joseph Banks said in his *Journal* in 1770: "A man need go no further to study the Chinese than the China paper, the better sort of which represent their persons and such of their customs, dresses, etc. as I have seen, most strikingly like, though a little in the caricatura style."

It must not, however, be imagined that the Chinese themselves used wall paper in the European manner. When Robert Fortune commenting on the house of a Chinese mandarin remarks: "a nicely furnished room according to Chinese ideas, that is, its walls were hung with pictures of flowers, birds, and scenes of Chinese life . . . I observed a scene of pictures which told a long tale as distinctly as if it had been written in Roman characters. The actors were all on the boards, and one followed them readily from the commencement of the piece until the fall of the curtain," he refers not to a series of strips of paper fixed fast to the walls, but to a series of kakemonos or paintings on silk or paper, mounted on rollers in the Chinese and Japanese fashion and attached to the walls only temporarily, and much easier to remove and change than European framed paintings. Even to-day the Chinese are only just beginning to use wall paper as in Europe and America.

Hand-blocked papers bear about the same relation to hand-painted papers that roller prints do to block prints. In the painted papers there is the utmost freedom of design. There is no more restriction upon the extent of the pattern than in a fresco or other mural painting. Many of the earlier block papers had the outline only made with the block, all the coloring being done later with the brush. The block, of course, makes it much easier and hence cheaper to produce several copies of a design, but the economy is proportionate to the limitations in size of the design. The roller goes still farther in the pattern or small repeat directions and is most effective for quantity when the pattern is not larger than 18 inches square, whereas blocks can be used economically on designs many times larger. The tendency to develop in the repeat direction seems to have been European

rather than Chinese, and while block printing in black and white in China dates back to the sixteenth century A.D., according to Chinese historians, and in color at least to the seventeenth century, there is no doubt that the block printing of wall paper in colors is a process that was developed and brought to perfection in Europe. There still exist in England a few paper imitations of Italian velvets, which are attributed to the Elizabethan period, and generally have a flock surface. Follot, however (see bibliography), maintains that the wall-paper industry in France dates from the beginning of the seventeenth century, and names Le François, *dominotier* and *enlumineur*, who in 1610 made at Rouen "des papiers veloutes pour tentures" (flock papers for hangings). The patterns of these were stenciled on in varnish and the flock powder was then blown on with the bellows, and tinted with water color when dry. Follot attributes the invention of the block as it is used in printing wall paper to Jean Papillon, a French engraver, in 1688. However, there was recently discovered at Borden Hall in England a thick block-printed paper of Indian floral design which is attributed to the last half of the sixteenth century. In 1692 a patent was granted in England to William Bayley for the manufacture of paper hangings.

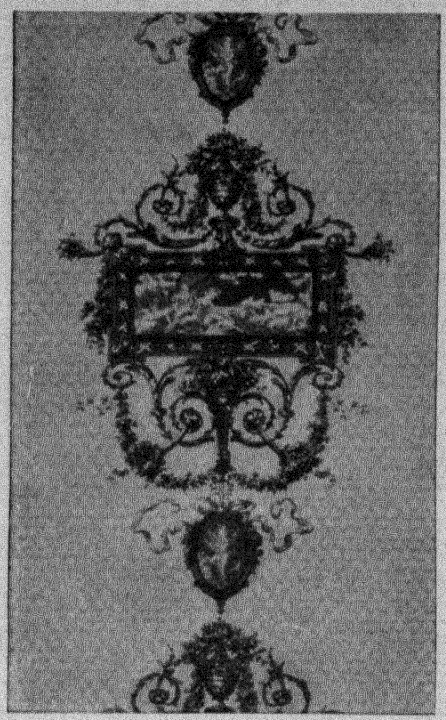


In the nineteenth century, the wall-paper industry was transformed, and the production of huge quantities at a trifling price was made possible, by the introduction of continuous paper, the roller, and power. Paper in continuous rolls was first made in 1829 by Zuber in Alsace, who sold the English rights for $5000. Previously rolls had been made by pasting together sheets 18 inches wide. About 1850 Zuber brought from Manchester in England a six-color roller-printing machine based on the one used in printing cottons. (See TEXTILE PRINTING.) Henceforth the majority of papers were machine made, although since William Morris began to design wall papers in 1862 a few modern patterns have been hand-blocked, and some of the finest eighteenth-century ones, even those requiring more than 2000 blocks like the famous Cupid and Psyche scenes designed by David for Napoleon, are still printed from the ancient blocks. The block-printing of paper is easier than that of cloth and the blocks are consequently larger. While the rollers from which textiles are printed are of copper, the wall-paper rollers are of wood, with the pattern outlined in copper or brass ribbon, and the solid surface filled in with felt. One reason that block-printed papers are superior to roller prints is that the block surface is softer, being mostly of wood, and carries the ink better; also in block printing each color dries before the next is applied, while in roller printing all the colors follow one another immediately. Also the block releases more of the pigment, and drives it harder into the paper, while the effect of the roller prints is comparatively thin and poor. Consult: Félix Follot, *Papiers peints* (Paris, 1900); Horace Warner, "How Wall Papers are Printed," in the *Art Journal* (London, 1901); Kate Sanborn, *Old Time Wall Papers* (New York, 1905), valuable chiefly for the many illustrations of ancient papers from the walls of American houses; G. L. Hunter, *Home Furnishing* (ib., 1913).

WALLS'END. A town in Northumberland, England, 4 miles east-northeast of Newcastle (Map: England, E 1). It is celebrated for its collieries and the quality of its coal, has shipbuilding yards, engineering works, lead and copper smelting works, and manufactories of aluminium, cement, bricks, and tiles. As Segedunum it was a provision depot of the Romans, and the remains of its ancient quay have been discovered. It derives its modern name from its position at the east end of Hadrian's Wall. Pop., 1901, 20,932; 1911, 41,464.

WALL STREET. A street in New York City from Broadway to the East River, following the line of the early city wall across Manhattan Island. It contains the United States Sub-Treasury and numerous banking institutions, and is the centre of financial operations in the United States.

WALLY, vä'lē', LA. An opera by Catalani, first produced in Milan, Jan. 20, 1892; in the United States, Jan. 6, 1909 (New York).



WALNUT (AS. *walhhnutu*, walnut, foreign nut, so called because first brought from Italy and France, from *wealh*, OHG. *walh*, foreign + *hnutu*, Icel. *hnot*, Ger. *Nuss*, nut), *Juglans*. A genus of beautiful trees of the family Juglandaceæ. The species, of which about 12 are known, are mostly North American and Asiatic. All but one or two species are trees with alternate pinnated leaves, monœcious flowers, and a drupe with a deciduous fleshy husk and a deeply wrinkled two-valve shell, within which is the curiously lobed and wrinkled seed. The species of hickory (q.v.) were formerly included in this genus. The common walnut, Persian, Circassian, or English walnut (*Juglans regia*), is a native of Persia and the Himalaya, but has long been cultivated. The wood is usually called Circassian walnut and the nuts are called English walnuts quite generally in the United States. The date of its introduction is unknown, but it was certainly cultivated by the Romans in the reign of Tiberius. It is a lofty tree of 60 to 90 feet, with large spreading branches. The leaves have a balsamic odor when bruised. The tree yields a sugary sap and is sometimes tapped like the sugar maple. Pickles and ketchup are made of the unripe fruit. The ripe fruit is one of the best of nuts (q.v.) and an important article of export from southern Europe and California, where the trees are extensively cultivated. The nearly mature nuts are much used in France with vinegar, salt, pepper, and shallots. Walnuts yield by expression a bland, fixed oil, which under the names of walnut and nut oil is used by painters and in the countries of its production as an article of food. The cake left after expressing the oil is sometimes used as human food and for cattle

BLACK WALNUT (*Juglans nigra*).

and poultry. The timber of the walnut is valuable, and is used for cabinets, gunstocks, etc. It is light, although hard and fine-grained. The wood of young trees is white and little esteemed; that of old trees is brown, veined and shaded with darker brown and black. The wood of the roots is beautifully veined. Both the root and the husks of the walnut yield a dye, used to stain light-colored woods brown. The walnut when meant to become a timber tree is best sown where it is to remain, as the roots are injured by transplanting. The best kinds of walnut for fruit are generally grafted. The black walnut (*Juglans nigra*), a similar tree, found in most of the United States, except the most northern, is one of the finest, largest, and most beautiful trees in American forests, attaining heights of 150 feet and diameters of 6 or 7 feet. The fruit, which has a thick woody shell, is inferior to that of the Persian walnut. *Juglans californica*, a Western species, greatly resembles the Eastern black walnut, and in California is much used as a stock on which *Juglans regia* is grafted. *Juglans rupestris* is a small tree or shrub from Colorado to Mexico. *Juglans sieboldiana* and *Juglans mandshurica* are the most important East Asiatic species. *Juglans cinerea*, the white walnut or butternut (q.v.), is a close relative. A species, *Juglans insularis*, occurs in Cuba, where it sometimes attains a height of 100 feet.

WALNUT FAMILY. See JUGLANDACEÆ.

WALNUT INSECTS. The chief insect enemy of the black walnut in the United States is the hickory and locust tree borer (*Cyllene pictus*). The beetles which are reared from walnut, however, are larger in size, and their yellowish markings are more or less white. (See LOCUST TREE INSECTS.) The common June beetle (q.v.) of the South is especially fond of the foliage of the walnut. The larvæ of the luna moth and of the regal moth are also found commonly feeding upon walnut leaves, and several species of underwing moths (q.v.) are especially fond of this tree; also one of the hawkmoths (*Cressonia juglandis*), which has a large pale blue-green caterpillar. Several leaf miners and leaf rollers (qq.v.) also attack the foliage, and a weevil (*Conotrachelus juglandis*) allied to the plum curculio feeds in the nuts. A scale insect (*Aspidiotus juglans-regiæ*) occurs on the bark of the English walnut. Forty-five species of insects have been recorded as attacking this tree in the United States, while only 15 are recorded from the so-called English walnut (*Juglans regia*) in Europe. Consult A. S. Packard, *Insects Injurious to Forest Trees* (Washington, 1890).

WALPOLE, wąl'pōl. A town in Norfolk Co., Mass., 18 miles south by west of Boston, on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 4). It contains a public library and the Union Training School, has a paper mill, rubber factory, dyeing and bleaching works, machine shop, tannery, sandpaper mill, and manufactures medical supplies, asbestos products, felt goods, asphalt roofing, etc. Pop., 1900, 3572; 1910, 4892.

WALPOLE. A town in Cheshire Co., N. H., 18 miles by rail northwest of Keene, on the Boston and Maine Railroad (Map: New Hampshire, D 7). The high school and Bridge Memorial Library are attractive features. Walpole is essentially a farming town and has a great many places of historical interest. Its first charter was granted in 1752. Pop., 1900, 2693; 1910, 2668.

WALPOLE, wąl'pōl, HORACE or HORATIO, fourth EARL OF ORFORD (1717–97). An English littérateur. He was probably the fourth son of Sir Robert Walpole, although some of his contemporaries believed the scandal according to which Carr, Lord Hervey, was his father, owing to the remarkable differences in temperament and taste between Horace and his brothers. He was educated at Eton and Cambridge, afterward traveling abroad for some years, principally in Italy. In 1741 he returned to England and took his seat in Parliament. In 1747 he purchased a piece of ground near Twickenham, and built there his famous mansion and literary establishment—Strawberry Hill. In 1758 he published his *Catalogue of Royal and Noble Authors*. This was followed by *The Castle of Otranto* (1764), a weird tale of mystery which was one of the earliest signs of the Romantic movement; *The Mysterious Mother*, a tragedy (1768); and the *Historic Doubts on the Life and Reign of Richard III* (1768). Among a multitude of works, however, those to which he owes the preservation of his name are his *Letters*. These will always be interesting as pictures and records of the society and fashionable gossip of his day, although their historical value is considerably marred by their evident want of truthfulness. Though Walpole thought of himself rather as a fine gentleman who condescended to write than as a professional author, the literary value of his *Letters* is very high, and sets him at the head of English letter writers. On the death of his nephew in 1791 he became fourth Earl of Orford, but seems never to have cared to exercise his privileges as a member of the House of Lords. The best edition of the *Letters* is by Mrs. Paget Toynbee (16 vols., London, 1904); others are edited by Cunningham (ib., 1886), and by Yonge (ib., 1891). Among his other writings in modern editions are *Memoirs of the Last Ten Years of George II* (London, 1846); *Memoirs of the Early Reign of George III* (ib., 1845); *Journal of the Reign of George III from 1771 to 1783* (ib., 1859). Consult also: Eliot Warburton, *Memoirs of Horace Walpole* (London, 1851); T. B. Macaulay's well-known essay on Walpole in the *Edinburgh Review* for October, 1833, edited by G. A. Watrous (New York, 1901); Austin Dobson, *Horace Walpole* (ib., 1890); M. A. Havens, *Horace Walpole and the Strawberry Hill Press* (ib., 1901); *Correspondence of Gray, Walpole, West, and Ashton, 1734–1771*, with introduction, notes, and index by Paget Toynbee (2 vols., Oxford, 1916).

WALPOLE, HUGH SEYMOUR (1884–). An English novelist, son of the Rt. Rev. G. H. S. Walpole, Bishop of Edinburgh. Educated at King's School, Canterbury, and at Emmanuel College, Cambridge, he subsequently taught school for a time, and would seem to have drawn upon his experience as a schoolmaster when he wrote his first novel, *The Wooden Horse* (1909). After the publication of that book, he turned to literature as a profession, and wrote successively: *Maradick at Forty* (1910); *Mr. Perrin and Mr. Trail* (1911); *The Prelude to Adventure* (1912); *Fortitude* (1913); *The Duchess of Wrexe* (1914); *The Golden Scarecrow* (1915); *The Dark Forest* (1916). In 1916 he served with the Russian Red Cross in the European War.

WALPOLE, SIR ROBERT, first EARL OF OR-

FORD (1676–1745). An English statesman, born at Houghton, Norfolk, and educated at Eton and King's College, Cambridge. He was elected to Parliament from the family borough of Castle Rising in 1701, and from the more important constituency of King's Lynn in 1702. Through membership in the council to Prince George of Denmark in 1705, and services as Secretary of War from 1708 to 1710, he won a high position in the Whig councils, only to fall with his party through the failure of the impeachment proceedings against Sacheverell. A brilliant share in the opposition incurred for him the bitter enmity of the Tories. Reëlected to Parliament from King's Lynn in 1713, the accession of George I in the following year secured his return to ministerial favor. Serving at first as Privy Councilor and Paymaster-General of the forces, on the impeachment, largely through his endeavors, of the Bolingbroke ministry, he was in 1715 made Chancellor of the Exchequer and First Lord of the Treasury. Disunion in the cabinet during the year 1717 led to his resignation and the transfer of his energy to the opposition, in which he was a most determined enemy of the South Sea scheme. Restored to the paymastership of the forces in 1720, the disastrous failure of the South Sea bubble was followed in 1721 by his elevation for the second time to the office of First Lord of the Treasury and Chancellor of the Exchequer. From this time until his retirement in 1742, the life of Walpole may be said to be the history of England. "But his long administration is almost without a history," says Green; "all legislative and political activity abruptly ceased with his entry into office." His policy throughout was peace abroad and sound finance at home. Frauds in the excise during 1733, and the unpopular Gin Act of 1736, weakened his hold on popular affection; and quarrels between the King and the Prince of Wales in 1737, together with the Spanish War, into which the ministry was forced in 1739, led to the overthrow of Walpole in 1742. He resigned February 2 of that year and was created Earl of Orford. His name is chiefly remembered for his frank avowal of the necessity of parliamentary corruption.

In addition to the various parliamentary records, source material of value may be found in the writings of Horace Walpole (q.v.). Consult: William Coxe, *Memoirs of the Life and Administration of Sir Robert Walpole, Earl of Orford* (4 vols., London, 1798), the standard biography; John Morley, *Walpole* in "Twelve English Statesmen Series" (ib., 1890); N. A. Brisco, *The Economic Policy of Robert Walpole* (New York, 1907).

WALPOLE, SIR SPENCER (1839–1907). An English historian, grandson of Spencer Perceval (q.v.). He was educated at Eton, and held several minor governmental positions, but is known chiefly for his historical works. His *History of England from 1815*, which appeared in five volumes from 1878 to 1886, is in some respects the best work that appeared on England in the nineteenth century. In 1898 Walpole was knighted. Other works by him are *Life of the Right Honorable Spencer Perceval* (2 vols., 1874); *The Electorate and the Legislature* (1881; 2d ed., 1892); *Foreign Relations* (1882); *Life of Lord John Russell* (2 vols., 1891); *The History of Twenty-Five Years* (4 vols., 1904–08); *Essays Political and Biographical* (1908). Consult J. F. Rhodes, *Historical Essays* (New York, 1909).

WALPURGA, väl-pụr'gȧ, or **WALPURGIS,** -gĕs, or **WALBURGA,** SAINT (?–c.780). An early missionary to Germany, born in Sussex, England, the niece of St. Boniface and the sister of Saints Willibald and Wunnibald. She went to Germany, where her uncle and brothers had founded Christian establishments, about 750, and founded a nunnery at Bischofsheim, and in 754 became abbess in the double monastery of Heidenheim, where Wunnibald was abbot. Upon his death in 760, she succeeded him as head of both parts of the monastery. Bishop Otgar (879–880) caused her bones to be removed to Eichstätt, where later the nunnery of St. Walpurgis arose. From the rock in which her tomb was made an oil exuded, believed to come from the body of the saint and to be of medicinal value. On account of this she is pictured as bearing a vial of oil. She is the patron saint of various places in Germany, and her cult has spread to France, England, and the Netherlands. The true day of the saint is February 25, but her name, without good reason, became attached to May 1, and took up customs inherited from an ancient spring festival. With these ideas witch superstitions became connected in the Middle Ages, and Walpurgisnacht, between April 30 and May 1, was regarded as the time of the witches' assembly. This was held at various places, but the Brocken, or Blocksberg, in the Hartz Mountains was the most famous. Goethe's *Faust* makes use of the superstition. Walpurga was regarded as the protector from magic. Consult Ballandist, *Acta Sanctorum III*, February 25; F. Schanerte, *Die Heilige Aebtissin Walpurga* (Paderborn, 1892); G. F. Brown, *Boniface of Crediton and his Companions* (London, 1910).

WALRAS, vȧl'rȧs', MARIE ESPRIT LÉON (1834–1910). A French economist, born at Evreux. From 1870 until his retirement in 1892 he was professor of political economy at the University of Lausanne. Walras became known for his employment of the so-called mathematical method in economics, of which his *Eléments d'économie politique pure* (1874; 4th ed., 1900) is a good example. His writings include, also: *Francis Sauveur* (1858); *L'Economie politique et la justice* (1860), which refuted the economic doctrines of Proudhon; *Théorie critique de l'impôt* (1861); *Recherches de l'idéal social, théorie générale de la société* (1868); *Etudes d'économie sociale* (1896).

WALRUS, wôl'rŭs (Swed. *hvalross*, Dan. *hvalros*, walrus, whale horse, from Swed., Dan. *hval*, whale + Swed. *hross*, Dan. *hros*, horse). One of the largest animals of the seal tribe (Pinnipedia), the two species of which constitute the family Trichechidæ (formerly Rosmaridæ) and classified on anatomical grounds between the eared seals (otaries) and earless or common seals, though having little external resemblance to either. The form is thick and clumsy (see Colored Plate of SEALS), and a full-grown male will measure 12 feet in length and may exceed 2200 pounds in weight; females are somewhat smaller. Young ones are thickly clothed with a faded brown fur, but as age advances this falls out, and old individuals are almost naked. The blunt muzzle is set with a thick mustache of bristles, which with the lips is very mobile. The ear is marked only by a fold of skin. The primary characteristic of the family is the possession of a pair of enormous tusks (the canine teeth), which project downward from the upper jaw, and are solid ivory, hard and more yellow-

ish than those of elephants. Those of the female are longer (reaching sometimes 30 inches) than the male's, but his are stronger and thicker. For the support of these huge teeth—used as pickaxes in digging up mollusks, for aid in climbing on ice or rocks, and as weapons—the anterior part of the skull is greatly enlarged and strengthened. Most of the other teeth fall out, so that an old walrus has in the upper jaw, besides the tusks, only two incisors and three pairs of molars, and in the lower jaw no incisors, two canines, and four pairs of molars. These animals are confined to northern shores, and two species are known—the Atlantic (*Odobænus* or *Trichecus rosmarus*) and the Pacific walrus (*Odobænus obesus*). The latter is rather larger and more obese than its congener, and the tusks are usually longer and thinner. The Atlantic walrus, the rosmarus or morse of old writers, is found from the archipelago north of America eastward to about the mouth of the Yenisei, and in Hudson Bay, Labrador, and Greenland, but it no longer, as formerly, comes south to Nova Scotia or southern Norway, and is scarce around Spitzbergen and Nova Zembla. The Pacific walrus is no longer seen south of the Aleutian Islands, and does not pass eastward of Point Barrow, nor much west of Bering Strait.

They pass most of their time near ocean shores, resting in crowds on the floating ice, and do not often go ashore except in early summer, when the females produce their one or two young. The period of gestation is said to be about nine months. Their food consists mainly of clams, dug with the tusks; seaweed is also eaten. The flesh is an important factor in the sustenance of the natives of Arctic coasts, but is not well liked by civilized men. The diminution of the Pacific walrus has been a serious deprivation to the natives of Alaska and neighboring Siberia, threatening famine here. Their greatest natural enemy is the polar bear. Their oil is inferior in quantity and quality to that of seals; but the thick hide is used in Russia and Scandinavia as sole leather and for harness and ship rigging, while the ivory is valuable. This commercial importance has led to a steady hunting of the animal, and the race is diminishing in all accessible parts of its habitat. Occasionally a young one is captured alive, and shows docility and some intelligence, but none have long survived captivity.

Consult Allen, *North American Pinnipeds* (Washington, 1880), which contains an exhaustive treatment and bibliography of the subject.

WALSALL, wôl'sąl. A manufacturing market town, municipal, and parliamentary borough, in Staffordshire, England, on an eminence near the Tame, eight miles northwest of Birmingham (Map: England, E 4). The town has fine ecclesiastical and municipal buildings, markets, and a free library; it has built artisans' dwellings and it owns the tramways and other works. Coal, iron, limestone, and clay are obtained in the neighborhood; tanning, malting, and the manufacture of hardware, saddlery and other leather goods, and iron and brass founding, are the industries. Walsall was fortified early in the tenth century and received charters from Edward III and Henry IV, confirming prior royal privileges. Pop., 1901, 86,440; 1911, 92,130. Consult Willmore, *History of Walsall* (1887).

WALSCHMIDT, väl'shmĭt, Max. See Schmidt, Max.

WALSH, Edward (1805–50). An Irish poet whose significance lies in his relation, as a precursor, to the Celtic revival (see Irish Literature, *Irish Literature in English*). Born in Londonderry, Walsh became a teacher, and, eventually and incongruously, a schoolmaster to convicts on Spike Island. Up to 1848 he was a regular contributor to the Irish patriotic paper the *Nation*. He collected, and made known to English-reading people, many fine waifs and strays of Irish popular poetry. His work is represented in his *Reliques of Irish Jacobite Poetry* (1844) and *Irish Popular Songs* (with translations and notes, 1847). Walsh is to be associated with J. J. Callanan, who was the first to give adequate English renderings of Gaelic poems.

WALSH, Francis Patrick (1864–). An American lawyer and investigator. Born in St. Louis, he was educated there in St. Patrick's Academy, was admitted to the Missouri bar in 1889, and was a member of the Kansas City Tenement Commission in 1906–08. In the same city Walsh became attorney of the Board of Public Welfare in 1908 and president of the Board of Civil Service in 1911. In 1913 he was appointed by President Wilson chairman of the Federal Commission on Industrial Relations, in which office he attracted attention by his investigation in 1914 of industrial conditions in Colorado.

WALSH, James Joseph (1865–). An American physician and author, born in New York City. He graduated from Fordham College in 1884 (Ph.D., 1892) and from the University of Pennsylvania (M.D.) in 1895. After postgraduate work in Paris, Vienna, and Berlin he settled in New York, where in 1906 he became professor of physiological psychology at Cathedral College and professor of nervous diseases in and dean of the Fordham Medical School. He resigned his Fordham offices in 1912. In 1916 he received the Lætare medal (q.v.). He contributed to medical and other journals, and published various works of popular type: *Catholic Churchmen in Science* (1906; 2d series, 1909; 3d series, 1915); *Makers of Modern Medicine* (1907); *The Popes and Science* (1908; new ed., 1915); *The Thirteenth, Greatest of Centuries* (3d ed., 1910); *Modern Progress and History* (1912).

WALSH, Robert (1784–1859). An American publicist. He was born in Baltimore, was educated at the Jesuit College of Georgetown, and for a short time practiced law. From 1811 to 1813 he published the first quarterly in the United States, the *American Review of History and Politics*, revived by him in 1827–37. From 1821 to 1837 he edited the *National Gazette*, and in 1822 the *Museum of Foreign Literature and Science*. In 1837 he removed to Paris, where from 1845 to 1851 he was United States consul. He contributed to many publications of the time, and his books include a *Letter on the Genius and Disposition of the French Government* (1810), *Correspondence Respecting Russia* (1813), an *Essay on the Future State of Europe* (1813), and *An Appeal from the Judgments of Great Britain* (1819).

WALSH, Thomas James (1859–). An American legislator, born at Two Rivers, Wis. He graduated LL.B. from the University of Wisconsin in 1884, and then took up the practice of law at Redfield, S. Dak. Moving to Helena, Mont., in 1890, he became interested in land and cattle companies in that State in addition

to his law practice. Walsh was unsuccessful as Democratic candidate for Representative in Congress in 1906 and for Senator in 1910, but was elected to the latter office for the term 1913–19. He served as a delegate to the Democratic National Conventions in 1908 and 1912.

WALSH, WILLIAM J. (1841–). An Irish Roman Catholic prelate. He was born in Dublin and educated at Maynooth College, where he became professor of dogmatic and moral theology in 1867. He was made vice president in 1878, and in 1881, on the death of Dr. Russell, was unanimously chosen president by the Irish bishops. He was consecrated Archbishop of Dublin in 1885, and since then has been a member of many important government commissions, besides having had great influence in the framing of the Irish Land Act of 1881, of which he published a *Plain Exposition* in the same year. His other works include a *Harmony of the Gospel Narratives of the Passion* (1885) and *Bimetallism and Monometallism* (1893).

WALSINGHAM, wŏl'sĭng-*ăm*, ALAN DE. An English prelate and architect of the fourteenth century, subprior of Ely in 1321 and prior from 1341. He is principally famed for the great octagon and lantern which he erected after the fall of the Norman tower over the crossing had wrecked the central part of the cathedral. Here he created an octagonal rotunda about 80 feet in diameter, and covered it with a pseudo-vault and lantern, all of wood, externally covered with lead—a unique feature of Gothic architecture.

WALSINGHAM, SIR FRANCIS (c.1530–90). An English statesman, born either in London or in Kent. He studied at King's College, Cambridge, but appears not to have graduated. He was a zealous Protestant and lived abroad during the five years of Mary's reign, acquiring a knowledge of foreign languages and politics which was of the utmost value to him in his conduct of England's foreign affairs under Elizabeth. Burleigh sent him on a difficult mission to France in August, 1570. He remained in Paris until April, 1573, and acquitted himself so well that he was made one of the principal secretaries of state, a member of the Privy Council, and knighted. He labored incessantly for intervention in the Netherlands and the suppression of Catholic plots which Spain encouraged in England. In 1578 Walsingham was sent to the Netherlands with the unwelcome task of trying to pacify the country by diplomacy; in 1581 he was sent to France and in 1583 to Scotland. In 1585 he brought Elizabeth to a momentary support of the Dutch, but the results did not meet his expectations. In 1586 he unearthed the Babington plot, the object of which was the murder of Queen Elizabeth, and Walsingham produced letters in Mary's cipher, which, if genuine, proved beyond a doubt Mary's complicity in the conspiracy. (See BABINGTON, ANTONY.) Walsingham was one of the commissioners by whom Mary was tried and condemned, and he was one of the most active in bringing Elizabeth to the point of signing the death warrant. In 1587 and 1588 Walsingham's secret service kept him completely informed of the plans and progress of the great Armada (q.v.). During Walsingham's last years he was greatly embarrassed by debt, due in part to expenditures in the service of the state, but Elizabeth gave him no relief. He died April 6, 1590, and was buried privately at night in St. Paul's Church. The Camden Society has published *Sir Francis Walsingham's Journal* from December, 1570, to April, 1583 (London, 1870). Consult: Thomas Wright, *Queen Elizabeth and her Times, a Series of Original Letters* (London, 1838); M. A. S. Hume, *The Great Lord Burleigh* (ib., 1898); Karl Stählin, *Sir Francis Walsingham und seine Zeit* (Heidelberg, 1908).

WALSINGHAM, THOMAS (?–c.1422). An English monk and historian, supposed to have been born in Norfolk. He was connected with the Abbey of St. Albans as precentor and scriptorarius, and in 1394 he became prior of Wymondham. He is thought to have composed: *Chronicon Angliæ*, covering the period from 1328 till 1388 ("Rolls Series" for 1874); *Gesta Abbatum*, history of the abbots of St. Albans ("Rolls Series" for 1867–69, in 3 vols.); *Historia Anglicana*, covering the years 1272–1422 ("Rolls Series" for 1863–64); *The Ypodigma Neustriæ*, a history of the dukes of Normandy ("Rolls Series," 1876); and other works. Although he was a chronicler rather than an historian, his works form the chief source upon the reigns of Richard II, Henry IV, and Henry V, including the career of Wiclif and the insurrection of Wat Tyler. Consult Charles Gross, *Sources and Literature of English History* (2d ed., London, 1915).

WALT, vält, ABRAHAM. See LIESIN, ABRAHAM.

WALTER, wąl'tẽr, EUGENE (1874–). An American playwright, born in Cleveland, Ohio. He began his career as a reporter on the Cleveland *Plain Dealer* and was later connected with several newspapers in different parts of the country. Subsequently he acted as advance agent and business manager for various traveling theatrical companies. He began writing for the stage in 1900, and his first successful play, *Paid in Full*, was produced in New York in 1908. The best known of his later plays are *The Easiest Way* (1908), *Fine Feathers* (1911), and *Just A Woman* (1916). He was married to Charlotte Walker, the actress, in 1908.
